The "you-do-the-rest" part is one of the most delightful phases of photography. It is a pleasure, of course, to take pictures, but you are not getting all the fun, all the delight till you *make* them.

For printing there now comes the kodak amateur printer, a new thing—new of necessity embodying, as it does, the very latest ideas in photographic printing.

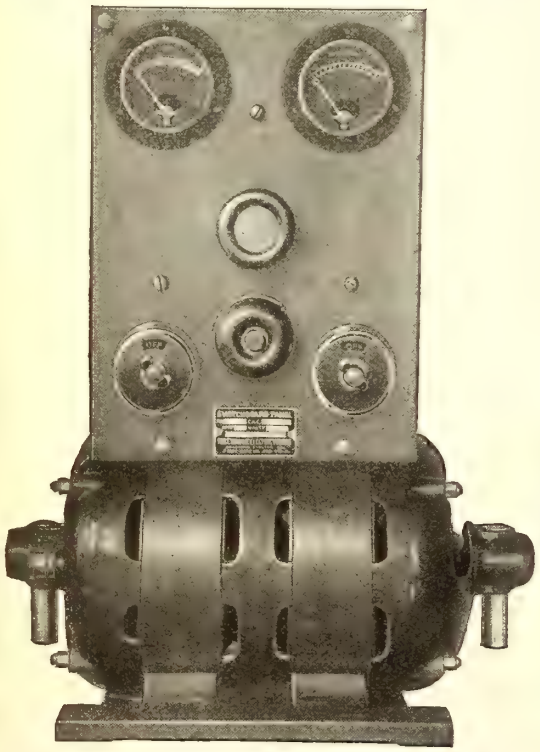
The printer consists of a box with a removable top in which is located the printing glass. Inside the box are two electric lights —one, a small, red bulb which supplies the necessary illumination for the adjustment of negative and papers, the other, a powerful Mazda lamp which provides the printing light. At the side of the box is a window covered with orange fabric which serves as a dark-room lamp with the red bulb turned on or, with the Mazda lamp, a safe light for Velox developing.

A particular feature is an automatic masking device. Thin metal strips which may be adjusted as desired mask the paper with perfect accuracy, so that prints with white margins may be obtained from any

Electric Printer for Amateur Photographers.

film negatives from the vest pocket up to and including the 4x5 and postcard size. A hinged frame holds the negative and paper tightly together.

The exposure is entirely automatic. When the hinged cover holding the negative and paper is closed the Mazda lamp is automatically turned on, when the catch is released the Mazda lamp is extinguished and the red bulb burns. This arrangement prevents wasted current in making prints.



NEW COMPACT BATTERY CHARGING SET.

The new battery charging outfit shown herewith is designed especially for service in garages for charging automobile ignition and lighting batteries. This outfit consists of a small motor-generator set on which is mounted a small switchboard panel bearing all the switches, instruments, etc., necessary for their control. The outfit is to be connected to the incandescent lighting circuit by means of lamp cord and plug, the motor generator being supplied for service on 110 or 220 volt, 60 cycle, alternating current circuit, or on 110 or 220 volt, direct current circuit.

The motor generator is supplied to deliver direct current at 12, 18 or 24 volts, such voltage being specifically adapted for charging 12, 18 and 24 volt batteries.

The switchboard, which is mounted upon these sets, has a snap switch in the line circuit for the purpose of starting and stopping the set; a snap switch in the circuit from the generator to the batteries to be charged, for opening the charging circuit; a voltmeter for reading the voltage delivered by the generator; an ammeter for reading the charging current, and a field rheostat for raising or lowering the voltage of the generator end of the set and, therefore, serving to adjust the battery-charging current.

This set needs practically no attention in service other than an occasional filling of the bearing grease cups with oil. The switchboard, bearing all of the instruments, rheostats, switches, etc, properly wired, leaves as the whole work of installation simply the necessity of connecting to lighting circuit and to battery by lamp cord.

New Compact Type Storage Battery Charging Set.

RESISTANCE OF THE HUMAN BODY.

A human being is not generally looked upon in terms of ohms, yet if a man grasps two oppositely charged terminals, he becomes as much a part of the circuit as the wire itself, and he offers a certain resistance to the flow of current.

It has been estimated by capable authorities that the resistance of the human body is about 10,000 ohms, but it varies greatly with the path the current takes through the body. If a person firmly grasps two metal conductors the resistance from one hand to the other is only from 1,000 to 3,000 ohms. If a shorter path be taken, as for instance through a man's head, the resistance is very much less.

Some interesting experiments have been made relative to the conductivity of the human body, and it has been found, by means of very delicate instruments, that the resistance of the same body varies constantly, even different human moods affecting it.

A change of diet also makes a difference, while such a slight event as a third person entering a room causes a change in the result. One very variable element in the result is the resistance of the skin. When dry, the skin may be regarded almost as an insulator, but by having the pores full of liquid matter the resistance is much reduced.

Nervous people have been found to have a very low resistance, as have also heavy smokers and drinkers.

How The "Movies" Exploit Wireless

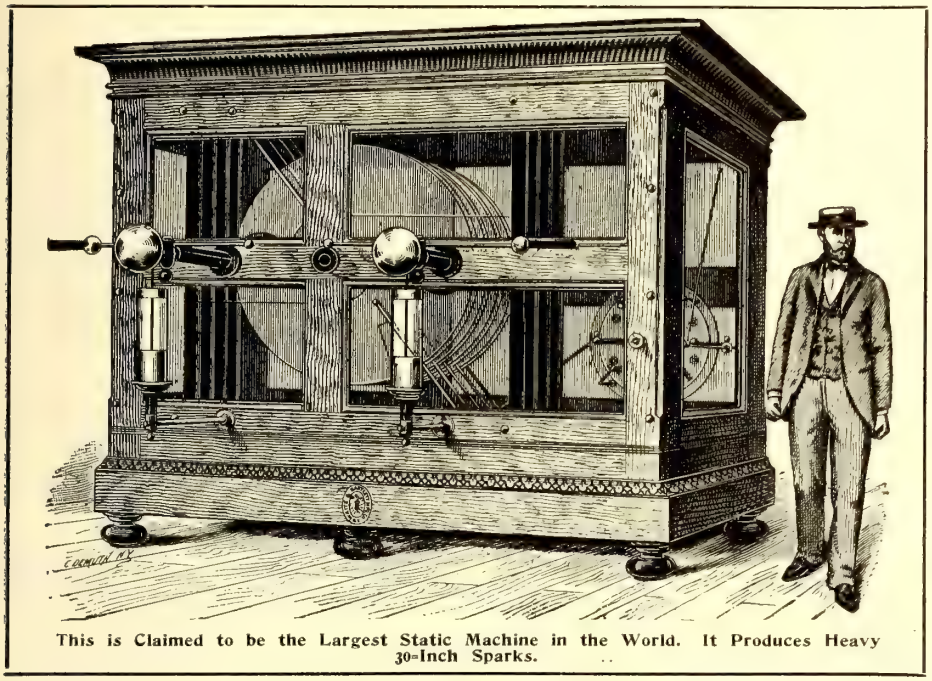
We reproduce herewith illustration from one of the popular "movies" of the day, known as the *Romance of Elaine*, in which wireless telegraphy plays an important rôle. The picture in question shows Prof. Arnold, as he is known in the film episode, which is entitled "The Wireless Detective," at the special wireless set on board his yacht. He is seen picking up secret radio signals being sent out from the hidden station of the conspirators, who play an important part in this exciting story.

An Exciting Moment in "Romance of Elaine" Film When the "Wireless" Helps to Locate the Conspirators.

The wireless outfits used are quite ordinary, generally speaking, but in our photo may be seen (at the left) lying on the table an instrument somewhat resembling a Galvanometer. This device is one of Prof. Arnold's marvelous inventions and when connected to any wireless set is supposed to show how far away and exactly in what direction a wireless station lies and from which the signals are being received.

Truly, this is a little ahead of applied science in this direction, as while we have the Radio-Goniometer, which will show quite accurately the direction in which a wireless station lies, we have not as yet any instrument which will show how far away a station is when signals are received from same at any other radio station. Possibly, however, such a device will be used by future radio engineers, and thus it is that the "movies" pave the way unwittingly in scientific advance, so it seems.

INVENTOR CLAIMS TO GET CURRENT FROM AIR.



Following the same principles as those involved in wireless telegraphy, A. Bloomfield, an oil district inventor of Pemeta, Okla., claims to have discovered a method of drawing current from the air and successfully propelling a motor without other power. So successful has he been in his demonstrations that the Federal Government has taken it up and has asked the inventor to take his model to the Brooklyn Navy Yard for a test.

The model which Bloomfield has made is a small motor of about one-quarter horsepower. By means of a mast, erected to a height of 75 feet, the current is drawn from the air and the motor is operated.

[Ed.—*Such schemes do not seem to be practical, and we have our doubts about this one.*]

LARGEST STATIC MACHINE IN THE WORLD.

What is claimed to be the largest Holtz type static induction machine in the world is that shown in the illustration herewith. It was built by a well-known New York concern. The relative size of this mastodon of static machines may be judged by the comparative size of the man, shown in the picture. It is in use in the Battle Creek Sanitarium, Battle Creek, Mich., and previous to its installation at that institution it was set up and demonstrated in the laboratory at the College of the City of New York, where its merits and electro-therapeutical properties were explained by Dr. Roger Doremus to countless hundreds of the medical and electro-therapeutical profession.

This is Claimed to be the Largest Static Machine in the World. It Produces Heavy 30-Inch Sparks.

This monster static generator stands 8 feet high and carries eight stationary plates and eight revolving discs. These discs are 60 inches in diameter and they are excited primarily by a small 30-inch plate diameter Töppler-Holtz static machine, which may be observed in one corner of the massive plate glass cabinet, containing the larger machine elements. This machine is capable of producing heavy spark discharges 30 inches long and a wonderful brush discharge of considerably greater length.

LIST OF NEW RADIO STATIONS ANNOUNCED.

The Bureau of Navigation of the United States Department of Commerce announces a list of six additions made to the land stations of the country in the radio service and 16 additional ship stations since its last bulletin on the subject was issued. Of the land stations, the one of longest range is at Tolovana, Alaska, which has a normal reach of 300 nautical miles. The station is located in longitude 149:30 west and latitude 65 north; the wave lengths are 300 and 600 meters, the latter normal, and the system is Telefunken, with 1,000 sparks per second. It is operated by the Alaska Wireless Telegraph Co.

Other land stations established are: Rialto, Cal., 250 miles range; Massie system, 200 per second; wave length, 600 normal, 300 and 1,610; longitude 117:26:53 west, latitude 34:12:08 north; operated by Southern California Edison Co., limited to correspondence with stations of that company. Two at Portland, Ore., each with range of 150 miles; one operated by Charles L. Austin; latitude 45:30:45, longitude 122:42:30 west; limited to correspondence on ships' business with vessels entering and leaving the port of Portland; composite system, 450 per second; wave lengths, 600 normal, 300 and 550; the second, operated by the Northwestern Electric Co., composite system, 400 per second; longitude 122:41 west, latitude 45:32; wave lengths, 600 normal, 300 and 1,700. Fort Adams, R. I., 125 miles range, United States Army system, 500 per second; wave length 1,200; operated and controlled by United States Signal Corps, War Department, and used exclusively for Government business. Marconi station, at Jualin, Alaska, statistics not available.

Of the new ship stations, the largest are the Ossipee and Tallapoosa, each operated and controlled by the United States Coast Guard, Treasury Department, with range of 300 miles, and the Roosevelt, operated and controlled by the Bureau of Fisheries of the Department of Commerce, with a similar range. The Ossipee and Tallapoosa are available for the general public, with rates of 4 cents per word, 40 cents minimum per radiogram.

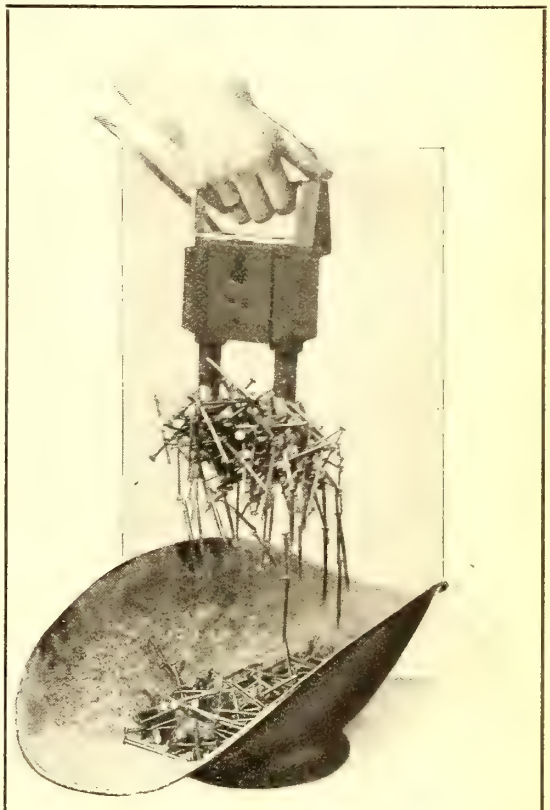
The Bureau of Navigation has now in the hands of the printer an edition of the "List of Radio Stations of the United States," which will be issued within a short time. Inquiries should be sent to Superintendent of Documents, Washington, D. C.

Watch for wonderful article on "Warfare in the Future" in next issue.

AN EXTREMELY USEFUL HAND MAGNET.

The hand magnet here described is designed for operation on 110 or 220-volt direct-current circuits, and is furnished with a 4-foot length of reinforced flexible cord and a standard attachment plug.

The circuit to the magnetic coils is closed and opened by means of a quick make-and-break snap switch mounted in the handle support. A brass push-button, insulated from the switch, is conveniently located for operation by the thumb when grasping the handle. Pushing the button closes the circuit to the coils and makes the magnet operative. Slight release of the button does not cause the circuit to be opened until the button reaches almost the normal position, when the switch mechanism operates with a quick break and opens the circuit. The magnet then becomes de-energized.



The hand magnet is used in machine shops for clearing chips and borings out of the machinery or removing them from parts of the work not easily accessible. Dropped tools, bolts, boring bars, etc., are easily recovered with the aid of the magnet from places from which it would be difficult to fish them by ordinary means. The weight of the hand-magnet is only 7½ pounds.

In shops where large quantities of brass and iron filings accumulate the hand-magnet is useful since brass being non-magnetic is not attracted by the magnet, like iron, thus enabling the two metals to be separated by merely passing the magnet through the mixed metals.

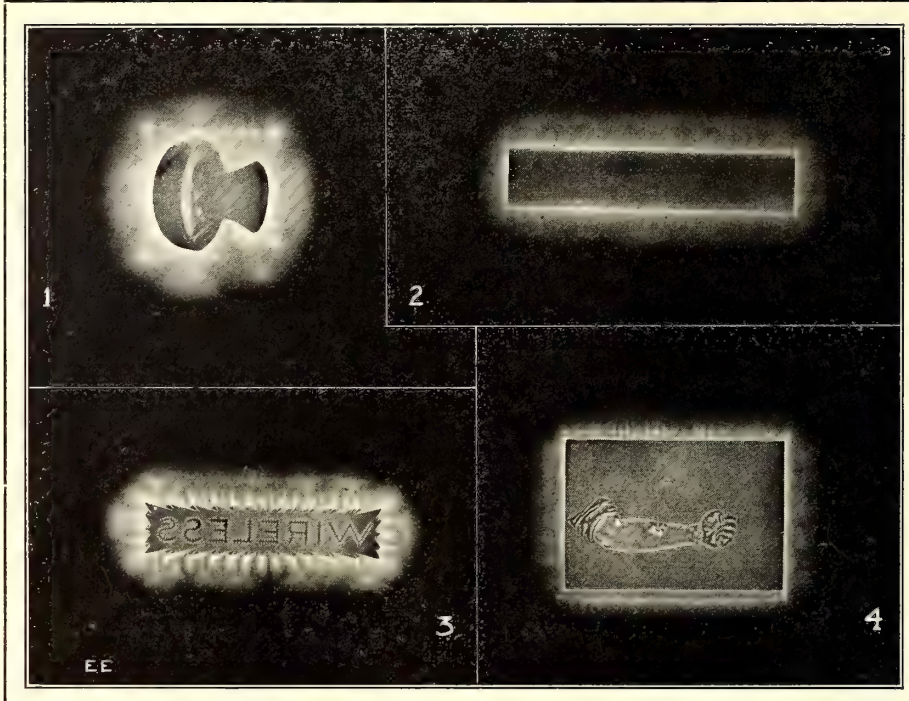
In foundries this magnet may be used to pick up hot or awkwardly shaped castings; smooth plates, which are sometimes difficult to secure a hold on when lying on a flat surface, or for cleansing the molding sand of minute particles of metal.

Suspended with its two poles immersed in the liquid, the magnet will attract to itself any particles of iron or steel which it may be desired to remove from the tubs in which paints, glazes, chemicals, etc., are mixed. It is also used for dipping can covers, etc.

In the shipping department many hundreds of nails are recovered daily by hand from the sweepings. For work of this sort, or for handling nails, nuts, screws, etc., in hardware stores the hand-magnet is particularly useful.

Useful Hand-Type Electro-Magnet for Lifting Nails, and Other Iron Pieces.

Electric Spark Pictures



THE illustrations herewith present some new ideas on electric spark pictures.

While electric spark pictures, of course, have been taken right along, our illustrations present some modifications, and in order to show our readers how these pictures are made, a short treatise on the subject will not be amiss. An ordinary spark picture is taken as follows:

Any spark coil from one quarter-inch up to three inches with a fast vibrator should be used. Connect one lead of the secondary terminal to a piece of tin foil or to a piece of sheet metal or metallic plate which should be level. Directly on top of this, with the gelatine side upwards, place an ordinary photographic glass plate. It goes without saying that this operation must be carried on in red light, or else the photographic plate will be spoiled. It is also necessary to carefully blind with black cloth the vibrator of the spark coil so the white spark will not cast light upon the plate.

When everything is ready, take the metallic object which is to be printed by electricity and place it face down directly on top of the photographic plate, so it is in contact with the sensitized gelatine. If the object is square or round without any relief on its face, the negative when developed will show a gray square or a gray round spot. If, however, an object with a relief such as a coin or similar metal object is used, and the plate is developed, subsequently, it will show faithfully all the details which the original article has.

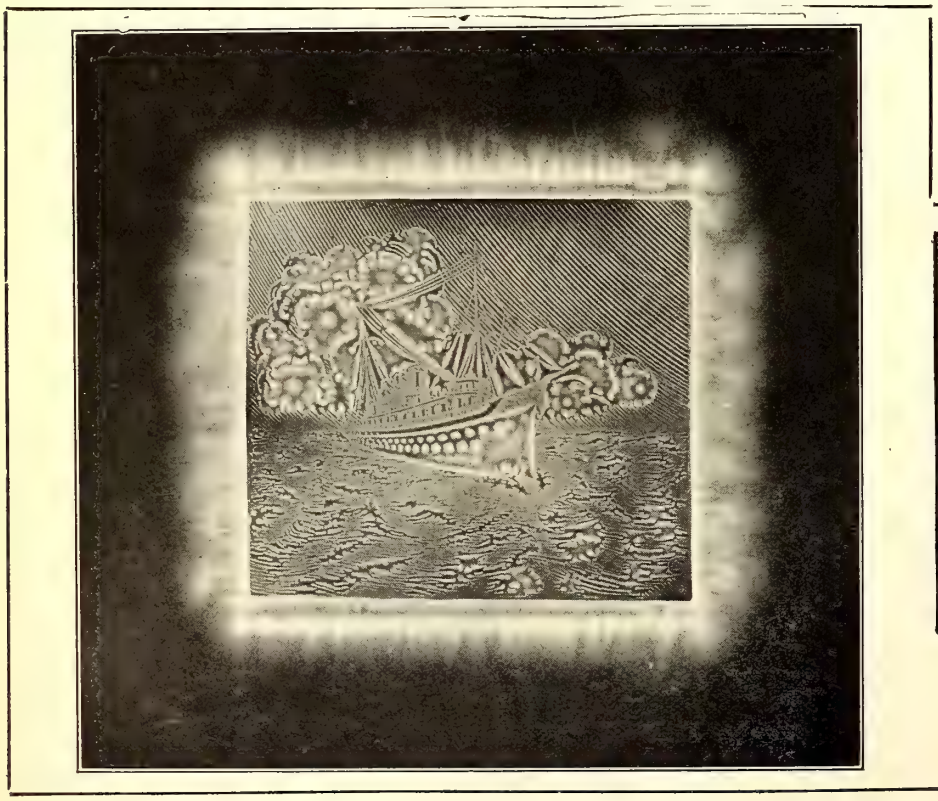
When making spark pictures it should be remembered that a short spark only should be made, and should under no circumstances last longer than a second. Just starting the vibrator for a fraction of a second will usually give best results. Pictures taken with more than two seconds duration usually come out too black.

Some Out of the Ordinary Spark Pictures. (1) Made from Electrotype of Microphone, (2) Steel Rule, (3) Electrotype of "Wireless," (4) Zinc Line Cut of Arm and Hand.

The philosophy of spark pictures is as follows:

When a spark is made the electrical current passes between the object and the metallic plate underneath the photographic plate, the three acting like a condenser.

Wherever the metal touches the plate upon developing the negative will show a black spot at that point. When the negative is printed on paper this process is, of course, reversed, and whatever is black on the plate will be white on the paper and vice versa.



The pictures as shown in this article were taken by H. Gernsback, and the following explanation is given. Up to this time no pictures were known to have been taken of common electrotypes or zinc cuts such as are used for printing purposes, and it occurred to Mr. Gernsback that good results might be obtained if such plates were used. The illustrations show the result.

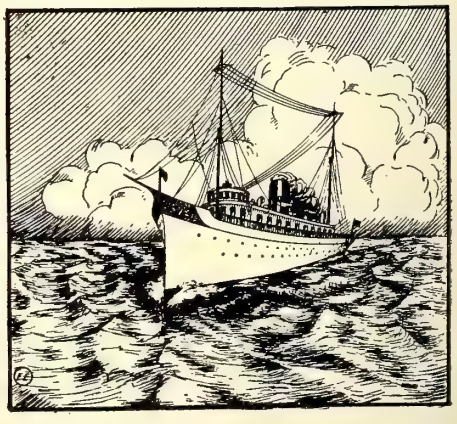


Fig. 1 shows an ordinary line cut, copper electrotype of a microphone which was placed face down upon the plate. The result is clearly shown.

In Fig. 2 an ordinary three-inch steel ruler was used, and in the original photograph all the details down to the division of 1/64 of an inch were clearly shown. These details and also the details of the other three photographs have been lost in the half-tone process by making the plate for printing the illustrations in this magazine.

Fig. 3 shows another copper electrotype with the word "wireless" on it.

Fig. 4 shows an ordinary zinc cut illustration. This cut originally illustrated an article on page 66, June issue of this magazine. It shows much clearer in the orig-

Above: Original Zinc (Line Cut) from Which Spark Picture at Left Was Made.

At Left: Beautiful Spark Photo Made from Zinc Cut Shown at Right. Note Port Holes "Illuminated" by Spark Effect.

inal print. As will be seen, everything is reversed, i.e., white is black and black is white.

The aurorae which show around the illustrations are simply stray sparks during the time the spark was made.

Fig. 5 shows a unique spark picture made with the above process, and this also was a zinc cut, and was originally used in the *Electrical Experimenter,* page 52, June issue. We reproduce the original cut so it may be compared with the spark picture. It will be noted that a curious effect is produced, and attention is called to the port holes which seem lighted up, whereas in the original they only show as points. The explanation is that these sharp points when they made contact with the plate blackened the latter at those points, and when the print was made they, of course, appeared in white. It will be seen that the electrical spark reproduces every detail of the picture down to the most minute detail.

Half-tone cuts were tried but without obtaining results for the reason that the multitude of points which make printing possible were too fine and too near together and the resulting picture therefore appeared simply as a blur.

NEW TALKING MACHINE UTILIZES COMPRESSED AIR AMPLIFIER.

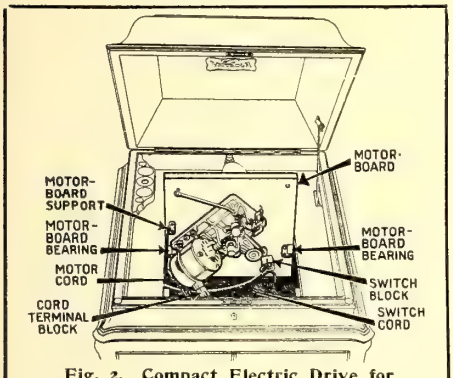

Fig. 2. Compact Electric Drive for Victrolas.

A new talking machine, which is known as the "Auxetophone" and constituting one of the well-known "Victor" line, is shown in our illustration herewith at Fig. 1.

As at present supplied, the Auxetophone constitutes an amplifying phonograph. It utilizes regular disc records, the same as any talking machine of the "Victor" type, and the sounds as given forth from the records and through the regular stylus needle on the phonograph arm are caused to *interact* on a special air valve hooked up with a compressed air tank, as illustration shows.

A compressed-air blower is driven by an electric motor, as perceived, and the machine is equipped either for direct or alternating current, as the service may require.

The motor is directly connected to the blower, which furnishes air for the pneumatic sound-box, in which the volume of the sound is augmented or amplified. An oil condenser is mounted on top of the blower, as shown, which is connected by a flexible tube to an air-pressure equalizing tank. A flexible tube connects to the top of the tank and leads to a filter. From the filter another tube leads off to the taper-arm equipment, which includes the taper tube leading to the horn. The tube is finally connected to a pneumatic sound-box.

The turntable of the machine, which holds the disc records, is in the present

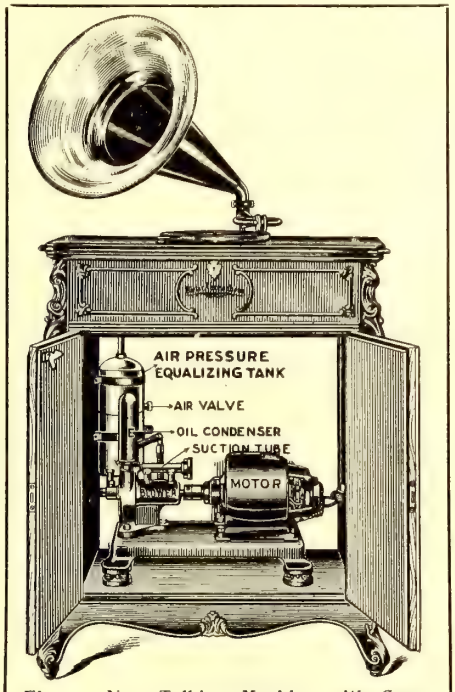

Fig. 1. New Talking Machine with Compressed Air Amplifier.

style operated by a spring motor; but of course it is readily fitted with an electric motor drive.

The second illustration shows the latest model Victrola, equipped with electric motor drive. This machine has no connection with the one aforementioned, known as the Auxetophone. A very neat and readily accessible method of mounting the electric motor drive for the standard Victrola is observed from the sketch, Fig. 2. The top table-board, containing the record holder or turntable, etc., swings on pivots, as observed, so that the motor and its speed governor, etc., become at once accessible for repairs, oiling and other attention by simply pushing a button.

NEW TELEPHONE SET FOR AVIATORS.

Our two illustrations herewith show a new style telephone set, known as the "Aero-Phone," and particularly designed and intended for the use of aviators. Its express purpose is to permit the aviator and his mechanician or passenger to talk to each other freely without being in any way interfered with, due to the excessive noise of the engine, etc.

The Aero-Phone in Use.

These aero-phone sets utilize a regular head-band, specially made and carrying two compact type watch case receivers, as observed. These receivers are held against are ears by the spring head band, so that practically all of the extraneous disturbing noises are thoroughly excluded. The spring tension, however, is so arranged that the entire outfit is not in any way uncomfortable for the wearer of the phone. Special microphone transmitters are provided with soft rubber caps on each, strapped to the chest at a point below the collar bone and above the third rib.

In speaking the chest muscles transmit the voice vibrations to the transmitter, thus enabling telephone conversation to be carried on comfortably between the two occupants of the aeroplane. The microphone is thus not placed before the mouth.

The telephone receivers and transmitters are connected by flexible cords, which terminate in a small plug. When the aviator or passenger takes a seat the plug is inserted in a jack mounted on the framework of the aeroplane. The only battery current required is that furnished by three regular dry cells, which will provide continuous service for 100 hours without any appreciable loss of transmission quality.

Aviator with Aero-Phone, Talking Through His Chest.

This perfected telephone set for aeroplane use is of great interest, particularly for military aeronautical applications.

BRONX RADIO CLUB.

The club is composed of 11 enthusiastic members, most of whom have stations of their own. Those wishing to further their knowledge of the subject are instructed by the more advanced members.

Officers are as follows: M. Haber, president; H. Berlin, vice-president; L. Brodie, secretary; A. Richter, treasurer; J. Smith, business manager.

Communications from other clubs and individuals should be addressed to L. Brodie, secretary, 1382 Boston Road, Bronx, New York.

Electricity and the Modern Automobile Torpedo

By Samuel Cohen

AMONG the most ingenious weapons of modern warfare is the automobile torpedo, a cigar-shaped shell constructed entirely of steel, with an electro-mechanical brain and carrying a high-explosive guncotton charge.

This self-propelling demon is shown at Fig. 1 with its clever devices for steering and diving. It measures 22 feet long and 21 inches in diameter, with a weight of one ton. This modern fighting machine consists of three parts, viz, a War Head, carrying 250 pounds of high explosive; the central Flask, charged with compressed air at 2,250 pounds per square inch, and an after-body or Tail, in which the propelling and controlling mechanisms are enclosed.

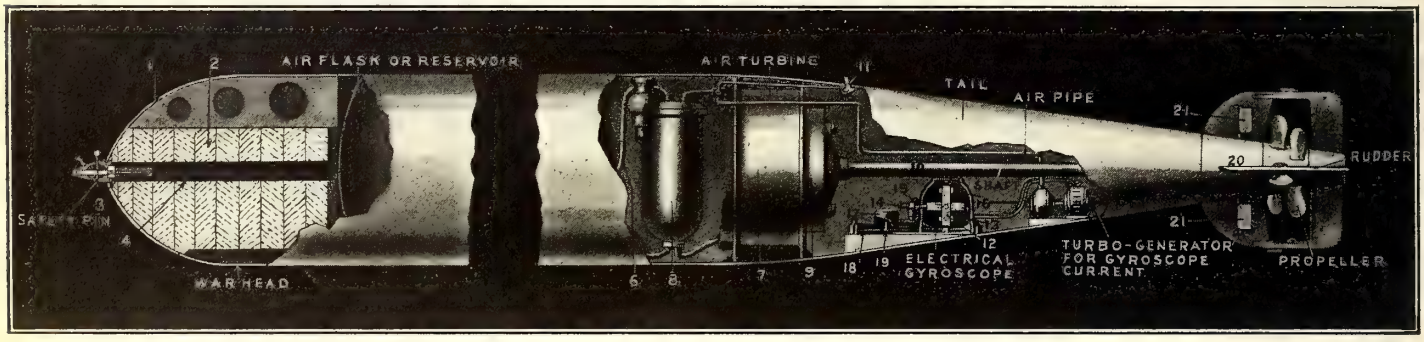

Fig. 1. Semi-Sectional View of Latest Type Automobile Torpedo. (C) Experimenter Pub. Co.

The "war-head" (1), Fig. 1, differs from the "practice-head" and is used only in actual fighting. It is loaded with a charge of guncotton (2) containing 25 per cent. moisture. At 4 is the detonating charge, which is fired by the plunger or striking rod 3. A safety pin is provided at the end of the plunger, as depicted, this being used for safety when loading the torpedo in the firing tube.

The central flask or air reservoir 6 (Fig. 1) is connected to the turbine through the superheater 8. This turbine is connected to a reducer gear 9 and then to the propeller shaft 10 which operates the two propellers 22, 22. These are rotated in opposite directions. The power developed by the turbine is 110 horsepower and the shaft runs at 1,200 R.P.M., enabling the missile to travel at the rate of 35 to 40 knots, with an extreme range of 10,000 yards.

It is in the "Tail" that the *brain* of the weapon is installed, and the little electric gyroscope 16, which a few years ago was considered a toy, steers the torpedo to the right or to the left. It is an almost human pilot and steersman, so to speak. The gyroscope herewith shown, is entirely driven by electricity, supplied by a small turbo-dynamo set. The turbine itself is operated by compressed air from the air flasks 6. This electrically operated gyroscope consists of an alternating current induction motor, with its rotor and stator 12, while 13 is a gimbal ring. The gyroscope wheel acts upon a small crank lever 15, which is connected to the control lever 16, operating the vertical rudders 21.

As is well known, a gyroscope will always attempt to maintain its center of gravity with respect to a certain point or angle. That is to say, if we have a wheel of any type revolving at very high speed in a certain position, with respect to its axis of rotation, then any effort to change the plane of this wheel, in so far as its rotation is concerned, will be found to cause considerable effort necessary in order to accomplish this change. Thus, the gyroscopic principle is brought into play in order to keep the modern automobile torpedo in a true course. As becomes evident, and especially when the water is very rough, it is practically impossible to discharge one of these high-speed torpedoes with a "fixed rudder" or steering gear on same, which shall cause this weapon to absolutely maintain its natural course along a straight line, as was previously intended when discharging same.

Therefore when the torpedo shell is deflected from its course, even to a slight degree, by tidal or wave currents, etc, it will be maintained in practically a *dead straight course* by the correcting action of the electrically driven gyroscope.

The rapidly revolving gyroscope element 12 will, as seen from the foregoing description, tend to rotate from in the same axial plane as at the moment previous to the deviation of the torpedo's true course. Hence the gyroscope will swing about, so as to maintain its *original* plane of rotation, even though the hull of the torpedo may be pointing several degrees off its true course at the moment due to interfering water currents, etc.

When the rotating gyroscope element 12 makes this swing about its plane it will carry the gimbal ring 13 with it. On this ring is a trigger release cam which, as the ring 13 moves around, allows the spring-actuated cam rod 14 to slide forward.

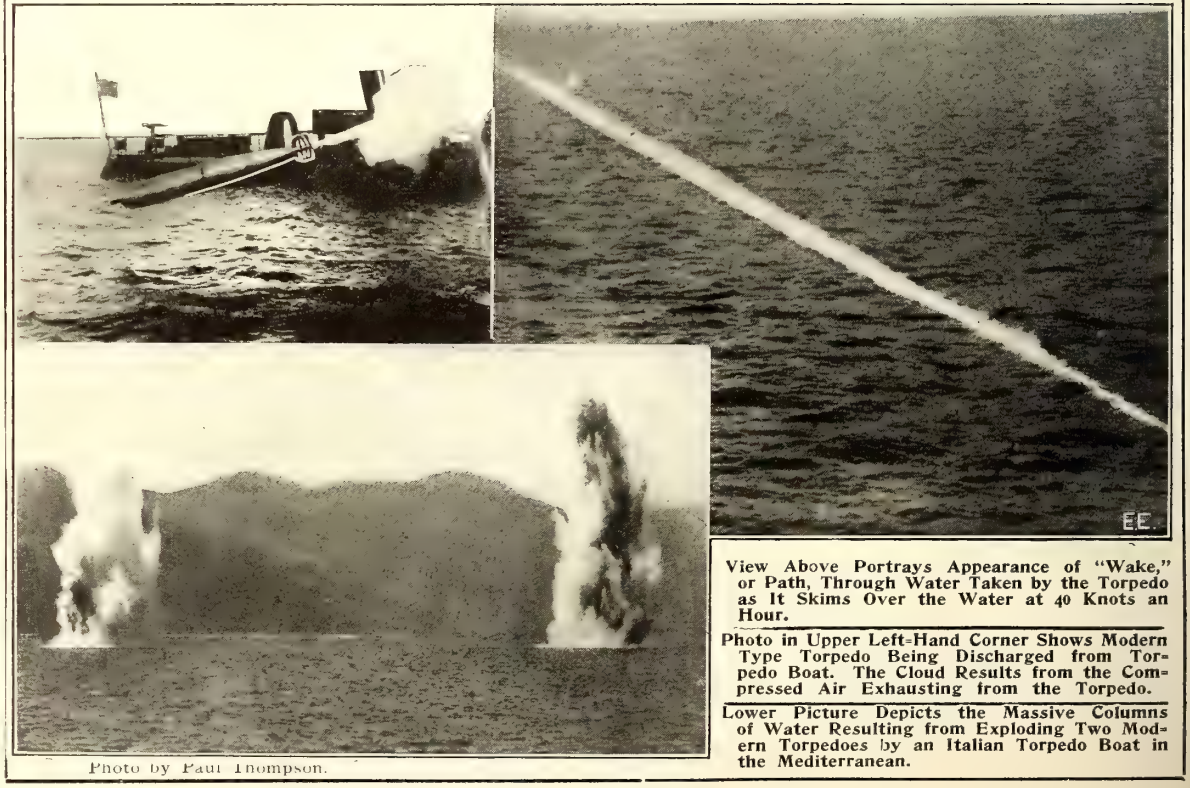

Photo by Paul Thompson.

View Above Portrays Appearance of "Wake," or Path, Through Water Taken by the Torpedo as It Skims Over the Water at 40 Knots an Hour.

Photo in Upper Left-Hand Corner Shows Modern Type Torpedo Being Discharged from Torpedo Boat. The Cloud Results from the Compressed Air Exhausting from the Torpedo.

Lower Picture Depicts the Massive Columns of Water Resulting from Exploding Two Modern Torpedoes by an Italian Torpedo Boat in the Mediterranean.

When this cam rod slides forward, as described, it ejects or pushes upward the rudder control trigger 15. When the torpedo has been thus automatically brought back into its true course it will be seen that the gyroscope will then have its gimbal ring 13 brought back into its normal plane, and in so doing it will, of course, reset the cam rod 14 to its normal position, and so on.

The depth of the torpedo is regulated by a depth-control mechanism 17. It consists of a metallic diaphragm 18, actuating lever 19 and in turn operating the rudders 20. This device is usually "set" for 15 feet below the surface of the water, so that when the tube is fired it will go below this mark, but the diaphragm immediately is actuated by the greater pressure of the water and in turn lowers the rudders 20, which raises the torpedo to its proper level.

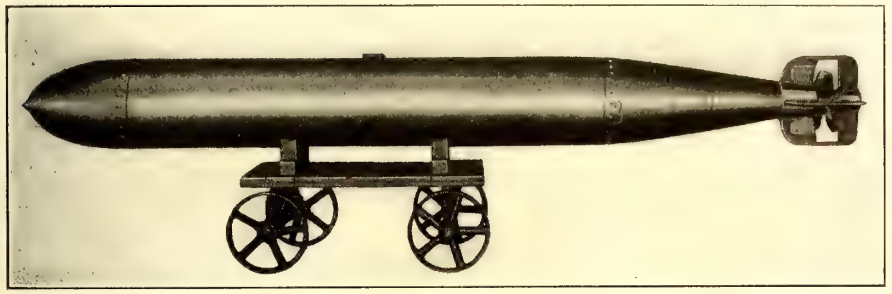

Fig. 2. Actual Photograph of Bliss-Leavitt Automobile Torpedo.

A new method of controlling the depth of torpedo tubes has been recently tried which employs electricity. This is kept secret at present and information on the details of this system is unavailable now

The torpedoes are launched from a discharging tube by an impulse charge of compressed air. As soon as the torpedo is launched the trigger 11, at the center of the flask, is released, which disengages the high pressure valve of the reservoir and the turbine, and in turn operates the two propellers. As soon as the torpedo strikes the water it submerges to the proper depth and rushes with a mad pace straight to its target.

One of the latest 21-inch diameter automobile torpedoes of the Bliss-Leavitt type is shown in Fig. 2. This complicated machine costs nearly $6,000 to build. Uncle Sam is now expending large sums of money in building these weapons, and the Newport naval factory is turning out about 100 of them annually. These fighting sea machines have proven a great success, as shown in the present European conflict.

NEW FLY CHASING CEILING FAN.

The photograph portrays a new fly-chasing electric ceiling fan recently installed in the Reading Terminal Market, Philadelphia, Pa., and at present there are 42 of them in operation. The fans are a special type made up for the purpose, running at 100 revolutions per minute and with a very slight pitched blade so there is practically no breeze developed by them. The blades have a sweep of 90 inches. The purpose of the fan is simply to throw a moving shadow on the meats, fruits and vegetables to scare the flies away.

These fans have the advantage over an ordinary ceiling fan with a high speed, in that the ordinary fan causes meats to become black and also hastens the decay of fruits and vegetables, while this new design gives very little breeze and does not affect them. Flies are also in evidence where the ordinary fan is used, but the shadow effect scares the flies and has completely solved the problem for market-house people.

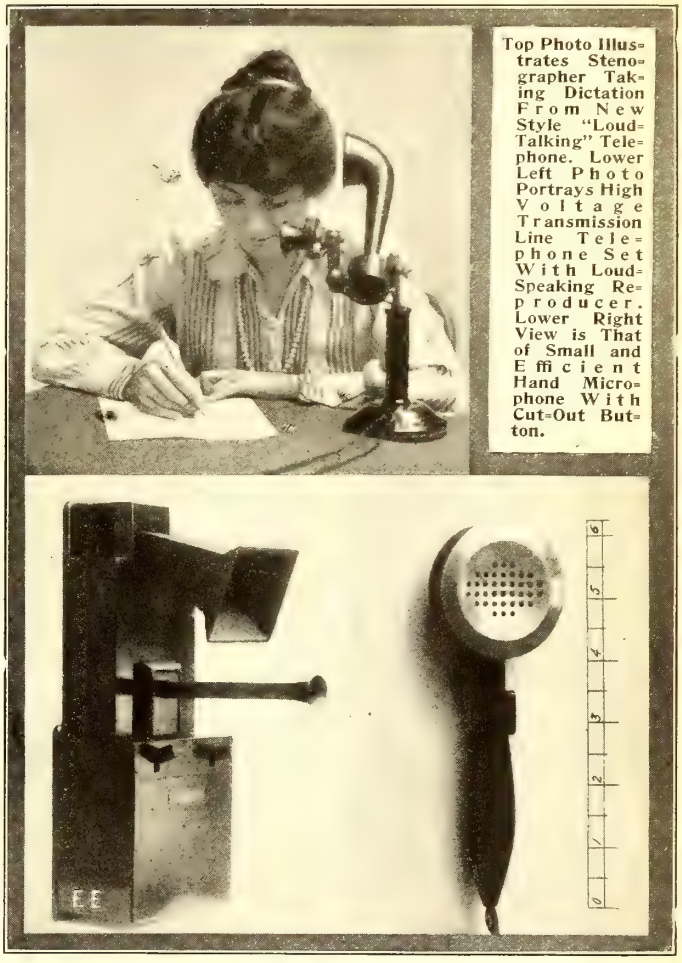
Thus a little science added to practise has apparently solved a very troublesome problem.

The Shadow, Not the Breeze, Chases the Flies.

TENNESSEE TRI-STATE FAIR TO HAVE RADIO.

Visitors to the Tri-State fair at Memphis, Tenn., who want to send their regards to the Kaiser or Kitchener, can step into a wireless office, write out the message, pay a fee of a few dollars a word, and let 'er zip.

This became known recently when Frank Fuller, secretary of the fair association, stated that the Tri-State Wireless Association was going to install a service branch at the fair grounds.



An aerial will be erected and apparatus with sufficient power to give the visitors an idea of what a real wireless station is, will be installed.

MODERN APPLICATIONS OF THE LOUD SPEAKING TELEPHONE.

The "loud talker," or more properly the loud-speaking telephone, is now being extensively employed in places where the ordinary telephone cannot be used, and the illustrations herewith presented depict some novel applications. Fig. 1 portrays a stenographer taking dictation from her employer by means of these loud talkers. The transmitter is placed on the left of the apparatus, as seen, and is utilized in ordinary talking, as for instance, when the stenographer desires repetition of a sentence, etc.

This method of dictating is very efficacious as a time saver, and eliminates the use of a buzzer or bell in calling the stenographer.

Fig. 2 illustrates a field-type loud talker employed in high-tension line work, where the linemen need to keep in constant touch with the switchboard operator at the power station. This instrument is constructed entirely of an insulating material, so that the high voltage of the line does not enter the instrument in proximity to the person talking. The square-shaped horn leads to the receiver, and the long, round tube in the center is connected to the microphone transmitter. The small handles in front are the two switches operating the calling and talking circuits.

Top Photo Illustrates Stenographer Taking Dictation From New Style "Loud-Talking" Telephone. Lower Left Photo Portrays High Voltage Transmission Line Telephone Set With Loud-Speaking Reproducer. Lower Right View is That of Small and Efficient Hand Microphone With Cut-Out Button.

A miniature hand-style transmitter for general use is shown in Fig. 3. It is of the ordinary carbon-grain type and it measures 6¼ inches long by 2¼ inches and weighs only four ounces. This transmitter can be placed in the regular telephone circuit. A small push-button is placed near the end, as depicted, and is used for calling purposes. These instruments have been developed by the Stentor Electric Co.

Sayville Once More

An Attack on the Electrical Experimenter

THE two letters reproduced herewith require no comment. The one illustrates the German viewpoint, the other the American. We leave it to our readers to decide which is the correct one.

Dr. K. G. Frank, as is well known, is the present executive head of the Sayville wireless station. On August 17 the *Providence Journal* laid before the U. S. Neutrality Board in Washington eight formal charges. One of these charges was that Dr. K. G. Frank is the head in the United States of what is known in Berlin as an Information Bureau (secret service).

The letters follow:

ATLANTIC COMMUNICATION CO.
(Telefunken System of Wireless Telegraphy)
47-49 West Street,

The Experimenter Publishing Co.,
Attention Mr. H. Gernback, Editor.

Dear Sir:—With regret and surprise I have read your editorial in No. 28 of *The Electrical Experimenter* on "Sayville."

According to my knowledge your paper is the only technical paper which joins some of the daily newspapers in the contemptible attempt to cast suspicion upon Sayville. One would at least expect that your paper would take cognizance of the fact that not only no single instance of an unneutral act can be proved, but also that there has never been any charge of such act made by any official of the United States Government.

The standard of the technical and scientific press in this country is, fortunately, so high that I am convinced your paper will remain the only one which distinguishes itself in such manner.

Very truly yours,
(Signed) *Dr. K. G. Frank.*
New York, N. Y., August 17, 1915.

Atlantic Communication Co.,
New York City.
Attention Dr. K. G. Frank.

Dear Sir:—

The writer was indeed surprised to receive your communication of August 17. He is at a loss to understand how you could possibly misconstrue the true meaning of his editorial in view of the fact that at the time it was published Sayville had already been taken over by the Government. What the editorial meant to convey was that even though the Government had taken over Sayville, it was not at all certain that messages pregnant with unneutral information, yet harmless on their face, could not be sent in spite of all censorship. The imaginary case of the message from the "Adriatic" was cited as an illustration. Anyone by paying the usual tolls can even now send such a message. The management or the operators at the Sayville station obviously need not necessarily have cognizance that the message is an unneutral one.

That the writer's viewpoint was correct is best shown by the announcement of Secretary of the Navy Daniels under date of August 18, "that as a result of the demonstration that unneutral messages could be sent through the Sayville station he had issued orders that in all cases where the Government experts were in doubt about any message presented for sending it should be referred to Washington for judgment."

As to the second paragraph in your letter your attention is directed to page 210, September issue of *The Electrical Experimenter*. It gives facts with which you are doubtless familiar. These facts disclose one of the main reasons why Sayville was taken over by our Government.

Your assertion that "*The Electrical Experimenter* is joining some of the daily newspapers in the contemptible attempt to cast suspicion upon Sayville and, further, that no single instance of a dishonorable act can be proved, but also that there has never been any charge of such act made by any official of the United States Government," is as perverted as it is unfounded. Its tone is also resented by the writer. *The Electrical Experimenter* certainly never attempted to cast suspicion upon Sayville, but it has shown that the station can, and perhaps has been used to convey unneutral messages, though not necessarily with the knowledge of the management or its operators.

At the same time the writer desires to voice his opinion that there is sufficient circumstantial evidence at hand to lead anyone who wishes to view the matter in its true light to believe that the management of the Sayville station probably had some knowledge of the real purport of the many "irregular" messages sent over the Atlantic by Sayville before the station was finally taken over by the United States Government.

The slur contained in your last paragraph is best met by bringing to your attention the fact that *The Electrical Experimenter* to-day is considered an authority on wireless matters in this country. As such it is its duty to publish any matter of interest to the wireless world. It will distinguish itself in the future by continuing to do so. It will also continue voicing its opinion especially at times when the welfare of this country is concerned.

Very truly yours,
The Experimenter Publishing Co.

New York, August 30, 1915.

$2,500.00 Edison Day Contest for Boys and Girls

Edison, the Wizard of Menlo Park, whose name is mentioned with reverence by all for his inventive ability, has always been liked by his fellow investigators. It was his invention of the incandescent lamp 36 years ago that will indirectly cause him to be equally liked by thousands of boys and girls throughout the country.

From the crude little carbon filament lamp that made its initial bow to the world on October 21, 1879, it has rapidly advanced to the modern high efficiency tungsten filament lamp of to-day known universally as the *Mazda*.

The manufacturers of the modern form of this lamp are planning a unique advertising campaign that will enable numerous children to win, in all, $2,500.00 worth of valuable prizes.

These lamps are so saving of current and give such satisfying results that not to use them is a loss of money to the storekeepers and the householder; therefore, to introduce this lamp more widely this special campaign was organized. It is understood, of course, that you must live in a town having electric lights, but if you live sufficiently near a city you may enter the contest.

The plan outlined is as follows: You obtain cards from the local agent for Edison Mazda lamps and after signing your name in the proper space thereon you distribute them to persons whom you think can be induced to use the lamps. You get as many cards as you think you can distribute, then go in to "win." Make a list of people and visit them. Learn all you can about the prices and different sizes of lamps, so as to be able to talk intelligently on the subject.

Instruct the people you visit that they are to hand in your card with their order for lamps, so you can see it is necessary to get into action before another boy or girl can get in ahead of you. Don't distribute your cards before the 21st of September, although you can obtain the cards before that date.

Any further details are explained by the Conditions:

1. You must be under 18 years of age.
2. You must live in or near a town having electric light.
3. You must get a number of cards from the local lighting company or agent for Edison Mazda lamps.
4. You must sign your name and address to all the cards.
5. You must distribute the cards to users of electric light in homes, stores, factories, etc., from September 21 to October 21, 1915.
6. The cards will be returned to the lighting company or Edison agents as orders for Edison Mazda lamps at any time between September 21 and October 21, 1915.
7. A *watt* is a point. For example: A card with your name on is turned in as an order for four 40-watt Edison Mazda lamps. This credits you with (4x40) 160 points.
8. After October 21 the lighting company or Edison agent turns in all the cards to the Edison Lamp Works of the General Electric Company, Harrison, N. J.
9. The cards are sorted and the boy or girl whose name appears on cards totaling the greatest number of watts or points gets first prize, the next largest the second prize and so on down.
10. In case of a tie by two or more contestants, each one will receive the prize.
11. The prizes will be distributed by the Edison Lamp Works of the General Electric Company as soon as the cards are counted and the winners determined.
12. No prize will be awarded to any employe of the General Electric Company, lamp agent or lighting company.

You have the plan before you, now mobilize your forces, bring up your artillery, for there's an *Indian motorcycle* for first prize for the boys, and an Edison diamond disc *Phonograph* as first prize for the girls. The other prizes for boys run all the way from a row-boat motor to baseballs and gloves, including canoes, watches, boxing gloves, rifles; and girls' prizes include mandolins, wrist watches, electric chafing dish, toasters, desk sets, fountain pens. A host of valuable articles, all told, and 2,000 flash-lights are to be given away.

It will require some work, but you will enjoy it as much as the premium you will win.

THE CONSTRUCTOR

Construction of an Inductive Tuner.

By Milton B. Sleeper

IN the design of this tuner are incorporated all the advantages of the larger, more awkward designs, in a compact enclosed form, having a *centralized control* for the sharpest tuning by simple adjustments. With the regulation size antenna it will bring in signals over 1,200 meters; the largest range any tuner can have without being affected by dead-end losses. Fig. 1 shows the unique tuning control. On the large 30-point switch every fourth turn of the primary is tapped, while with the compensator handle, in the middle of the other, three turns can be added, one at a time. This gives the sharpest tuning possible in the simplest way. Taps from the secondary, 10 in number, are brought to the right hand switch. The coupling, while sliding, is adjusted by rotating the handle 65 degrees, giving to this type the advantage of the variometer. Although it has ample variation of coupling, it is a very compact instrument. To keep the coils from being affected by the atmosphere, and to protect the working parts from dust it is enclosed, except for the controls. These are closely grouped on the front of the case. Tuning can be done many times quicker, with less effort than is required with the ordinary type, where the primary switch or slider is at one end, the secondary switch at the other, while a movement of 5 or 6 inches is required to vary the coupling.

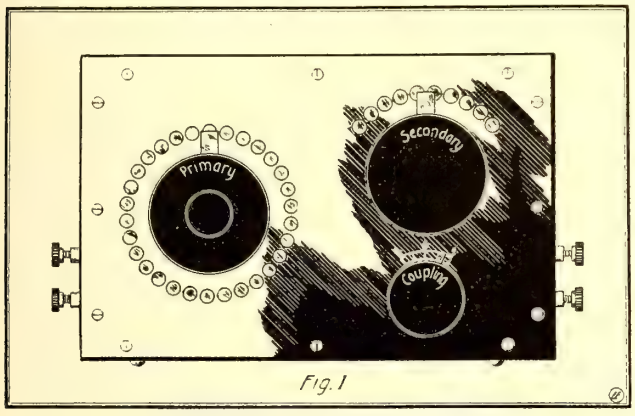

Fig. 1. Front View of Completed Coupler.

At the conclusion of the article is an entire list of parts, with their size, number, material, etc. Using this list, all the rough materials should be bought before any actual work is done. Then do not put any pieces together until they are *all completed*. Follow the drawings closely, otherwise the pieces will not fit.

Coils.

Cores.—These are shown sectionally in Fig. 2. While ordinary mailing tubes can be used for the cores by changing the diameter of the inside pieces, it is not at all advisable; the drawings are for tubes made by Beetle & Maclean. As they are not made just the right size, they must be purchased oversized. Get one 7½x3 9/16x4 inches and one 7½x3¼x3½ inches. First cut them 3¼ inches long with a hacksaw, then finish the tubes to the proper length with sandpaper on a large block. As the larger coil is too small inside, it must be worked out with sand paper or a coarse file to the required diameter. Keep the walls uniform in thickness. One-sixteenth of an inch must be taken from the outside diameter of the smaller core. This is to allow room enough for them to slide. After the cores are brought to size, rub them smooth with fine sand paper. Do not shellac or in any way moisten or heat the tubes, as this causes them to expand. After two or three weeks they shrink again, and if the coils are wound the wire loosens. One-half pound of No. 24 double silk-covered wire is required for the primary.

Primary winding.—Begin at the left-hand end to wind. To start the winding, make two small holes one-sixteenth of an inch from the end of the tube. Put the end of the wire from the outside into one hole and bring it out the other, leaving the loose end 6 inches long for connection. It is best to run the wire over a series of spools on spikes pounded into a flat board. This keeps the wire tight without rubbing the insulation. Hold the coil in your lap, facing away from the spool of wire. Turn the coil with one hand and guide the wire with the other. Do not turn the wire around the core, as this makes kinks.

The taps are made in the following order: beginning of winding, end of first turn, end of second turn, end of third, 7, 9, 12, 16, 20, 24, 28, 32, 36, 40, 44, 48, 52, 56, 60, 64, 68, 72, 76, 80, 84, 88, 92, 96, 100, 104, 108, 112, 116, 120. (1) Fig. 6 shows the method of making taps. The taps should be made in a straight line down the coil; however, the first ones should be staggered a little, so the bare wires will not come in contact with each other. Be careful in scraping the insulation where the taps are twisted (see Fig. 6) not to cut the wire. By scraping the wire in this way losses from taps are minimized. Leave a good 6 inches for connections to the switch. It is well to run a little sealing wax over the wire where the taps are made. When the winding is complete fasten the end through two holes as before, leaving enough for connection. Next, cut up four strips of thin cloth, 4 inches by ½ inch, and soak them in fairly thick shellac. Then lay them lengthwise on the winding, 90 degrees apart. Cut off the ends of the cloth even with the ends of the tube; do not turn them under. This will keep the wire tight without shellacking it all over. Inside the core at the bottom, 90 degrees from the line of taps, glue the two guides 1/16 of an inch apart (Figs. 2 and 3, which will keep the secondary

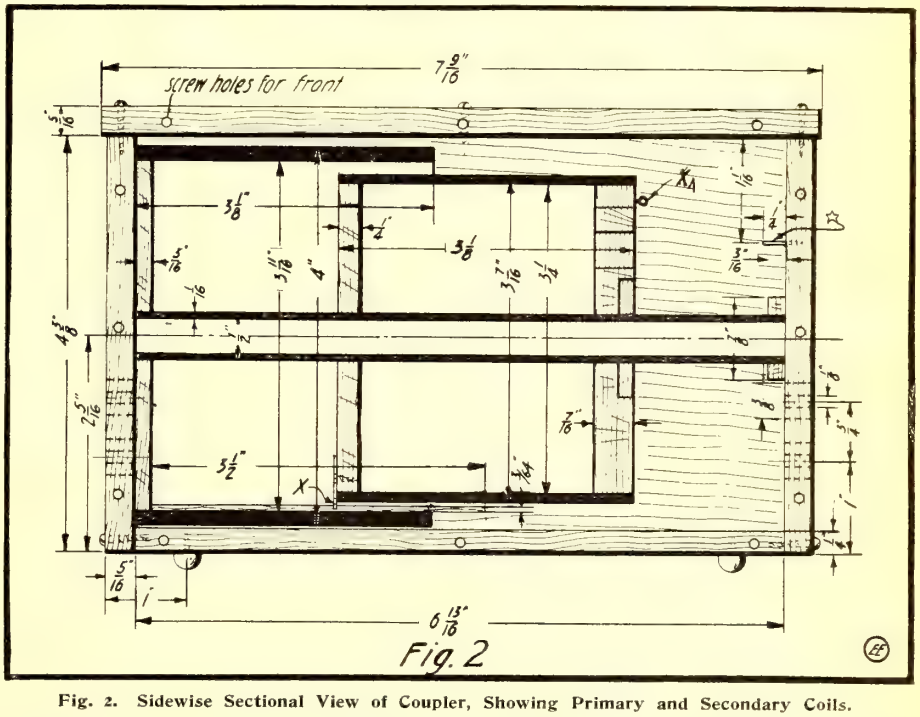

Fig. 2. Sidewise Sectional View of Coupler, Showing Primary and Secondary Coils.

from turning. Be careful they are *perfectly* parallel with the axis of the core.

Secondary.—One-fourth pound of No. 26 double silk-covered wire is required for the secondary coil. The taps (see (2) Fig. 6) are made differently. Instead of coming from the outside, they must come from the inside of the core. Beginning 1/16 of an inch from the end of the secondary core, mark off 3/10 of an inch 10 times. At these points make holes just large enough to slip the wire. There are 14 turns of wire between these holes. If the holes are made right and the wire is tightly wound this will be just the right distance. These taps must be at least 10 inches long. Put thin strips of cloth with shellac on this winding also.

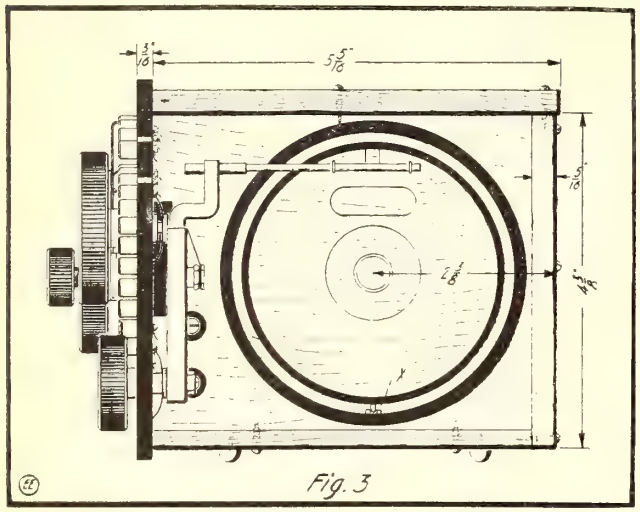

Fig. 3. Assembly of Primary and Secondary Coils in Cabinet.

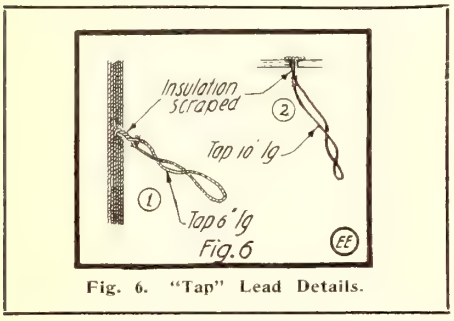

Fig. 6. "Tap" Lead Details.

Cabinet Details.

The dimensions for the case are given in Figs. 2 and 3 and in the list of parts. Each piece must be perfectly accurate or the case will not look well nor will the other parts fit in it properly. Put the bushings in from the *outside;* then it will not matter if the wood is chipped in forcing the bushings into the holes. The staple X in Fig. 2 is 1¼ inches long. Drive it into the end-piece before the case is assembled. An excellent finish can be made with a dark mahogany stain. When it is perfectly dry apply three coats of thin white shellac and rub it down with finest sandpaper covered with linseed oil. This gives a dull, durable polish. The rubber feet on the bottom prevent the case from scratching the table and keep the case up to allow for the overhang of the front.

Primary Switch.

The parts of this switch must be turned out exactly. Fig. 4 gives the details. (1) shows the underside of the handle; (2) is a section through the switch; (3) is the back side of the switch, showing the compensator. The large switch contact is made of three thicknesses of No. 30 spring brass. This gives a better contact than can be had with a single piece. It is fastened to the plate by a screw threaded into the handle. The plate is held to the center piece (D) by a little drop of solder. Connection is made by soldering a strip of copper to the spring (A) under the centerpiece. In this way connection is made to the switch-points through the switch contact, plate, centerpiece and spring. The handle must fit tightly over the end of (D) to keep it from slipping. The insulating tube (C) is forced into (D), but the compensator rod (B) must turn easily in the tube. The four switch-points for the compensator are made of round-head 8-32 screws, their heads turned down 3/16 inch in diameter and 1/16 inch thick, then lugs for the taps are fastened under the heads of the screws. To keep the compensator switch contact from turning off the points it is necessary to put in a stopping pin at each side. The spring (A) must be strong to hold the switch together. The nuts which hold the compensator contact must not be screwed too far down or the compensator handle will bind. Get all the switches fastened to the front and in working order before fastening any taps.

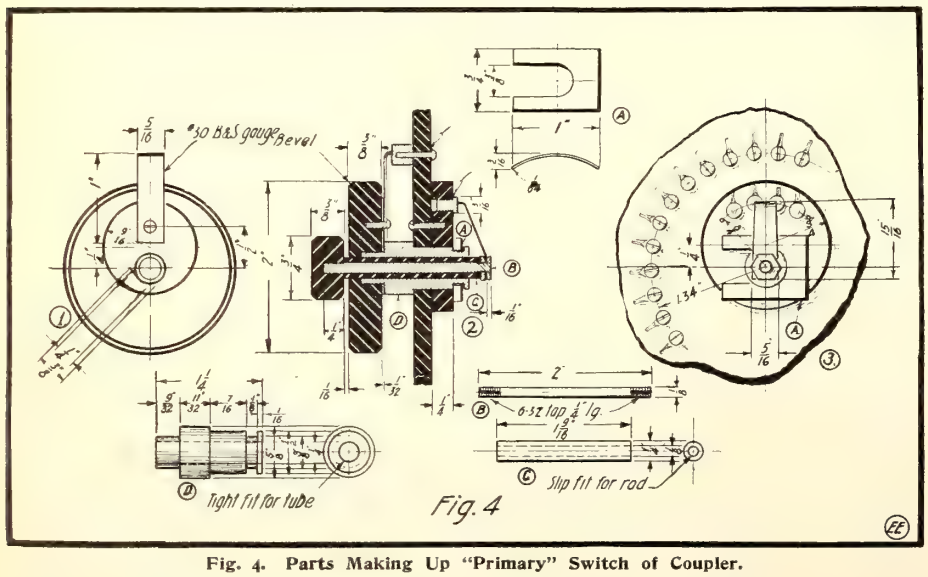

Fig. 4. Parts Making Up "Primary" Switch of Coupler.

Secondary Switch.

Fig. 5 gives the dimensions of this switch. This contact is also made with three thicknesses of brass strip. The connection is made by a copper strip soldered to the spring on the back side. Although it is not necessary, it is best to knurl and bevel the edges of the handles as Fig. 3 shows.

(*To be concluded.*)

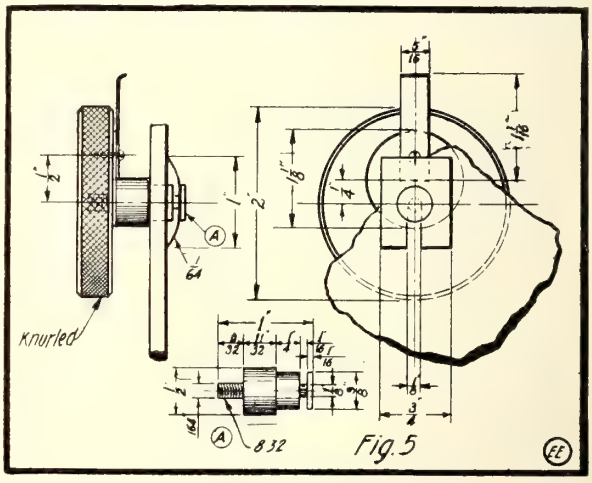

Fig. 5. Details of Secondary Switch.

TREATMENT FOR SULPHATED STORAGE BATTERY PLATES.

A great many experimenters have storage battery plates on their hands from time to time which have become badly sulphated as indicated by a tenacious white coating, which gathers on the surface of the plates. Of course this renders them practically inactive so far as the regular function of the storage battery is concerned.

A method not generally known is described below for the treatment of such sulphated plates, but great care should be exercised in using this method in the thorough washing of the plates after the bath below mentioned has been utilized.

Before replacing the plates in the battery they should be washed 12 to 15 times in different changes of water or placed for a considerable period under a running water spigot, or otherwise any remaining ammonium acetate in the plates would cause them to disintegrate when the battery was again put in service.

This special sulphation treatment "bath" is made up of about one-half pound of ammonium acetate, dissolved in one quart of water and put in an earthenware jar. The lead storage battery plates requiring treatment are immersed in this solution for about one-half hour, and they should be kept hot during this period by a gentle flame placed under the jar. The plates will now become freed from the sulphate coating, and they are then afterward removed from the jar and very thoroughly washed as previously explained. The ammonium acetate can be purchased at any drug store or chemists' supply house and is fairly cheap. A larger bath solution may be made up, of course, following the above proportions.

HOW TO CLEAN BRASS.

Brass instruments or parts thereof that have become tarnished from exposure to air may be cleaned in the following manner: Boil for a few minutes in a solution of one ounce of alum to every part of water. Then polish with any kind of brass polish, or even a dry cloth will do. This will remove tarnish from all crevices where other means have failed. S. C. V.

ELECTRIC IGNITION SCHEME FOR GAS RANGES.

The electrical experimenter may put some of his ideas to a good purpose in rigging up an electric ignition system on the kitchen gas range. Two methods are suggested in the drawings herewith, at Figs. 1, 2 and 3.

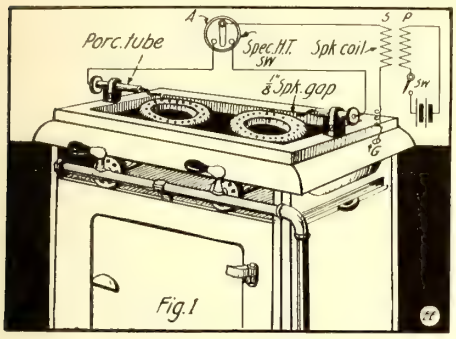

Fig. 1. "Jump" Spark Applied to Gas Range.

At Fig. 1 is indicated the connections for utilizing a small jump spark coil of about ½-inch rating, together with battery and primary switch, and also the specially insulated secondary switch. The secondary wiring for the jump spark circuit to the burners should be made with high tension or automobile engine cable. Ordinary wire may be used, as sketch shows, by leading this wire through porcelain tubes suitably secured to the top of the stove. Two or more burners may be provided with spark circuits by using two or more switch points on the high-tension switch A. This switch should have good spacing between the points and the blade on same should be about 4 inches long. It should be provided with a hard rubber stem and handle, so that the hand will be several inches away when manipulating same.

As evidenced from diagram, Fig. 1, both the primary and secondary switches have to be manipulated when the gas is turned on in the burner. The spark jumps from the wire (at the end of the porcelain tube), which is placed over one of the small holes in the burner, to the burner itself. One side of the secondary winding of the coil is grounded, at G, to the stove frame.

It is very easy to rig up an automatic primary switching stunt for this outfit using a jump spark coil, as shown at Fig. 3 in detail. The one primary wire is joined to the iron frame of the stove and the other primary wire connects to an insulated copper or brass wipe spring, as observed. A metal pin, such as a machine screw, tapped into the knob of the gas valve handle makes contact through the first part of its swing with the wipe spring. Thus the primary circuit is closed while the gas valve is being first turned open and the secondary spark from the coil jumps at the burner, igniting the gas. As the valve handle is opened further it breaks contact with the wipe spring and the spark is cut off. The secondary H. T. switch still has to be used for the different burners.

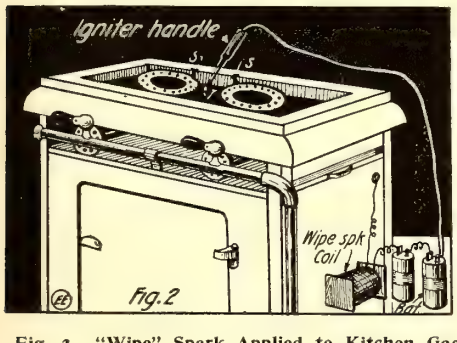

Fig. 2. "Wipe" Spark Applied to Kitchen Gas Range.

At Fig. 2 is shown a common system used in shops and readily adaptable, of course, to the kitchen gas range, whereby a common "inductance" or "kick" coil is utilized in series with a battery. The spark produced in this way is a "wipe" spark, as it is commonly termed. To create the spark a metal-tipped handle T is used to make and break the circuit against a sparking wire or point over one of the holes in the gas burner, as at S S. This wire S may be a piece of steel or German silver stock.

In operation the gas is turned on and directly after it, the igniter handle T is passed across the spark point S, thereby producing a "wipe" spark, which ignites the gas. A battery of four dry cells is usually sufficient and ordinary bell wire may be used in hooking up the circuits between the battery, stove and coil.

Inductance spark coils may be purchased cheaply at any electrical supply store and are commonly known as "gas lighting coils." It also may be made up from an iron wire core about 9 inches long by 1 inch in diameter. This core is provided with two wooden discs at the ends about 2½ inches in diameter and the core is covered with several layers of heavy paper. Over this is wound 8 to 10 layers of No. 14 cotton-covered or enameled copper magnet wire. This coil will serve for all kinds of gas ignition, utilizing the "wipe" spark principle. Contributed by

JOHN GALLAGHER.

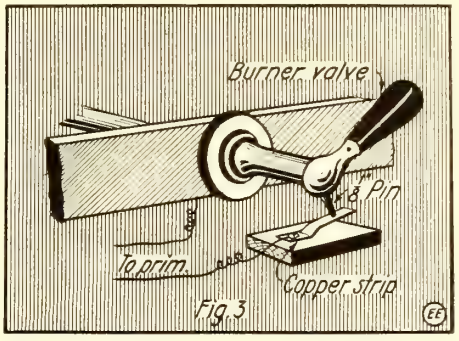

Fig. 3. Detail of Automatic Gas Stove Igniter Attachment.

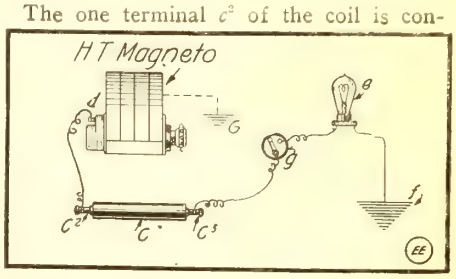
ELECTRIC LIGHT FROM HIGH TENSION MAGNETOS.



With the advent of magnetos for the purposes of ignition in internal combustion engines, the thoughts of motorcycle and automobile manufactures turned to the possibility of introducing in a satisfactory manner, some means whereby the electric current generated by the magneto, could be utilized for illumination, as well as for ignition.

Accordingly, various devices to effect this happy combination have been given birth, and one of them because of its simplicity of construction and operation, is worthy of consideration.

The device is of recent invention and is the subject of an English patent. The principle the inventors have worked upon is that of transforming the voltage at the primary terminals of the magneto down to that of the lamp to be used. The invention accordingly consists of a resistance in the form of an iron core choking coil, *c* together with an incandescent electric lamp *e* (preferably of the metallic filament type) connected between the primary winding *d* of the magneto and the particular means employed to earth one end of this winding, say at *f*.

A convenient arrangement is shown in the accompanying drawing illustrating a diagrammatic view of the complete apparatus, including a *Bosch* high-tension magneto.

The one terminal c^2 of the coil is connected to the terminal *d*, which is in connection with the primary winding of the magneto, and is provided for use in conjunction with a switch *g*, whereby the ignition may be cut out by earthing the primary current and preventing an effective portion of it passing through the contact breaker. The other terminal c^3 is connected to one of the terminals of the lamp; the other terminal of which is "earthed" at *f*. A switch *g* may be inserted in the circuit at any convenient place between the coil *c* and earth, whereby the lamp may be put into and out of action.

Electric Light From High Tension Magnetos.

The inventors have subjected this device to a test with a one and two-cylinder motor-cycle engine, employing a *Bosch* magneto for ignition purposes, using a metallic filament lamp of 3.5 volts. Their experiments have shown that excellent results can be obtained from an iron core having a length of about 4 to 5 inches and a diameter of 5/16 inches, wound with approximately 517 turns of double cotton-covered copper wire No. 24 and efficiently insulated between the windings. The apparatus may be applied to other suitable magnetos in a substantially similar manner.

A POWERFUL ELECTRO-MAGNET FOR BATTERIES.

A great many electrical experimenters often wish to have a good strong electro-magnet suitable for excitation on a few

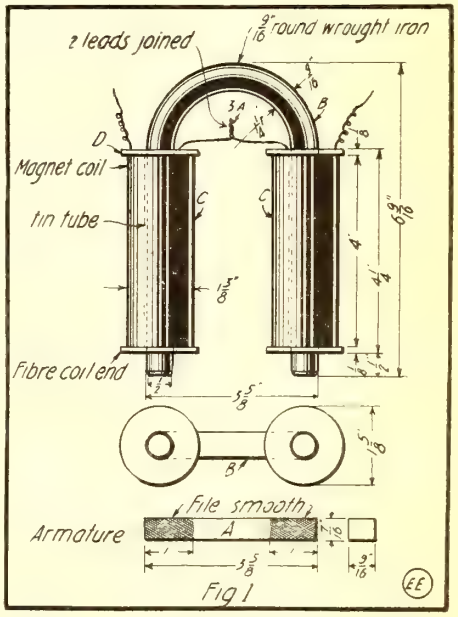


Fig. 1. Parts of Powerful Battery Magnet.

battery cells, such as dry cells, for instance. The following describes the detailed construction of such a magnet. This data is from an instrument that has actually been built and, when operated on 10 ordinary dry cells, such as the "Columbia," it developed a lifting power of 50 pounds, the voltage being 15 and the current in amperes 0.95. This lifting effort was attained by tying the load to the center of the iron armature A.

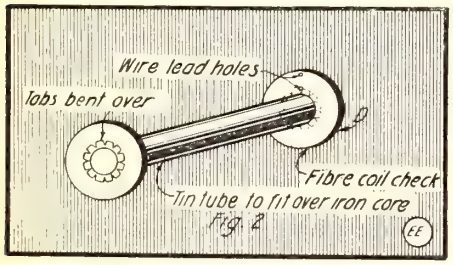

Fig. 2. Making Magnet Coil Spools.

To begin with, a piece of wrought iron bar should be obtained at the hardware store or from a blacksmith, and it should have a diameter of 9-16 inch. Its length should be sufficient to allow of bending to the dimensions shown in the sketch Fig. 1 at B. Another short piece of square wrought iron bar, A, Fig. 1, is required also to form the armature. One side of the armature bar, that which is to be in contact with the pole faces of the magnet, must be filed off smooth and flat for about 1 inch at both ends to insure a good magnetic circuit between these two parts of the iron circuit.

After the piece of 9-16 inch round iron bar has been bent to a "U" shape, as indicated in Fig. 1, the two pole contact faces must be filed up smooth and flat with respect to each other. Also to increase the magnetic density at the pole faces, and thereby gaining a greater pull, these pole face areas are reduced as shown, so that they have but ½ inch diameter. This can be accomplished very easily with a file.

The magnetizing coils are wound on two tin spools or bobbins, made after the fashion illustrated at Fig. 2. The end cheeks of these spools are made of heavy cardboard or fiber. The tin tubes should be about 4½ inches long and fit nicely over the iron core legs. After making the tubes, which can be held together by a little solder, the end cheeks are placed on them and the ends of the tubes (previously cut all way around for about ⅛ inch deep are bent upward to hold the cheeks on. One cheek on each bobbin should have two 1-16

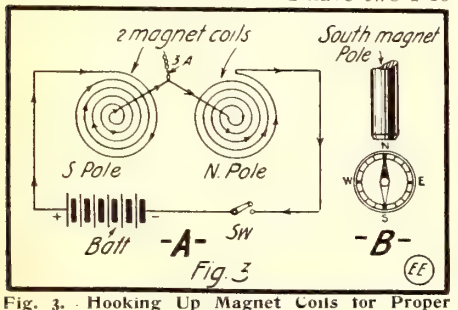

Fig. 3. Hooking Up Magnet Coils for Proper Polarity.

inch holes drilled through them—one near the tube and the other close to the outer edge. These are to lead the coil or wire terminals through.

When the two bobbins have been finished thus far they are insulated over the metal portions by wrapping two layers of ordinary notepaper around them. This paper must fit snugly up against the end cheeks to prevent the coil wires from touching the metallic part of the bobbins, as this would be liable to cause a "ground."

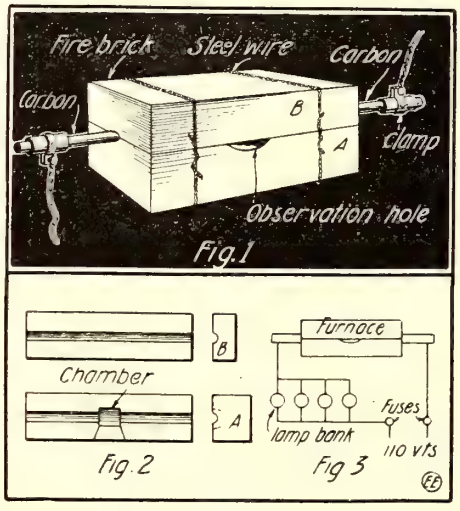
The bobbins are each wound with 14 layers of No. 22 B. & S. single cotton-covered copper magnet wire (this requires about 2¼ pounds of wire). These layers are to be placed on evenly, and not wound on any old way, as fewer turns are obtained on the coils in this way. The starting terminal of the coil is led through the inner hole in the end cheek, while the finishing terminal is brought out through the outer cheek hole previously made for it. The two magnet coils are joined in series at 3A in diagram. In assembling the complete electro-magnet the relative magnetic polarity of the two poles must be observed, and reference to Fig. 3 will make this quite clear.

The poles of a magnet are termed north and south, depending upon whether or not they attract the N. or S. pole of a magnetic needle, such as in the small compass shown in Fig. 3 at B. By looking at the diagram Fig. 3 A, it is perceived that the current must travel around the two magnetizing coils in opposite directions to give resultant

(*Continued on page* 302.)

HOW TO BUILD AN ELECTRIC FURNACE FOR LABORATORY USE.

Following is a description of an inexpensive, but practical, experimental electric furnace.



The materials necessary are two fire bricks (such as those used in building fireproof structures), two carbon rods, and two pieces of No. 10 gauge steel wire, about 25 inches long, to be used in holding the fire bricks together.

Grind or file a groove in A and B, as shown in Fig. 2, so that when the bricks are placed in position the carbon rods to be inserted will slide easily back and forth.

On one brick, used for the base of the furnace, chisel a groove in the middle, two inches in diameter, so that it forms a semicircle (see Fig. 1). This hole will be used in making observations of the reactions that take place and for the insertion and extraction of materials to be melted, which are placed in the grooved chamber between the ends of the carbon rods.

This simple furnace when properly assembled and connected to 110-volt lighting current, as illustrated in Fig. 3, will develop such an intense heat that some of the following refractory substances can be made: Calcium carbide (used for generating acetylene gas), carborundum and artificial gems. The current can be controlled by a lamp bank made up of a number of 110-volt lamps (D. C. is best employed), as indicated in diagram. A water rheostat can also be used for the current regulation. ALFRED GWYNNE.

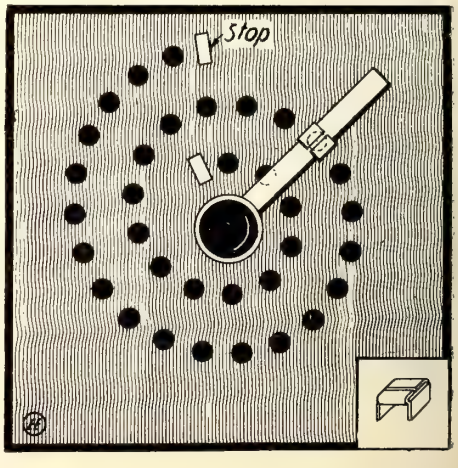
Simple Electric Furnace.

INSPECTING EGGS WITH X-RAYS.

Eggs are now being examined by X-rays, and this new method is said to be a very good one.

A special darkened room is installed in the quarters where the eggs arrive and the apparatus consists of a closed lantern containing an X-ray tube. In the front of the lantern is a small opening about the size of an egg, so that the rays can pass through the egg. The rays throw a shadow of the egg upon a fluoroscope screen placed in front. Fresh eggs are seen to be quite clear, but any defects are shown up as spots appearing on the screen. Such eggs are put in the second class, but if the spots are too large they are rejected. It is well to have a sheet lead front in the box A to screen off the rays not necessary in inspecting the egg.



X-Rays Used to Test Eggs.

UNIQUE COUPLER SWITCH.

The multi-point switch, shown in sketch herewith, provides a large number of switch points in a small space. This is accomplished by arranging a sliding contact shoe of thin copper or brass, as perceived, and as the switch arm is rotated this movable or sliding contact shoe gradually works outward from the center of the switch, at the same time making contact with each successive switch point, as will be apparent.

A fiber stop may be mounted, as shown, so as to prevent the switch shoe from moving past the final contact points either way. These stops are made level with the tops of the switch points, of course, so that the lever can pass by them, but so as the shoe cannot.

Unique Switch Enables Use of Many Contacts in Small Space.

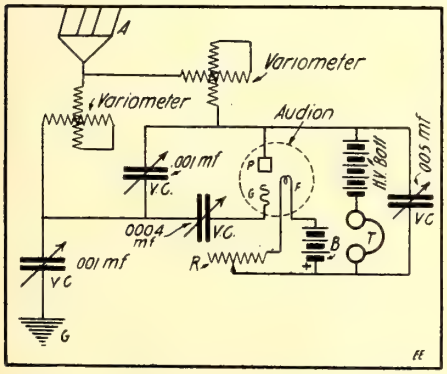
RADIO DEPARTMENT

Tufts' College Professor Devises New Wireless Control Scheme

A NEW scheme for controlling various kinds of mechanical apparatus by means of wireless waves properly developed and propagated from an antenna has been devised by Prof. B. K. Shepard, of Tufts College. Our illustrations show Prof. Shepard's apparatus as used in demonstrating his new system of radio control. It is said to be different from that involved in the well-known "Hammond" apparatus of this character, and also this new arrangement does not make use of any ground or "earth" connection, as is usual with practically all other systems of this type.

The first illustration shows the inventor holding his transmitting apparatus, which is quite light, as will be evident. This employs a spark similar to other radio systems and the waves are sent out from the vertical metallic antenna rod and the etheric waves set up are intercepted by the vertical antenna of the receiving set, mounted on a table.



By means of this apparatus it is possible to ring bells, start and stop motors, operate semaphore arms, light lamps, steer a miniature auto, navigate a 7-foot model boat, fire a cannon, etc.

Prof. Shepard is now at work on a wireless submarine boat destroyer. This apparatus, as so far developed, employs no ground connection, as previously mentioned, and in case a torpedo fitted with this device misses its mark, it can be steered back to the sender, in virtue of the wireless wave control involved in its operation.

The second illustration shows Prof. Shepard operating a miniature automobile, and the little girl in same is his young daughter, Miss Leonora Shepard.

A NEW AUDION RECEIVING CIRCUIT.

Herewith is illustrated a new receiving circuit employing two variometers and four variable condensers in connection with an audion detector. With these condensers, having maximum capacity, it was found that best efficiency can be realized. Each variometer, as well as condenser, is independently tuned and a regular audion hook-up is utilized, as perceived, with the exception that across the phones and high-voltage battery a variable, high capacity condenser is shunted. Very sharp tuning is readily accomplished with this new circuit and static is practically eliminated.

Improved Audion Hook-Up With Variometers for Sharp Tuning.

SAYVILLE WIRELESS STATION COMPLETED.

The Sayville wireless station, recently taken over by the United States Government from the Atlantic Communication Co., is now completed and is one of the largest stations in the world. The fourth of the new reinforced towers has just been finished. This makes a total of 11 towers.

The new powerful 100 K.W. transmitter makes direct communication with Germany easy, regular and intelligible.

Above: Prof. Shepard Holding His New Wireless Control Transmitting Set. Receiving Set with Various Devices Mounted on Switchboard.

HAMPTON, IA., GETS RADIO TIME.

Hampton will soon be one of the few small cities in Iowa to receive correct time signals by wireless direct from Springfield, Ill., and Arlington, Va. C. H. Haney has had an aerial wire installed extending from the top of the standpipe to the tower of the court house and thence to the roof of the Rule block, and wires will lead from there to an instrument in his store, enabling him to get the time by wireless direct. For the present he will be able to receive messages only, but later an apparatus may be installed enabling him to send out signals also.

The November issue will eclipse even the present one. Don't miss it.

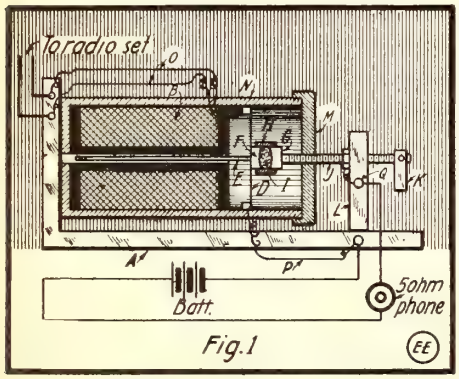
WIRELESS STATION IN CAMP.

A wireless station has been set up by David Meirowitz at S. Melnik's cottage on Orlando avenue, at Pontoosuc Lake. The aerial has only one wire 200 feet long. After some experimenting very good results have been obtained.

A UNIQUE CHEMICAL RADIO AMPLIFIER.

At last an amplifier for the radio amateur, which will boost incoming wireless messages *fifteen hundred times* their original audibility in strength of signals, has been devised.

This new amplifier consists of a special chemical placed between two electrodes which arrangement changes the resistance by virtue of a diaphragm attracted to an electro-magnet. This will be more clearly understood by referring to a cross-section view of this instrument, which is depicted in Fig. 1. It consists of a permanent magnet A, supporting a metallic case N, having a threaded screw cap M. The case contains the amplification parts, comprising the electro-magnet B, which has a small iron core E connected to a very fine steel diaphragm D, carrying a cup F upon its surface. Another cup G is placed on the opposite side and within it, the (secret formula) chemical is placed at I. A tube H is provided so that the material is retained within the cups. The cup G is connected to a threaded rod J and lever K, supported by a rubber standard L on the steel magnet A. The diaphragm D is gold-plated in order that the chemical will not affect the steel. The electro-magnet B is connected by means of the wires O, while diaphragm D is joined to wire P. Rod J connects to terminal Q. The complete amplifier is shown in Fig. 2. The knob at the front is used to regulate the cup G (Fig. 1) and is used in place of lever K. This is done in order to regulate the pressure on the chemical mixture between the cup electrodes.



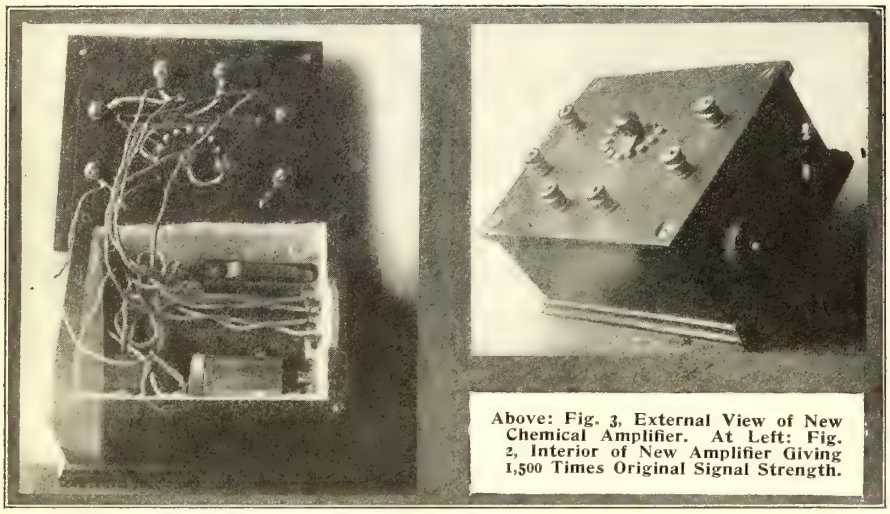


Fig. 1. Diagrammatic View of New Chemical Amplifier.

The action of this amplifier is somewhat microphonic, and as the diaphragm is caused to vibrate by the incoming signals it varies the distance between the electrodes, consequently varying the resistance of the chemical and thus also the phone circuit. A 5 ohm 'phone is used in connection with this apparatus, so it is perceived that a large current is used in this secondary circuit. A horn is usually fitted to the receiver so that messages can be readily heard around the room without using a pair of head 'phones. If two or more of these units are used in tandem signals can be boosted to such an audibility that one cannot stay in the room on account of the terrific loudness of the signals. These amplifiers are also used in long distance telephone work and also for detective work on account of the remarkable sensitiveness.

L. Bishop, the inventor of this wonderful instrument, has spent four long years experimenting on different types of amplifiers and has found after more than a thousand different experiments that the chemical amplifier of this type gives the best results. Fig. 2 depicts the interior of the amplifier, while Fig. 3 illustrates the complete apparatus in cabinet.

Receiving Wireless Messages With Odd Aerials

THE composite illustration shown on the opposite page indicates a number of odd aerials, which may be used more or less successfully under certain conditions for the reception of wireless messages, especially in large cities. The action of these freak aerials is based, of course, upon the fact that they are of metal, and that also they have a distinct electrical capacity and inductance, the same as any regular antennae, used especially for the purpose.

Above: Fig. 3, External View of New Chemical Amplifier. At Left: Fig. 2, Interior of New Amplifier Giving 1,500 Times Original Signal Strength.

The first scheme, shown in Fig. 1, has recently been tried out by a radio experimenter quite successfully, and involves the use of the metal frame and strings of a *Piano* for receiving wireless messages. It may be said that in most of these cases a Ground connection is invariably used, the same as with a regular wireless, and the ground wire may be connected to a gas, water or steam pipe in the building. Failing this, an artificial ground may be provided by driving a piece of pipe several feet into damp earth. Also, the ground wire may connect to a metal plate immersed in a brook, etc.

Of late there has been a great deal heard regarding the use of *Spiral Aerials* where space is at a premium, and Fig. 2 shows such a structure. These are said to work over quite long distances indeed and a great many turns of copper wire are thus provided, which give the entire aerial considerable inductance value, as will be appreciated. The turns of wire can be quite close, even ½ inch apart, the diameter of the turns being 1½ to 2 feet or even more.

Iron *Fire Escapes* on buildings have been used successfully in picking up wireless signals, especially in cities, as seen in Fig. 3.

Another freak aerial, which generally works quite well unless the leader pipes are grounded through iron water pipe conductors, is that shown at Fig. 4, making use of a *Tin Roof* on a house.

A scheme described in detail in the March, 1914, issue of this magazine is indicated at Fig. 5, for the reception of wireless messages, and which employs a *Cardboard Tube* wound closely with a layer of fine insulated magnet wire. This method was tried out by a French engineer, P. Dosne, with considerable success in receiving wireless time signals as sent out by the Eiffel Tower Station at Paris, France. In this case the 'phones are shunted across the detector and the detector in turn is joined in series with a fixed or variable condenser and the inductance coil aforementioned. In this case no ground whatsoever is used. The coil is about 20 inches long; its diameter is 2 inches.

At Fig. 6 is depicted a method which was tried out by Major G. O. Squier, of the U. S. Signal Corps, some years ago quite successfully for short range work. As observed, two large *Iron Nails* are driven into a *Tree* of fair height; one nail is driven in the trunk of the tree *near the ground*, while the second nail is driven in the trunk *just below the foliage*. A tuning coil may be used in series with the 'phone and detector, as the diagram shows, although the coil is not absolutely necessary.

Some experimenters have had quite good success utilizing *Wire Fences* as antennae. A gentleman located on Long Island and at a considerable distance from the Sayville radio station succeeded in picking up the signals from that station very nicely indeed.

At Fig. 8 is shown an idea which is often adaptable to some experimenters' surroundings, and this considers the use of the *steel Elevator Hoisting Cable* as an antenna. A peculiar feature about this scheme is that as the elevator goes up the wave length becomes less and thus, if the elevator is doing service pretty regularly, there is provided an automatic tuning system for the lucky experimenter making use of this make-shift aerial. If he should happen to use this scheme in such a building as the 60-story Woolworth skyscraper in New York City he would have indeed quite a range of wave lengths automatically tuned in and out several times a minute!

A scheme which has been tried out by H. Gernsback some years ago with considerable success in New York City consisted of pasting or temporarily pinning *Tin-foil Strips* on the wall of the room, as Fig. 9 portrays. Needless to say, all of the foil strips are overlapped or pinned together so as to make the whole act as a single capacity area. In these experiments he used some 50 square feet of tin-foil.

Another substitute for the regular antennae is a *metal ceiling,* as pictured in Fig. 10.

The scheme at Fig. 11 utilizes a *Metal Bed,* such as a brass or iron structure, for an antenna.

Even *Umbrellas* with their metal ribs will serve for the reception of wireless signals, as Fig. 12 indicates.

In all the diagrams here outlined a 1,000-ohm 'phone is preferably used, or better yet, a pair of them, together with a sensitive mineral detector using galena or silicon, which requires no battery.

It goes without saying that where these

RECEIVING WIRELESS MESSAGES WITH ODD AERIALS

Full Explanatory Text on Opposite Page.

Telemechanics or Control by Radio Waves

THE science of controlling distant machines or devices, such as boats, airships, or torpedoes, has been brought into the public eye very prominently in the past few years by the successful researches of John Hays Hammond, Jr., and several European scientists. The possibilities and usefulness of "telemechanics," as this branch of wireless science is termed, is of great importance in time of war. How do we know that some of the war vessels reported as blown up in the present war by mines were not blasted into eternity by a sharp-nose torpedo guided by invisible etheric waves?

Fig. 1. A "Gabet" Radio Controlled Torpedo in the River Seine, France.

Some six years ago the French tried out a successful wireless torpedo controlled from shore by a radio sending station. A view of one of these demons of war gliding swiftly through the waters of the River Seine is shown in the photograph, Fig. 1. This particular torpedo carries antenna structures above the water, as perceived, and was perfected by M. Gabet.

A most interesting phase of this subject is how can it be done without the etheric waves from various radiotelegraphic stations interfering with it, causing it to become erratic in its behavior or changing its course? It may be said that some of the finer developments of the art of telemechanics are pretty well locked up in laboratory note books as yet, but, however, a few methods of interest to those interested in such work are cited here.

In the diagram, Fig. 2, is outlined the plan for rigging up a small model boat with propelling motors, batteries, wireless control devices, aerial, etc. The boat may be made of tin or galvanized sheet iron, soldering all the joints. Details are not mentioned on the design of the boat, as most readers would probably prefer to make or use a stock form procurable cheaply from most toy stores.

Let us now take up the scheme of radio wave control applicable to such an experimental model. One of the simplest means, theoretically (and also practically if the proper apparatus is used), such as a quenched spark transmitter, etc., is shown in the diagram, Fig. 3. The basis of this whole scheme now under discussion is the accurate transmission and reception of sharply tuned waves having different lengths or vibration periods.

The arrangement is not complicated, although it may appear so at first sight. At the sending station an aerial A_1 is connected to a variable tuning coil B. It is supposed that several wave lengths or tunes are obtainable in this way, each wave being several hundred meters, if necessary, different in value from the next nearest wave. For instance, suppose the six steps shown vary from each other by a difference of 200 meters. If the switch lever B on step 6 gave a wave length of 400 meters, then step 5 would give 600 meters, etc. As the wave is changed in the aerial circuit A-B-G the closed oscillating circuit C-Q-D is simultaneously varied in proportion so that both open and closed oscillating circuits are in syntony or tune.

If a good quenched spark transmitter is employed the tuning will be very sharp, as we well know. The transmitter may be a spark coil, but preferably a small transformer working on 120 or more cycles frequency A.C. A Clapp-Eastham "hy-tone" set will create sharp tuning facilities on 60 cycles.

So much for the emitting of the successive tunes or waves. At the receiving station on the model boat or other device several attuned circuits are provided. Each properly tuned receiving circuit contains a coherer C_1, C_2, C_3 and C_4. Each coherer actuates its own relay R_1, R_2, etc. The relays in turn control their respective local circuits through batteries B, B_2, motor A_2, motor B, etc. All batteries can be of the flashlight type.

Every coherer circuit is properly attuned to the various emitted wave lengths by means of tuning coils L_1, L_2, L_3, etc. These inductances may be shunted by variable condensers to more sharply tune the circuits. Also the coils are best made adjustable. A common antenna A serves all the resonant circuits, as well as a common ground G, which can be the metallic hull of the boat.

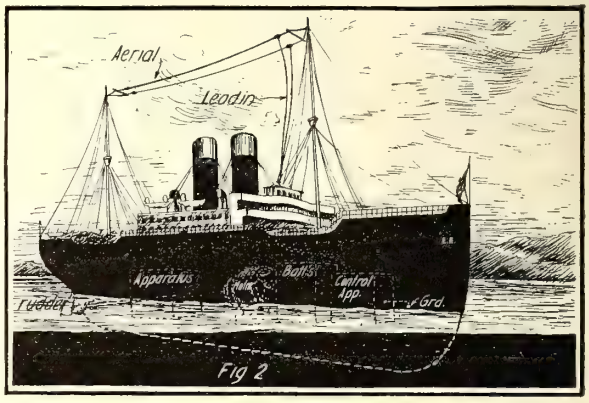

Fig. 2. Miniature Boat With Radio Control Set on Same.

To simplify matters permanent magnet field motors are utilized at A_2 and B, which motors, if on a boat, may control, say, the rudder and propeller. To cut off the motor current from A_2 or B two extra tuned circuits with coherers and relays are necessary, but are not shown for the sake of clearness. As the various waves of differing lengths are sent out from the transmitter the corresponding coherer and relay circuits respond actuating their respective motor circuits.

Two sets of batteries are used to control one motor of the type mentioned, and by passing the battery current into the motors in opposite directions alternately by the relays R_1 and R_2, for example, the motor is caused to rotate right or left handed, as the case may be.

This is only one idea for radio control and many others have been worked out. One of the simplest, but disadvantageous in that prompt selective control is not possible can be had by utilizing the old step-by-step relay with a ratchet wheel and pawl. A solenoid or plunger type electro-magnet acts on a pawl tooth, as seen in Fig. 4, serving to pull the drum and switch lever S around step by step over the various circuit contact buttons, 1-2-3, etc. The contacts are usually arranged in a circle.

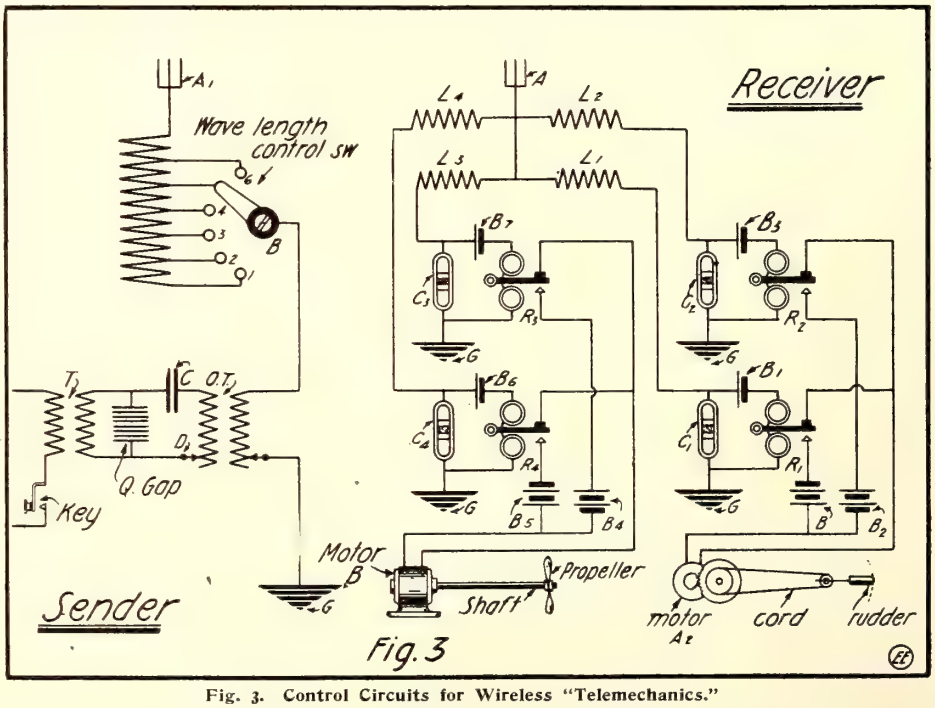

Fig. 3. Control Circuits for Wireless "Telemechanics."

A very unique scheme said to be practical is illustrated in the diagram, Fig. 5. Here the selenium cell is brought into play, which, as is well known, changes its electrical resistance in direct proportion to the strength or amount of light thrown on it. In this manner a relay is operated with a selenium cell and battery in series. If the relay be adjusted so it does not close its local circuit with the selenium cell in the

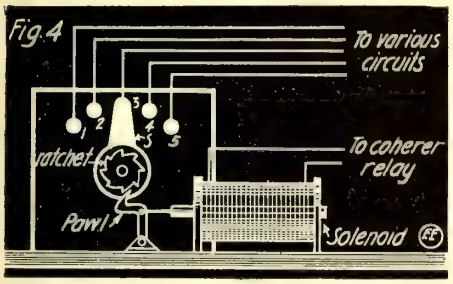

Fig. 4. "Step by Step" Radio Control Relay.

dark, then, when the cell is exposed to light, its resistance falls from 1/4 to 1/6 or more of its dark resistance, and the relay deriving more current from the battery will close.

The complete theory of Fig. 5, however, goes further than this and takes into consideration the latest discoveries in the art, which made known the fact that under certain physical conditions selenium will perform its function best as above explained when a certain *colored light*, corresponding to a definite etheric vibration frequency, is projected against it. With this in mind, a working arrangement possible is hypothecated at Fig. 5, where a powerful searchlight A is caused to project various colored beams of light on to the parabolic reflector R.F. In the focus of this reflector are grouped the battery of selenium cells 1-2-3-4, etc. Each cell operates a distinct relay, as did the coherers in Fig. 3. If a red light is thrown on the selenium cell, then a "red-sensitive" cell responds, causing the device carrying it to act accordingly.

This new science is undoubtedly only in its infancy, and at the toddling age at that, so that the wireless fiend will find plenty

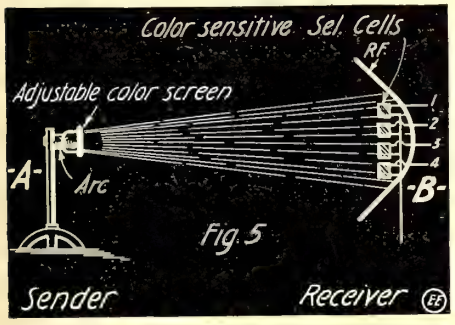

Fig. 5. Using the Selenium Cell for Wireless Control.

to keep him busy in this useful branch of the wireless art.

MEMBERS OF RADIO CLUB TO PREPARE FOR COMMERCIAL LICENSES.

A course of lectures and instruction will be given to the members of the Connecticut Valley Radio Club beginning with its next meeting, and after finishing the course the members are expected to be prepared to take the examinations in Boston for first-grade commercial licenses. The future meetings, which will begin the season in wireless telegraphy, will be featured by wireless telegraphy apparatus loaned by the various manufacturers.

Efficiency in the Amateur Radio Station

By Thomas W. Benson

EFFICIENCY in wireless telegraphy resolves itself in getting the longest range and the loudest signal obtainable with the apparatus in use. Of course good design is necessary, but the object of these paragraphs is to point out the best methods of utilizing instruments that are really unfitted for radio work.

For instance, take the amateur who possesses an X-Ray coil. It gives a long thin spark, ideal for the purpose for which it was designed, but in the average set its efficiency is very low, due to the fact that most articles describing the use of coils for radio telegraphy take it for granted that the proper coil is employed, and deal with the standard apparatus in connection with it.

A coil of this description when connected, as shown in the usual hook-ups, gives a long wave or else a highly damped wave. The first is the result of the enormous amount of capacity used to shorten up the spark gap. A short gap is necessary if the decrement is to be kept low, as the spark gap is a form of resistance which affects the decrement. On the other hand,

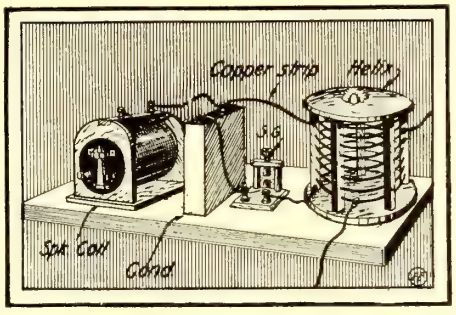

Fig. 2-A. Compact Arrangement of Wireless Sending Set on Shelf.

if a small condenser is used to keep within the 200-meter limit, an extra long gap is necessary and a broad, highly damped wave is emitted. The latter evil is the less noticeable because the Government stations will pick up and observe a long wave, paying little or no attention to the badly tuned wave if under 200 meters.

The proper method of employing an X-Ray coil for wireless telegraphy is sketched in Fig. 1. Here the coil is used without condensers, the aerial itself acting as the capacity, while a lumped inductance, I, is connected in the aerial lead. The gap used is of the compressed air type where the spark occurs in air at a pressure of two or three atmospheres. The exact design of the gap is left to the reader, but one that can be easily constructed is shown.

The container is an ordinary Mason fruit jar, one-quart capacity. The standards are mounted on a piece of hard rubber and the pressure is created by a hand bulb acting through a check valve. Soft rubber gaskets are used to render the whole air-tight.

This method gives a sharp wave of good carrying power and with a very small gap it may be used with coils under one-inch spark length, whereas the helix cannot be employed very well.

Another point overlooked in amateur wireless stations is the relation between interrupter speed and the high tension condenser. The usual practise in determining the proper condenser is to build one with as many plates as the constructor happens to have. If this condenser stands the discharge of a two-inch coil, it is a two-inch coil condenser. If someone else finds that a three-inch coil does not puncture it, it then becomes a three-inch coil condenser, and so on indefinitely.

It is also true that from time to time

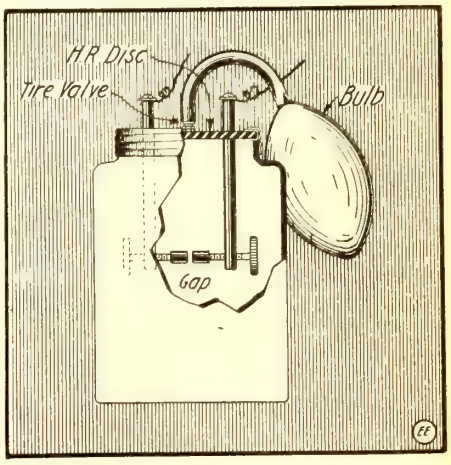

Fig. 2. Home-made Compressed Air Spark Gap.

tables appear in the various journals, stating the number of plates to use with the different size coils. These tables are very good, invaluable in fact when followed out properly, but many amateurs make a serious mistake in trying to obtain a very high pitch note with these condensers. They have, in most cases, speeded their interrupters up to the limit; when, of course, these condensers have been adapted for use with a medium speed interrupter. Therefore, it is necessary to adjust the voltage and speed of the interrupter for best results or efficiency.

I will not deal with spark gaps here, as they have been well covered in the past, but one thing necessary is to keep them cool by radiating wings, air blast or damp-

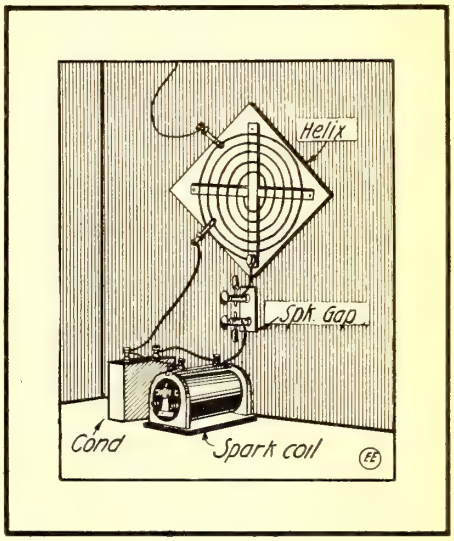

Fig. 2-B. Short Wiring Possible for Radio Set on Table and Wall.

ened sponges, and let me suggest that a vertical gap be used instead of a horizontal in straight gap sets. In rotary and quenched gaps this is not so important.

I have also noticed a number of articles on synchronized rotaries to be used with spark coils. A much better way is to use the interrupter end of the device and use a quenched gap instead of the rotary. Less noise and more satisfactory results are obtained. Efficiency again!

By all means keep the leads as short as

possible, both on the sending and receiving sets. Arrange the instruments in proper order. If your sending set is on a shelf, Fig. 2, "A" offers a suggestion for short wiring; if on a table and the gap and helix are fastened to the wall, the second sketch, "B," will be found of service. Use copper

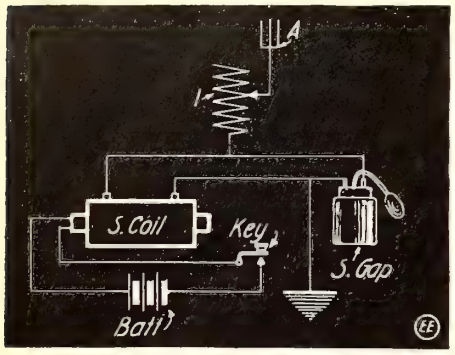

Fig. 1. Connections for Compressed Air Spark Gap.

strip for the sending set connections, not "bell wire"!

The aerial switch is another energy-wasting device. It puzzles me why amateurs persist in using a switch, which requires the best of insulation and is always more or less bulky, when a small switch properly connected is much better, or even a telephone key may be used. In Fig. 3 a hook-up is shown that has the usual aerial switch beat for several reasons. The first is that leakage does not affect the results, thus making it cheaper and easier to construct. Secondly, it enables a symmetrical wiring diagram to be used. The aerial enters at top of window, runs to helix, then to switch and thus to ground. An easier, better method is impossible. The hook-up, using a telephone key, is also added. This may be mounted on a table and the change-over can be made in an instant with the small finger. Who wants to use those big switches now?

Turning to the receiving set, most losses are incurred in dead ends, poor contacts, detectors and *poor* condensers.

To overcome dead ends, use fixed inductances and use variables for tuning. The primary of the coupler should have about 40 turns of No. 24 S.C.C. copper

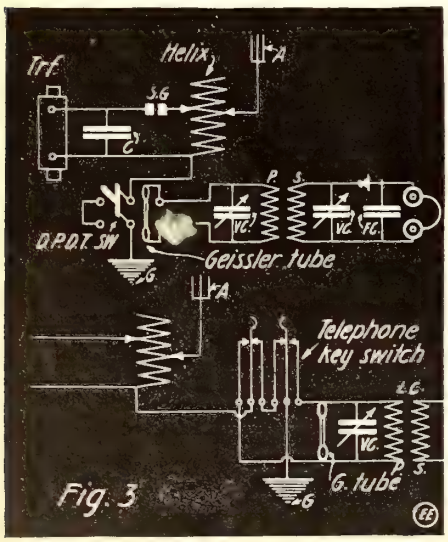

Fig. 3. Simplified Transmitting and Receiving Radio Hook-ups.

wire and the secondary 60 turns of No. 28 S.C.C. The tubes may be 4 inches and 3½ inches in diameter, respectively. The variables, of a good commercial make, as

An Almost Human Wireless Receiving Set

An automatic receiving outfit, an "almost human radio receptor," was the title given to his latest device by Mr. Walter Goodchild, the well-known inventor of the "Permanent Wireless Detector" and other scientific apparatus.

This receiving set is operated entirely by an electric motor, as depicted in the center of the illustration at Fig. 1. This motor operates the various mechanisms by pressing any of the control "keys," portrayed on the front panel, each of which performs a certain distinct function.

The complete machine comprises a specially designed inductive coupler, which consists of four reels containing a copper ribbon, one side of which is coated with a special flexible insulating compound. These reels are wound and unwound as required by the motor. Two sets of coils, one pair of primaries and one pair of secondaries, are provided, as Fig 2 shows. The inductive value between the primary and secondary is changed by moving the secondary back and forth parallel with the primary; this is accomplished by the same motor, operated by a different key. A scale and needle indicates this inductive value, as seen in the upper part of the instrument at Fig. 1. The dial indicator moves according to the position of the secondary coils. The dials on each side of the machine denote the *wave lengths in meters*, corresponding to the position and amount of ribbon in use on the coils.

Two specially designed variable condensers, placed on each side of the apparatus, are illustrated in Fig. 1. These are driven by two separate electric motors, also operated by control "keys" located on the right hand corner of the instrument The condensers are of the variable plate type, i. e., instead of varying the dielectric as in the ordinary variable condenser; the number of plates in use are actually connected and disconnected electrically by changing the position of the plates. This is accomplished by the motors and in this way the condensers are absolute and reliable in their work. Here the proper dials depict the *capacity of the condensers* in the regular units.

The detector is of the permanent type and is located inside of the case, as also the batteries for driving the motors. The central switch is used to vary the current supplied to the detector.

The operation of this remarkable set is very simple, requiring merely a pressure on the right "key," and watching at the same time the dial indicators to see that the proper wave length is tuned for. It has been found in testing it out that it takes only 11 seconds to change the wave lengths from 200 to 8,000 meters. The set can easily be carried about, as it is very compactly built, adapting it for use on aeroplanes, battleships, automobiles, etc., as the keyboard can be located in any place desired.

Front and Back Views of Improved Radio Receiving Set That is Almost Human in Its Working. Fig. 1, Above; Fig. 2, Below.

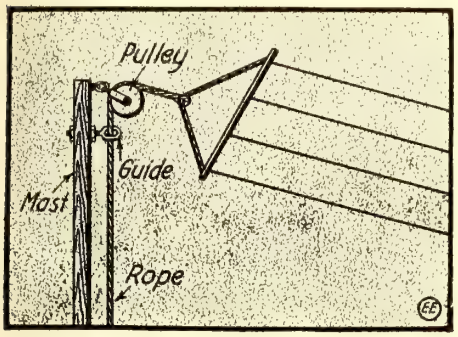
compared with home-made variables (which are nothing more than makeshifts nine times out of ten), should be connected on parallel with the windings. Wave lengths up to 300 meters may be tuned on this coupler; the exact length depending, of course, on the length of the aerial. To receive longer waves a second coupler should be constructed, using 200 to 250 turns on the primary and secondary, respectively. A switch is arranged so as to throw from one coupler to the other, and the fear of "dead ends" is removed. The above construction does away with sliders and switches, thus lessening chances of poor contacts.

The detector is a trouble maker and many devices have been produced to obliterate this. Galena is the favorite and a stand for this excellent detector should be selected that is sturdy, simple and provided with fine adjustments.

All condensers should have an air dielectric, even the blocking condenser. A good blocking condenser may be made from 70 sheets of aluminum, 4x5 inches, mounted in a case and separated from each other by strips of mica at each end. This condenser should be adjustable by a suitable switch. This is another factor for obtaining loud signals, which is often overlooked, as nearly every set of receivers requires a different capacity. The reason for this has puzzled many, but still the fact remains. However, it may be more clearly understood when the 'phones and blocking condenser are considered as an oscillatory circuit tuned to a certain harmonic of the secondary circuit. As a general rule, the higher the resistance the smaller can be the blocking condenser capacity.

In closing, I would say, run parallel wires as far apart as possible; cross all wires at right angles and solder each and every joint.

WIRELESS SAVED GERMANY MANY MILLIONS.



"War has been declared on England. Make as quickly as you can for a neutral port."

This message, flashed for a radius of 2,000 miles over the system of world-girdling German wireless telegraph stations at 5 p. m. on Aug. 4, 1914, saved Germany the bulk of her merchant marine, according to Godfrey Isaacs managing director of Marconi's Wireless Telegraph Co., London, England, at a meeting of the company.

The saving of the Hamburg-American liner "Vaterland" alone, he added, more than balanced the $10,000,000 Germany had expended in erecting the stations.

GUIDE FOR AERIAL ROPES.

A simple but efficient rope guide for an aerial pulley may be made from a ¼-inch bolt about 6 inches long and a couple of nuts. The bolt is bent, after the head has been cut off, in a circle to fit the rope. A hole is then bored into the aerial mast to

Guide for Aerial Ropes to Prevent Jumping Off Pulley.

fit the bolt, and a nut is put on each side of the mast. The guide should be placed about 3 or 4 inches below the pulley. This simple device often saves much trouble when the rope catches in the pulley. Contributed by W. R. MILNER.

LOOSENING CORRODED BATTERY TERMINALS.

It is sometimes very hard to loosen the terminal nuts on storage batteries. This is often true when no great care has been taken to see that the terminals were free from the acid used in the battery before the terminal nut was screwed on. In cases where these nuts "stick" it should be remembered that if too much force is used the terminal is likely to be torn off bodily.

The best method that I have found to remove them is to use a pair of pliers which have been made fairly hot and to hold the terminal nut with them until the terminal parts are heated through. The nut will then turn quite easily. It is well to cover the screw threads of the terminal with vaseline, after cleaning them thoroughly from acid, before the nut is applied. If this is done there should be little trouble from corroding.

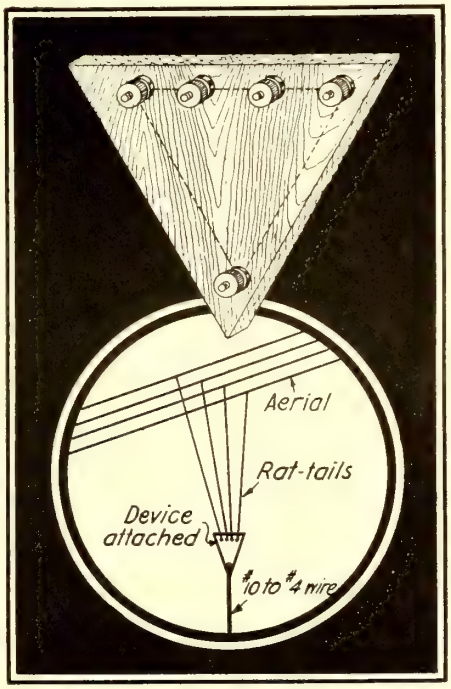
MILTON E. SAUL.

[Soaking the terminals in strong ammonia for 30 minutes accomplishes the same purpose.—*Editor.*]

AN INSULATED TURNBUCKLE.

Here is an easy way of combining the insulator and turnbuckle on the guys of a wireless pole into one piece, thus strengthening the guys by not breaking them up into several parts to insert insulators and turnbuckles.

Insulated Turnbuckle.



The insulated turnbuckle herewith described consists of three parts, namely, the turnbuckle, which in this case is an ordinary 7-inch carriage bolt having a diameter of ¼ of an inch, and two standard porcelain insulators. They should be arranged as shown in diagram. To tighten the guys it is only necessary to tighten the end nut of the bolt.

AN EFFICIENT AERIAL CONNECTOR.

Many wireless troubles result from loose, weak or faulty connections, and the device described and depicted herewith practically eliminates all troubles arising therefrom.

It consists of a simple block of hard wood, shaped somewhat like a triangle, as shown in sketch 1. It should be boiled in wax. Four holes are bored at the top of the block to admit four binding posts from "dead" dry cells. Another hole is drilled at the bottom, where the two sides of the block meet, for the same purpose. Insert loosely all the posts and then take some No. 14 aerial wire and lead around all the posts, arranging as per dotted lines, from one to the other. Small grooves may be made on the back of the block and wire squeezed snugly into these. Tighten the nuts on the posts and fasten the rat-tails and lead-in to posts.

The illustration clearly shows the device attached, but it may be stated that all such "connectors" usually extend down from about 15 to 25 feet from aerial. Lead-in

Antenna Connector Made of Wood.

can be made of from No. 10 to No. 4 wire.

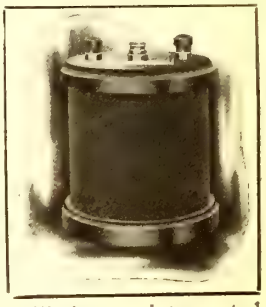
SOME PRACTICAL HINTS.

A short permanent horseshoe magnet fastened to the end of a stick is a most handy article for locating and recovering small screws dropped to the floor from the work-bench. You do not have to get off your seat and get down on all fours to hunt for them. Slide the magnet slowly over parts of the floor and soon the screw will be found attached. *(Provided it ain't a brass one!—Ed.)*



Plain newspaper rolled into a small tube makes a cheap and handy brush for applying lacquers, etc., and also saves the trouble encountered when you failed to clean the brush last time and wish to use it again.

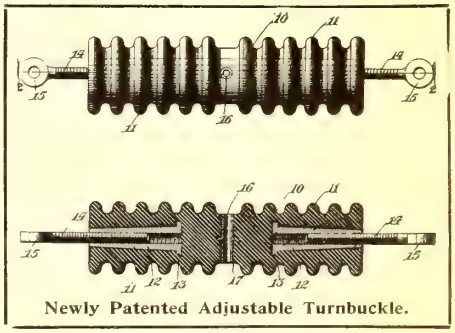
Often it is desired to know if an arc lamp is being fed by A. C. or D. C. A sure and quick test can be made by taking a hexagonal pencil and holding it at one end, and slowly pass it horizontally from side to side before your eyes. If A. C., the pencil seems to rapidly revolve in the hand; if D. C., it appears to be at rest in the hand. Contributed by

GUY H. DALTON.

NEW BUZZER TEST RESONATOR COIL.

A new and effective buzzer test circuit intensifier, in the form of a specially wound inductance, has recently been perfected and placed on the market. The illustration depicts the appearance of the resonator coil, and it is claimed that adjusting radio detectors becomes a pleasure with this resonator, when connected in series with the buzzer test circuit wire.

Presumably the device acts to increase induction in the circuit, and as the buzzer test currents are a series of rapidly oscillating or interrupted currents it is evident how this inductance in the circuit can "boost" these currents so as to give a magnified effect when they reach the detector and phones.



It is said to be particularly efficacious when utilized in conjunction with the well-known Crystaloi detector. It is finished in hard rubber composition and is a neat addition to any radio receiving set.

NEW TURNBUCKLE INSULATOR.

A useful form of strain insulator has been patented, and description follows:

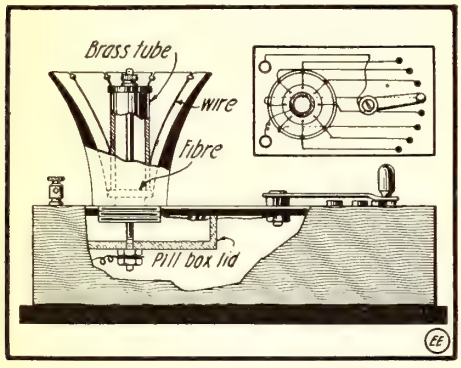
The device as completed forms a turnbuckle having a body or shank of insulating material 10, and having threaded eye bolts engaging threaded bolt-receiving members 12 imbedded in the ends thereof, and these bolt-receiving members are in turn firmly anchored in the insulating body so that the device will possess great mechanical strength. Its insulating value is also very high, since the terminals are separated by the body of the insulating material in which they are imbedded.

The device can be adjusted to tighten or loosen the wire or cable in which it is inserted by rotating the body or shank 10. This can be done by inserting a tool such as a rod or screwdriver into the central hole 16 so that a great leverage may be obtained. This central hole is lined with a metallic sleeve so that abrasion of the brittle insulating material will be prevented, since the tool engages and transmits the force through the sleeve 16, which is imbedded in the insulating body. The sleeve 16 is positioned between the ends of the sleeves 12, and is therefore insulated from both of these sleeves and from the eye bolts and the wire in which the device

Newly Patented Adjustable Turnbuckle.

is inserted; the device may therefore be adjusted to tighten or loosen the wire without danger of shock even if one of the eye bolts is connected to a high-tension wire.

THE "BRODIE" DETECTOR.



The subject of detectors has been well covered in the past by this magazine, but I believe the one herewith described deserves a place on the list. I have nicknamed it the "Brodie" detector, as the element of chance is foremost in adjusting it.

The principal part consists of a microphone mouthpiece with 10 saw-slots one-eighth of an inch deep, spaced equidistantly around its edge. A small wooden box, 5x3x1 inches, forms a very good base for it. In addition you will need the following: 10 switch points, 1 switch lever; 2 binding posts; 1 threaded brass rod 2½ inches long, and 2 nuts for same; one ½-inch inside diameter brass tube, 1 inch long; 1 fiber washer, ⅝-inch diameter; 1 lid of wooden pill box about 1½ inches diameter; 10 pieces soft brass wire about No. 24.

The mouthpiece (after the slots are cut) should have the perforations in the center knocked out, but the outer row of holes should be left intact.

Take the brass wire, tie a knot on one end, put each wire in a slot with the knotted end outside and run the wire down the inside of the mouthpiece and through one of the holes of the perforated shield at back.

After putting all the wires in place, lay it aside. Now take the box and cut a hole one inch from one end to allow the thread

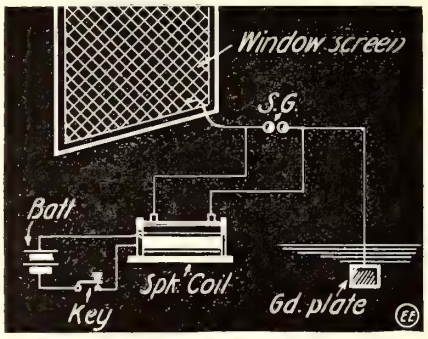
Multiple Contact "Brodie" Detector.

on the mouthpiece to fit in without slipping through. At the other end lay out and drill holes for a ten-point switch, as shown in illustration. Drill holes for binding posts at back. After staining woodwork to suit taste of builder, we can assemble the various parts.

The drawing will be of great assistance in assembling, therefore it should be closely studied. Place the transmitter mouthpiece in place in the hole and carefully separate wires inside of the box. Take the pill box, which has a hole drilled through the center large enough to pass the threaded rod. Put rod through it with nut on end, pass up through center of mouthpiece, drop fiber washer over rod, then the brass tube, a washer and finally the other nut. Center the tube and screw up tight after drawing the brass wires taut. Connect each wire to a contact on the switch, threading a band of paper or thin fiber between them, so they don't touch.

After connecting one binding post to the center brass tube and the other to the switch lever, the detector is ready for use.

To use, break the galena up into pieces about as large as a pea and drop into mouthpiece around center tube. The switch is quickly moved from point to point until an adjustment is found.



Although there is no law of physics that states that a sensitive spot will be found, it is surprising to get at least two points to respond on the first trial, if the mineral is at all good.

With the assistance of the drawing I believe the description sufficiently clear to allow of the amateur building this instrument, which will always be ready in a pinch. Contributed by

THOMAS W. BENSON.

WINDOW SCREEN SERVES AS ANTENNA.

While my regular antenna was down

Window Screen Radio Antenna.

temporarily I experimented with various substitutes.

Upon connecting my receiving set to an ordinary window screen I found that signals from a local spark-coil station about one-quarter mile away were received almost as loud as on my regular aerial. A small transmitting set consisting of an "Electro" ½-inch Bulldog spark-coil, gap and key was then hooked up with this novel antenna and, with the addition of an aerial switch, regular communication was carried on. Slightly better results were obtained by connecting two screens together. Neither station was grounded on water pipes, but to metal plates buried in the ground at each station, so that there was no metallic connection between the two stations. The screen used was of ordinary size and not more than 12 or 15 feet above ground.

When using a sending set with an aerial of this kind it is absolutely necessary that all connections between coil, gap and screen be as short as possible and fairly heavy in order to secure good results.

DONALD PALMETER.

GOLF-BALL AERIAL INSULATORS.

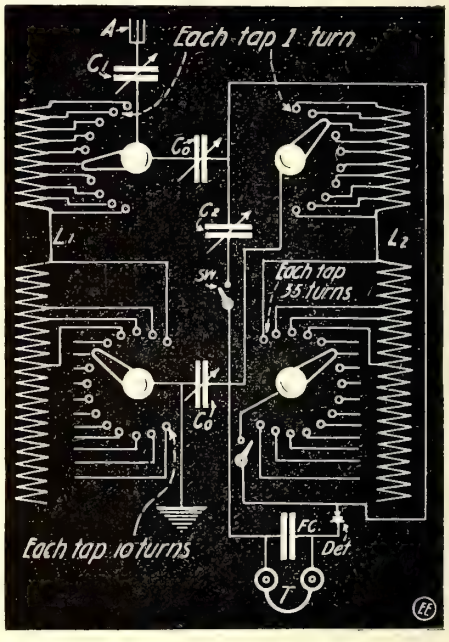
A very good aerial insulator may be made from a golf ball, the solid gutta percha kind being the best.

First, it may be well to remove the paint, because it acts like a conductor, due to the lead in the paint; it may be done by applying a coat of paint remover. This accomplished, take a small drill and at opposite ends drill holes a short way in. Now take a few brass screw-eyes and

Golf Balls Prove Good for Insulators.

thread them in the holes made, being careful that they do not touch at the center. By following the drawing, all points will be made clear. These insulators will be found to be very strong and also will resist fairly high voltages. Several may be joined in series to increase the insulation value. Contributed by

F. PELTON.



LONG ISLAND BOYS STUDY WIRELESS.

The establishment of the wireless plant in Sayville has given an impetus to the study of the wireless among Sayville, L. I., school boys, a large number of whom have receiving apparatus. A number of them are also members of the Sayville troop, Boy Scouts. They have organized a wireless class under the direction of First Class Electrician Dunkie, who is a Government operator at the station.

ANENT DR. COHEN'S NEW NAVY TYPE RADIO SET.

In the July issue of the *Electrical Experimenter* I took particular note of Dr. Cohen's improved Navy set and hooked up my set in the identical manner, and must say that the selectivity is wonderful.

However, for the benefit of amateurs contemplating using Dr. Cohen's hook-up, I wish to contribute a diagram which was tried out on my set and tested by me. It is similar to the improved style, except that every turn of inductance on the primary and secondary may be obtained.

Modified Hook-up and Construction for Dr. Cohen's New Wireless Receiving Set.

The amateur will find this to his advantage and for sharp tuning it has no equal. Contributed by

HARRY Y. HIGGS, R.E.

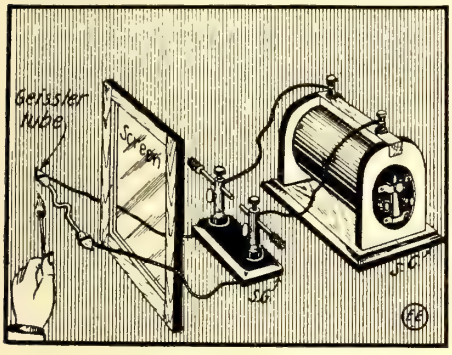
NEW CARNEGIE INSTITUTE OF TECHNOLOGY RADIO PLANT.

At a cost of $1,500 the Carnegie Institute of Technology, at Pittsburgh, Pa., is installing in the tower of Machinery Hall a new radio plant which will be the most powerful in that part of the country. The outfit will have a wide range over which it may communicate, the western boundary being Honolulu and the eastern Germany. Communication will also be established with other technical schools throughout the country which have radio equipment.

The other station is being installed for the use of the student Radio Club, an organization of electrical students. The equipment of the new set consists of a 10-kw. motor-generator of the latest design and an Audion detector.

If you are a "newsstands reader," look sharp next month. We are changing the heading of our cover to make it more readable. You will like it, too.

A GEISSLER TUBE EFFECT.



Connect a small Geissler tube to a gas engine or other small spark coil and shunt a spark gap around it, as indicated in sketch. Now adjust the gap so that when the coil is started the discharge will *just fail* to pass through the tube.

If the setting has been carefully made the coil may now be operated without producing a glow in the tube *as long as the tube is kept in the dark.* If a light from the spark gap or any ordinary light be allowed to fall on the tube a discharge will begin at once and will continue as long as the coil is operated. The current may be cut off at any time and the performance repeated indefinitely.

A rather interesting way of showing the effect is to "light" the tube with a match. For the success of the experiment the adjustment must be such that a very slight change in conditions will cause a discharge. The gap must be set apart as widely as possible and the vibrator of the coil should operate very steadily.

My explanation of the effect obtained is that the light thrown upon the tube ionizes the gas, making it more conducting and thus lowering the potential needed to produce a glow discharge to a value below that of the applied potential.

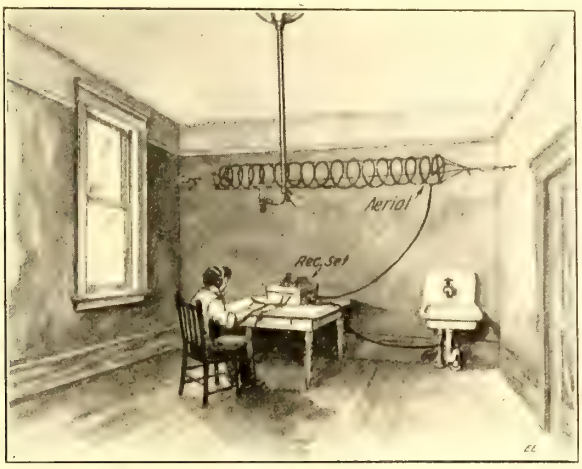
With most Geissler tubes the effect is very difficult to obtain if the regular sealed-in electrodes are used. Temporary condenser electrodes are made by wrapping

Light of Match Starts Spark Through Tube.

tinfoil bands around the tube near each end and the coil leads are connected to these. Contributed by S. KRUSE.

OVER 4,000 MARCONI RADIO MEN IN EUROPEAN WAR.

Presiding at the annual meeting of the Marconi International Marine Communication Company, Godfrey Isaacs expressed the regret of William Marconi at his inability to be present.



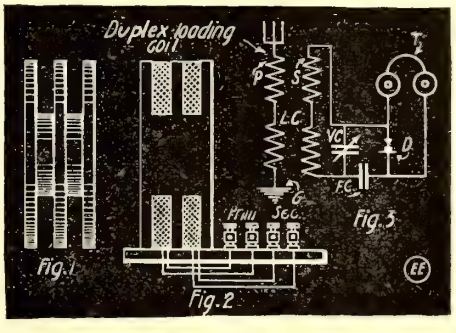
Mr. Marconi, said Mr. Isaacs, had been called upon by his Government and had joined the engineering staff of the Italian Army in order to superintend the organization of its wireless communications. At no time had the value of Mr. Marconi's invention been more prominently emphasized than since the outbreak of the war, and when peace was obtained an interesting chapter might be written of the part played by the 2,000 Marconi stations fitted upon vessels of the mercantile marine.

Over 4,000 Marconi operators, said Mr. Isaacs, were in the service of the British Army and Navy, and the Admiralty had, on more than one occasion, expressed appreciation of the resource and courage displayed by the men.

Now is the best time of the year to erect an aerial or to overhaul an old one. Better get busy.

SPIRAL INDOOR AERIALS.

Where aerials are desired for wireless experimental purposes, etc., in apartments and other places where it is not desirable



Spiral Antenna for Small Spaces.

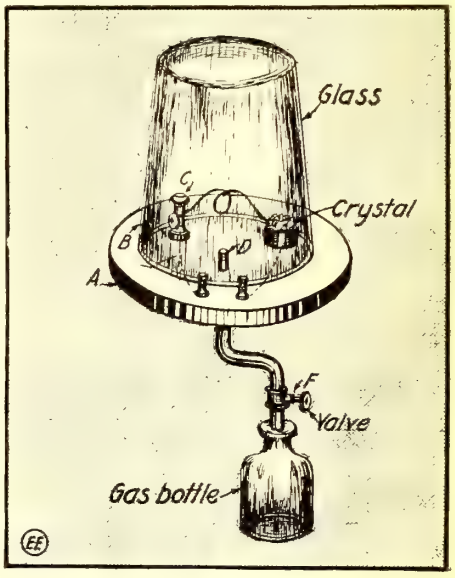
to place long stretches of wire on the roof, the newly devised spiral aerial will be found very suitable for the purpose. This form of aerial, of course, possesses a large amount of inductance in proportion to its actual length when opened up. It can be used in an ordinary room, and as it may be made with a large number of turns in same, spaced even as close as ¼ to ⅜ inch, it can be seen that the inductance will reach a large value. Hence its receiving activities and also wave length capacity will be quite appreciable.

It has been stated that with this form of aerial it has been possible to pick up radio messages over distances of 1,500 miles and more. Strings may be used fastened to each turn in the helical aerial, so as to help support same in a straight line, or nearly so, between the end spreaders. These spreaders may be made of two crossbars of wood. Two heavy wireless insulators placed in either suspension rope supporting the aerial will insulate it nicely. It can be composed of 50 to 100 turns or more of No. 14 solid conductor or stranded cable with a turn diameter of 1 to 1½ feet.

A DUPLEX LOADING COIL.

The following is a description of an instrument which should be found in every radio station. It is known as a duplex loading coil, as it allows both the primary and secondary circuits of a loose coupler to be adjusted to long wave lengths. If inductance is added to the secondary circuit and that inductance inductively coupled to the primary circuit very good results will be

Making a Duplex Loading Coil.



obtained. Of course, increased capacity could be added to the closed circuit, but it has been found that for the loudest signals the inductance employed should be considerably greater than the capacity. The device which will now be described consists of two coils having coupling between them; one coil being connected in series with the primary and the other in series with the secondary of the loose coupler.

Obtain three circles of ¼-inch wood 5 inches in diameter and two discs 4 inches in diameter. Glue these together so that they will appear as in Fig. 1. Wind one of the grooves full of No. 26 S. S. C. wire and the other full of No. 30 S. S. C. wire. The wire should be wound on roughly, crossing the turns as much as possible. Enamel wire should not be used. The coils may then be mounted on a base as shown in Fig. 2, the ends of each coil being brought out to binding posts. Connect up as shown in Fig. 3.—Contributed by IRVING BYRNES.

GAS JACKET FOR DETECTORS.

Herewith you will find notes and drawing on constructing a new form of detector. All the material can be obtained around the experimenter's workshop.

In the drawing A is a circular base having a groove B about ¼ inch deep and the diameter of a good sized jelly glass. C is a detector of the cat whisker type,

Detector in Gas Chamber.

with connections to two bindings as usual. At D a short length of glass tubing is put through the base. Great care must be taken so that it will fit tight.

The detector stand should be firmly fastened down and the glass tubing allowed to go through the table to which the detector is fastened.

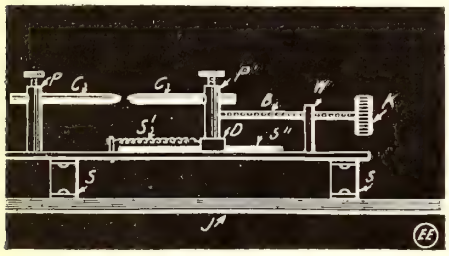
Then adjust the detector; put the glass over it and connect a piece of rubber tubing to D. This tubing is connected to a bottle of hydrogen gas which may be caught by a downward displacement of water, etc. A pinchcock should be fastened at F. One will be surprised at the increase in the strength of the signals.

Contributed by RAD COOVER.

[*This suggests a good field for research by the radio experimenter. Tests of different temperatures would also be worth while.*—ED.]

The correct time by wireless from Arlington, Va., will check the clocks and watches at Tobin & Canham's jewelry store in Springfield, Ill.

HOW TO MAKE IT

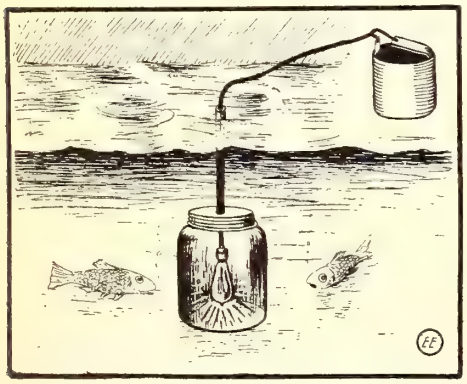


This department will award the following monthly prizes: FIRST PRIZE, $3.00; SECOND PRIZE, $2.00; THIRD PRIZE, $1.00.
The idea of this department is to accomplish new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best ideas submitted a prize of $3.00 will be given; for the second best idea a $2.00 prize, and for the third best a prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings.

FIRST PRIZE $3.00.

SIMPLE ARC LAMP.

A simple hand-feed for arc lamps is given below. At C C are the carbons. P P' are standards. I have large ones so as to hold large carbons. S S are brass supports, which I use to hold base above



Efficient Hand-feed Arc Lamp.

table J. S' is a spring used to hold back P', which is soldered in detector cup D, which slides in a brass slide about 3½ inches long. B is 4 inches of threaded brass rod which screws through support W, which has a threaded hole in it. K is a typewriter knob. The base is 11 by 5 inches and is of wood or slate. The wire to carry the current can be fastened in same place as the carbons are, or can be held by separate binding posts placed on the base. I hope that this contribution will be of some use to the readers of *The Electrical Experimenter*. Contributed by

EDWARD RHOADES.

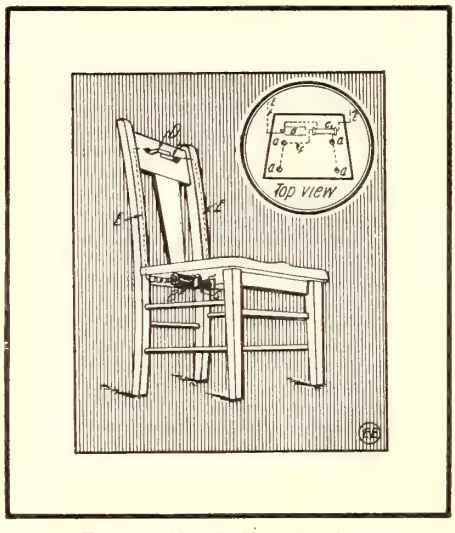
AN ELECTRIC LURE FOR FISH.

Every good fisherman knows that a light will attract fish. A simple light can be made by taking a pint fruit jar, cutting a ¼-in. hole in the top of the cover, inserting a piece of gas pipe in the hole and soldering it to the cover. Insulated wires are run through the pipe, and a small electric globe is attached to the ends in the

Luring Fish by Electric Lamp in Bottle.

jar. The other ends of the wires are attached to a pocket battery. The jar is placed under water and the light turned on, which attracts the fish.

SECOND PRIZE $2.00.



AN ELECTRIC "GOAT" FOR LODGES.

I give herewith a sketch of an electrically charged chair, and below, a brief outline of method of setting up same.

This chair will afford unlimited amusement in your office and probably rid it of a few chair warmers, and for lodge "initiations" it is the boss stunt.

Drive four small wire brads (a) into the under side of chair seat, letting just the points appear on the upper side of seat. With a fine nail set drive them back so that they remain just below the surface.

Fasten a small induction coil (c), and a battery (b) under the seat, soldering the secondary wires (f) to the ends of the brads (a). The parts of the switch (d) can be made from small strips of brass or

An Electric "Goat" Chair for Lodges.

copper, and screwed to the back of chair, as shown. The switch can be covered up by fake upholstery, etc.

Run the wires (e) down the back of chair to coil and battery, keeping them out of sight as much as possible. The switch (d) is concealed by a pad or drape of some kind thrown over the back of the chair, as aforementioned and the chair is ready for the first victim. When said victim leans back against the switch (d), closing the battery circuit with the coil (c), the *fireworks* begin. The coil may be a ¼ to ½-inch spark coil, and it is well to cover over the bottom and legs of the chair with cloth, etc. Contributed by

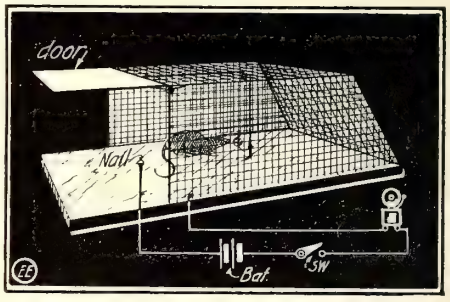
C. F. CONANT.

RECIPES FOR ERASING FLUID AND CLEANING FILES.

For obliterating ordinary script, prepare a solution of chlorine gas in water. Take a freshly written copy and wash repeatedly with this solution and then with some lime water. This will neutralize any acid which may be left.

The following suggestion may be useful to those making use of steel files:

Thoroughly clean the file from any grease, oil, alkali, soda or potash and dip it into a solution of 1 part nitric acid, 3 parts sulphuric acid, 7 parts water, by weight, for from five seconds to five minutes. Then wash in hot water; dip in lime water and oil to prevent rusting.



Contributed by G. J. ENGLESTEAD.

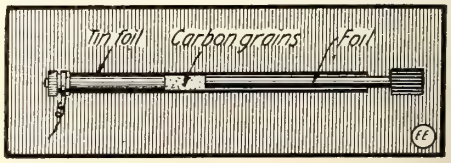
THIRD PRIZE $1.00.

AN ELECTRIC MOUSE TRAP ALARM.

The diagram herewith given depicts a novel little *mouse trap alarm* attachment.

Near the "trap" door is driven a nail so that when the door of the trap shuts it

Mouse Trap Alarm.



will touch the nail firmly. Two wires are fastened, one on the nail and the other to the trap, and connected up, as shown in diagram. When Mr. Mouse enters and attacks the cheese, the door closes, which causes the current to flow and rings the bell.

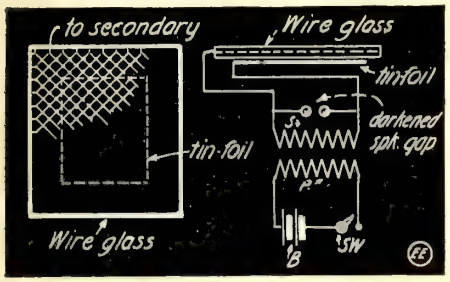
Of course this alarm is not always necessary, but those wishing a mouse trap alarm for traps located at a distance will find this most useful.

Contributed by BERNARD COHEN.

A POCKET-SIZE BATTERY RHEOSTAT.

A pocket regulator for battery currents is made from a piece of small glass tubing,

Simple Pocket Size Rheostat.



carbon grains, a match, tinfoil and a knob.

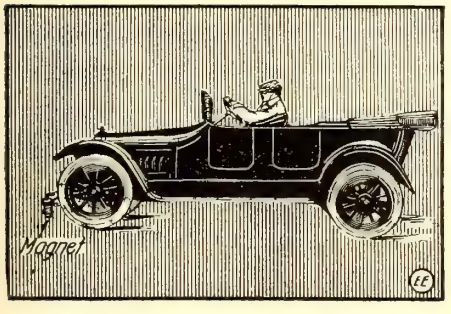
The match is fastened into the knob and covered with tinfoil, so that it will slide loosely in the tube. Stop the other end with tinfoil and fill in the ⅛-inch space with carbon grains. To regulate this move the match in and out.

Contributed by J. H. WILSON.

AN INTERESTING EXPERIMENT WITH "WIRED GLASS."

What might be termed "an interesting and peculiar spark effect" can be carried out by procuring a piece of window glass, with chicken wire made into it, commonly used in factory windows and doors. Now shellac one side of the glass and place a sheet of tinfoil on it having a smaller area than the glass. Before placing the tinfoil

"Wired Glass" Gives Spectacular Spark Effects.



on, paint it black, and this face shall be toward the glass. Break off all the wires around the edge of the glass except one, and this is used for one connection as shown. Now, by connecting a 1-inch or, still better, a 2-inch coil to this glass arrangement and darkening the spark gap of the coil in a paper or wooden box, and taking the whole in a dark room, a most wonderful phenomenon will be noticed. When the current is turned on the glass will all light up with a violet hue in the form of the wire and little bubbles in the glass will become fluorescent, each in a different color, probably due to gas formed when the wire was plunged into the molten glass.

JOHN SEDGWICK.

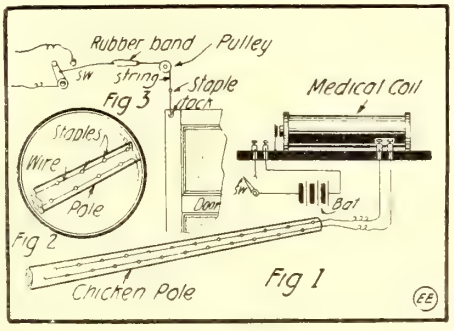
SO YOU WON'T HAVE TO "GET OUT AND GET UNDER."

Have you ever leaned back among the cushioned comfortableness of your motor car on a scorching hot day, when your car went spinning along wafting delightful and fragrantly cool breezes to you, and blessed the wonderful invention of this means of refreshment? when bang! would come a loud report and the blissful trend of thoughts would be broken, your ease disturbed to the extent that you would vexatiously have to "get out and get under" to fix that "tiresome" tire. But at last has been found a remedy which will obliterate the thoughts which usually give vent to profane expression, significant of a punctured tire.

Magnets on Autos Pick up Tacks and Nails.

This aid has come in the form of a powerful electro-magnet, which may be attached in the front of the wheel or wheels of any *tired* vehicle, as illustrated herewith. Any steel or iron particles, such as nails, tacks, etc., lying along the road will be picked up by this magnet, and thus prevent a puncture. If a truck or automobile is to be used a magnet may also be adjusted to the rear wheel, so as to protect the rear tires from such mishaps as aforementioned, and this will be found very serviceable should it become necessary to back the vehicle up.

Sketch is herewith shown as to how the magnet is applied. This device is very practical, and at the end of a long ride or trip, if the rider or driver will examine his magnets, he will realize how many times his tires were endangered, but thanks to my invention, saved! Contributed by



HARRY S. PAINE.

"SOME" CHICKEN THIEF ALARM.

I herewith give a suggestion which I am sure will remedy and comply with all demands of the suburban districts where the theft of poultry from the chicken houses is exercised without detection.

Procure a medical or spark coil, a few dry cells, a tack, some bare copper wire, insulated wire, a switch and a few staples.

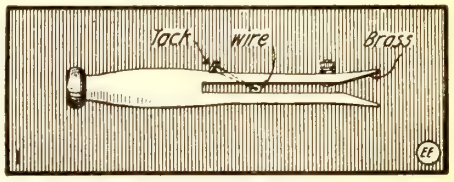
We will first consider the pole on which the chickens rest at night. Cut two single pieces from the bare copper wire a few inches longer than the pole, and by means of small staples tack the wires about ½ inch apart along the entire length of the pole as shown in Fig. 1. (Fig. 2 gives a top view of the pole showing how wires, etc., are arranged.) Then place the coil in a corner and, after removing both electrodes from the binding posts on the side of coil, connect one insulated wire and

Electric Chicken-Thief Alarm.

lead it to one of the bare wire ends, as shown protruding from the chicken pole. By means of tape, insulate the connections well. The other connections may be made by following the diagram, which is self-explanatory.

The switching mechanism of the device is now constructed. Although very simple, it controls the entire operation of the instrument.

Drive a tack in at the top of your door. Procure a string about 6 feet long and in the center of it fasten a rubber band as shown. Fasten the string to the tack on the door, drive a small staple about 2 inches above and pass cord over a pulley to the switch handle as illustrated. Connect one point of the switch to one of the wires from the battery, and the handle of switch to one post on coil. The instrument is now completed and ready for operation.



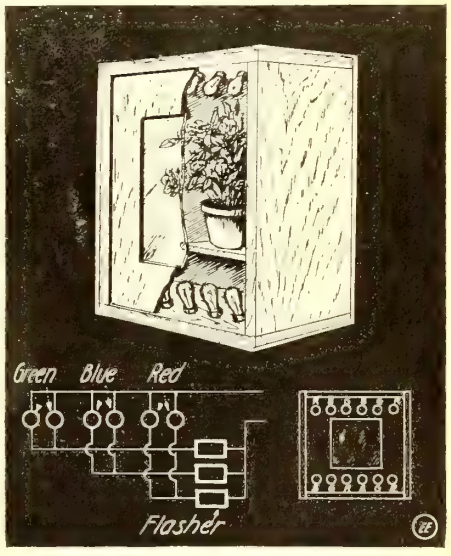
As soon as the intruder opens the door the string pulls the switch handle over to the switch point, both of which are in circuit, and naturally the coil is actuated. This sends a high-tension current through the bare wires on the pole and the chickens clutching it receive a "shock" and leap or fly about, cackling, and otherwise venting their disapproval. This will arouse the owner, and the unwelcome visitor will be welcomed in a manner that he (the owner) sees fit. Contributed by

WILLIAM WARNECKE, JR.

A HOME-MADE WIRE TESTER.

Many times there is a hurried demand for a reliable and sure wire tester to test some wire efficiently. The following is almost one of the simplest conceivable. Articles necessary are: A common clothes pin, a sharp-pointed nail or carpet tack, a binding post, some very small tacks and a sheet of brass or metal.

First cut out a thin brass strip the exact length of one of the jaws of the clothes pin and fasten it on by some very small



Test Clip Made From Clothes Pin.

tacks. (The heavy line in the drawing denotes the strip of brass.) Fasten it on either one of the jaws of your pin and also attach a binding post as shown. Now drive a sharp-pointed nail or tack about 1½ inches above the binding post and your tester is complete. It works as follows: Presume that you wish to test some insulated wire. You push the tester into the wire so that it is firmly gripped by the jaws of the tester. It is just the same as if the wire to be tested was a clothes line and you were hanging up wash by the use of clothes pins. The sharp-pointed nail or tack pierces the insulation on the wire until it has the bare copper wire thoroughly in its grip. There's where the excellent connection comes in, and although the clothes pin, in fact, the whole device, looks so odd and simple, yet it cannot be overestimated in its various uses.

Contributed by HENRY BROWN.

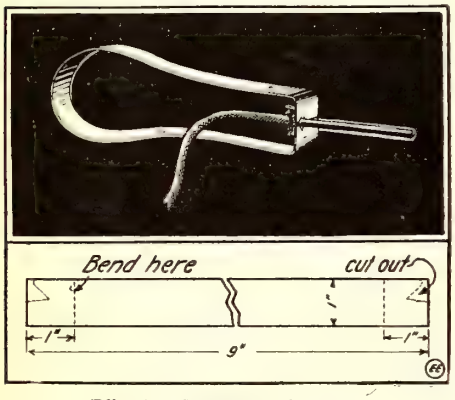
COLORED LAMPS IN WINDOW DISPLAY.

One of the most attractive window displays can be made by using colored lamps connected to flashers, giving an illumination variable in color. The advantage of this effect is that it has an almost universal application. Any kind of goods can be shown to advantage.

Ever-Changing Colored Lamps Give Beautiful Window Display.

A box with an opening in front as indicated is painted a dead black inside and the back is lined with black velvet. Red, green and blue lamps are used as shown, the wir-

ing being very simple. The lamps being shielded from the observer and the inside of the box being black, the goods exhibited appear to undergo mysterious changes in color.



The number of lamps to be used depends upon the size of the box, and likewise upon the surroundings. Twice as many blue lamps should be used, for their intensity is lower than the green or red lamps. If the lamps are 60 watt Mazda, the number of lamps shown in the illustration will be sufficient to display in a box with an opening 20 inches square. The more lamps used, however, the more striking is the effect.

This sort of window display should be of service to the florist who is intending to advertise his flowers. The flashers can be of the thermostat type, which operate automatically and are very cheap to purchase. The best method of switching on the various colored lamps successively, however, would be by means of a small motor-driven flasher with rotating metal segments and brushes in the place of the thermostatic flashers mentioned. With a little ingenuity on the reader's part such a commutator flasher arrangement can be easily improvised. Contributed by

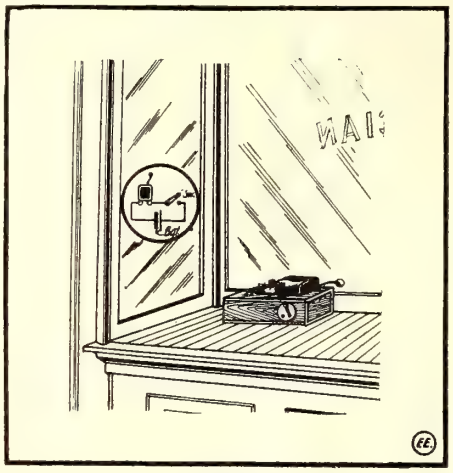
A. FLORIA.

A WIRE INSULATION REMOVER.

To scrape the insulation off wire with a knife blade or pliers is a very slow and tiresome job, as every experimenter knows. In order to make this work easier, the following directions may be employed:

Effective Insulation Scraper.

Procure a piece of spring steel about 9 inches long and 1 inch wide (a heavy clock or phonograph spring will serve the purpose), and with a file make a V-shaped notch in each end, as shown in the drawing. One side of the notch should be made a little shorter than the other, so that the wire can the more easily be inserted. Now bend over carefully the ends at the dotted lines as illustrated, because spring steel when cold is very apt to break. It is a good idea to heat the spring where it is to be bent, over a bunsen burner, so as to insure its flexibility. The notches should then be sharply ground and the scraper shaped as sketch shows. The scraper is used by inserting the wire in the notch, pressing the sides together with the hand and drawing the wire through.



Contributed by

FRANK J. L. HAVERLAND, JR.

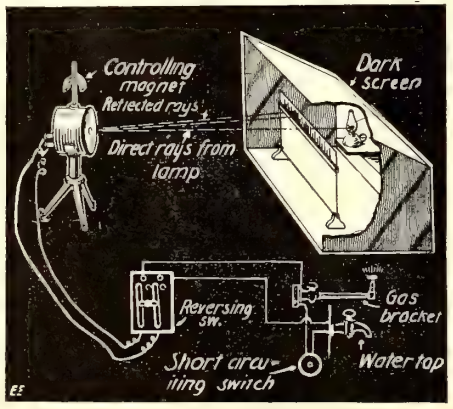
AN ELECTRIC WINDOW TAPPER.

This little device can also be termed a "show window attractor," and is commonly used in electrical and other stores. To construct, the following directions will be serviceable:

A box 8 inches long by 3½ by 4 inches, with a hinged cover, is necessary. Mount on the cover with screws, a common electric bell, minus the gong. A switch is fastened on side or top of box. A 3-volt "Radio" dry cell is preferable, as this eliminates the bulk of other batteries, giving only 1½ volts. A diagram of the wiring is given herewith. The bell should be

Window Tapper Made From Ordinary Bell and Battery.

mounted about 1 inch over the cover from the edge, and the best effects are obtained by placing the box in a corner of the store window and bending the hammer of the bell to give the proper adjustment to the window pane.



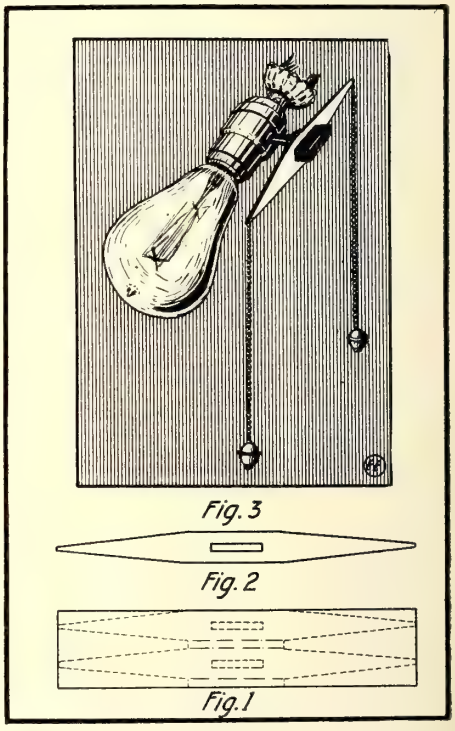
The bell will work intermittently or constantly, as desired, and the hammer vibrating against the glass of the store window produces an ear-shattering noise, which naturally attracts the inquisitive passer-by. Contributed by

W. R. WELLS.

DETECTING ELECTRIC CURRENT BETWEEN WATER AND GAS PIPES.

Those having a sensitive galvanometer at hand will find it interesting to conduct experiments to see if they can detect any electrical potential differences between the gas and water pipes in their house or laboratories. In some cases this amounts to a considerable voltage.

The sketch herewith shows how a reflecting galvanometer is arranged with a scale and a lamp which throws a beam of light through the small hole in the scale proper. This beam of light strikes the small mirror in the reflecting galvanometer and reads across the scale by reflection, according to the magnitude of the current passing through the galvanometer windings or coils.



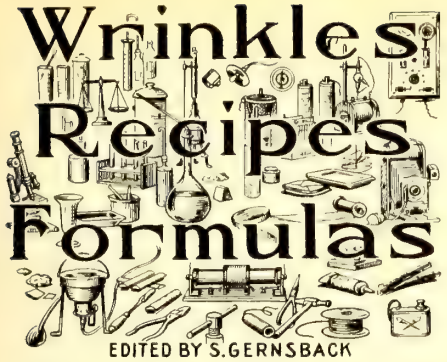
Detecting Stray Earth Currents.

An English experimenter recently stated that he had measured considerable electrical current potentials existing between water and gas pipes in his house and in some cases he detected 1/60 of a volt. He also very ingeniously arranged a method of telegraphic signaling with a friend residing about ¼ mile away from his house. This signaling was carried out by having his galvanometer connected across the gas and water pipes and his friend simply arranged a Morse key or push button across the gas and water pipes in his laboratory ¼ mile away.

This experiment is very interesting and it hardly seems possible that such an arrangement would work over distances of ¼ mile, but it is a matter of fact that it has worked, and further experimenting along this line would seem indeed worth while.

A CHAIN PULL FOR KEY SOCKETS.

Here is a valuable idea which your readers can use successfully on any socket key of their electric lighting system. Only a piece of stiff metal and a gilt chain or cord is necessary. Mark out (see Fig. 1) and then cut around the dotted lines made. Fold over and put on finishing touches as illustrated in Fig. 2. Then slip the novelty into your key of socket and it will work simply, easily and reliably. It has the "chain pull" effect, and you will find if you make *one* that you will make more and more until there is one on every socket key.



Chain Pull Attachment for Key Sockets.

FRED WARNER.

INLAND WEATHER FORECASTS BY WIRELESS.

The distribution of marine weather forecasts and warnings by radio-telegraphy is well known, but the use of this method of conveying weather information to inland dwellers is about to be tried for the first time in this country. Arrangements have been made to send out a wireless forecast daily, between 12.45 and 1 p. m., from Illiopolis, Ill., to all receiving stations within a radius of 125 miles. The messages will be sent slowly (10 to 12 words a minute) for the accommodation of amateur operators who are not sufficiently expert to receive faster.

Under this heading we will publish every month useful information in Mechanics, Electricity and Chemistry. We shall be pleased, of course, to have our readers send us any recipes, formulas, wrinkles, new ideas, etc., useful to the experimenter, which will be duly paid for, upon publication, if acceptable.

EXPERIMENTERS APHORISMS.

In the following, we wish to give to the Experimenter some hints as to the use of the different ingredients and how to work them:

(1) Always bear in mind that exact working of a formula requires ACCURACY, CLEANLINESS, PATIENCE, and SKILL.

(2) Know what you are about, before you start to experiment.

(3) "THE HISTORY OF FAILURES IS THE HISTORY OF SUCCESS" goes an old adage, and it applies well to the experimenter.

(4) Many times impure, wrong or deteriorated raw materials, spell FAILURE instead of SUCCESS.

(5) A great many of the chemicals and ingredients required, cannot be obtained from drug stores; buy them at a reputable supply house.

(6) BEFORE CONDEMNING A FORMULA, be sure the fault does not lie with the manner of handling it, or the purity of the ingredients.

(7) Be sure to mix the materials comprising a certain formula in the proper sequence.

(8) When starting to prepare a mixture, especially one containing liquids, ask yourself: "IS THE SPECIFIC GRAVITY CORRECT, AS INDICATED BY A HYDROMETER? IS THE TEMPERATURE RIGHT? IS THE QUANTITY OR WEIGHT RIGHT?

(9) Acids and water, when mixed, should be manipulated in the proper manner, i. e., THE ACID SHOULD BE POURED INTO THE WATER, and not vice versa, as the solution is liable to be forcibly ejected from the containing vessel and into the mixer's face.

(10) For any kind of SYSTEMATIC WORK, a floating THERMOMETER and HYDROMETER, as well as measuring glasses and scales, should always be provided, as GUESSWORK is EXPENSIVE, and SOMETIMES FATAL.

(11) Put labels on ALL bottles, boxes and packages with FULL INSCRIPTION as to their contents, it will avoid troubles and mistakes.

(12) Remember that a beginner cannot expect to make articles AT FIRST, which will compare with regular manufactured products.

FORMULA NO. 14.
BLUINGS FOR METALS.

Blue Finish.—Clean the article very carefully. Make a mixture of 1 part of *Nitric Acid*, 10 parts of *Water*. Apply the liquid with a sponge until a blue film is produced. Wash with warm water; dry with a flannel and wipe with *Linseed Oil*.

Bluing Brass Like Steel.—Take a leaden vessel, put in some *Hydrochloric Acid* and very little of *Arsenic Acid*. The brass article is laid in this vessel and soon assumes iridescent tints. Remove when the desired shade is obtained; wash with water and dry.

Bluing Gun Barrels.—Dissolve 4½ oz. of *Hyposulphite of Soda* in 1 qt. of *Water*. Also dissolve 1¼ oz. of *Acetate of Lead* in 1 qt. of *Water*. Mix the two solutions and bring to a boil in a stone pot. After having thoroughly cleaned the barrel, coat with the hot solution, using a piece of sponge tied to a stick of wood. When color develops, wash with water, dry with a piece of flannel and finish with *Boiled Linseed Oil*.

Oxidizing Silver.—Boil the article in a mixture of 5 oz. of *Bromine*, 120 grains of *Bromide of Potassium*, 10 oz. of *Water*, in an earthenware pot for three to five minutes. Remove, dry and polish.

Bluing of Steel.—Heat the steel over a flame of alcohol and varnish with a mixture of *Prussian Blue* and *Alcoholic Shellac Varnish*. Use a thin varnish. Of course this is only an imitation of bluing, and the article has to be lacquered to make it wear.

Real Bluing of Steel.—This formula is used to blue revolver parts, vibrators, steel knives, etc. Mix carefully together 25 parts of *Trichloride of Antimony*, 25 parts of *Fuming Nitric Acid*, 50 parts of *Hydrochloric Acid*. Tie a rag to a stick and apply the mixture freely. After rubbing the article with a flannel it may be polished on a polishing head with a green oak wheel until an even, clear blue is obtained.

Revolver Barrel Bluing.—Clean the barrel with emery cloth; remove all grease with lime and polish the surfaces. Take fine and clean wood ashes in a muffle, put the barrel in the middle and heat the muffle to a temperature of *cherry red*. With a pair of tongs, remove the article from time to time to see if a dark blue can be obtained when cooled in the air. When the desired color is obtained take the barrel out and let it cool in THE AIR. Finish with *Boiled Oil* and polish.

Bluing Steel.—A very simple process is the following: Melt *Saltpeter* in an iron pot. Clean and polish the steel article and dip in the saltpeter until sufficiently blued. Remove and cool at once in *Paraffine Oil*. Wipe with a flannel rag and dry in sawdust.

Bluing Silver.—The oxidizing of silver is produced by placing the articles in a solution of *Liver of Sulphur*, diluted with *Spirits of Sal Ammoniac*. Allow to remain until the desired dark blue-black tone is produced; then wash in water, dry and polish.

Durable Blue on Iron and Steel without Heat.—Take a stone pot and mix together 1 part of a ½-% solution of *Red Prussiate of Potash*, 1 part of a ½-% solution of *Ferric Chloride*. Dip the articles until the desired effect is produced. When dry, the articles may be lacquered. S. G.

SYMPATHETIC INKS.

I give below the formulæ for making sympathetic inks:

Formula No. 1.

Take some pure lime juice, or lemon will do, and write with it on a paper. Then heat over an alcohol lamp and the writing will come out brown.

Formula No. 2.

Dissolve some sulphate of iron in water and write with it. Heat and the writing will come out dark brown or black.

Formula No. 3.

Dissolve some chlorate of potash in water. Write with it and heat. The writing will come out brown.

Formula No. 4.

For purple invisible ink. Take some salicylate of soda and dissolve in water; don't make the solution too strong, or it will turn brown where you write with it. Reagent. About 50 per cent. solution of tincture of iron applied with a brush. The writing will come out purple.

Contributed by ELLISON FRAZER.

Aluminum Lacquer.—For aluminum dissolve 100 parts *Gum Lac* in 300 parts *Ammonia*, heating for one hour over a *Water* bath, paint the thoroughly cleaned aluminum with the varnish and heat it to about 570 degrees Fahrenheit.

Polish for Varnishing Wood.—Shake well together 1 pint *Vinegar*, 1 oz. *Alcohol*, 1 pint *Linseed Oil*, 1 oz. *Butter of Antimony*.

INTERESTING EXPERIMENTS FOR THE AMATEUR CHEMIST.

The following experiments can be performed with household chemicals:

If you possess a battery giving from 4 to 20 volts you can perform the following experiment, which is particularly interesting on account of the variation of results, with apparently the same conditions:

Immerse two pieces of brass in a strong solution of common salt or sal-ammoniac and water. Connect one piece to the positive wire and the other to the negative, taking care that the brass pieces do not touch each other.

After the current has passed for one or two minutes the solution will become colored, and if the process is continued a colored pigment will be precipitated. The color of the precipitant varies considerably and may be either red, purple, green, blue, orange and possibly others, depending on the strength of the current and the composition of the brass.

The Grand Rapids can be made as follows: Fill a tumbler or test tube with water, throw upon its surface a few fragments or thin shavings of camphor gum and they will instantly begin to move and acquire a motion both progressive and rotary, which will continue for a considerable period of time. If the water be touched by any greasy substance the floating particles will reverse their course and dart back and, as if by a stroke of magic, be instantly deprived of their motion and vivacity.

A Rival to Jack Frost is produced by dissolving camphor gum in warm spirits until the spirits will dissolve no more; pour some of the solution into a cold test tube or tumbler and the camphor will instantly crystallize in beautiful forms like trees and landscapes.

This next experiment sounds as if it were "bigger," but it is not. Dissolve 150 parts of hyposulphite of soda in 15 parts of water and pour the solution slowly into a test tube or tumbler which has been heated in boiling water; fill the same about one-half full. Dissolve in another glass 100 parts of acetate of soda in 15 parts of boiling water. Pour this solution slowly on the top of the first in such a way that it forms an upper layer, without mixing the solutions. The two solutions are then covered over with a thin layer of boiling water and allowed to cool. Lower into the test tube a wire, at the extremity of which is fixed a small crystal of hyposulphite of soda. The crystal traverses the solution of acetate without causing trouble, but crystallization will immediately set in as soon as it touches the lower hyposulphite of soda solution. When the hyposulphite of soda solution becomes crystallized, lower in the upper solution a crystal of acetate of soda suspended by another wire and this will crystallize the same as the other solution. HAROLD B. FINKELSTEIN.

ANENT MAKING ELECTROTYPES.

I notice in the August last number of the *Electrical Experimenter*, page 160, an article on "Making Small Electrotypes," which, although excellent in its way, is capable of much improvement.

Mr. Sutton says, "*Three* cells of battery should be connected in series to do the plating." This seems not only absurd, but wasteful. One gravity (Zn-Cu-Cu. SO_4) is all that is needed. The writer has made many electros (beginning in 1861) and never used more than an E.M.F. of one volt.

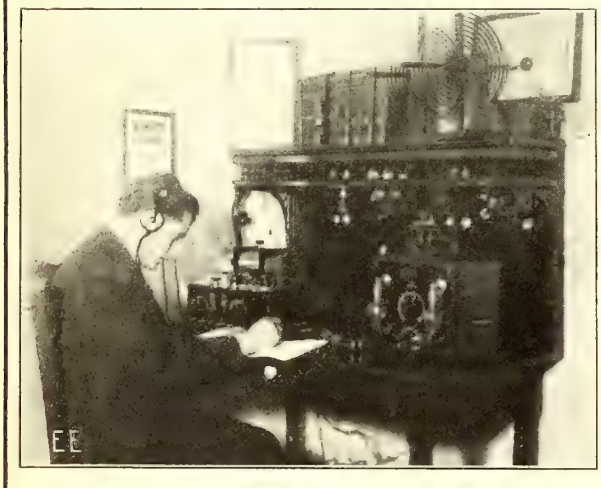
WITH THE AMATEURS

AMATEUR RADIO STATION CONTEST.



Monthly Prize, $3.00.

This month's prize winner.

AN EFFICIENT EXPERIMENTAL STATION.

I present a picture of my wireless station which I should like to have appear in your Radio Station contest. The instruments, which are of my own make and design, have produced very satisfactory results. The receiving set comprises a loose coupler, two variable condensers, a fixed condenser, loading coil, galena and perikon detectors, high-pitch buzzer and 2,800 ohms head 'phones, mounted in a hard rubber box which measures 12x12x 4½ inches.

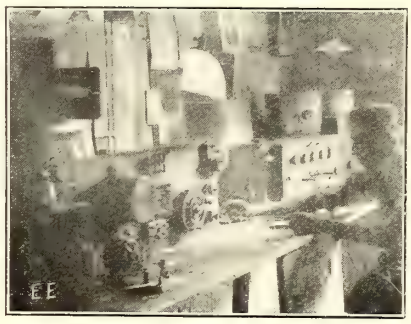
On the right of the picture can be clearly seen an audion detector set with two Hudson filament bulbs, which can be also used as an amplifier. The front of the box is made of hard rubber and measures 11x10x 8 inches. In addition to this set, a variometer is employed which increases the sensitiveness of incoming signals. I hear

Prize Station of Louis A. Kaplan.

NAR, Key West, NAX, Colon, and a number of long distance stations.

My aerial is 45 feet long, 40 feet high and consists of four No. 14 copper wires spread 2 feet apart. My transmitting set is composed of a ¼-kw. transformer, oscillation transformer, stationary and rotary spark gaps, glass plate condenser and a heavy sending key. Owing to a low aerial, my sending range does not extend very far, but I am heard clearly up to 20 and 30 miles.

LOUIS ARNOLD KAPLAN.



Bronx, N. Y.

AMATEUR WIRELESS STATION OF C. W. WATKINS.

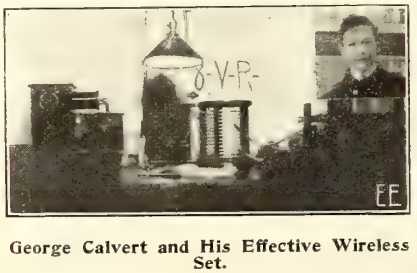
Herewith I present photo which depicts my radio station and which I hope will appear in the radio station contest columns of your valuable magazine.

For sending I use a 1¼ K. W. transformer, oscillation transformer, aerial loading inductance, rotary and quenched gaps, condenser, hot wire ammeter, relay key, sending key and aerial switch. With this transmitting set I have been heard up to 200 miles; as far as Youngstown, O.

My receiving set, which was devised ex-

C. E. Watkin's Station.

clusively by Prof. M. E. Packman, of Dodge's School of Wireless, consists of a loose coupler, loading coil, variable and fixed condenser, two galena detectors and phones. Opposite the receiving set can be seen a large loose coupler, which is employed for long wave lengths and which can tune up to 10,000 meters. Mounted above the latter outfit is a wave meter built by Prof. Packman and myself, composed of variable condenser, inductance, buzzer, lamp and detector.



My aerials, of which I have three, constitute, respectively, a flat top 81 feet high at one end, 60 feet at the other by 94 feet long, and umbrella composed of eight wires and a one-wire aerial.

After four years of experimenting I can now obtain very satisfactory results with this station and can hear "N. A. A.," "W. S. L.," "N. A. R.," as well as other stations very well. My call is "9DI," and I would be pleased to communicate with anyone within my range.

Ashland, Ky. C. E. WATKINS.

GEORGE C. CALVERT'S WIRELESS SET.

I herewith submit a picture of my radio set for the Amateur Wireless Station contest. My aerial is made of No. 14 copper

George Calvert and His Effective Wireless Set.

wire, 200 feet long, 75 feet high, on spreaders 5 feet wide.

My transmitting set comprises the following: a ¾-kw. transformer, glass plate condenser, rotary gap (10,000 R.P.M.), with helix, hot wire meter and anchor gap. For receiving I use a loading coil, loose coupler, two variable condensers, a fixed condenser, audion and mineral detectors. The necessary switches are mounted on a panel.

When 2,000 ohm head 'phones are used I am able to hear "N. A. A." and "N. A. R." However, my 'phones are only wound to 1,000 ohms. My call is "8 V R" and I would like to arrange tests with anyone within my range.

I have read the *Electrical Experimenter* since it started and enjoy it very much.

GEORGE C. CALVERT.

Pittsburgh, Pa

RADIO STATION OF W. MORRISH.

The photograph I submit herewith shows my Canadian wireless experimental station which I used at Gravenhurst, Ont., Canada.

This station performed very good service all around in both transmitting and receiving, and I hope shortly to send you photograph of my new radio station in England.

As may be seen from the photo, the transmitting set comprised the usual helix, a spark gap, "Auto" ignition coil, key and condenser. A specially arranged D. P.

William Morrish and His Canadian Station.

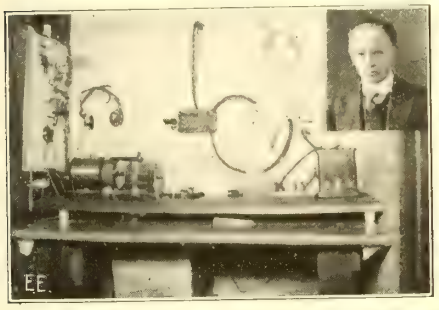
D. T. knife switch mounted on the center of the panel-board over the table switches the aerial and ground connections from transmitting to receiving, and vice-versa.

The receiving set included a home-made loading coil, which is seen mounted on the wall at the left, also a large size loose coupler with auxiliary tuning inductance, as well as variable condenser of the tubular type. Crystal detectors were employed as well as others.

W. MORRISH.

Mutley, Plymouth, England.

GREENFIELD, MASS., RADIO CLUB IS FORMED.



At a meeting held recently at the Postal Telegraph Cable Co.'s office, the manager of the company, Costas S. Theofan, brought about the organization of a wireless club in Greenfield, Mass., and it is named the Greenfield Radio Club. The club was formed with a membership of 15. The following officers were elected: President, Arthur Duchemin; vice-president, Howard S. Wing; secretary and treasurer, Costas S. Theofan. Communications from

amateurs within 20 miles from Greenfield are solicited by the club.

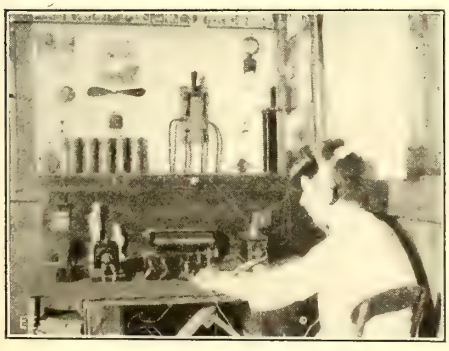
A few of the members are: Albert Karner, Rolland Stratton, Brenton E. Perry, Raymond Holden, Donald N. Dinsmore. The members of this club are mostly boys who are experimenting with wireless telegraphy. Albert Duchemin, of 26 Pond street, was the first of the local fellows to begin this line.

Radio Station of Marcus G. Limb.

Herewith is given photo of my wireless

Marcus G. Limb and His Radio Set.

outfit. My receiving set comprises a Murdock loose coupler, E. I. Co. variable and adjustable condensers, loading coil, universal and crystal detectors and transatlantic type 'phones. The two detectors are back of the receiving transformer. The following constitutes my transmitting set: A humming transformer, oscillation transformer, oil-immersed condenser, spark gap and a condenser in series with the ground to reduce the wave length.



I can send about 25 miles and on favorable nights I can get N. A. R. My aerial is 85 feet long, 50 feet high and has six wires in it.

Wooster, O. MARCUS G. LIMB.

Doughty Radio Station.

The accompanying photograph depicts my radio station located at Fairhaven, N. J. My aerial is of the inverted "L" type and consists of four No. 12 copper jacketed wires, 150 feet in length, spaced 2½ feet apart. It is supported by an iron mast 75 feet high and the lower end is attached to a pole 45 feet high. The lead-in is 50 feet in length and is taken in at the back of the building through porcelain tubes. My ground wire is connected to a water pipe which is driven into moist ground at a depth of 12 feet.

For receiving I employ Brandes' 2,000-ohm receivers, Amco receiving transformer, silicon and galena detectors, fixed con-

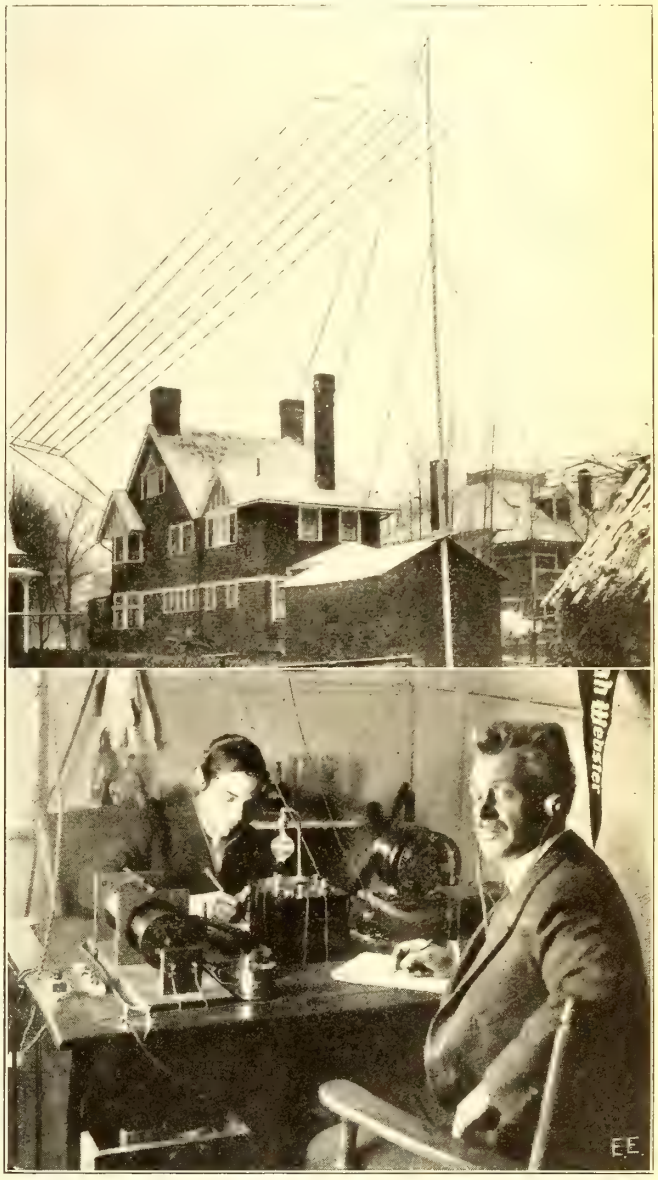
Mr. Doughty's Wireless Outfit.

denser and two loading coils of my own construction.

My sending set consists of a 1-inch spark coil, condenser and zinc spark gap, which is mounted on top of my coil case.

JOSEPH H. DOUGHTY.

Greenwich, Conn.



Radio Station of Famous Inventor

Herewith I submit photograph and description of my wireless experimental station.

The receiving station outfit consists of a large loose coupler by means of which I can get very accurate tuning, an Audion detector and variable condenser. The two sets of phones are usually connected in. The transmitting set consists of a 1 kw. specially made transformer, glass plate condenser, oscillation transformer, and a ¼ horsepower General Electric Co. motor running a specially built, quenched-rotary spark-gap. Two aerials are arranged, one for sending on 200 meter wave length for distances less than 10 miles, and one for sending on 425 meter wave length for distances in excess of 10 miles. Five plates of the condenser are used for the 200 meter wave length and 10 plates added to these five for the 425 meter wave length. The outdoor equipment consists of a 60 foot mast at one end and a 50 feet mast at the other, 100 feet apart. The spreaders are 10 feet long and have 11 wires of stranded copper between them. The ground connection is carefully soldered and connected to ground at three places. This station can "work" points in Southern New Jersey, Northern Massachusetts and can receive Colon, Panama and ships at sea, when two or three days out of New York. The station holds a special license for the purpose of relay work in the American Radio Relay League. The call letters are 1ZM.

HIRAM PERCY MAXIM.

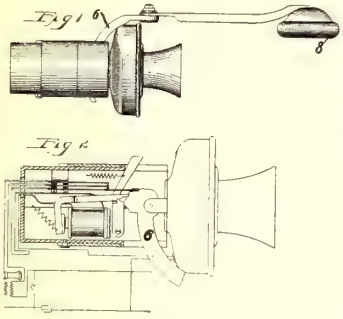
Hartford, Conn.

Efficient Wireless Experimental Station and Aerial of Hiram Percy Maxim.

WIRELESS AT MASSACHUSETTS "TECH" CAMP.

Far down in Maine, where the morning newspapers of the great cities are not received till after nightfall, the students at the Massachusetts Institute of Technology surveying camp have the baseball scores and news items posted on the bulletin before breakfast. In fact, it would be possible to post these items at night before the presses of the city papers have begun their work of printing, but for the fact that the receipt is after camp hours at night and there would be no one astir to read the bulletins if posted when received. This touch with the world is because the students have wireless receivers that catch the news. Technology camp has its own post-office, Technology, and is located on Gardner Lake, East Machias, about eight miles by road from the village. It is a summer school which transfers the work of practical surveying and hydraulic measurement from the limited city areas to the woods and ponds where actual work can be done on the commercial scale. There are about 100 students in the camp and a score of professors, and the students have in commission two wireless receiving sets.

RADIO CLUBS ATTENTION!



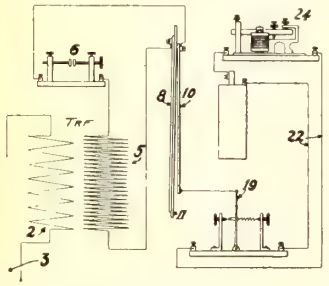
We are always pleased to hear from young Edisons and Radio Clubs. Send a write-up of your Club with photos of members and apparatus to-day to: Editor "Amateur Gossip" Section, The Electrical Experimenter, 233 Fulton St., New York City.

LATEST PATENTS

Automatic Telephone Switch.

(No. 1,145,632; issued to William C. Ude.)

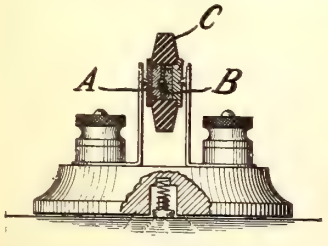
An automatic telephone switch, so designed that the pressure of the ear against, say a watch case receiver 8, on a pivoted arm 6, will



cause the switch springs, as perceived, to automatically control the cutting in and out of circuit of the telephone transmitter and receiver, instead of having to hang up the receiver in the usual way. A very good idea.

Wireless Receiver for Lighting Circuits.

No. 1,143,799; issued to Ross B. Avery.)

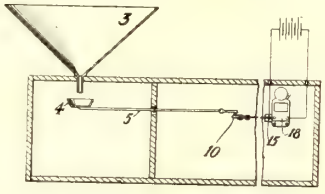


An ingenious wireless receptor, claimed to work on lighting lines by its inventor. The wires 3, connect with an ordinary alternating current

lighting or power circuit. The current then passes through primary 2 and secondary 5 of a step-up, high-potential transformer. The current from the secondary transverses the small spark gap 6 and charges an electro-static plate arrangement 8 and 10, separated by an insulating plate 11. Whenever a sufficient charge acts between the plates 8 and 10, the plate 10 is attracted and in its movement actuates a switch 19, which in turn closes a local sounder circuit 22. It is claimed by the inventor that this arrangement will work on A. C. circuits and in adjusting the device the spark gap 6, is so regulated that the ordinary current from the secondary 5 will not jump the gap. Then when any wireless waves superimpose on the A. C. circuit and reach the apparatus, they will boost the current sufficiently to jump the gap and thus actuate the sounder 24, as evident from the foregoing.

Improved Mineral Detector.

(No. 1,144,399; issued to Eugene T. Turney.)

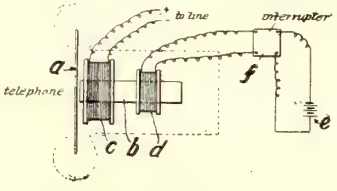


The well-known "Crystaloi" detector now for sale on the market for some time. It employs two electrodes A and B; the former having a piece of sensitive mineral, such as the best grade natural galena. The electrode B consists of a mass of finely divided conductive material, such as aluminum-bronze filings or they may be carbon grains, etc. These mineral electrode members are carried in a rotatable casing C; so that the detector is quickly readjusted, by simply turning the container on its axis, between two supporting springs, as perceived. Thus, a number of sensitive contact points are practically always available with this ingenious form of detector construction.

Electric Rain Signal.

(No. 1,143,246; issued to Joseph J. Barrash.)

A useful device where a rain signal is desirable. The rain is caught by the funnel 3 and passes through it into a catch pan 4, which overbalances the pivoted lever 5. When rain falls and actuates the lever, it releases a sliding catch 10, connected by a spring or otherwise to

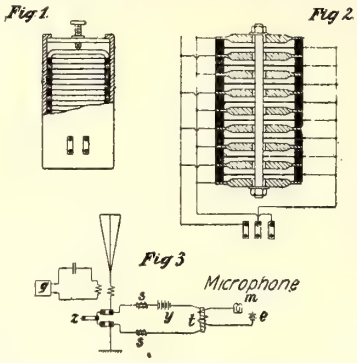


a spring switch 15, which closes the battery circuit for an electric alarm bell 18 or instead, this circuit may control an electric motor for closing windows or skylights.

Sound Enunciator.

(No. 1,145,554; issued to Francis W. H. Clay.)

The inventor of this sound enunciator arranges to have the diaphragm A kept in a constant state of high frequency vibration by using for instance, a superimposing magnetising coil D, containing in its exciting circuit a source of electric current E, and a very high-speed interrupter F. It is claimed that if the diaphragm A is thus maintained

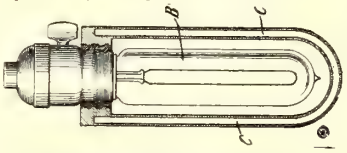


in a constant state of vibration, at a frequency above audibility, that the ordinary sound waves to be reproduced by the diaphragm from the telephone line coil C, in the usual way, will be much clearer and freer from distortion or false tones than in the usual way, where the diaphragm is allowed to vibrate by itself.

Condenser Transmitter for Radiotelephony.

(No. 1,148,827; issued to Walther Burstyn.)

A modification of the condenser transmitter, at one time used by Prof. Fessenden for radiotelephonic antenna current control. This patent covers a multiple disc condenser transmitter, as drawing shows. The dielectric spaces between the various metallic discs are varied and conjointly the electrical condenser capacity, by creating various degrees of electric charge on the plates, through a circuit SYT, made up of a battery, choke coils S S, and telephone induction coil T. The primary of this induction coil is hooked up with a microphone of the usual pattern M, and a battery E. The regular high frequency radiophonic current charges the antenna through

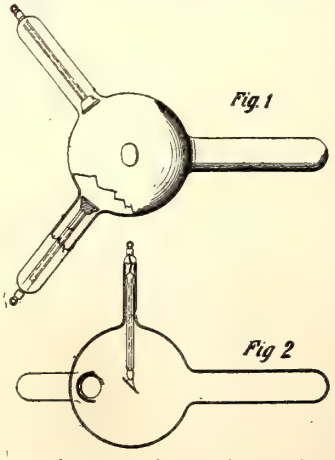


an oscillation transformer and the high frequency generator G. The condenser transmitter is shown at Z.

Heat-Shield for Incandescent Lamps.

(No. 1,145,837; issued to Edward Redmond Hoff.)

This invention relates to the provision of a glass vacuum chamber C around the regular incandescent lamp B'. The idea is to prevent excessive heat being projected from the lamp, especially when used in close proximity to a person reading, etc.

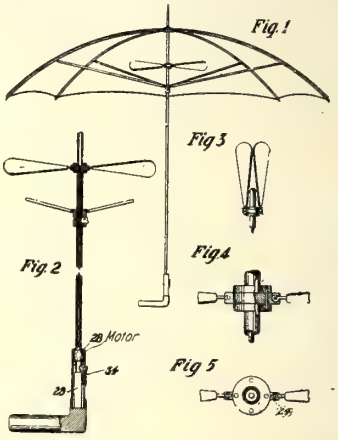


High-Frequency X-Ray Bulb.

(No. 1,147,125; issued to James E. Seeley).

This invention relates to a double cathode X-ray tube for use with alternating currents, irrespective of their method of production and especially with alternating high frequency currents.

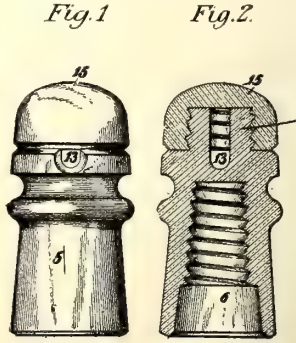
The present invention consists fundamentally in the combination of a pair of cathodes and a single target, in such arrangement that both cathodes may focus on and bombard the target at a single focus point. This invention is effected by an arrangement of both cathodes on the same side of the plane of the impact face of the target; and the arrangement necessitates relatively angular positions of the cathode



axes, these axes intersecting at the point of impact on the target, and also practically necessitates the placement of the target at an angle with the plane determined by the cathode axes. These features and others of more minor importance, accomplish the fundamental object of the invention; that object being to provide a tube capable of operating with alternating currents and having a single focus point on the target.

Electrical Umbrella Fan.

(No. 1,148,332; issued to Sylvester Onyskow, assignor one-half to Lubomir Dulikrovich.)



This invention covers the use of a small, electrically driven fan, as perceived and to be utilized in umbrellas. The fan blades are driven by a small shaft, passing upward through the umbrella handle and

stem, as is evident. This shaft connects with a miniature electric motor 28, which receives current from a small flashlight type battery 29, in the handle of the umbrella. A push button 34 controls the battery current to the motor. The expense in making up this arrangement and also considering the gross efficiency, and especially the small "breeze producing power" in this case, does not seem to warrant at all the expense in making up such an arrangement.

Electrical Insulator.

(No. 1,146,201; issued to Silvester Nunn.)

A new and simple form of insulator, intended to be made up of porcelain or glass. This insulator, so the inventor claims, is very efficacious for telegraph and telephone lines, especially; and the wire is not clamped in same, but is simply retained in the insulator in the slot 13. A threaded cap 15 screws down on a stud 11, forming part of the insulator base 5. Thus the wire once placed in the slot 13 cannot get out of same. The patentee claims that a long length of wire (even a mile or more) can be tightened up without touching any of the individual insulators along the line, due to this novel construction.

COPIES OF ANY OF THE ABOVE PATENTS SUPPLIED AT 10c. EACH.

Phoney Patents

Under this heading we will publish hereafter electrical or mechanical ideas which our clever inventors, for reasons best known to themselves, have as yet not patented. We furthermore announce the grand opening of the

PHONEY PATENT OFFIZZ

For the relief of all suffering daffy inventors in this country as well as the entire universe.

We will revolutionize the Patent business immmediately and OFFER YOU THREE DOLLARS ($3.00) FOR THE BEST PATENT. If you take your Phoney Patent to Washington, they charge you $20.00 for the initial fee and then you haven't a smell of the Patent yet. After they have allowed the Patent, you must pay another $20.00 as a final fee. That's $40.00 ! ! WE PAY YOU $3.00 and grant you a Phoney Patent in the bargain, so you save $43.00 ! ! When sending in your Phoney Patent application, be sure that it is as daffy as a lovesick bat. The daffier, the better. Simple sketches and a short description will help our staff of examiners to issue a Phoney Patent on your invention in a jiffy.

PHONEY PATENT OFFIZZ

PHONEY PATENT ALMOST AFFIRMED BY I. M. A. NUT

"No. √69512." **ELECTRO-MECHANICAL NURSE** **Applied to Feb. 37, 1926.**

Specifications Overlooked

TO those unconcerned and who care not, let it be known that I, myself, unassisted and alone, have invented a peculiar worthyful and valueish apparatus to alleviate and circumnavigate the multifarious troubles of the housewife.

This invention has the full sanction of Mr. Roosevelt in his great crusade against race suicide, and I feel that I am to be heralded as the Saviour of the race. 'Tis true that the canine included in the design is subject to more or less torture for the time being. However, I expect shortly to be able to improve on this detail.

The operation of this contrivance is as follows: The baby (1) wakes up and, not seeing its mother, starts to cry. (The mother no doubt is operating the wireless telephone, back-fence type.) The voices actuate the microphone (2), which is connected by wires (3-4) to the 'phones (5) clamped on the ears of the dog (6). The dog, naturally, knowing something is wrong, runs from his kennel (7), pulling out the sliding bar (8), to which he is fastened by means of the chain (9). This closes the switch (10), thus completing the circuits containing batteries (11), motors (12-13) and the electric phonograph (14).

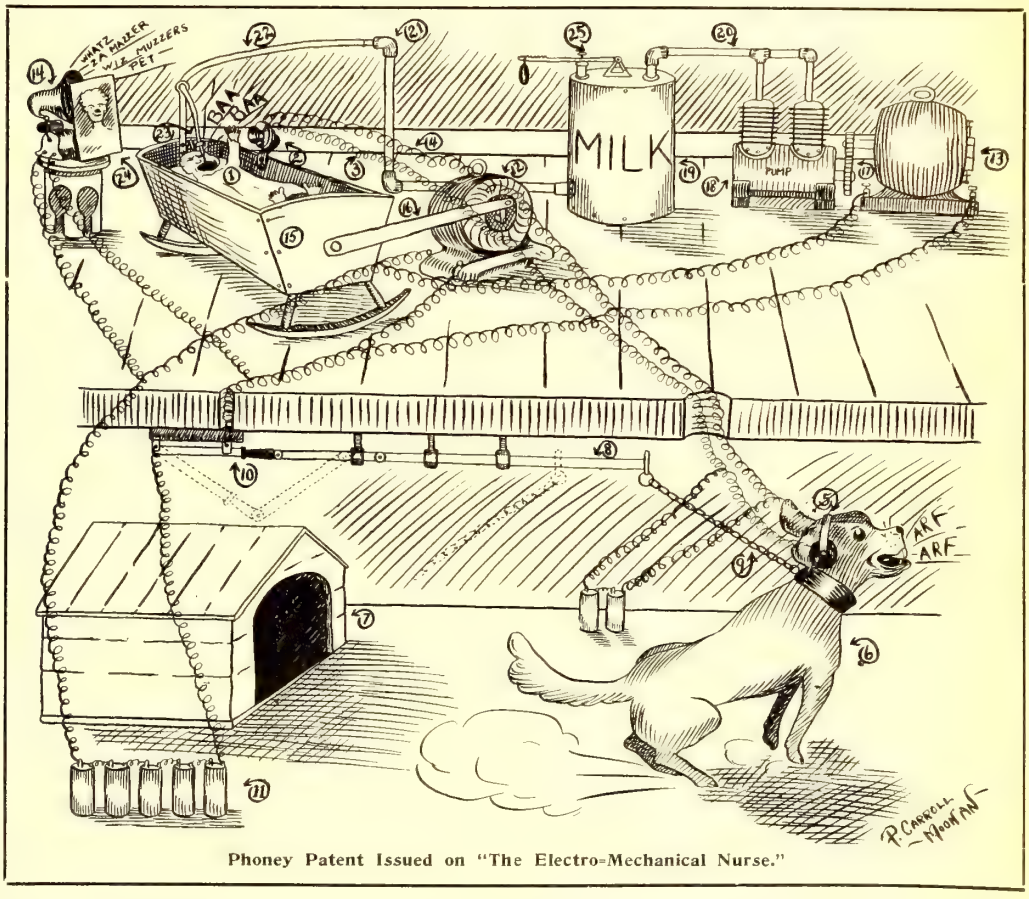
The motor (12) rocks the cradle (15) by means of the arm (16) attached to an eccentric on the motor shaft.

Simultaneously motor (13) starts the double compound duplex air-cooled pump (18), to which it is connected by means of gearing (17). The pump forces air through pipe (20) into milk tank (19), which in turn forces the milk through pipe (21) and flexible tubing (22), thus supplying the baby with a stream of milk.

At (23) is shown the adjusting screw which regulates the delivery of the milk to the baby, and by this means it is possible to regulate the hose to give anything from a steady, forceful stream to a fine spray.

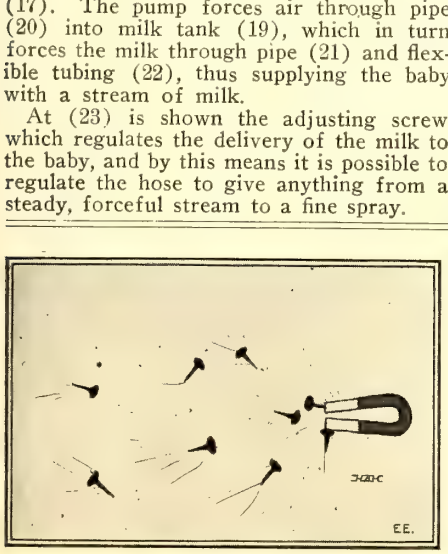
The phonograph (14) contains a record made by the mother of the child. A photograph of the mother (24) is placed in front of the phonograph, so in case the baby should look in the direction of the voice it will see the photograph and, thinking same is its mother, will instantly fall asleep.

A safety valve (25) is used to adjust the pressure in the milk reservoir.



The dotted lines show the position of the switch before the dog leaves the kennel, and when the baby stops crying the dog goes back to the kennel and the switch opens again, thus saving milk and current.

All rights to this invention are retained, including foreign and domestic motion picture rights.



In testimony thereof I have riveted and soldered hereto my seal, this day, date unknown and unstated, in this slow old burg of Earthquakerdom. I. M. A. NUT.

By his Attorney,

Witnesses: *P. Carroll Moonan,*
G. O. Beatit, *Philadelphia, Pa.*
Ded Enburied, 2d.

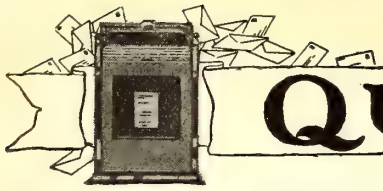
Phoney Patent Issued on "The Electro-Mechanical Nurse."

"In-Come Tacks."

SOLUTION OF "PHONOGRAPH" CODE PUZZLE IN SEPTEMBER ISSUE.

This Way, Boys, to the Maze, Follow Me Around, Now Please Don't Get Dizzy, Soon We'll Be There. Ooh, Such a Headache!

BLAME GERMAN WIRELESS PLANT FOR RAIN OR DROUGHT.



No matter what happens, the German wireless station at Sayville, L. I., is to blame, Sayville folk think. Last year, when there was a memorable drought, they said the electrical effects absorbed all the moisture and made Sayville dry as a Saratoga chip.

Now that the skies have bathed Sayville about every second day all summer, the German wireless station is again to blame.

AN ELECTRIC SQUIRREL?

A German who had not been in the country very long walked into a drug store one day. The first thing that caught his attention was an electric fan buzzing busily on the soda counter. He watched it with great interest for some time, then, turning to the clerk, he said:

"Py golly, dat's a lifely squirrel vot you got in dare, ain't it?"

QUESTION BOX

This department is for the sole benefit of the electrical experimenter. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be published. Rules under which questions will be answered:

1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered.
3. Sketches, diagrams, etc., must be on separate sheets. Questions addressed to this department cannot be answered by mail.

ENERGY EQUIVALENT OF 1/12 H.P. ENGINE.

(328.) F. Efermeyer, Cleveland, O., asks about the equivalent power or energy in foot pounds of a 1-12-horsepower engine.

A. 1. A 1-12-horsepower engine is capable of doing 2712.5 foot pounds of work per minute, thus it will lift that number of pounds one foot per minute, or another weight an equivalent height in that space of time.

ELECTRICALLY DRIVEN BICYCLE

(329.) Byron S. Human, Niagara Falls, N. Y., inquires about the practicability of utilizing a ⅛-horsepower battery motor for propelling a bicycle.

A. 1. This is quite impracticable. In the first place, ⅛ horsepower is insufficient to drive a bicycle and, furthermore, it requires an excessive weight of lead storage cells for any appreciable length of run with the proper horsepower.

Experiments are being carried on with motorcycles driven by electrical power, but so far nothing really practical has come of it.

WIRELESS QUESTIONS.

(330.) Wynn Boydan, Medina, O., asks several questions on radio matters.

A. 1. We cannot understand why the mere adjustment of a detector should necessitate such a great change in the inductance used in tuning.

You must have made some change in the capacity of your aerial to cause this marked effect, as detectors have little or no effect on the wave length.

Your suggestion for a new loose coupler is not exactly new and possesses no advantage over modern types. In winding the two coils so close you practically destroy all selectivity, which is the secret of the operation of the loose coupler. The plan will work, we admit, *and the coupler will produce louder signals* under certain circumstances, but for all around work use your present loose coupler.

The adopted method of shortening the wave length of an aerial is to connect a variable condenser in series. This is done on shipboard when the "distress signals" are sent out and all stations with the long wave require a series condenser to pick up short waves. We know of no instruments which will eliminate excessive static without also weakening to a certain extent the wireless signals. The only way this static may be done away with to an appreciable extent is to shunt a variable condenser across the coupler secondary, which dissipates considerable of the static.

SELENIUM CELL CURRENT.

(331.) L. C. Yeaw, North Adams, Mass., wishes to know the current that will pass through selenium cells.

A. 1. The current that will pass through selenium cells varies, of course, with the resistance of same, and the cells regularly furnished all have different individual resistances in most cases.

At any rate ,the current in amperes is readily deduced from Ohm's law, which states that the current in amperes equals the volts divided by the resistance in ohms. Some of these cells "drop" as low as 4,000 to 5,000 ohms in the light.

PERPETUAL MOTION?

(332.) Harold Jackson, Woodbine, Ia., proposes a scheme whereby (apparently) an electric motor is to be operated from a storage battery, while the motor in turn drives a dynamo that is supposed to recharge the battery.

A. 1. We know of no arrangement, such as we presume you have in mind, whereby an electric motor can be operated from a storage battery, and which motor will in turn drive a dynamo which recharges the battery. This is physically impossible. Remember that the electrical and mechanical losses encountered in overcoming the frictional and resistance effects reacting on such a system absolutely precludes any possibility of "making" energy, resulting in what would really be "perpetual motion."

Want to Swap?

If you have anything to buy, sell or exchange and want to make sure of doing it quickly and at an insignificant cost advertise in the

Scientific Exchange Columns
OF
The Electrical Experimenter

You will find advertised in these columns:

Photographic supplies, Phonographs, Wireless Apparatus, Electrical goods, Bicycles, Motorcycles, Rifles, Gasoline Engines, Microscopes, Books, Skates, Typewriters, Etc.

The owners of these things wish to ***"swap"*** them for **something else, something which you may have.**

The Rates

One cent per word (name and address to be counted) minimum space 3 lines. Average 7 words agate to the line. *Remittance must accompany all orders.*

The Classified Columns of the ELECTRICAL EXPERIMENTER GET RESULTS

More than 40,000 Electrical Experimenters will see your ad.

RE SMALL RADIO AERIALS.

(333.) Patrick J. Leary, Boston, Mass., inquires about indoor aerials.

A. 1. We understand that the special indoor aerial described in the March, 1914, *Electrical Experimenter* works very well, as used by the French engineer, Mr. P. Dosne.

As to your second query on small size aerial, which you propose to erect on top of a piazza roof, we are of the opinion that this will be all right for short range work undoubtedly, and you would not gain anything by placing the wires in this aerial any closer together than about 1½ feet.

TRANSFORMER QUERIES.

(334.) J. Glancy, Mars, Pa., asks several transformer queries.

A. 1. A closed core wireless transformer made up from two ½-K.W. (E. I. Co.), No. 8050 coils, as you suggest, would have a capacity of most probably in the neighborhood of ½ K.W.

A. 2. The No. 8050 coils give about 10,000 volts apiece, and if two of these are used in making up the closed core transformer the secondaries should be connected up on multiple.

A. 3. The difference in voltage ratio in the transformer as you mention would have no effect whatever on the primary frequency, or, rather, the frequency transformation through the transformer, the secondary frequency in any case being identical to that of the primary in cycles per second.

TRANSMITTING CONDENSER QUERIES.

(335.) K. K. Knaell, Mars, Pa., asks several questions on radio transmitting condensers.

A. 1. Undoubtedly the E. I. Co. No. 530 condenser is correct as regards its electrostatic capacity in M. Fs., which, of course, corresponds to the value as given in their catalog. The highest capacity is obtained when the metal rod is pushed through all of the switch posts.

A. 2. The condenser you have should give ample capacity for your wireless transmitting outfit with rotary spark gap, and the best capacity to use in the rotary spark gap oscillatory circuit should be found by varying the condenser switch until the maximum radiation current is obtained on hot wire ammeter in series with the aerial, etc.

Regarding the formula as cited in the "Electro" *wireless course* for the proper capacity of a wireless transmitting condenser this is used in the regular way for a rotary gap, excepting that function "F," or the frequency value, is taken (for rotary gaps) as one-half the number of sparks per second given by the rotary gap. This, of course, you can readily deduce from the number of points on your spark wheel and the speed of the motor. If no rotary spark gap was used in your set then the function "F," or the frequency, in the capacity formula under discussion would be taken to mean the frequency of the alternating current in the primary and secondary circuits of your step-up transformer. This considers that there will be two sparks per cycle of current.

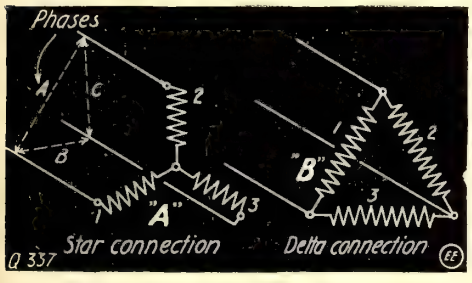
The rotary spark gaps usually cause the

condenser capacity, used in the spark gap oscillatory circuit, to be much reduced, as the spark frequency is, of course, raised very appreciably. Four hundred to 500 sparks per second are quite common with such gaps. For best results with such gaps a synchronous A. C. motor should be used to drive same, of course, so that the sparks will take place at regular periods with relation to the rise and fall of the alternating current wave in the primary and secondary circuits of the transformer. However, non-synchronous rotary spark gaps are widely used and very good results are obtained with them, all things considered.

5 K.W. TRANSFORMER ON 3 K.W. ALTERNATOR.

(336.) R. A. Bawles, Columbus, Ga., has a regular lighting type a.c. transformer and wants to use it for wireless transmitting purposes.

A. 1. If your 5 k.w. transformer of commercial pattern is of the high voltage type, giving 10,000 to 15,000 volts, it will be serviceable for radio transmission purposes.



You could not, of course, operate same at full activity with a 3 k.w. alternator, but if the voltage of the a.c. dynamo and the transformer primary correspond, you will get your secondary voltage correctly; but the net output of the transformer will be controlled by the output of the a.c. generator naturally.

It is possible to use lower secondary voltages from the transformer than those above mentioned under certain conditions, and this matter, of course, is something we cannot speak definitely on, as you do not state what secondary voltage the transformer gives.

A. C. HOOK-UPS AND AUDION ACTION.

(337.) John B. Moore, Downsville, N. Y., asks about three-phase "star" and "delta" connections.

A. 1. By the term "star connection" in alternating current work is meant that connection used for three windings on a three-

Alternating Current Circuit Hook-ups, at "A" the Star Connection; at "B," Delta.

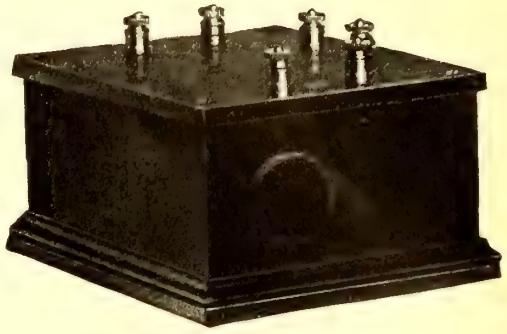
phase alternator, motor or transformer, whereby the three windings, when hooked up, appear as in diagram A herewith, which resembles a star, as you will note.

The other connection widely used for similar purposes in alternating current work is that known as the "delta," shown in sketch at B.

A. 2. Relative to the ratio of turns in the primary and secondary windings on the magnetic detector; there are several hundred turns on the secondary coil which would have the same resistance (approximately) as the head 'phones used in connection with same, and the primary winding contains several dozen turns of heavier wire.

The secondary is usually about No. 32 or 34 silk insulated magnet wire and the

Multi-Audi-Fone
The New Wonder in the Wireless World



This instrument increases the audibility
ONE THOUSAND FIVE HUNDRED TIMES

Remember that the Multi-Audi-Fone will work equally well with all detectors, including the Audion, and when used with any wireless set will double and even triple the distance, and renders audible hundreds of stations that you can get in no other way, bringing out all nearby stations, as well as those thousands of miles away.

Price, $30.00

SIGNALS CLEARLY HEARD AND ACCURATELY READ WITHOUT HEAD-SETS

The amplification is so great that when two Multi-Audi-Fones are used in tandem and a horn is attached to the receiver, the signals can be heard all over the five story building from our laboratories which are located on the third floor. If the windows are opened, the signals can be heard across the street, even when the trolley is passing.

MULTI-AUDI-FONE

The exact measurements of this instrument are 4¼x3x2⅛ inches. Weight, 12 ounces

It increases the audibility one thousand five hundred times

MULTUM IN PARVO
(Much in Little)

The exact measurements of this instrument are 3¼x2x⅞ inches.

This instrument is indeed "much in little." It is a marvel of efficiency and compactness, for it combines the CRYSTALOI DETECTOR, which is superior to any other, with a COMPLETE AND PERFECT RECEIVER.

The Crystaloi Detector especially designed for us becomes far more sensitive when used in combination with our Multum in Parvo. This compact little instrument has a wave length ranging from 50 to 3,600 meters, and **will go into your vest pocket.**

Price, $20.00

These instruments in combination have a receiving range of 3,000 miles. They are beautifully finished in triple nickel plate and made of hard rubber composition.

One Hundred of These Outfits Sent On Free Trial

Naturally we must follow the rule of first come, first served. Therefore, if you do not get your outfit at once you will understand that there are others ahead of you and that you will get yours when your turn comes.

Offer to Radio Clubs or Others

We will send, at our own expense, one of these complete outfits to any radio club or any two persons. If you want to try this newest and greatest wireless improvement, sign the following letter. Have it guaranteed by your father or some other responsible man, and we will send the outfit to you on trial.

MULTI-AUDI-FONE: 273 Morris Ave., Elizabeth, N. J., 1915.

Gentlemen:—Please send us, at your expense, one of your complete outfits upon these conditions: First—We agree in no way to mar or injure any of the instruments by taking them apart. Second—We agree to repack carefully any of the instruments we do not buy in the same box in which we received them. The prices of these instruments are understood to be: Multi-Audi-Fone, $30; Multum in Parvo, $20. Head-Set, $5; the outfit, $55. Third—We agree to remit within ten days of receipt of the instruments for such of them as we decide to purchase and to repack the rest as above agreed, and return the same at your expense within ten days after they are received by us.

Very truly yours,

Two Signatures are required

No apparatus will be sent unless responsible person signs this Guarantee

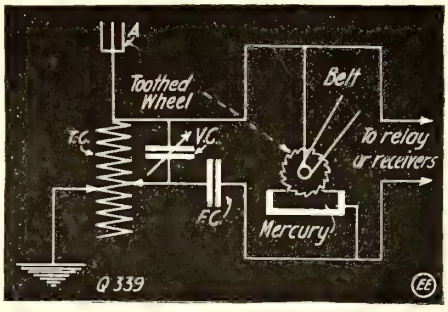
MULTI-AUDI-FONE—273 Morris Avenue, Elizabeth, N. J.

primary about No. 24 silk or cotton insulated magnet wire.

A. 3. The principle upon which the Audion detector operates is that of causing a variation or change in the absolute value or strength of a stream of electrons. A variation in this stream of electrons (as produced in the Audion bulb by the incandescent lamp filament in same) is created by a *trigger* action. This *trigger* action is carried out in practise by means of a wire grid and a metal plate placed in the proper position about the incandescent filament. The grid and the plate are connected up to the Hertzian wave circuits of the radio receptor or receiving set. The incoming wireless signals in the form of Hertzian or etheric waves thereby cause a change in the electron stream produced in the Audion bulb, and this variation in the quantity of electrons allowed to strike the plate in same is registered in a pair of sensitive telephone receivers connected to the plate in the Audion bulb.

RADIO OPERATOR'S SALARY.

(338) M. H. Chapman, Baldwinsville, N. Y., asks about the demand for radio operators and the remuneration.



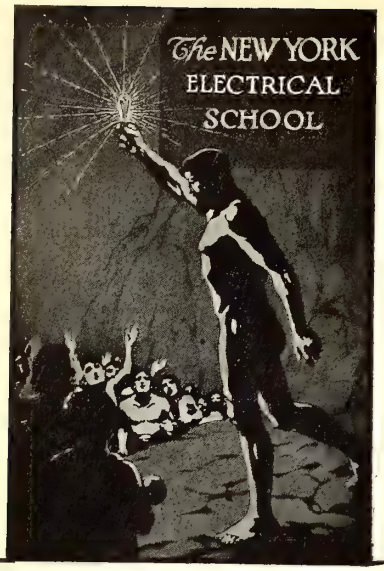
A. 1. There is at present a good chance for wireless operators, especially in view of the great demand created owing to the European war, which has taken many operators from this side of the world, and thus there are numerous openings both here and abroad.

On the average, a ship radio operator's salary is approximately $35 to $40 a month in most cases, which includes board and medical attendance as well as berth.

Land operators get from $75 to $125 a month, depending upon the station they are appointed to, and in most cases a percentage or bonus is paid on the number of messages handled by the operator, which on shipboard of course depends a great deal on the personality and abilities of the operator himself.

LODGE-MUIRHEAD MERCURY COHERER.

(339.) L. Bosserman, Pleasanton, Kan.,



Mercury Coherer Hook-up.

is interested in the Lodge-Muirhead mercury coherer.

A. 1. Concerning the construction of a Lodge-Muirhead mercury coherer, the brass wheel used in same may be about 1 inch or more in diameter, or even less, and the number of teeth is immaterial. It is rotated by a belt or otherwise at fair speed and the teeth of the wheel should just barely touch the mercury.

This adjustment, of course, is very easily ascertained when trying out the detector in the regular wireless circuit. The rotating tooth wheel should be movable vertically on a slide or else the mercury cup should be adjustable as to height.

Diagram is shown herewith for the connection of this mercury coherer and regular tuning coil, condensers, etc. It has a receiving range on par with other coherers.

THE N. Y. ELECTRICAL SCHOOL is the pioneer and premier school of the "Learn by Doing" method. When you have completed this Course you shall be fully qualified to handle ALL branches of Electrical industry.

The equipment of this School is unequalled and up-to-the-minute. No preparation needed to become a "learner" in this school. You can start to learn on any day of any week throughout the whole year. Send for catalogue.

NATIONAL RADIO SCHOOL, 1405 U St. Washington, D. C.

A. C. GENERATOR DESIGN.

(340) Fred V. Bechtold, North Manchester, Ind., asks several questions on alternating-current generator design.

A. 1. In reference to your small alternating-current generator, the armature volts developed by same is dependent upon three main factors, viz.: upon the flux in lines per square inch of field-pole cross-sectional area; upon the number of armature conductors per slot (and total conductors, of course), and the revolutions per minute at which the armature is rotated.

You will thus see how it is possible to increase the voltage on your alternator by varying any of these factors. If you desire to keep the speed of the machine the same, and also the number of the armature conductors, then you have only one alternative, which is to increase the field-flux density per square inch. This means that more powerful magnet coils must be used in the manner you suggest, and it is doubtful whether there is room on the field frame to do this.

We would refer you to any book on the subject of dynamo machine design for the data you desire, and several good books on this subject are handled by our book department. You may use a storage battery for exciting the field as you mention.

In changing your field winding for low voltage, the cross-sectional area of the copper wire for the coils is increased proportionately as the direct ratio of the new voltage compared to the original voltage rating for which the coils were designed. Also for the low-voltage winding a proportionately less number of turns would also be used.

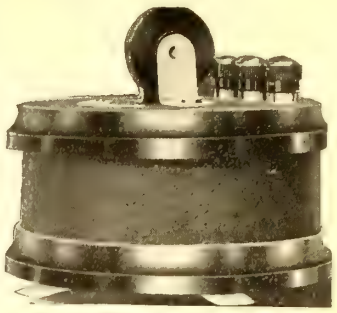
RESISTANCE AND DAMPING.

(341) J. L. Green, Rosser, Man., Can., asks several questions on damping, resistance, etc.

A. 1. The matter of loose-coupler wave lengths was explained somewhat in the September, 1914, *Electrical Experimenter*. The primary and secondary windings of the loose coupler when shunted by variable condensers are considered as distinct oscillatory circuits, and the regular wave-length formula is applied to them for general calculations.

We would suggest the ⅜-inch thickness of hard rubber for the small switchboard you mention. The reason why, as you mention, some text-book writers and others often suggest loose couplers for wireless work having a comparatively small number of turns to be counter-balanced by condenser capacity in tuning oscillatory circuits, is due to the fact that if a great number of turns are used in the coils there is also a high ohmic resistance encountered.

This directly affects the "damping" of the circuit, of course, as the greater the ohmic resistance of any oscillatory circuit the higher the "damping," and vice versa.



This relation between the resistance of the circuit and the damping is observed from the following formula for this function as cited in Commander S. S. Robinson's "Manual of Wireless Telegraphy for Naval Electricians" (1913 Edition). The formula is:

$$d = \frac{R}{2 n L};$$

where d = damping of any circuit.
R = total resistance (high frequency value in radio circuit, of course) in ohms.
n = frequency of oscillations in circuit.
L = self-induction of circuit in Henries.

2100 MILES
FOR SIX DOLLARS
READ THIS

SUPER-SENSITIVE

CRYSTALOI DETECTOR
TYPE AA $6.00.
Weight, Two Pounds.

Hilo, Hawaii, T. H., July 14, 1915.
EUGENE T. TURNEY CO., New York City.

Dear Sirs—After having tested your Crystaloi type AA Wireless Detector for two months on both the Atlantic and Pacific sides, under practically all conditions which wireless is subject to (static, freaks, etc.), I feel it my duty to tell you of a few "stunts" that I have accomplished with it.

On May 29, while 915 miles south of Scotland Lightship, copied all of W S T (Miami, Florida) press through static which was heavy. The signals came in clear and strong. The steamer "Honolulan" then about 100 miles to the south of us was unable to hear W S T on account of heavy static. I gave him a copy of the press.

On June 2 at 1 a. m. copied Miami's press while on the Pacific side, about 370 miles west of Balboa, Canal Zone; signals were clear and strong and did not fade as is usually the case with most all other Detectors. This was a distance of 1,600 miles, over part of Central America and the Gulf of Mexico, and was accomplished through quite a heavy static which is prevalent in the Tropics at night in the summer.

On the next night, June 3, I again copied Miami's press at a distance of 1,800 miles. The S.S. "Kansan" at that time was about 100 miles away and he could not hear W S T at all and said that the static knocked his point. But my Crystaloi was not in the least affected by the heavy splashes of X.

July 9, while at anchor in Kahului harbor, Hawaiian Islands, copied K P H San Francisco press at a distance of 2,100 miles, which is extremely good work for this time of the year.

I am more than pleased with your Detector and would recommend it to anyone who desires a Detector for extreme long distance combined with ease of operation and simplicity. It does not fall short one point in what you claim for it. Wishing you continued success, I am,

Respectfully yours, A. H. RANDOW, Operator S.S. "Dakotan."

USE OF TWO LOOSE COUPLERS.

(342) George Meister, Newark, N. J., asks for hook-up for two loose couplers in a radio receiving station.

A. 1. Diagram is given herewith for connection of two loose couplers, with the other usual instruments. In this way the second loose coupler serves as a duplex loading coil in both primary and secondary

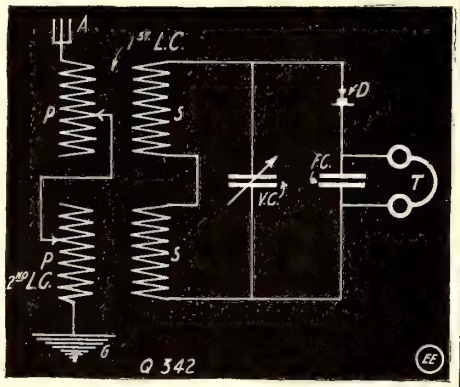

Diagram for Two Loose-Couplers.

of the second coupler with a wide range of coupling.

TESLA COILS FOR RADIO WORK.

(343) Fred Kessler, Springfield, Ill., speaks of using a Tesla high-frequency coil for radio-telegraphic sending circuits.

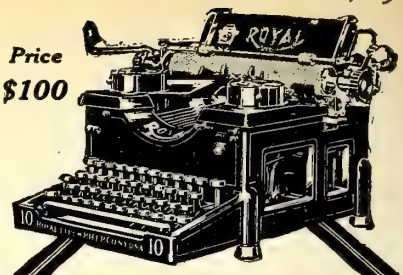
A. 1. This is not practical and it is never employed when the usual form of Tesla coil is considered. Of course, every wireless transmitting set constitutes a special form of high-frequency Tesla or Oudin coil, but the ratios of the primary and secondary windings of these wireless high-frequency coils is many times lower than those existing in regular Tesla transformers used for demonstration and experimental work.

A. 2. The matter of aerial wave lengths was covered completely in an exhaustive article which appeared in the February, 1915, issue of *The Electrical Experimenter*. Copy of same may be procured from the publishers, prepaid, for 10 cents.

Roughly, it is: The wave length is equal to four and a half times the length in meters of the aerial wire plus the length of lead-in and ground wires.

RAISING DYNAMO POTENTIALS.

(344) William L. Crawford, Lima, O., wishes to know if he can procure a transformer to raise the voltage of his type "SS" 6-volt, 4-ampere direct-current dynamo, and thereby the output also.



A. 1. We do not know of any transforming device of the nature you mention for increasing the voltage developed by a dynamo such as the Knapp type "SS" machine.

You would not gain anything by such a transformation or boosting of the voltage, as of course the net energy will be reduced by such a transformation, as no machine operates at perfect efficiency. If you rewind the dynamo to give a higher voltage then the amperage will be less than it originally was. The watts (volts × amperes) will be roughly the same.

STORMS TIE UP WIRELESS.

Because of equinoctial storms, the Atlantic Communication Co., which maintains the wireless station at Sayville, L. I., has announced that until further notice it will be unable to accept any private messages to Nauen, near Berlin.

PATENT ADVICE

Edited by H. GERNSBACK

In this Department we will publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Questions addressed to "Patent Advice" cannot be answered by mail. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

DESIGN PATENTS.

(19) H. B. Meadowcraft, San Antonio, Tex., wants to know what a design patent is, and what it costs to obtain one.

(A.) Design patents may be granted for any new ornamental design or article of manufacture. For instance, you might design a fork or spoon which has a new ornamental design which might be a flower or any other pattern which has not been used before. In order to keep others from copying the design, one applies for a *design patent* by submitting the design to the patent office. Design patents may be for any new distinctive design or ornaments which may be adopted on silks, fancy fabrics, cut glass, metals, emblems, jewelry, pictures, shapes and almost every other article of manufacture. If a design patent is obtained, the patentee has the right to mark the article patented which gives notice to his competitors that the same design must not be used by others.

Design patents are granted for three and one-half, seven and 14 years, at the option of the applicant, but it cannot be extended at the expiration of the period for which the original patent was granted.

The Government fee for three and one-half years for a design patent is $10, for seven years $15 and 14 years $30. Full fee must be paid at the time the application is filed. To this must be added the fee which the patent attorney will charge for his work in preparing the specifications and drawings. These fees vary from $25 upwards, all depending on how much work is to be performed.

WIRELESS TELEPHONE TRANSMITTER PATENTABLE?

(20) I. Rosin, Cincinnati, O., sends in a sketch and description of a new wireless telephone transmitter which our correspondent claims can carry very heavy currents. He wishes to know whether the invention is practical and patentable.

(A.) The invention presents nothing not known so far, and while a patent might be obtained on some technical points, we doubt whether the device is satisfactory at all, for it is nothing but a relaying scheme whereby the microphone operates a relay system which actuates another large capacity form of microphone. It does not present a good solution of a heavy current carrying microphone such as is desirable in wireless telephony.

EMPLOYER AND EMPLOYEE ON PATENTS.

(21) H. Cabot, Boston, Mass., wishes to know if an employer is not entitled to the invention of an employee if the invention has been made on the employer's premises.

(A.) An employer merely by employing an employee is not entitled to the invention of the employee unless there is an express contract to assign it to him. In other words, if no contract exists between the employee and the employer whereby the former is to assign his patent right to the latter, it will be the property of the original inventor.

COST OF PATENT IN UNITED STATES.

(22) Hamilton B. Lancaster, Lynn, Mass., wants to know what the Government fee is for a simple invention in the United States.

(A.) When you apply for a patent of your invention there are two fees, the first Government fee when applying for patent being $15. When the Government has finally allowed the patent, a final payment of $20 must be made to the Government before the patent can be issued. In other words, the total fee that the Government requires on any patent is $35. Of course, this is only the Government fee and does not include the fee of the patent attorney who prepares the papers, drawings, etc. Usually such a fee to the patent attorney varies from $25 upwards, all depending on how much work has to be performed, how many patents must be looked up, and authorities consulted, etc. An ordinary patent with one sheet of drawings and specifications that are not too complicated will usually amount from $25 to $40 with the average patent attorney.

CAN SWITCH BE PATENTED?

(23) Newell M. Ferris, New York, has sent in a drawing and explanation of a new flush switch, and he wants to know whether we would advise him to patent it, also if there is a demand for such a switch, and whether he ought to submit it to some electrical manufacturing company in order to get financial aid for patent.

(A.) While the device submitted is unquestionably novel, and while we think that a patent might be obtained upon it on account of the constructional details, we do not think that it would be worth while to do so, as it appears to us that the device is entirely unpractical and has several features that make it particularly undesirable. The biggest objection is a sliding movement covering quite a little range and a necessarily large hole which thereby is necessitated in order to move the handle back and forward.

We do not think it would be passed by the Board of Fire Underwriters in its present shape and therefore would be valueless.

ABOUT TRADE-MARKS.

(24) A. B. McCann, Los Angeles, Cal., inquires about trade-marks, where used and how obtained.

(A.) A trade-mark may be registered by an individual, firm or corporation in the United States or in any country granting similar privileges to citizens of the United States when used in commerce with foreign nations, provided it is a proper

Book "Inventions—Patenting & Promoting" Free
Our co-operation with an inventor is, FIRST, to help him establish his rights before he discloses the idea to ANY attorney. SECOND, to give a frank opinion whether it will pay to patent his idea, based upon our extensive knowledge of manufacturers' wants and facilities. THIRD, to obtain for him a patent which is in reality a valuable monopoly. FOURTH, to advise and assist him in the profiting by outright sale, territorial grants, obtaining royalty, or independent manufacturing of the invention and FIFTH, aiding him to so profit by conferring with manufacturers, investors or distributors of machinery
Before sending a sketch to anyone, sign, witness, and deposit in our fire-proof vault our document
EVIDENCE OF CONCEPTION AND ESTABLISH YOUR RIGHTS.

PATENTS WANTED
Write for Our Five Books, sent Free to any address. "What to Invent" contains List of Inventions Wanted, with full information regarding $1,000,000 in prizes offered for inventions, among which are
$100,000 for Best Substitute for Gasoline.
$50,000 for First Person Crossing Atlantic in Aeroplane.
$26,000 for New Substance for Denaturing Alcohol.
$50,000 for Best Device for Saving Life at Sea
$10,000 for Machine for Pulling and Topping Beets.
$10,000 for Automatic Train Control.
$10,000 for Improvements in Postal Service by United States Government.
$12,000 for Improvements in Navy Department by United States Government.
$10,000 for Improvements in Field Motor Ambulances.
$5,950 for Miner's Electric Lamp.
We have a special department devoted to Electrical inventions and having secured many valuable patents in this class we are in a position to advise and assist inventors in this field in the development of their inventions.

READ the Classified Advertisements in this issue. They are small but contain big bargains and opportunities.

subject for registration.

Briefly, a trade-mark is a particular or distinctive design by which the goods of the owner are distinguished from other goods of a similar class. No geographical names or insignia of the United States, municipality, foreign nations or marks which are descriptive of the goods upon which they are used can be trade-marked. No emblem of a fraternal society can be used. The meaning of "descriptive of the goods" is that, for instance, you could not obtain a trade-mark if you were a manufacturer of electrical lamps, and you wanted to trade-mark a picture of the lamp. This would be held as a trade-mark descriptive of the goods. You might obtain a trade-mark of your own name if presented in a distinctive manner providing it did not conflict with any already existing similar name.

In other words, a trade-mark is nothing but a seal which is used in order to brand or distinguish your goods from other goods. It is also necessary that once a trade-mark has been obtained, it cannot be changed in any way. This is an important thing to consider and should be very carefully weighed before application is made, for no change can be made without effecting the validity of the mark.

IS RADIO SCHEME PATENTABLE?

(25) S. Beecher, Campbell, Tex., sends in a sketch of a device to control machinery on a small boat by radio, and wants to know if it is patentable.

(A.) Nothing new is contained in the idea; as a matter of fact, similar schemes have been shown repeatedly in this magazine, and any text book containing some chapters on radio tele-mechanics will show a variety of such devices.

We do not think it is possible to obtain a patent that is worth while on this device.

AN INGENIOUS LAND TORPEDO.

(26) William E. Egan, Troy, N. Y., submits an ingenious torpedo which is supposed to move under its own power from one trench to another. When arriving at the enemy's trench several hundred pounds of gun powder are supposed to be exploded at any desired time by means of a flexible electrical cable attached to the machine.

(A.) The idea is certainly novel and to our knowledge nothing like this has ever appeared in print so far. While there are several objections to a scheme of this kind, it might prove of real use to countries at war if all the details were worked out fully. One of the main objections of the invention in its present shape is that it is too vulnerable, in other words, even a small shell when shot at the machine would not only wreck it but blow it up, and if this happened near the trench from which it had been sent it would prove as deadly to the sender as to the enemy. We think the invention is patentable, but we would suggest to cover the machine with an inverted "bath-tub" shape armor protector in order that a shell fired from the enemy will not wreck and destroy the machine before it reaches its destination. We would advise our correspondent to get in touch with one of the patent attorneys to see what has been done in this art before.

HOW LONG DOES IT TAKE TO GET PATENT?

(27) Hamilton Brown, Springfield, Ill., claims he has invented a new electrical bell on which he feels sure that a patent will be granted. He wants to know how long it will take him to obtain a patent once he has made application.

(A.) It is impossible to prophesy how long it will take for a patent to issue once applied for. It depends entirely upon how much work is at hand in the particular department of the patent office, also how fast the applicant's attorney will do the work. It happens not infrequently that a patent takes from six to eight years to issue for the reason that changes of claims, amendments, etc., have been made after the application has been made. Some patents have issued as soon as two months, but such cases are extremely rare.

We would say that the average patent takes from eight months to a year to issue after the application.

SCIENTISTS WILL STUDY STRAY ELECTRIC CURRENT IN THE ATMOSPHERE.

Wireless experts are congratulating themselves on the increased facilities now afforded for studying the by-products of nature's laboratory, namely, "strays" or "x's." The completion of the new and powerful radio station at Yokohama, Japan, not only facilitates wireless communication across the Pacific but likewise opens a broader field for investigation of atmospheric electricity.

Long-distance stations, due to their high power receiving apparatus, are best equipped to give data on etheric disturbances. Scientists located at San Francisco, Hawaii and Yokohama will collaborate to reach a definite understanding of these stray currents.

Dr. W. Eccles is at the head of the investigation, having been appointed by the British Association to carry on the work.

Very little is known about the origin of "strays" or "x's." They were given these names for brevity, about 1887 or 1888, and were more recently called "static." They are familiar to everyone who has worn wireless receivers in one or more of their various forms.

It is natural that we should jump at the conclusion that "strays" or static is due to lightning, but this theory ignores the fact that they may be due to forces exterior to the earth. There is nothing unreasonable in supposing that the sun may send us occasional electric waves.

The formation of spots on the sun or the constant colossal changes of relative position of the various heavenly bodies may give rise to electric waves that reach the earth and cause these disturbances. It is questions such as these that the British Association is to solve, if possible.

Another subject under observation is the part played by the atmosphere in the variations of signal strength, these variations in relation to weather conditions, the time of day and with the position of such freak disturbances on the face of the globe.

RECEIVING WIRELESS MESSAGES WITH ODD AERIALS.

(*Continued from page* 274.)

odd aerials are used inside of a house no results can be had unless the house is constructed of stone or wood. A house containing steel beams or a mass of other iron work will make the use of such indoor aerials out of the question.

We publish these suggestions not as a mere curiosity, but it is thought that any one of these schemes might prove of invaluable benefit in case of emergency. Storms, a fire, sleet, etc., might put the regular aerial out of commission; in that case some of the above-suggested freak aerials could be used to possibly good advantage. Note that most of these odd aerials can be used for sending as well as receiving. For sending purposes they should, of course, be well insulated.

BARON MUNCHHAUSEN'S NEW SCIENTIFIC ADVENTURES.

(*Continued from page 248.*)

explored on this dead world. Besides, the meteors had become so alarmingly frequent that it would be only a matter of time when one of us would be killed.

"Flitternix wanted to return to earth at once, for he itched to present a lecture to the American Astronomical Society, whose honorary president he is. I, however, had more ambitious plans. I once had looked through the great telescope at the Lowell Observatory at Flagstaff, Ariz. If I live to be a thousand years old I will never forget the glorious sight which then presented itself to my eyes.

†"I saw a ball, lighted up dazzlingly at both extremities. I saw great patches of an ochre red scattered over the surface of the sphere and I had seen dark blue areas among the vast ochre patches. Over the latter runs a mass of fine lines, nearly all of them connecting with the white caps at each extremity. Moreover, these fine lines cause one to gasp involuntarily, for they are as straight and true as if laid out with a rule and pencil. More astonishing yet, some of these lines run absolutely parallel with other ones for the whole length of their extent. And more wonderful yet, whenever two or more lines meet in a junction there is invariably a round black point.

"The ball I had been looking at transfixed for a long time was Mars, the nearest planet to earth, then 37,000,000 miles distant from the latter. Prof. Percival Lowell, the greatest living authority on Martian research work, has convinced the scientific world that the dazzling white caps at the poles of this planet are the polar snow fields. The great ochre patches are desert land, while the dark blue areas represent large tracts of fertile land and its resulting vegetation.

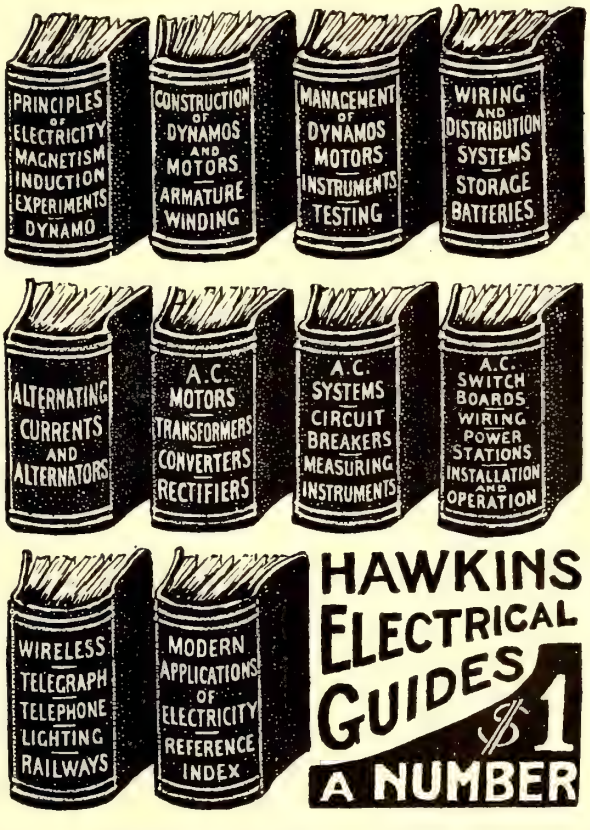
"Now, according to well-known physical laws, proved beyond discussion, the smaller a body the quicker it will cool off. All planets and their moons once were white-hot like our sun. The smaller ones cooled off first and the larger ones are not cold as yet. Thus the earth, which measures 7,912 miles in diameter, is still red-hot in its interior, as is proved by its active volcanoes. The moon, which is but 2,164 miles across, cooled off ages ago. The oceans once filling its beds then filtered down in its bowels, there to freeze solid, for there was no heat to keep the water fluid. Its atmosphere, which was formerly as dense as that of our earth, was gradually thrown off into space, till to-day practically no atmosphere remains. Thus the moon to-day rolls on through space a dead world.

"The planet Mars, measuring 4,363 miles in diameter, as will be seen, is only twice as large as our moon and much smaller than the earth. Consequently it must be rapidly nearing its extinction, the same as the moon. Its oceans are already dry, while most of the land is desert. The atmosphere has nearly all gone too, proved by the fact that we practically never observe clouds on Mars through the telescope. But there must be water on the planet as yet, this being irrefutably proved by its polar snow caps. This view is further strengthened by the fact that these caps undergo seasonal changes. As the sun beats down upon them we see first the one, then the other, grow smaller in size, till at the end of the Martian mid-summer the northern one has disappeared almost entirely. During the next hot season the same happens to the southern one. Where has this water—*the only remaining water on Mars*—gone? It cannot have filtered into the interior, for if it had, we could not possibly witness the reappearance of the polar snow fields, every Martian year, as we actually do. Where, then, does the water go?

"Dr. Lowell solved the problem in a brilliant as well as ingenious manner.

"His view—and it is shared by most of our scientists to-day—is that Mars is inhabited by a thinking people, fighting a heroic battle for their existence. Without water, life, as we know it, cannot exist. Now ages ago the shortage of water had made itself felt on Mars. Long before the first cave man appeared on earth Mars had been an old world, where civilized peoples had reigned for centuries. While our ancestors were still jumping from limb to limb among the trees in primordial forests and jungles, the water problem on Mars had become acute. The fertile lands were fast turning into deserts for rains had become more and more infrequent, until they had stopped almost entirely. Furthermore, as Mars is flat without mountains or elevations of any sort, there could not be any natural rivers to convey the water to the plains and valleys as is the case on our world. The Martians, seeing utter extermination staring them in the face, proceeded to save their race. They did precisely the same thing as we are already doing in Western America and the Egyptians are doing in Egypt, namely, irrigation of deserts or semi-deserts on a large scale. Our recent Roosevelt dam in Arizona offers a good example of this. Our engineers on earth have to bring the water to the deserts, precisely as the

This Splendid



LIBRARY of ELECTRICTIY

Sent Free for Examination

$1 Per Volume—Pocket Size—Leather Bound

HERE is a set of books that no man in the ELECTRICAL FIELD should do without. This is the ELECTRICAL AGE in which we live; ELECTRICITY now controls more trades, directs more men, offers more opportunities than any other power that man has yet discovered. Do you wish to know the underlying principles of **Modern Electrical Practice?**

If so, **HAWKINS ELECTRICAL GUIDES** will give you the information. In reality they are a school within themselves, containing a complete study course with QUESTIONS, ANSWERS AND ILLUSTRATIONS, written in plain everyday language so that a practical man can understand.

The How, When and Why of Electricity

Read over the titles shown on the back of each volume, and note the scope of each book. They are handsomely bound in flexible black leather with gold edges and will readily go in the pocket. **They are not only the best, but the cheapest works published on Electricity.**

FILL OUT the Coupon now and get this practical education in electricity "Written so you can understand it."

"That's Just What I Need"

Each book is complete in itself, eight numbers now ready, and will be supplied $1.00 per number, but we believe that the complete set is the best bargain. The books can speak for themselves and a careful examination, page by page, and illustration by illustration, will convince you of their big value. If you will fill out the following coupon giving all the information requested, *we will submit the first eight volumes for examination on conditions named.*

Theo. Audel Co., 72 5th Ave., New York—Free Examination Offer

Please submit me for examination HAWKINS ELECTRICAL GUIDES. (Price $1 each.)

Ship at once prepaid the first eight numbers; if satisfactory I agree to send you $1 within seven days and to further mail you $1 each month until paid.

HOLTZER-CABOT ELECTRIC CO.
BOSTON, MASS.

Special Price for 30 days on Complete Receiving Set

$3.45

With One 1000 OHM Receiver

This fine Receiving Set comprising three-slide Tuner, Variable Loading Coil, Fixed Condenser, Silicon Detector and Head Set is self-contained and well adapted for either portable or stationary use.

Detector is of radical design, making it possible to place point on any side of mineral.

Loading Coil is enclosed within tuner cylinder and its inductance is controlled by instrument switch on end of tuner.

Tuner inductance controlled by sliders of improved design.

THIS OFFER GOOD FOR ONLY THIRTY DAYS

We will send this complete receiving set with one 1,000 ohm receiver head band and cord on receipt of $3.45 for 30 days only. This is an unusual offer. Send us your check today. If not entirely satisfactory money refunded if goods are returned within 10 days

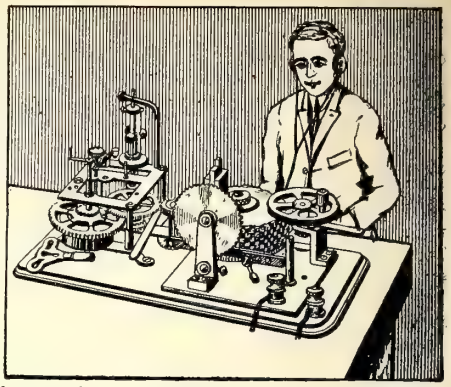
M. MUELLER, 18 Devonshire Street, BOSTON, Mass.

Martian engineers must have been doing it for centuries past.

"On earth, however, this is a comparatively simple matter, for here we have rivers and lakes in abundance which can be tapped with ease. Not so on Mars. The only remaining water there is found around the poles; by sheer necessity, therefore, the Martians had to go to the poles for their water supply, and this is exactly what our telescopes reveal that they did. For the long, unswerving straight lines which we see are part of the canals bringing the water down from the poles to the desert land there to irrigate it. So far the Lowell observatory has discovered almost 600 canals, but there are doubtless many more. They criss-cross the entire surface of the planet in every conceivable direction, most of them, however, running due north and south in the direction of the poles. Not only do the canals cross the desert lands, but we see them carried bodily across the dark blue areas which we know to be irrigated vegetation tracts. The fact that the canals run across these areas is another proof that they are not oceans, as had been thought at one time.

"Now the lines which we see running over the planet are really not the canals themselves, but are simply wide strips of vegetation fertilized and kept alive by the water from the canals. The average width of the canals proper Dr. Lowell estimates to be about six miles. There are some of them, however, which are thought to be much wider than this. The length of these canals, however, is stupendous. There are some canals which actually measure 3,400 miles. A great many are over 2,000 miles long. Dozens of them run for 1,000 miles, and nearly all of the canals run in absolutely straight lines.

"The circular black points, mentioned above, which we see almost invariably at the juncture of one or more canals, are termed oases. They also represent vast tracts of vegetation and probably contain large cities, farms and so forth.



"It must convince the strongest opponent of Dr. Lowell's theory, when viewing Mars and its canals through a first-class telescope, that these wonderfully straight lines cannot by any possible chance be the work of Nature. Its counterpart is found nowhere on earth nor in the heavens. And if by any chance, for argument's sake, these lines should be of a natural origin, so many of them could not for any conceivable cause join and meet as they do and form these exact circular areas. Their artificial origin is too apparent and cannot be otherwise considered to-day. Dr. Lowell's theory has so far withstood the onslaughts of all opponents, as a matter of fact, his explanation is to-day accepted almost universally.

"But how do the Martians move the tremendous masses of water through their canals? For, as explained already, Mars is entirely level, and water does not flow on a level surface without a "head." Moreover, during one season it must needs flow from the north towards the equator, when the northern polar snow cap melts under the influence of the sun's heat. *During the next season, however, this flow must be reversed* for now the south polar snow cap melts, with a resulting flow of the water from the south to the north.

"But how do the Martians succeed in moving the water? We don't know. Even Professor Lowell is silent on this point. Terrestrial science simply has as yet not advanced enough to offer an explanation.†

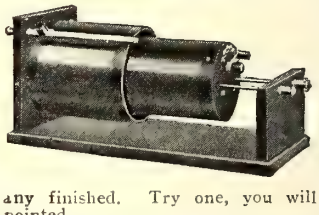
"Well, to make a long story short, Flitternix and I decided to voyage to Planet Mars. My little astronomical lecture was given solely for the purpose of refreshing

LEARNING TELEGRAPHY

becomes simple when your instructor is the Omnigraph Automatic Transmitter. Combined with a standard key and sounder or Wireless Buzzer, it will send you telegraph messages at a slow speed, which can be increased at will to match the sending of an expert operator as you become more proficient. † Adopted by U. S. Gov't. Made in 4 styles, from $2.50 up, all accurate. Circular free.

Omnigraph Mfg. Co., 39 L Cortlandt St., New York

HIGH TONE ROTARY RUNS 8,000 R. P. M.



Gives 600 cycle whistling spark like a quenched gap. Attains full speed in 1 second; stops dead inside of 3 seconds.
You do not have to wait for this Rotary to start nor do you have to wait for it to stop. It always beats you to it.
The light revolving discharger arm allows a quick start and quick stop.
Will work on sets up to 1 K. W. Used on 60-cycle current.

cast in metal box with 2 binding posts. Insulation good for 800 volts

Regular Price, $7.00; Special Price, for cash with order $2.00

Rosenthal Laboratories, Camden, N.J.

Here It Is At Last!

This 1/6 K. W. Closed Core Transformer **$6.85**

After months of experimenting, and after making dozens of designs and models we have finally produced a thoroughly practical *closed core wireless transformer* to retail at $6.85, the price that formerly you had to pay for spark coil and batteries.

We have sacrificed nothing in quality or manufacture. The size is smaller—that's all.

This transformer will send messages *twenty* (20) *miles*, with a good aerial, instead of the 2 and 3 miles obtainable on spark coils. Best silicon iron is used in its construction; the best enamel and cotton covered wire; mica insulation; sectionally built.

It will throw a heavy, crackling spark that with proper condensers will fill a gap with a ball of fire almost 1-4 in. in diameter.

This heavy spark will send six (6) times as far as 1 in. spark coil.

Send money order today for this new, marvelous little transformer. Shipping weight 10 lbs.

Big Catalog of Newest Experimental Goods, 4 cents in stamps.

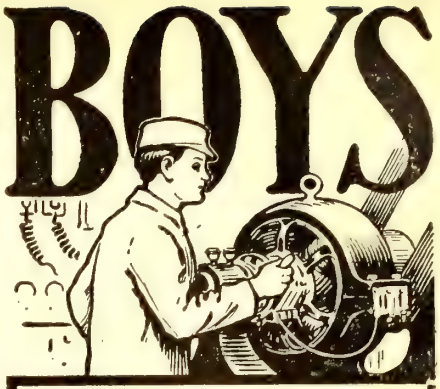
your mind as to Mars in order that future reports which I shall make to you from the planet will be better understood by you and your friends.

"If our 'Interstellar' was able to succeed in reaching the moon without mishap, I felt sure that the trip to Mars would not be an unduly difficult undertaking. Flitternix was of the same opinion. We calculated that the intervening 50 million miles separating the moon from Mars should be negotiated by our space flyer within 30 days, barring no accidents. While this may seem like a short time to cover such an immense distance, our speed of 1,600,000 miles a day, or 66,666 miles an hour, is only a trifle greater than †the speed of the earth (65,533 miles an hour) as it travels in its orbit around the sun.†

"We immediately made our preparations and within six hours after I had emerged from the crater, the 'Interstellar' had left the moon.

"And now for a little surprise! No doubt you noted that my voice does not sound the same as usual. You will have observed, furthermore, that I did not stop talking since I started. To break the news gently to you, I am not talking at all! While you are listening to my voice at this minute, I will be some 1,100,000 miles distant from the moon heading towards Mars!



"The explanation? Simplicity as usual!

"Before leaving in our 'Interstellar' we stretched an immense aerial inside of the canyon, the one of which I spoke to you several days ago. As you will remember, I told you then that it was open but a few feet across its opening at the top. It thus formed a long, narrow slit at the top into which there was little likelihood of meteors dropping, which could destroy the aerial. We stretched four wires in all along the inside of the canyon, spacing the strands six feet apart. Each strand is 6,000 feet long in order to give the required long wave length in transmitting as well as receiving impulses between Mars and the Moon, as well as between the latter and the Earth.

"To this aerial I connected my latest invention, by *Interplanetarian Radiotomatic*. It is nothing but an ingenious adaptation of modern tele-mechanics and works as follows:

"When the aerial receives a certain number of equally spaced dashes an ultra-sensitive detector is actuated upon which in turn operates a gas-valve relay. This relay then closes its contacts, which sets in motion the well-known telegraphone, invented by Poulsen. A second ultra-sensitive detector, also connected to the aerial, is in series with the *registering* electro-magnets of the telegraphone; in front of these magnets runs the moving steel wire, on which are then recorded the impulses coming in over the aerial. You will observe that no message can thus be recorded unless the original *key dashes* unlock the telegraphone mechanism. At the end of the message the same number of equally spaced dashes will lock the telegraphone mechanism. The recorded message is now ready for retransmission at any time desired. This is accomplished in a simple manner too.

"I took our 300-day clock and fastened upon it a contact which would be closed at exactly 11 p.m. every night and would be opened again at 12 o'clock midnight. This contact closes a circuit in which is included the telegraphone mechanism. As soon as it starts the steel wire with its recorded message begins to reel off in front of the two *reproducing* electro magnets, which in turn are connected with a special telephone receiver. Thus the telephone receiver will begin to talk its message (if

Big Money in Electricity

The electrical industries offer wonderful opportunities for boys with a liking for electricity. The salaries paid to trained men are large—promotion comes rapidly, and, best of all, the profession is not overcrowded.

The opening of new lines, from time to time, (such as wireless telegraphy and telephony), promise attractive and paying fields to those who wish to specialize. The *will to do* and *Special Training* will bring success to you.

The International Correspondence Schools of Scranton can help to make you an expert in electrical work. Hundreds of boys have already won success through I. C. S. help. You can do the same. Everything is made so clear that you can learn in your spare time, regardless of where you live or what you do. No books to buy.

There's big money in electricity. Get after it by marking and mailing the attached coupon today. Finding out costs you nothing.

"Construction of the Audion Amplifier"
with working drawings, particularly describing the transformer. Price, 50 cts.
THE MISCELLANY, 17 Board of Trade, KANSAS CITY, MO.

one was sent during that day) every evening at 11 o'clock.

"But connected to the telephone receiver are several amplifiers, arranged in cascade. The last amplifier is attached to the mouthpiece of the transmitter of my wireless telephone. Thus the weakest recorded talk on the telegraphone wire will cause the telephone of the last amplifier to talk into the wireless transmitter louder than myself.

"Now my 300-day clock every night at 11 o'clock also closes the contacts of a powerful relay, which in turn operates the generating plant of my wireless telephone, disconnecting it at midnight. Therefore when the amplifier with its telephone begins to talk into the transmitter of the wireless telephone, there will always be enough power to transmit it to you on Earth.

"As soon as we arrive on Mars we will in all probability find all the necessary materials to erect a giant Radio telephone plant, and if we succeed we will send daily messages to the Moon, while my radiotomatic relaying plant will transmit the messages to you every night. I might also mention that my ultra-sensitive detector contains two radio-active substances, making the detector such a marvelously sensitive instrument that it will work a set of amplifiers in cascade *when an electric pocket buzzer is operated one hundred and fifty miles away from it, connected to the ground only and using no aerial!*

"You might say: 'Why use the relaying plant on the Moon at all? Why not transmit from Mars to the Earth directly?'

"The reason is that when the weak impulses arrive from Mars, after having traveled from 50 to 60 million miles, they cannot be sufficiently strong to pass through the Earth's thick atmosphere, always charged with electricity and 'static.' It is far better that the weak impulses should operate the relaying plant first and send out from there very strong impulses which have but to travel some 238,000 miles to Earth.

"We tested the plant thoroughly and after we had satisfied ourselves that it would work for at least 300 days I opened the telegraphone circuit and began to register this message to you. It will be the last one which you will receive for 30 days or more. As it must needs take us from five to 10 days to build a transmitting plant on Mars, you need not expect to hear from us for from 35 to 40 days. You might, therefore, commence to 'listen in' beginning with the 35th day from tonight. No message can ever be repeated, for the *'wiping'* electro-magnets of the telegraphone wipe out the magnetic impulses from the steel wire as quickly as they pass the transmitting magnets. Neither can you transmit a message to me, for no provisions were made to relay your messages to us when on Mars.

"I will now bid you adieu, my boy. Think of us during the next 30 days! Good-bye—good-bye.....!"

There was a silence for some seconds, and as I was still listening awestruck, I was suddenly startled by another voice breaking in:

"Hallo there Alier, this is Professor Flitternix. How's Yankton? Beastly old town! Was once forced to sleep on a billiard table in the Palace Hotel, as all the rooms were full. The robbers charged me $2.50 for the "room" plus the regulation rate of 50 cents an hour for the use of the billiard table! Mean town, that Yankton! Well, good-bye....."

There was a snapping noise and the rhythmic low sizzling sound stopped abruptly. All was quiet once more.

(*To be continued.*)

THE AURORA BOREALIS OR THE NORTHERN LIGHTS.

(*Continued from page* 245.)

It is possible to produce an artificial Auroral effect in the laboratory, as Fig. 3 shows. Between the poles of a powerful electro-magnet is placed an exhausted glass bulb. When a high-voltage electric current is connected with such an exhausted globe in the manner shown and also when the magnetic flux in the magnets is caused to pass through the bulb, a remarkable change takes place, which has considerable bearing on the apparent action occurring in the Aurora Borealis as seen in nature. The artificial Auroras produced in the exhausted bulb, as here described, take a spiral form, the spirals tending to point toward the magnetic poles. This seems to confirm the theory that the streamers of the Aurora Borealis in nature are composed of electrons, descending to the outer gaseous envelope of the earth sometimes from a height as great as 300 miles. These spiral down, following the lines of magnetic force, toward the poles; the spiral at the same time gradually closing up and decreasing in diameter as the field strength increases. The luminous globe becomes brighter, due to this concentration and the improved conductivity which results; a combined effect of the magnetic and electric fields which are strongest at the poles, also helping to increase the conductivity. In the proximity or neighborhood of the conducting layer the Auroral streamers or rays come to an end, as the electrons or electrically charged particles then return upon their paths and spiral up again.

Regarding the state of the *electrical charge* in the atmosphere surrounding the earth at the periods when the Aurora Borealis occurs it was found by Andree, who made careful measurements with a sensitive electrometer, that before the appearance of an Aurora, the positive electric potential of the atmosphere diminished abruptly and in some cases it even became "negative." This also usually occurs when it rains, but after a rain storm the positive charge in the atmosphere generally returns promptly. When the Aurora takes place, the atmospheric potential takes up as before and quite rapidly a high-positive electro-static value. Thus we see that the Aurora Borealis does affect directly the *electrical equilibrium* of our globe, and therefore it is perceived how it can affect without any question the electrical telegraph lines and wireless systems built by man, and which use, of course, in any case a power which is but an infinitesimal fraction of the vast amount of energy involved in such effects as the Aurora Borealis.

THE GRAVITATION NULLIFIER.

(*Continued from page* 251.)

ing together, drifting as aimlessly as thistledown and all shrieking in terror. Guns and wagons were overturned or wafted away by maddened, frantic teams. The whole line as that gyroplane passed over it went into such confusion as only a terrific tornado could have caused.

Cawthorne swept ahead, his orders being to block the railroad. As he passed over the yards at Caliente and put the nullifier into action switching engines lost their traction and either spun their driving wheels uselessly or wobbled off the tracks, piling great loaded cars against each other like bales of cotton-batten. G.N.2 was less than half a minute gliding back and forth over that yard, and it took the enemy four days to restore working conditions.

On again, down the line, stalling the first train but allowing the hundreds of tons

weight of the following train to crash into the first. On again, through the Vegas Canyon, where a half-gale of wind distributed feather-weight moguls and freight cars up along the jagged, precipitous rocky sides of the mountains. Another train of 17 coaches loaded with troops fluttered away—all coupled—across the St. Piedras divide, where it straddled the summit, lying on its side. But, except for some wrenches and sprains, not a man was hurt, for there was not an ounce of weight in the entire outfit, men or cars.

On again, across the wild, arid Tepeguaras plains, where they sent 3,000 of Cabellero's Mexican warriors and horses fluttering in the air like dead leaves, and howling to every saint in the calendar—and many who are not there—to save them. On again, over the Allies' headquarters, where the Jap general, Kioki, and his Chinese ally, Lu Kien, were wafted from a council of war, clinging tenaciously to their camp seats, the Jap settling with sadly ruffled dignity on the flat roof of a 'dobe ranch house, the Chinese drifting against the gyroplane, which had circled down to 400 feet, and where welcoming hands stowed him in the frame—a prisoner for General Illington.

In advance of the G.N.2 flew two aeroplanes, from which were dropped the attractor pellets whenever they came in advance of a train or passed an occupied siding. Then, as Cawthorne followed, his nullifier threw those trains into most appalling confusion. At Mirau Nuevas the operation of this influence, helped by a strong breeze, lifted and deposited an enormous ore bin and the terminal machinery of a great aerial cableway along the main line tracks. In four hours the G.N.2 had blocked 300 miles of railroad at over 40 points.

They turned back, following a direct air line over the mountains to Illington's headquarters. Cawthorne reported amid deep and fervid congratulations, and then laid off for a rest. For nearly 60 hours his head had not touched a pillow.

Six hours later—it seemed but six minutes to him—Capt. Berger came to the tent and aroused him, with the news that the general had received an important dispatch from Washington and wished to see him.

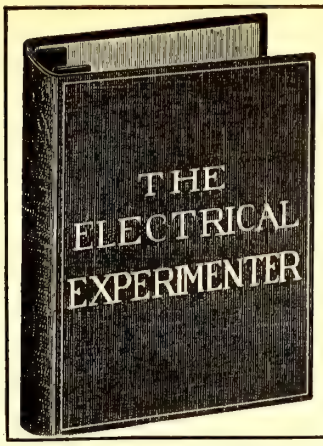
"Captain!" exclaimed the general as Cawthorne half staggered into the room, "I felt it necessary to inform you of this at once." He held out a dispatch:

"To Brig. Gen. N. C. Illington, in command of the Fifth Division at Montova:

"Your report on the work of the Cawthorne nullifiers received. Hearty congratulations. It is advisable that immediate action be taken against the enemy's transports and battleships now in the Gulf of Mexico. You will detail Capt. Cawthorne and his party, with ample escort, to proceed to the Gulf and report to Admiral Young for operation against those ships.

"By order of the President.

"JOHN J. SMITH, Secretary of War."



Cawthorne stared blankly and muttered: "Impossible, general! The nullifier can operate only on land. We have not discovered why, but we know that water is a perfect insulator against the electric zone which counteracts the gravitation. The attempt would be useless! The Navy will have to be depended on to clean out the Gulf—unless—"

"Unless what, captain?"

"Unless I can at once go North to my experimental shops. Did you ever hear of the Poniatowski Arc, sir?"

"Never!"

Cawthorne smiled grimly. "I think that

Handy Binder

for THE ELECTRICAL EXPERIMENTER

Holds and preserves 12 issues, each of which can be inserted or removed at will, without tools. Will keep your magazines perfectly for all time or just preserve them like new till you bind them permanently. Made of heavy material, extra strongly reinforced at the back and covered with handsome green cloth, suitably lettered in gold..... **50c**

Shipping weight 2 lbs. Add sufficient postage, otherwise we will have to send binder by express.

Order a Binder To-day and Preserve Your Magazines.

BRIGHT STAR BATTERY CO., New York CHICAGO MONTREAL

ACCEPT THIS BOOK FREE

IT'S INVALUABLE YET CAN'T BE BOUGHT

Just as you will receive it, cloth bound, size 7 x 10¼ ins., 160 pages, 20 lessons, 350 illus., 30 tables, with every bit of information on Wireless you can possibly want, besides valuable information on Electricity, Magnetism and Theory of them **—and it's FREE as explained.**

Will you take a 20 lesson Wireless Course absolutely FREE—even postage charge prepaid?

A course that tells you everything you can possibly want to know about "Wireless" starting off in Lesson No. 1 by explaining the Principles of Electricity. The Second and Third Lessons are devoted to magnetism, motors; generators and wiring. And then, by simple easy stages this wonderful Course takes you into "Wireless." The mysteries of "Wireless" are unfolded to you by the use of such simple language so skillfully used, that of necessity you must understand every word. The subject is not treated superficially, however, for there is a whole lesson devoted to the Theory and Mathematics of this epoch marking subject. To lend charm to the Course, the last Lesson (No. 20) is devoted to a history of Wireless and the men who developed it. The wireless course positively cannot be bought, but will be sent absolutely free with a full year's subscription (12 numbers) of the Electrical Experimenter at $1.00. It's the biggest dollar's worth you can ever buy anywhere at any time. Send for it to-day enclosing $1.00. Send **now** before you forget.

The coupon below is a convenient way. **But do it now.**

Don't Throw Away Your Worn Tires

You can get 5,000 miles more service from them.

For over three years European Motorists have been getting from 10,000 to 15,000 miles out of their tires by "half-soling" them with Steel Studded Treads, just as we half-sole our shoes when the first sole gets thin.

In the past 8 months over 20,000 American Motorists have followed their example and are saving $50.00 to $200.00 a year in tire expense.

Guaranteed 5,000 Miles without Puncture

Absolute freedom from tire worry—blowouts, punctures, rimcuts and cutwear eliminated—no matter whether your tires are old or new you should put on Durable Treads at once—they cover your tires from rim to rim—nothing can work in between—that's why we guarantee them as we do.

WE SHIP ON APPROVAL—prepay the express and allow you to be the judge. Durable Treads are easily applied in your own garage in 30 minutes without extra tools.

SPECIAL DISCOUNT to motorists in new territory on first shipment direct form the factory. Mail the coupon today and we'll send you full information, sample, and copy of signed guarantee without any obligation to you.

not one man in a thousand has, although it was discovered several years ago, but suspected only of capabilities for long-distance signaling. "But"—his voice sank into very low, earnest tones—"I know that with the apparatus we have completed in our shops you on land or an admiral at sea would have as full control over the firing of the enemy's guns as the enemy himself has!"

The general dropped back in his chair. "What! Another ghastly invention?"

"Exactly! If I can have leave of absence for ten days—perhaps a little longer, and take Kilroth with me, I think that I can bring you the power to not only countermand every order of the enemy's commanders, but to issue the orders yourself with the certainty that they will be obeyed. The gyroplanes and nullifiers will be here to use if needed again, and Capt. Berger is fully capable of handling them."

The general grunted hoarsely: "I've got to believe you, Cawthorne! I've got to! Your passports shall be made out at once!"

(*The End.*)

A POWERFUL ELECTRO MAGNET FOR BATTERIES.

(*Continued from page* 272.)

N. and S. poles. When the current passes around the coil in a *clockwise* direction (i. e., right-hand), the magnetic pole produced is a South one in a direction toward the reader. Every magnet has two poles of opposite polarity, no matter how small it may be. Unlike magnetic poles attract each other and, conjointly, like poles repel each other, as indicated at Fig. 3 B, where the S. pole of a magnet is attracting the N. pole of the magnetized steel compass needle. The end of the compass needle that points toward the north magnetic pole of the earth is, strictly speaking, the "north seeking pole," or the actual "south" pole of the magnetic needle, as only unlike poles attract each other.

WITH THE "AD MAN."

Along about the time when as a boy I first became a reader of magazines I can remember how people looked upon the ads. found in them. My dad used to tear the advertising pages out and occasionally use them for shaving paper, but most times the stove would get them. Those days when mother saw a department store "ad." she always remarked, "Well they say it's worth $2.50, but I'll bet it isn't worth even as much as they ask, and Lord knows the price is low enough." Those were the views, and the result was that advertising didn't pay as well as to-day, for the confidence of people was lacking, due, of course, to the belief held by many advertisers that people wouldn't believe all they said on paper anyhow, so they had better exaggerate a bit. Well, they did exaggerate all right, but most of them forgot when to quit.

It's different to-day. When Ma sees an ad. now in a good magazine and it looks as though a real bargain is advertised, she sends right off for it, because she realizes that no good magazine would think of carrying the advertisement of a non-reliable concern. Therefore when you see an advertisement in *The Electrical Experimenter* you need have no compunction about sending an advertiser your money, for the publishers of *The Electrical Experimenter* absolutely and unquestionably guarantee the integrity of every advertiser in his dealings with their subscribers.

Read this last paragraph twice—it's worth while, and above all, it means that you can absolutely rely on the advertisement of every advertiser in *The Electrical Experimenter.* MILTON HYMES.

PORCELAIN

"THAT'S OUR BUSINESS"

Standard and Special Shapes, Regardless of How Difficult

We illustrate one hard shape we make. A pair of rolls 7½" long and 1¼" in diameter with 8 holes on ends and middle. They must be perfectly straight and we make them so. It's hard but not for us. We can make your difficult designs also. Send us blue print for quotations.

Scientific Exchange Columns

UNDOUBTEDLY you have at the present time some things for which you have no further use. Do you wish to sell these things or exchange them for something, for which you have immediate use? There is no surer and quicker way to do this than by advertising your articles in these columns. The **Very** people, the **Only** people, who could possibly have a use for your things read this journal. More than 30,000 interested people will see your ad. It is furthermore the cheapest advertising medium for you in the country. Dealers' advertising accepted in Opportunity Exchange Columns only.

The rates are: One cent per word (name and address to be counted) minimum space 3 lines. Count about 7 words to the line. **Remittance must accompany all orders.**

We reserve to ourselves the right to refuse any advertisement which we consider misleading or objectionable. Advertisements for the November issue should reach us not later than October 5th.

The Classified Columns of "The Electrical Experimenter" Bring Positive Results.

TO SELL — One telescope, 3 feet long, special lens, good condition. Premo camera, pictures 2½x 3 in.; guaranteed; cost $1.50. Both for $1.55 prepaid. Richard Gaillard, 1719 Pendleton St., Columbia, S. C.

I WILL TRADE a complete wireless set, consisting of the following articles for an Indian or Harley Davison motorcycle of late model and in good condition: Loading coil, receiving transformer, 3 detectors, potentiometer fixed condenser, 2 variable condensers, spark coil, gap key, magneto, Holtzer-Cabot receivers, telegraph key and sounder and a 32-cal. revolver. Address Herbert Ewing, Point Marion, Pa. Box No. 62.

HAVE complete wireless set, racing bicycle, miscellaneous electrical goods, two revolvers. Want motorcycle, or make offer. Will also sell separately. All correspondence answered. Maurice Gelb, 74 East 116th St., New York City.

FOR SALE—Wireless outfit. Has single slide tuner, electrolytic detector, peroxide detector, condenser, two-point detector switch, potentiometer. Mounted and connected. Price, $6, or will sell parts separately. Box 84, Newburyport, Mass.

WILL EXCHANGE—$5 Seneca plate camera for spark coil or dynamo. Write to Elmer Dries, 205 S. Market St., Shamokin, Pa.

OLD jump spark coil, telephone generator and receiver, home-made tuning coil, Popular Mechanics 1913, lithograph locomotive model. Will sell or exchange for wireless goods. Ralph L. Kunan, Sabula, Iowa.

FOR SALE OR EXCHANGE—New $7 electric microscope, projector; guaranteed; ¾-inch coil, wireless key, loading coil with switches; $3 Murdock variable, spark gaps, powerful battery motor, excellent portable receiving set, stamp collection 1,000 rare varieties. Want Brandes Transatlantic phones and wireless apparatus. Write D. Goodman, 118 Seventh Ave., McKeesport, Pa.

WILL EXCHANGE—A 1-K.W. closed-core, high voltage transformer and cash for a Type "D" receiving transformer, De Luxe or Blitzen tuner. All correspondence or propositions answered immediately. John B. Hawley, Jr., 912 College Ave., Fort Worth, Tex.

WILL SELL—3,000-meter mahogany, factory-made loose coupler, new type S Dynamo-Motor cheap; Gravity cells, variable condenser printing press motors; can use spark coil. Write anyway. Carl Barnckol, 2317 Milwaukee Ave., Chicago, Ill.

FOR SALE OR EXCHANGE—$45 E. I. wireless goods, shotgun, 8-volt dynamo, 400 exposure kodak, Oliver typewriter, Electric vacuum cleaner, 8-inch fan, Moving picture camera and outfit. Verner Hicks, Marion, Ill.

FOR SALE—$17 takes Blitzen receiving set in perfect condition, without phones. If interested write Chester Fuss, Little Valley, N. Y.

FOR SALE—Fleming valve detector, new, $3, cost $6; 1-inch Bulldog coil, with extra large platinum points, $2.50; No. 9260 Sending condenser, $1.50; Polarized relay, 50 ohms, $2.50. Everything good as new. Max Kuhne, 94 River St., Hoboken, N. J.

FOR SALE—¼-inch Spark Coil, $1.35, postpaid; Spaulding single end punching bag cover, 50c.;; both good condition. Paul S. Potter, Riceville, Iowa.

WILL EXCHANGE—New three slider Tuning Coil, 8 x 12 inches, tested for Arlington, for services any live boy can render. For Sale, slightly used ½-kilowatt "Blitzen" transformer. Lloyd Gress, Pitman, N. J.

WHAT have you to trade? Join my Bureau of Trades. Have over 500 members; trades arranged anywhere. Send for full particulars. 3820 Lee Ave., St. Louis, Mo.

TYPEWRITER—Cost $100. Good as new. Will exchange for $18 Camera, Electrical goods, Books, Mail-order Goods, Musical Instruments, Athletic goods, Bicycle, Automobile Accessories; $18 Cash, or Offer. What have you? Write. Particulars FREE. H. Victor King, Box 3461, Boston, Mass.

FOR SALE—Clapp Eastham Ferron Detector, $5; Manhattan tubular condenser, $3.50; Brownie No. 2 Camera, $2; or what am I offered? Wm. Matthews, care Walbridge & Co., Buffalo, N. Y.

FOR SALE — $15.00 Murdock loose coupler, primary rewound with 140 turns and tapped to two ten-point switches on hard rubber plate. Worth $20; will sell for $10. Murdock tuning coil rewound as 2,000 meter loader with nine-point switch, sliders removed; $2.50; $18 case of Dietzgen drafting instruments; good as new; $7.50. Edwin L. Powell, 1206 E. Capitol, Washington, D. C.

EXCHANGE—One complete wireless receiving outfit. Want canoe or gasoline engine; prefer motorcycle engine, or what have you? All letters answered. Randall O'Brien, Louisiana, Mo.

FOR SALE — Brand new wireless outfit instruments; never used. For particulars, write L. J. Becker, P. O. Box 339, Galveston, Tex.

WANTED—E. I. Co.'s ½ K.W. transformer coil No. 8060. Must be in good condition. Write. Lloyd Copp, Center, Ind.

HAVE $9 worth of American model builder. Would like good loose coupler, or what have you? William Collins, Gran Ville, Mich.

FOR SALE—X-Ray tube in good condition; dia., 4 inches; will sell for $2.75 prepaid; also step-down transformer, $3 prepaid. Write C. A. Barley, 708 Dolphin St., Baltimore, Md.

FOR SALE—Name plates, battery, shunt, phones, aerial, ground, on, off; 2c. a piece. Henry G. Aschbrenner, 7617 Carpenter St., Chicago, Ill.

WOULD like to purchase, second-hand, a Ritchie induction coil; 4 in. or 5 in. spark; good condition. Apt. 9, 2103 N St., N. W., Washington, D. C.

FOR SALE—1,200 meter, loose coupler, $2.25; ½-inch coil, $1.50; fixed condenser, 25c.; plate condenser, 35c.; upright detector, 60c.; Simplex typewriter, 60c. C. Stanley, 405 Jersey St., Buffalo, N. Y.

FIRST REMITTANCE of $1 gets a coherer and decoherer complete; never used; postpaid. Instrument worth $2 when new. Wm. D. Wagner, 123 W. 4th St., Duluth, Minn.

WILL EXCHANGE—A 6-volt, 80-ampere Williard storage battery for polarized relay or phonograph, or what have you? Samuel Cohen, 1936 Pitkin Ave., Brooklyn, N. Y.

FOR SALE—A Baker electric coupe in first-class condition with new batteries; three passenger. On account of illness of owner, will sell at bargain price of $500; cost new, $3,200. S. Gernsback, 817 West End Ave., New York City.

WANTED—One Bulldog 1 inch or 1½-inch Spark Coil. I. Wiley, 1214 E. Madison St., Portland, Ore.

FOR SALE—Resonator, 75c.; Potentiometer, 75c.; Helix, 75c.; Variable Fixed Condenser, 75c.; Fixed Condenser, 25c.; Galena Detector, 50c. Leighton Gilbert, Bristol, N. Y.

FOR SALE—A complete wireless sending and receiving outfit. Cost me $40. Will send for $20. For complete list of instruments send to following address: Horace Hinz, 327 Old Bergen Road, Jersey City, N. J.

FOR TRADE OR SALE—Good D. C. Fan, fourth K. W. Transformer, fine Alto Saxophone, Revolver, etc. Will trade some of these for a good Microscope. Also want Camera, Storage Battery Motor, X-Ray Outfit, etc. Send your list and make offers. L. Smith, Oak St., Ashland, Ore.

BARGAIN—Daily Life of a Railway Mail Clerk, Modern Business Penmanship, New Commercial Arithmetic, Civil Service Manuals 1, 2 and 3, $3 takes entire lot. Mark Kistler, Centreport, Pa.

FOR SALE—1 De Forest Audion Detector (with new bulb and batteries), $15; an E. I. Co. 5,000-meter loading coil, $1.50; Fixed variable condenser, $1; oscillation transformer, $5; a pair of 3,000-ohm "Government" phones, $5; Variable condenser, $2; a Bunnell Mascot Rotary variable condenser, $6; a 5,000-meter navy type loose Coupler, $5. These instruments are in first-class condition. Other apparatus on application. If interested write George D. Todd, Jr., New Albany, Ind.

HAVE one 110-volt D. C. Fan Motor, one A. C. 110-volt, 125-cycle "Emerson" Fan Motor, one Volume of "Practical Electricity and Engineering" and four volumes "Electrical Review and Western Electrician" and some cash. Will exchange for any first-class wireless apparatus; want phones and Audion Detector. What have you? John Kidd, 421 Leslie Ave., Niles, Ohio.

READERS — I want the following magazines: Popular Electrics, 1908, from beginning to September, 1909; January Bubiers Nat. Electrician, 1906; June Elec. & Mechs., 1908; January, 1909; April, 1911; October, 1912; August Elec. Experimenter; 1913, January to April; 1914, January and April. For these will give 40 Elec. Mag., 2,000-ohm headset, or cash. Harold E. Hickey, 1435 Howard St., Philadelphia, Pa.

NAVY Type Loose Coupler; new; $8. Also complete portable set. What have you to exchange? Hathaway, 856 Fulton St., Brooklyn, N. Y.

FOR SALE OR EXCHANGE—Westinghouse step-down transformer, type A, 10-volt amperes, 60 to 133 cycles; in A1 condition. Will exchange for Type O Crystaloi, or 2-inch coil. W. Beattie, 517½ Chestnut St., Lebanon, Pa.

FOR SALE—Two good electric motors in first-class condition; 1-12 horsepower, $5; 1-6 horsepower, $8; 800 feet of good comedy moving picture film, $4. H. David, 711 S. Kedzie Ave., Chicago, Ill.

I WILL EXCHANGE a high-grade cornet for a half or quarter K.W. wireless transformer. Have a lot of copper ribbon for sending transformers. Will sell it out at 3 cents per foot. Henry Graves, Jr., Geneva, N. Y.

SALE OR EXCHANGE—One Weeden toy motor; 1-20 ohm sounder; 2-50 ohm relays; 1 small Leyden jar; 1 D.P.S.T. switch; 1 voltmeter; 1 telephone transmitter. Alexander V. Bollerer, 77 Linwood St., New Britain, Conn.

WILL SWAP electrical chemistry and books on physics for anything useful. Henry Priebe, Kent, Ohio.

WANTED — One-inch spark coil and gap; good condition. Have electric engine and car, 80 feet track; one railway switch; same as new; value, $9. L. D. Smith, 28 Poinier St., Newark, N. J.

EXCHANGE — A Gem adding machine in good working condition; cost $10. Want a pair Brandes Transatlantic phones or a good 110-volt Universal motor speed range from 3,000 to 8,000 r.p.m. with load. O. W. Nelson, 4333 Elm St., Calumet, Mich.

FOR SALE—Two one-inch coils, $2.50 each; two small motors, 50c. each; quarter-inch coil, 75c. Moershfelder, 34 Ketchum Pl., Buffalo, N. Y.

FOR SALE—Four H.P. Excelsior motor cycle engine with carb., $15; 4 H.P., 2 cycle, 3 port engine; use as stationary, marine or portable, with carb. coil-less oil cups; used very little; $25; one set cycle car wheels, axles, tires and tubes, set of steel castings for four cantilever Krupp springs, $60. For further description, E. W. Jenny, 3821 W. 34th St., Cleveland, Ohio.

FOR SALE—Complete Wireless Outfit. Consists of double slide tuner, condenser, potentiometer, detector, buzzer, 1,000-ohm receiver, 1½-inch coil, fluted zinc gaps, helix, condenser and key. All mounted on suitable base. No home-made instruments. $6. Portable receiving set, consists of loose coupler, galena detector, condenser; all in good case, $2.50. Motors, telephones, cameras, aerial and magnet wire. Write for particulars or send money. Everything guaranteed. Paul Woodward, Rodney, Iowa.

WANTED—2,000-ohm headset, or one good loose coupler. Have relay marked 200 ohms and sounder marked 20 ohms. Will trade for any of the above, or will sell cheap. Wilber E. Dittemore, Redmond, Ore.

SALE OR EXCHANGE—Complete wireless set, consisting of 1-inch coil, helix, gap, condenser, key, aerial switch, double slide tuner, galena detector, receiving condenser, single headset, Brandes 1,000-ohm receivers, binding posts. Will either sell or exchange for Audion or Variable condensers. Jeter Pinkston, Valdosta, Ga.

EXCHANGE—Murdock Tuner, variable, cash for ½ K. W. condenser; also other apparatus to exchange for good transformer. Give description to Arthur Sacka, 2670 E. 40th St., Cleveland, Ohio.

FOR SALE—Large Electro tuner, $1.75; variometer, 50c.; 11-plate variable condenser, 75c.; 9-volt rotary gap (8 electrodes), $2.50. All instruments in excellent condition. Stuart W. Pierson, Carrollton, Ill.

"HYTONE"—½ K. W. set for sale; condition excellent, price very reasonable. This apparatus, operating station 1HA, now 1ZW, has covered remarkable distances. Record, 650 miles. Come and inspect apparatus personally if possible; if not write for photo and description without delay. Have just installed more powerful set. Wm. H. Allison, Worcester, Mass.

A COMBINATION 4 x 5 or 5 x 8 Plate Camera (Tripod, one French and one Morrison Wide Angle Lens (each cost $25), Plate Holders, carrying cases, etc.; a bargain. W. E. Day, Pittsfield, Mass.

I HAVE 3 transmitters, 2 ringing boxes, 2 telephone receivers, 1 desk telephone, 1 Edison Primary battery, 1 telephone generator worth $25. Will swap for wireless set or apparatus. R. C. Bayley, 16 Main St., Plymouth, N. H.

FOR SALE—Set Ives Electric Train, 3 pieces; 8 Curve, 10 Straight, Third Rail Track, practically new, worth $6, will sell for $3.50. H. Ananiantz, 700 West Washington, Los Angeles, Cal.

WANTED—A 2,000-ohm double headset, each receiver 2,000 ohms. R. B. Watt, Box 1, Stapleton, N. Y.

FOR SALE OR EXCHANGE—Rotary Spark gap to work on dry batteries, Geissler tube, Harper's Aircraft Book, Spark gap, set of Meccano No. 3, Carl Seternfeld, 305 Lexington Ave., New York.

FOR SALE—Omnigraph Dunduplex transmitter, sounders, relays, keys, aerial insulators, small motor, tape transmitter and wireless goods. Write for list. John L. Bowman, Reinholds, Pa.

FOR SALE—$14 electric railway, $5; $2 omnigraph, $1; $6 worth Magic, $3.50; two $2 stamp albums, $1 each. For particulars write Franklyn Stratford, Bentley Ave., Jersey City, N. J.

FOR SALE—2 Electrolytic Detectors (new), $1 each; 1 Three Slide Tuner, $2; 1 Toy Motor, 50c. All in perfect condition. Miles F. Ham, 21 Crosby St., Augusta, Me.

FOR SALE OR EXCHANGE—160 Watt set, value $15; 400 watt impregnated condenser, $8; Davis battery motor, $4; Stevens single-shot rifle, $7. Write for list. Money or transmitting apparatus wanted. Make offer. H. Smeltzer, Norwood, Mass.

ELECTRICAL—35 K.W. Westinghouse Alternator, right for a small town plant, $300 in payments of $20 per month. 18 K.W. 220 volt direct current generator will carry 900 regular 16 candle Tungsten lamps, $200 in payments of $15 per month. 16 cells storage battery in good condition $35. Electric Bath Cabinet $25. Box M, Troy, Ohio.

FOR SALE OR EXCHANGE—Stevens' "Favourite" 22 cal. rifle, value $3; will trade for Crystaloi or Radioson Detectors. Gartz Windenburgh, Lamont, Iowa.

EXCHANGE—Brass upright Microscope, $1.75; Kodak, Premo Jr. No. 1, 2¼ x 3¼, $1.80. Want Loose Coupler, not home-made. Porter Bennett, Mesquite, Tex.

FOR SALE—½-H. P., 110-volt A. C. motor, $27.50. Will buy or trade 2-inch coil. C. P. Kelley, Irving, Ill.

FOR SALE—4 x 5 print washer, used once; two 8 x 10 trays, dark room lamp, Drake's Multiple Picture attachment, size 4 x 5; acetylene bicycle lamp; Year 1913 Scientific American, Spaulding's Note, Speller. Write for description and prices. Donald L. Zook, Denver, Ind.

FOR SALE—First-class wireless set at moderate price. Write for particulars. Gogerty, 210 Reid Ave., Brooklyn, N. Y.

FIRST MONEY ORDER for $10 takes either my 16-V. dynamo or ¼-H. P., 110-V. D. C. Motor or 1-H. P. Gas Engine. Maurice Lane, Geneseo, Ill.

FOR SALE—One Electro Loading Coil, $1.75; one Electro Loose Coupler, $2.25; one No. 2 Brownie Camera, $1.60; all for $5. Merwin Finkelstein, 308 Eddy St., Ithaca, N. Y.

FOR EXCHANGE—Eastman folding kodak, Medical Coil, Stepdown Type "N" transformer, cost $4; Electro and Delta electric bicycle lamps, Book "Practical Electricity," cost $2; two electro magnets; all goods new; value $23. Exchange for good wireless receiving set. Write and tell what you have. Ray M. Casper, 621 E. Innis St., Salisbury, N. C.

EXCHANGE—Variable Condenser for Telegraph Instrument, Switch Block, Silicon Detector and Fixed Condenser for Telegraph Instrument; Murdock Spark Gap and Buzzer for same. Harold Bonney, 103 Spruce St., Pana, Ill.

EXCHANGE—Solar bicycle lamp, cost $2.50, for water motor, standard thread faucet. B. Bergman, 120 N. 109th St., Chicago, Ill.

FOR SALE OR EXCHANGE—Loose Coupler, tuners and other wireless apparatus; have a number of pieces. Make offer. William Lesky, 2800 Snyder Ave., Philadelphia, Pa.

FOR SALE—Entirely new pumping outfit, 1½ H. P. engine, 10-foot belt pumpjack, $26; good coaster brake bicycle, $9. Frank Fish, Geary, Okla. R 1.

FOR SALE OR EXCHANGE—One Spark Gap mounted on marble base, 50c.; one Cat Whisker Detector mounted on slate base, 60c. R. A. Clapp, Groton, N. Y.

FOR SALE OR EXCHANGE—One motor and bicycle. Write for particulars. Lloyd W. Cameron, West Collingswood, N. J.

FOR SALE OR EXCHANGE—Sending and Receiving set. All in good condition. Write for information. Anythony G. Jurincic, 9550 Commercial Ave., Chicago, Ill.

FOR SALE—3A Brownie Camera (post card size). It is brand new; has never been used. Price $9, if taken at once. E. Haugerud, Scappoose, Ore.

FOR SALE OR EXCHANGE—Chemical laboratory outfit, nearly 300 pieces; will sell whole or in part. 8 Vol. Cyclopedia, I. C. S. Text-books of Chemistry and Electrical Engineering. Also other books and articles. Sell cheap for cash. Will exchange for suitable articles of equal value. Complete lists exchanged. M. Wand, 118 Crane St., Schenectady, N. Y.

WANTED—Receiving and sending instruments. Transformers from 1-6 K .W. to 1 K. W., Variable condensers, etc. Have one set of six books of the Practical Reference Library (fine), Automobile course, rifle, relay, omnigraph, story books, camera, revolver, home-made voltmeter, ammeter, galvanometer, Wheatstone Bridge and old magazines. Walter Franseen, Woodhull, Ill.

WANTED—Crystoli detector and variable condenser by September 20 for portable set (2-switch navy type tuner, detector and condenser), moving picture machine (electric), value $4.50; ¼-inch spark coil, in excellent condition. Thomas Steringer, 260 Hudson St., New York.

FOR SALE—Duck's new 1915 Detector with silicon, 1 New Rotary Spark Gap; never been used. All for $5 cash. M. H. Chapman, Baldwinsville, N. Y.

HAVE ½-inch Coil, zinc Gap, strap key, 4-plate condenser. Trade for loose coupler or Brandes receiver and Double headband. Garwood, 84 King East, Toronto, Canada.

WANTED—To buy a few Geissler or vacuum tubes, also an X-Ray tube. Albin Lundquist, Cable, Wis.

EXCHANGE—One Companion Lathe and Scroll saw in good shape, price, new, $8.50, for 2-inch Spark coil or other electrical apparatus. Leland Jones, Warrensburg, Mo.

Advertisements for November issue should reach us not later than Oct. 5.

BOOKS

YOU

Never will be able to understand yourself, much less GOD'S PERPLEXING WAYS, nor a great many other problems of LIFE and AFTER-LIFE, unless you read the results of thirty years' investigation by Erardus Sagra, entitled "THE MIGHT OF TRUTH"; a production **in as concise a form as possible**; not based on imagination or possibility (called hypothesis) but on plain self-evidence; **written in popular language**; and, so far, not refuted by the most eminent men of science or religion, for the simple reason that they learned the Truth, which in itself is Divine. A progressive reader says: "You do not know how much help and satisfaction the results of your investigations gave me." Another reader said: "Your production 'THE MIGHT OF TRUTH,' is the most beautiful book I ever read." **Index and first 4 pages Mailed Free on application**; and if you save this copy of THE ELECTRICAL EXPERIMENTER you can save 50c. (the retail price is $1).

In case you order "THE MIGHT OF TRUTH," enclose this announcement with your order, which will take a few days to fill. Money refunded if anyone can prove an untruth in this announcement. Address M. T. Dept., Box 2034, Middle City Sta., Philadelphia, Pa.

HAVE YOU SEEN A COPY?—Amateur Photographer's Weekly, $1 per year; weekly prize competitions; criticisms; print exchange; illustrated; many features. Three months' subscription 25c. Amateur Photographer's Weekly, 915 Schofield Bldg., Cleveland, Ohio.

360 POPULAR TOASTS—Selections suitable for all occasions; just what you need at an evening supper; 10c. Wedge Manufacturing Co., "KM.," Binghamton, N. Y.

FORMULAS

ANY FORMULA you want; 20 cents. Edwin Powell, 1206 E. Capitol, Washington, D. C.

BOYS—Make a small electric stove; easy to make; uses ordinary house current; dime for complete directions. Richard Gaillard, 1719 Pendleton St., Columbia, S. C.

FORMULAS

INKS—8c., 4-25c. P. Waldie, 21 Woodbury, Beverly, Mass.

FREE—Six valuable formulas. Easy to make—metal polish, "Resisto" cement, transparent soap, washing compound, eczema treatment, complexion beautifier. Send 2c. stamp. Daley & Meyer, 688 President St., Brooklyn, N. Y.

HOW to nickel plate. Formula, $0.50. E. F. Ball & Co., Buckland, Conn.

FOR INVENTORS

DRAWINGS made for inventors. Consulting Engineer, EE-3240 Seminary Ave., Chicago.

HELP WANTED

EARN MONEY at the fairs; instructions, 50c. E. F. Ball & Co., Buckland, Conn.

MISCELLANEOUS

THERE is but one Telegraph School that places all graduates direct in the Railway Telegraph service. It is Pelnars, Madison, Wis.

A POWERFUL oxy-hyd. dissolving view stereopticon outfit capable of making a 40-foot picture; complete with lecture sets and large assortment of colored dissolving views; a rare chance to get a large outfit at small price. W. E. Day, Pittsfield, Mass.

Our New Big 216 PP. Electrical and Wireless CATALOG

IS THE EXPERIMENTER'S REFERENCE BOOK

The Best Bargain in This Magazine is

No. 7729.

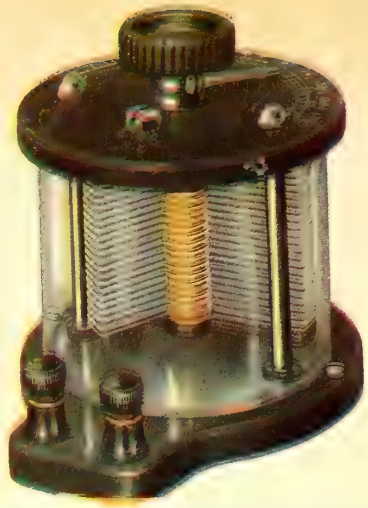
The Amco Navy Type Receiving Transformer

Represents the latest advances made towards the ideal tuner and embodies the greatest degree of perfection yet obtained. No greater value can be secured where accurate selectivity, sensitiveness and finish are desirable. The illustration shown herewith cannot possibly do justice to the instrument itself. The primary winding is enclosed in a cabinet, the sides and top of which are polished hard rubber. Two 15-point switches are mounted on the front. One switch controls the primary in groups of several turns and the other controls one turn at a time. The entire variation of the primary is thus secured by the rotary motion of two knurled knobs rather than the movement of a slider, and may be varied from **1 to 225 turns in steps of one turn at a time.** The windings are especially adapted to long wave lengths. The secondary is wound with green silk covered wire. The ends are HARD RUBBER, turned and polished. Secondary variation is secured by a 12-point switch which makes it possible to secure a very fine adjustment. **PRICE, ONLY $15.00.**

SEND 6 CENTS FOR OUR CATALOG—DO IT TODAY—YOU NEED IT

ARE YOU BUILDING SOMETHING?

Our No. 6 CATALOG shows several hundred parts and sets of materials for building your own apparatus at home which have never before been listed. We do all the difficult work in our factory and then you put them together.



WE HAVE JUST WHAT YOU HAVE BEEN LOOKING FOR

Complete description and prices of the Latest Electrical and Experimental Apparatus—Storage Batteries, Rectifiers, Transformers, Induction Coils, Wireless Apparatus, Lamps, Flashlights, Meters, X-Rays, Books, Tools, Electric Railways, Steam Engines, Water Motors, Dynamos, Motors, Telegraphs, Telephones, Electrical Supplies, Model Aeroplanes and Parts for building your own apparatus. A Treatise on Wireless Telegraphy, telling how to put up an aerial, connect apparatus, together with a Call List and Wiring Diagram, FREE with every catalog. 6c. in stamps will bring you this wonderful book. The best catalog of wireless apparatus, etc. published.

The only Transparent condenser that can be filled with oil.

Highest Quality

AT THE

Lowest Prices

IS THE

E. I. Co. Motto

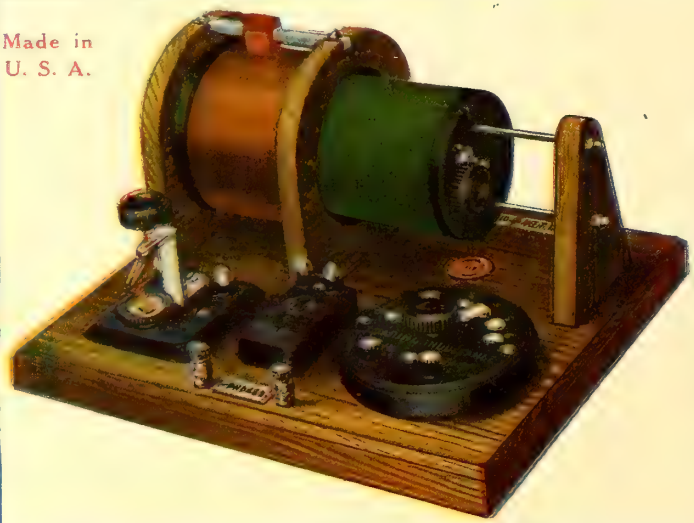
ROTARY VARIABLE CONDENSER

The only rotary variable condenser on the market that really marks an advance over those previously offered. The advantages of the Electro rotary variable are as follows: Connections at bottom handy and convenient. The only glass cylinder condenser which will hold oil without leakage. The use of oil doubles the capacity. Calibrated scale with stops that can be omitted if desired. The only condenser that can be screwed down to a table. Made in 2 sizes both a wonderful value.

No. 9240. Electro Rotary Variable Condenser. 17 plates. Size 4 1-8 x 3 7-8 in. **$2.25**
Capacity .0004 microfarads. Shipping weight 2 lbs.

No. 9241. Electro Rotary Variable Condenser. 43 plates. Sizes 4 1-8 x 3 7-8 in. **$3.75**
Capacity .001 microfarads. Shipping weight 3 lbs.

REMEMBER



We were established in 1904 and are the oldest and best known Electrical Experimental supply house in the world. The E. I. Co. sold the first Amateur Wireless outfit in this country in 1904. You buy established successes from us, not experiments.

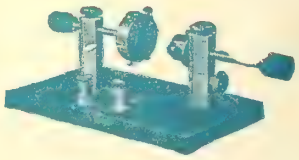
Are You Losing the Weak Signals?

ARE the receivers you use merely high-wound **telephone** receivers — which bring in ordinary signals clearly enough, but **miss altogether** the weak, long-distance ones?

Or are they real **wireless** receivers — sensitive enough to bring in even the extremely weak signals?

Until you have actually tried Brandes Receivers you will never know how many signals you may now be failing to receive because of inefficient receivers.

They are designed, made and used **solely as wireless receivers.** They have Sensitiveness which is surprising — Tone which is absolutely uniform — Lightness which permits their use for hours without causing fatigue. Comparison with any other make will prove these points of superiority to you.



To-day—write for our new CATALOG E, containing important information about radio receivers, as well as full information about our several types of Head Sets. Enclose 2c. stamp.

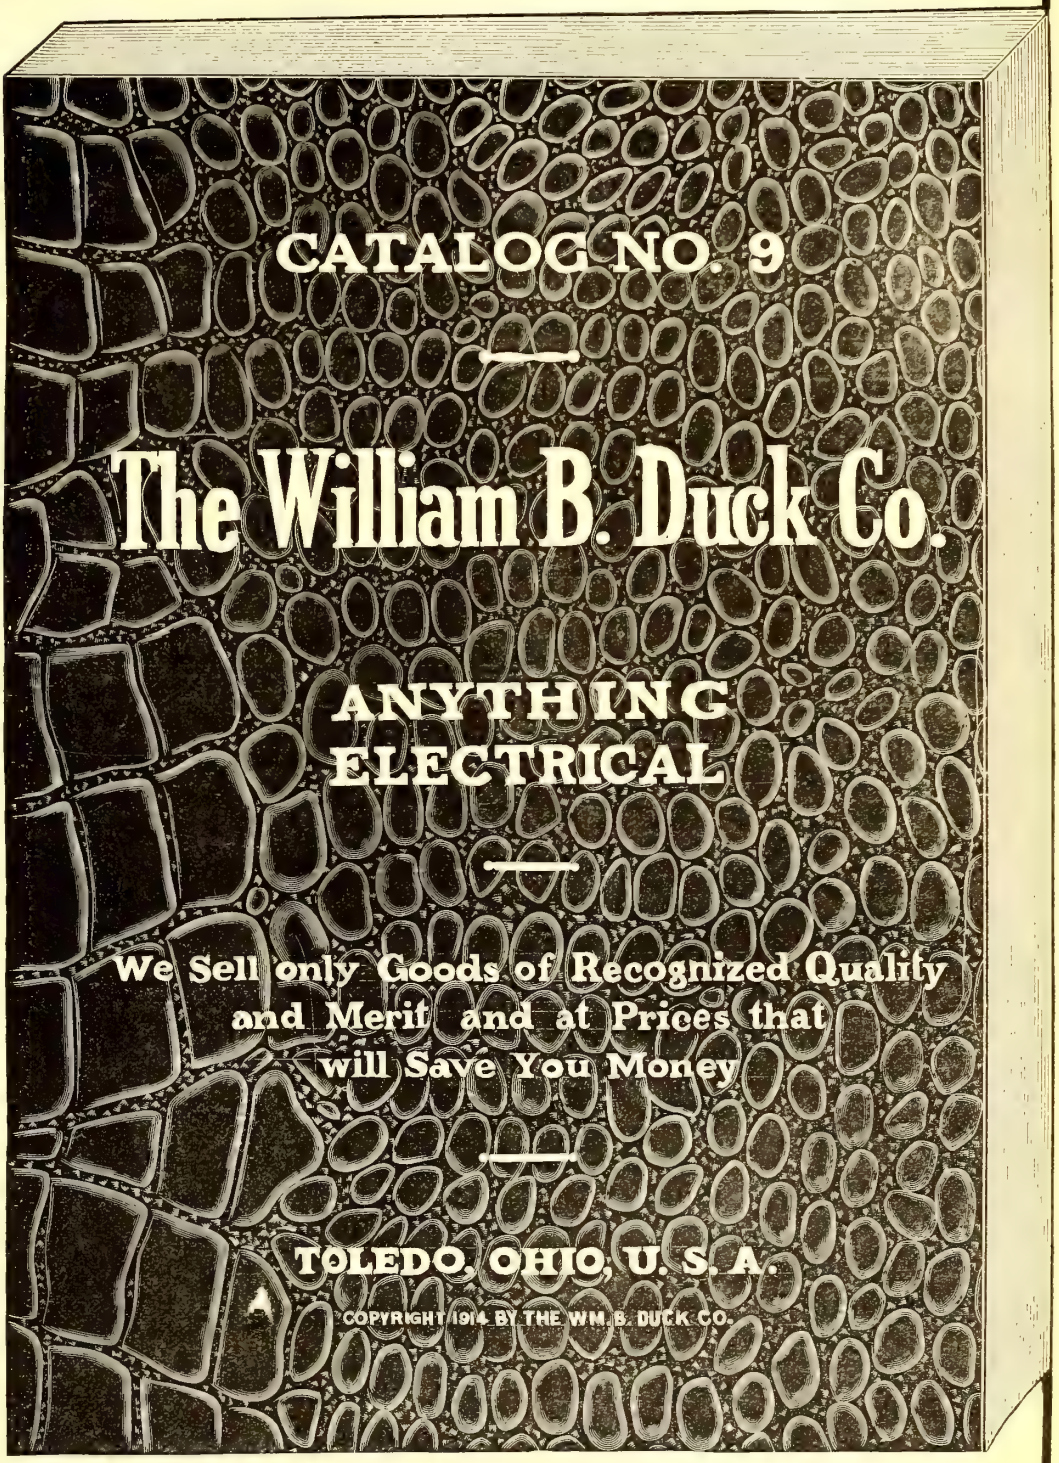
DUCK'S No. 9—325-PAGE

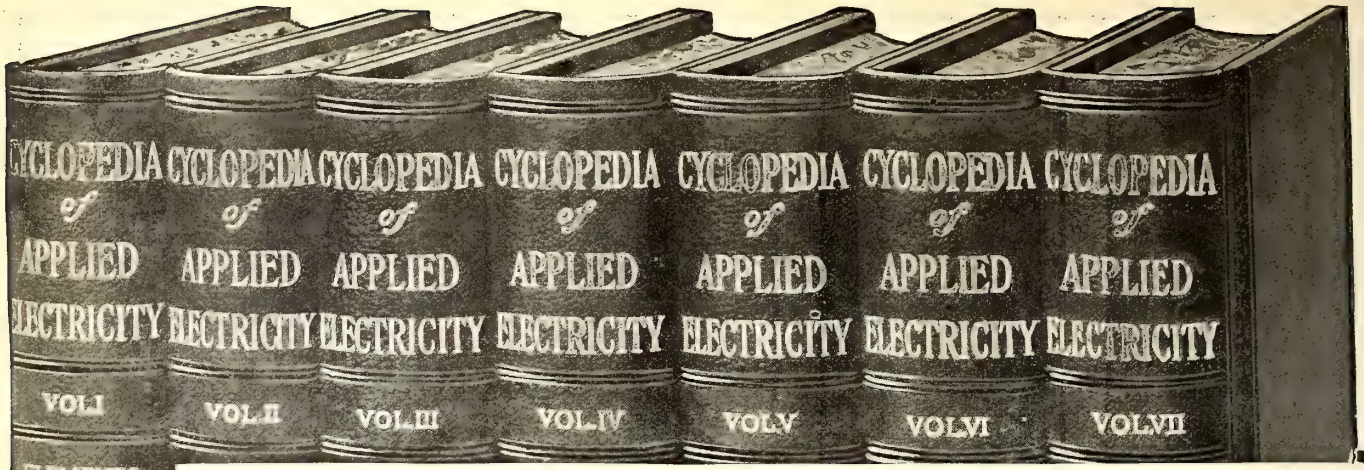
Electrical and Wireless Catalog



Ready on October 20th

40 more pages of wireless instruments at more attractive prices than ever.

Also many new items in electrical supplies at substantial reductions in price.



What This Big Catalog Contains

160 pp. Wireless Apparatus for Commercial and Experimental use.
10 pp. Raw Material,
5 pp. Transformers,
8 pp. Storage Batteries
15 pp. Telegraph Insts.,
42 pp. Motors and Dynamos,
10 pp. Miniature Lamps,
8 pp. Flashlights,
5 pp. Massage Vibrators,
10 pp. Miniature Railways,
5 pp. Lighting Plants,
10 pp. Ammeters and Voltmeters,
25 pp. Electrical and Mechanical Books,
12 pp. Telephone Equipment,
10 pp. Auto Accessories,
13 pp. Victrolas, on our Easy Payment Purchase Plan (No Down Payment),
30 pp. General Electrical Supplies.

THIS UNRIVALED CATALOG MAILED TO ANYONE UPON RECEIPT OF 8 CTS. IN STAMPS or coin, which may be deducted on first dollar purchase. Great cost of catalog and low prices prohibit distribution otherwise.

THE WILLIAM B. DUCK CO., 230-232 Superior Street TOLEDO, OHIO

World's Greatest Electrical Library SENT FREE FOR EXAMINATION

Send the coupon today—*now*—for your free-for-examination set of the world's greatest electrical library. The new 1915 edition, just off the press, is recognized by big men in the electrical field as the most practical work of its kind ever published. Covers completely the generation and use of electricity for power, light, transportation and communication, including the construction and operation of dynamos and motors, central station engineering and telephone work, as well as *wireless telegraphy and telephony* and land and submarine telegraphy. Particularly helpful in its exhaustive treatment of electrical "troubles" and their remedies.

Earn $150 to $250 a month Electrical Engineers earn from $150 to $250 a month. The work is pleasant—the hours short. These great books will fit you, in your spare time, to enter this fascinating, well-paid work. No previous experience necessary.

Cyclopedia of Applied Electricity

New 1915 edition contains 3,500 pages, 7x10 inches; 3,000 illustrations, full page plates, diagrams, etc.; hundreds of valuable tables and formulas; carefully cross-indexed for quick, easy reference. The books are substantially bound in half red morocco, gold stamped, and are printed in large, clear type on special quality paper.

50c a week Upon receipt of the coupon below the complete seven volumes, not a sample volume, will be sent, express prepaid, for seven days' free examination; returnable at our expense if they fail to meet with your expectations. If you keep them, pay $2 seven days after receipt and then $2 a month—50c. a week—until you have paid the special introductory price of $19.80, saving $15.20, as the regular price of this new and enlarged edition is $35.00. As this offer is for immediate acceptance only, fill in and mail the coupon to-day. It won't cost you a cent to examine these books, so get them into your home, shop or office and look them over at your leisure. Remember, if you don't like them they may be returned at our expense and you won't be out a penny. One of the most liberal offers ever made. You can't afford to pass it by.

What These Books Cover

Elements of Electricity—Electrical Measurements — Underwriter's Electrical Requirements — Theory, Calculation, Design and Construction of Direct Current Generators and Motors—Types of Generators and Motors—Management of Electrical Machinery—Electric Lighting — Alternating Current Machinery—Power Transmission—Electric Railways—Self-Propelled Railway Cars—Trackless Trolleys—Power Stations—Switchboards and Switching—Storage Batteries — Applied Electro-chemistry — Electric Elevators—Electric Welding and Heating—Wireless Telegraphy and Telephony—Land and Submarine Telegraphy.

This Coupon Worth $15.20 to You

American Technical Society, Chicago, U. S. A.

Please send me Cyclopedia of Applied Electricity for seven days' examination. If I keep the books, will send $2 within seven days and $2 a month until $19.80 has been paid, when $35 books and $12 consulting membership will be mine. Otherwise will notify you and hold books subject to your order. Title not to pass until fully paid.

Elec. Exper. 11-15.

New York to Honolulu by Radio Phone

SEPTEMBER 29, 1915 marks another milestone in the history of Wireless. On that date, for the first time, the human voice was projected through free space over the immense distance of 4,900 miles. The new wireless telephone here triumphed over the old wire telephone in an astonishing manner, for up to this time the greatest distance covered by the wire telephone was but 4,750 miles. Nor is the vanquishing of this enormous distance by the Radio Phone the greatest accomplishment of the feat as a whole. For when Mr. Vail at New York on that memorable date hurled his voice through 4,900 miles to Honolulu, where Lloyd Espenschied caught it over his aerial, Mr. Vail was not using the Wireless Phone at all. He spoke into an ordinary desk phone transmitter and his voice was thence relayed by the big Arlington Wireless station. Here, by means of gas valves of the Audion type, the impulses of the voice were "stepped up" till they were finally strong enough to operate the sending apparatus. Thus the feeble voice arriving at Arlington absolutely controlled several hundred horsepower —300 *kilowatts to be accurate*—and it was this enormous energy that was then radiated out into space for thousands of miles. While we know definitely that during this test the human voice was carried through 4,900 miles of ether, it is quite certain that the impulses were carried much further than this distance. Indeed, we do not doubt that if we had only the proper receiving apparatus, Mr. Vail's voice could have been clearly heard over twice the covered distance. Indeed we are not at all sure that the waves from the smallest amateur station do not travel all around the world. While this may sound fanstastic, let us consider that each succeding year, as our detectors become more sensitive, less and less power is required for transmitting. With a modern amplifying set, small stations can now be heard over astonishing distances, never dreamt of less than a decade ago.

In this respect we can compare the detector with a telescope. The more we can magnify, the further we are enabled to see, and there seems to be no limit to the distance that can thus be covered. It is precisely the same with a Radio detector; the more sensitive we can make it, the further away will we be able to receive messages from a given station. There seems to be no limit to the distance that can be covered in this manner.

Truly, while this recent feat has been a signal achievement, we confidently look forward to that time—not far off, we think—when it will be possible to talk from New York to Chicago with a power derived from six small dry cells.

H. GERNSBACK.

(Illustration shows container with cover off and battery partly inserted)

MESCOLITE WILL MAKE YOUR WAY SAFE and BRIGHT

in garage, barn, cellar, closet; in camp; on the motor boat; for the dark country road or any other situation where a lantern, lamp or candle is used, besides many places when an open flame would mean fire, explosion and disaster.

The MESCOLITE consists of a japanned metal container with cover, fibre disc with battery contacts, polished metal reflector, clear glass lens, miniature battery lamp, lens cap or rim with three bayonet catches, a non-detachable bail or handle large enough to allow the arm to go through it, and a RED SEAL Dry Battery. The light is strong, bright and steady and absolutely unaffected by weather conditions. For efficiency, economy and serviceability it is unsurpassed by any other battery lantern. Another good feature is that the battery cannot be inserted in the container in any other way than the RIGHT WAY.

The Red Seal Battery will give about twenty-five hours of continuous service and from forty to fifty hours of intermittent service. Always use the RED SEAL Dry Battery in preference to any other. It does not deteriorate when not in use. If the RED SEAL Dry Battery cannot be had any other standard size dry cell can be used.

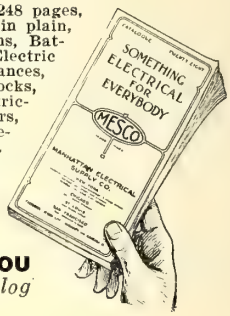
The MESCOLITE can also be supplied with a "Special" two cell dry battery which will give approximately 60 hours of continuous and 120 hours of intermittent service.

No. 5343—MESCOLITE, complete with RED SEAL Dry Battery 1½-volt lamp.....$1.50

No. 5344—MESCOLITE, complete with "Special" two cell dry battery.....$1.75

Send for Our Manual No. 9 on Wireless Telegraghy

You should have it even if only superficially interested. Around about you every day you read of some marvelous occurrence in which wireless played a distinguished part. It may not be entirely clear to you. The Manual will explain it. To the student of Wireless Telegraphy the Manual contains much that is indispensable to a proper understanding of the art. A good portion of this is now published for the first time—and consists of formulas, tables, diagrams, Federal regulations, codes, diagrammatic instruction for installing, maintaining and operating wireless stations, together with a complete list of up-to-date wireless instruments and accessories.



The Manual contains 120 pages, fully illustrated on high-grade paper stock with a two-color cover.

We ask ten cents ($0.10) for it—give you a coupon receipt which can be applied on any order amounting to One Dollar ($1.00) or more.

Do not wait until some other time, but sit down now and send your name and address, and get one of the most complete, comprehensive and reliable wireless pamphlets published.

Send for Our New Catalog W 28

It is pocket size, 8x4½ inches, contains 248 pages, with over 1,100 illustrations, and describes in plain, clear language all about Bells, Push Buttons, Batteries, Telephone and Telegraph Material, Electric Toys, Burglar and Fire Alarm Contrivances, Electric Call Bells, Electric Alarm Clocks, Medical Batteries, Motor Boat Horns, Electrically Heated Apparatus, Battery Connectors, Switches, Battery Gauges, Wireless Telegraph Instruments, Ignition Supplies, etc.

There exist a thousand and one ways where electrical devices may be used, and to know what is best for your purpose you need this catalog.

IT MEANS MONEY SAVED TO YOU
to have our Manual and our Catalog when you want to buy.

Vol. III. Whole No. 31 NOVEMBER, 1915 Number 7

The Electro-Magnetic Gun and Its Possibilities

WHILE we have heard of many different kinds of life destroying guns and other weapons during the present European conflict in all its magnitude, there are probably not many of us who have stopped to think of the possibilities of a somewhat unknown invention which relates to nothing less than the hurtling of large projectiles through space by means of electro-magnetism properly applied to a gun or cannon barrel.

There have been several patents issued on such devices, but to our knowledge none of these have been adopted by any of the world powers. As an introductory explanation reference may be made in this connection to Fig. 1, and undoubtedly the reader will then be able to grasp, with the aid of the following explanatory remarks, about how the various inventors of the electro-magnetic guns intend hurling their projectiles at the enemy with hair-raising rapidity and accuracy.

Referring to Fig. 1, and for the sake of simplicity, we may consider that but three electro-magnetic coils are in use as at 1, 2 and 3 along the gun barrel. It may be said that invariably such a gun barrel should have an inner lining of brass or bronze, so that the projectile which is usually made of a magnetic material (such as iron or steel), will not bind within the barrel. The barrel proper can be made of iron properly divided, but an all-brass barrel is common. Now consider that the three magnet coils, 1, 2 and 3, are connected up to a switch as shown. If, then, an iron projectile is placed in the position A, and the current caused to flow through the coil 1, the electro-magnetic field of force set up within the gun barrel will tend to pull the projectile forward in the direction of the arrow. It should be mentioned before going further that the iron barrel (if used) of the cannon or gun is divided up into several distinct sections so as to localize and intensify the magnetic pull on the projectile at each new impulse.

Of course, this scheme outlined at Fig. 1 is only mentioned to bring out the general theory of how these guns are supposed to operate. To continue: when the projectile has reached the position of coil 1 the control switch is moved so as to cut out coil 1 and to connect coil 2 into circuit. If this is done quickly the projectile will have been sucked forward on a line with coil 2. The operation is again repeated and the switch is moved so that coil 3 will be put into the circuit and coils 1 and 2 opened. Thus the projectile will again be pulled forward to section 3, and at the instant it reaches the center of the *final coil* the current is cut off and the momentum acquired by the projectile is relied upon to carry it on and out of the muzzle of the gun at B. This design is the basis of most of the patents on this unique device, which has yet, we may say, to be proven in a practical sense for modern warfare requirements, although it seems indeed to possess possibilities if the details are properly worked out.

The wash drawing illustration here presented at Fig. 2 shows how we may conduct warfare in the future if the powers that be still think that the only way to settle an argument is by main strength and ignorance. In our illustration is shown a probable development of a large electro-magnetic field gun mounted on a massive iron frame-work fitted with large caterpillar wheels, as observed, so that it is mobile enough to be quickly hauled from one place to another on the battlefield or for siege purposes. When used for portable requirements it will invariably be necessary, if such guns are ever adopted, to provide a complete portable electric generating plant as is shown in the picture. This would comprise a powerful gasoline engine direct connected to a suitable electric dynamo.

Some idea of the probable size of such guns may be obtained when it is stated that one of the best designs ever worked out on this principle, and due to Prof. Birkeland, has a barrel 90 *feet in length.* The projectiles used in this gun would be about 9 feet long and have a diameter of 19 inches. Also to gain the maximum magnetic pull by this arrangement it is recommended that the projectile be wound with coils of wire so as to be electro-magnetically reactive in conjunction with the regular magnetic disc coils placed along the barrel of the gun as perceived. In order to facilitate the passage of the projectile through the barrel of the gun with the least friction we strongly suggest that suitable lubrication be provided by means of grease or oil cups placed along the barrel at intervals; these may be observed in our illustration Fig. 2.

It must be remembered that these guns would not heat to any appreciable extent and not at all compared to the heat produced in the modern high powered guns using explosive charges of powder. Due to this and other obvious reasons such a gun as this can fire a great number of larger caliber shells per minute, possibly fifty to seventy-five shells in one minute. It will be seen from the foregoing that such a discharge of 19-inch shells, each of which contains a very high explosive powder charge, would serve to quickly rout the enemy, no matter how well he might be entrenched or ensconced behind fortified embankments. A rain of such monster shells would batter down almost any fortification whether natural or built by man. A method is suggested in the illustration of this electro-magnetic gun of the future whereby a constant supply of shells for rapid firing can be always maintained before the open breach of the gun. The shells might be hoisted by means of a gasoline engine and run on the platform at the left and then allowed to slide by gravity down the inclined chute. As fast as one of the shells is sucked into the breach of the gun barrel it is followed by another one right after it successively. It is easily possible to have means of firing the shells as far apart, in respect to time, as is deemed advisable, of course. The electric current supplied through the coils along the gun barrel can be controlled through a suitable switch by the man aiming the gun and who may be located alongside of the breach of same as perceived in our illustration.

Such guns as these firing 19-inch explosive shells may have a range of twenty-five miles or more. The shells may carry time fuses, or they may be of the concussive explosion type, whereby they do not explode or burst until they hit the ground or the wall of a fort, etc.

Of course, these magnetic guns are practically noiseless and naturally also absolutely smokeless. Furthermore the wear and tear or depreciation, in so far as the gun barrel lining is concerned, is very low compared with modern cannon and other arms using explosive charges to expel the bullet or shell from the barrel of same. The shells or bullets in such cases must fit very tightly so as to prevent the exploding charge in the gun barrel from leaking out and at the same time to force the shell outward with all available power. In magnetic cannon the shell does not

THE ELECTRICAL EXPERIMENTER is published on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. The subscription price is $1.00 a year in U. S. and possessions. Canada and foreign countries, $1.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 10 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of THE EXPERIMENTER PUBLISHING CO. INC. All communications and contributions to this journal should be addressed to: Editor, THE ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full return postage has been included. ALL accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.

THE ELECTRICAL EXPERIMENTER. Monthly. Entered as second-class matter at the New York Post Office, March 1, 1915, under Act of Congress of March 3, 1879. Title registered U. S. Patent Office. Copyright, 1915, by E. P. Co., Inc., New York. **The contents of this magazine are copyrighted and must not be reproduced without giving full credit to the publication.**

necessarily have to fit the barrel tightly and thus friction can be vastly reduced. Moreover, there is no pitting or other wear on the inside of the barrel, due to powder explosions as just mentioned.

At Fig. 3 is shown a patent issued to S. T. Foster, Jr., (No. 811,913) on an electro-magnetic gun. This patent will serve to give a fair idea as to the general make-up of these devices intended to supplant the modern artillery now in use by world powers. Mr. Foster arranges a series of powerful electro-magnetic coil windings along the non-magnetic gun barrel 11-12. The magnetic projectile made of iron or steel is placed in the breach at 11, just far enough to reach the electric contact 1. When this contact is depressed by the shell it closes the electric circuit through the magnetic coil 15. This causes the shell to be pulled forward, and as the forward section of the projectile then engages the cut-out switch 2, it depresses same and excites the magnet coil 16. The projectile is then pulled forward electro-magnetically until it is in line with coil 16, and simultaneously actuates the cut-out switch 1, which opens the circuit to coil 15. At this instant, generally speaking, the shell in sliding forward into line with coil 16 has engaged the cut-out switch No. 3 and this closes the coil circuit 17, thus the shell is pulled forward into line with that coil and coil 16 is cut out of circuit, owing to the contact 2 having reset itself automatically.

Thus it will be seen how the iron projectile is propagated through the barrel toward the muzzle 12. The operation previously described repeats itself until the shell reaches the position of coil 23, and here it strikes a cut-out switch 10, which opens the current circuit. No magnetic pull is further exerted on the projectile and it leaves the muzzle of the gun under its own momentum. The inventor in this case claims that the shell is supposed to gain velocity repeatedly and successively as it moves from each coil to the succeeding coil. This arrangement for cutting out the coils as the shell moves through the barrel is followed out in several other patents and seems to be a general idea with most of the inventions in this direction.

It would take up too much space here to describe in detail the very ingenious mathematical and engineering deductions cited in the wonderful patent of Prof. Kristian Birkeland of Sweden. In his patent (U. S. Patent No. 754,637) he brings out some very fine points with regard to the development of the electro-magnetic gun. A few of the considerations there advocated,

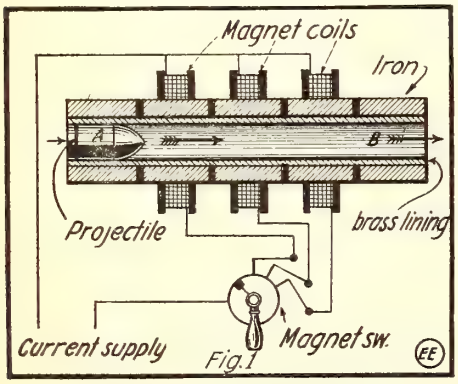

Fig. 1. Elementary Diagram Showing Action of an Electro-magnetic Gun.

hypothetically and otherwise, are outlined below.

In the first place, it has been found difficult to make an electro-magnetic gun of ordinary size which will exert a sufficient pull on the projectile to gain the effects now produced by the modern explosive charge type of cannon. Therefore this inventor proposes to arrange the switches, etc., on his gun so that the current through the coils will only be left on for a very small fraction of a second in any case. Also in considering the regular approved engineering design of such magnetic coils

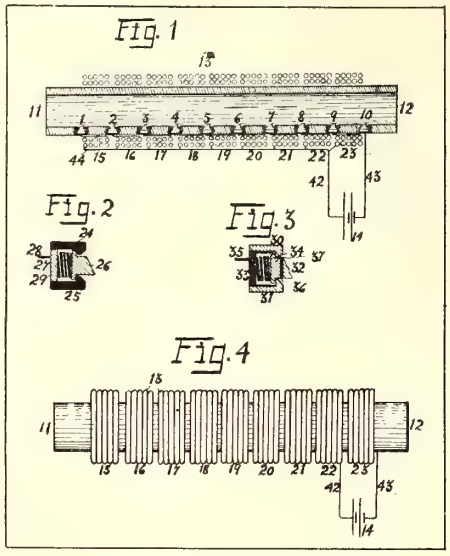

Fig. 3. Electro-magnetic Gun Patent Issued to S. T. Foster, Jr.

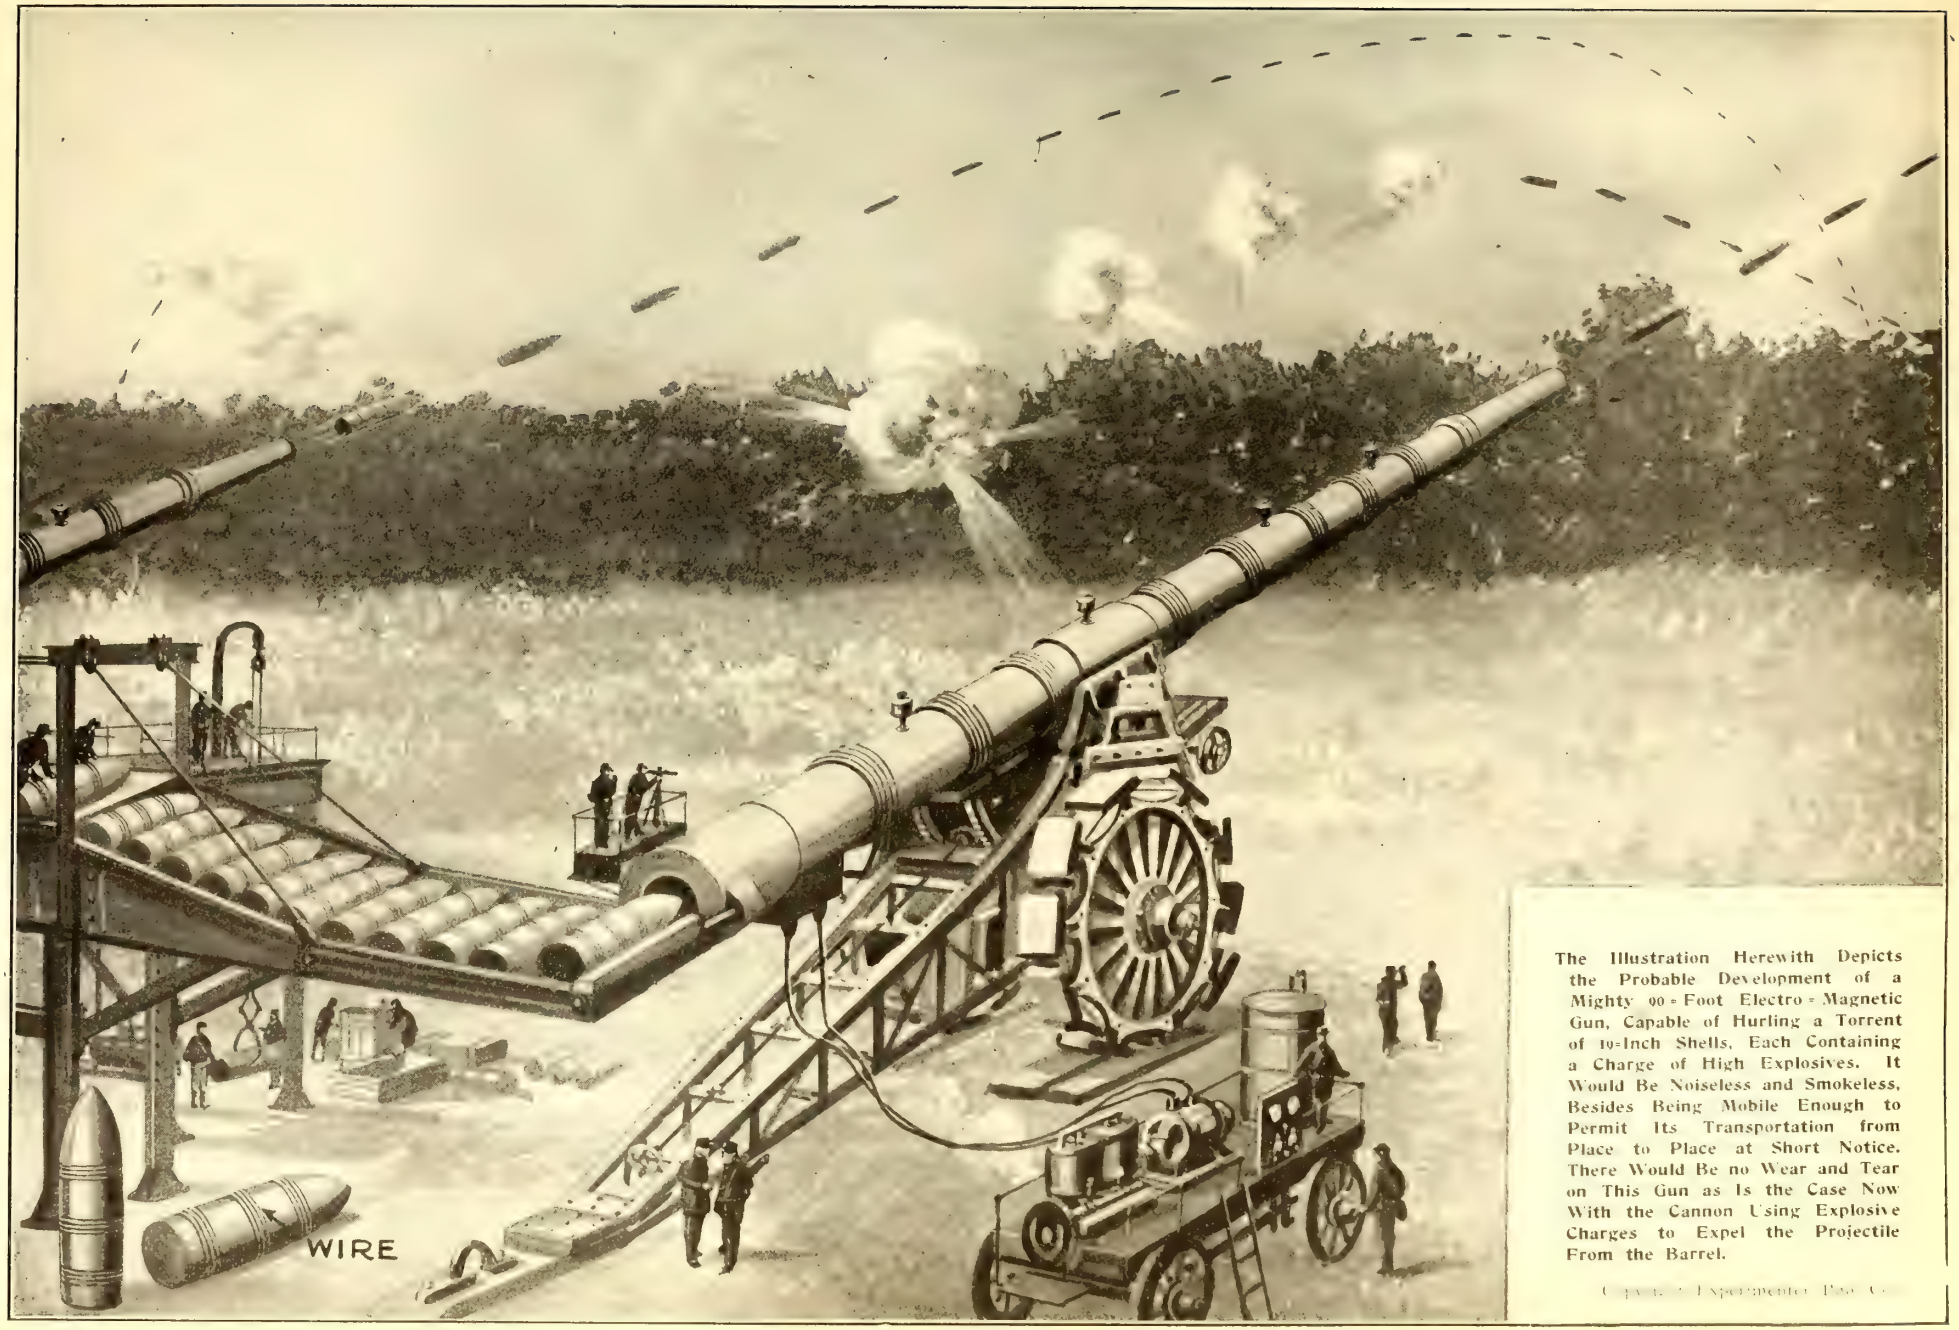
he proposes not only to pass a *normal current* through the coil, but a current even *ten times* as heavy, or more, and thereby momentarily (for the fraction of a second), a terrific magnetic pull can be exerted on the iron shell within the barrel. He mentions further (and this is a capital idea) in order to increase the magnetic action in such a gun it is preferable to make the projectile of iron surrounded by magnetic coils instead of iron alone.

Further schemes outlined in Prof. Birkeland's patent cover the arrangement whereby it is possible to open the magnetic coil circuit without any spark occurring at the break of the contacts. This is accomplished by taking advantage of the fact that the projectile moving through the barrel will induce electric currents in the magnet coils and at the instant when this induced current is approximately equal to the current flowing through the coil and which, of course, passes through the coil in the opposite direction to the normal current, then the cut-out switch is operated with no sparking at same.

He goes on to say: "As to the dimensions which may be given to guns constructed according to my invention, the following example may be mentioned: For throwing an iron projectile weighing two tons and containing one thousand pounds of nitro-gelatin at an initial speed of one thousand feet per second I propose the use of a gun with a length of about ninety feet, the projectile being about nine feet long and having a diameter of about nineteen inches. The gun solenoids may be made up of square wire, each solenoid containing seven hundred and twenty windings of a total resistance of fifteen ohms. The length of each solenoid is made about three-eighths of an inch and the height (radial dimension) about eight inches. With an electromotive force of three thousand volts this will give a current of two hundred amperes. If the current is set up simultaneously in all the solenoids (there will be about three thousand elementary solenoids), this will require altogether six hundred thousand amperes, and the suction acting on the projectile will be about two thousand five hundred pounds per square inch of the cross-sectional area of the projectile. A calculation shows that when a firing is to take place the current should be set up one-seventh of a second before the firing. The projectile is then set free, and will pass the barrel in the course of one-fifth of a second. The current has then been on the outermost solenoid about one-third of a second. If, however, a construction is used in which all the groups of solenoids are not at once excited less than half the current will be used for the same effect, and the generation of heat in the outermost solenoids will be reduced."



ENGINEERS FORMING RESERVE CORPS.

The movement begun in a tentative way last spring to form a reserve corps of engineers to be available in case of war has assumed definite form, according to announcements made by Bion J. Arnold, of Chicago, chairman of the A. I. E. E. committee of the proposed reserve corps of engineers.

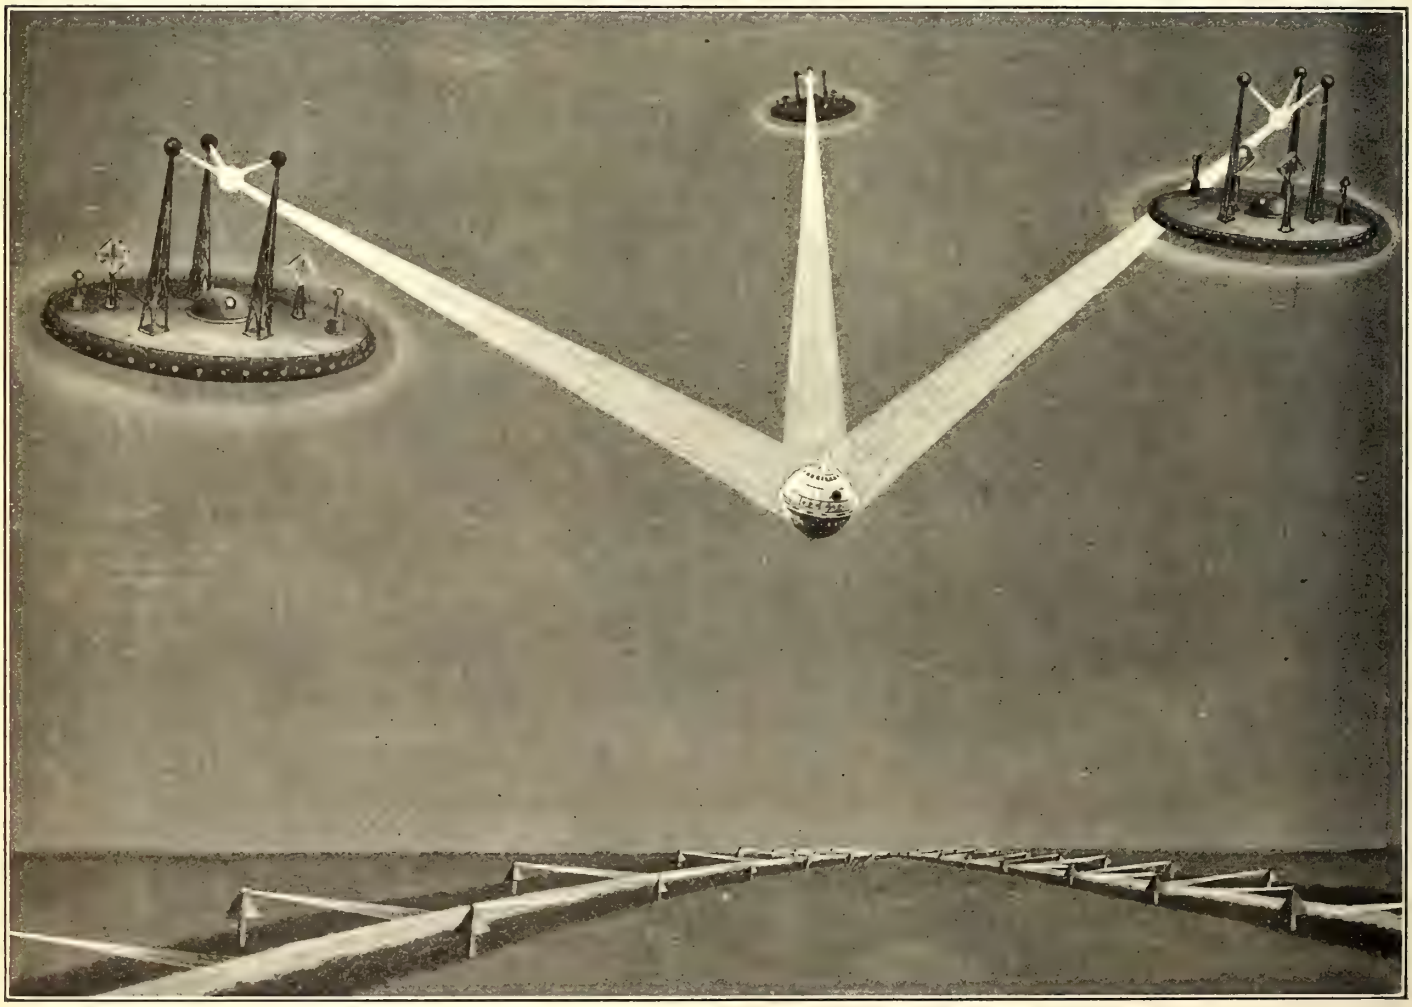
Some time ago the suggestion was taken up by the American Society of Civil Engineers, the American Institute of Mining Engineers, the American Society of Mechanical Engineers, the American Institute of Electrical Engineers and the American Institute of Consulting Engineers. Each of these organizations appointed committees to further the movement, which has now become more closely consolidated by the appointment, just announced, of the chairman of various committees as members of a joint committee to take charge of the work in co-operation with the War Department. The members of the committee are as follows: William Barclay Parsons, New York, chairman, and Henry S. Drinker, Pennsylvania; William H. Wiley, New York; B. J. Arnold, Illinois, and Ralph D. Mershon, New York.

INCREASING WIRELESS RANGE BY KITES.

The recent manoeuvres in northeastern Massachusetts were of particular interest because of successful experiments by the Signal Corps in maintaining a wireless aerial at a great altitude by means of kites, and thereby increasing the efficiency of an ordinary field radio set from six to sixteen times. At the invitation of Adjutant-General Cole of the Massachusetts Volunteer Militia, Samuel F. Perkins, a maker and flyer of man-lifting kites, went to Newbury and experimented with the Signal Corps. As there happened to be fairly strong winds at the time, Mr. Perkins was able to send up a string of kites to a height of 1,600 feet. The messages transmitted from the kite-supported aerial are said to have been received 150 miles away with distinctness, although the field wireless set used would only transmit messages 25 miles ordinarily. The results were obtained because the kites flew so steadily that the aerial was always maintained at a constant altitude. The receiving qualities of the kite-supported aerial were remarkable. Messages were received from the battleship Georgia, off Newport, and from the Government stations at Arlington, Va., and Bermuda. Code messages being exchanged between two British warships out in the Atlantic Ocean were received with accuracy. Further experiments by the United States Government and Marconi officials are now being conducted, and it is expected that in a short time the range of sending from an ordinary field wireless set will be increased.

The Illustration Herewith Depicts the Probable Development of a Mighty 90-Foot Electro-Magnetic Gun, Capable of Hurling a Torrent of 19-Inch Shells, Each Containing a Charge of High Explosives. It Would Be Noiseless and Smokeless, Besides Being Mobile Enough to Permit Its Transportation from Place to Place at Short Notice. There Would Be no Wear and Tear on This Gun as Is the Case Now With the Cannon Using Explosive Charges to Expel the Projectile From the Barrel.

Fig. 2. Electro-Magnetic Gun of the Future, Which Can Hurl 19-Inch High Explosive Shells 25 Miles and More. It Could Fire a Perfect String of Shells, Sufficient to Batter Down the Strongest Forts.



Baron Münchhausen's New Scientific Adventures

By Hugo Gernsback

Münchhausen Lands On Mars

FOR forty-one days I had been "listening in" nightly at my wireless set, since that eventful evening when Baron Münchhausen had left the Moon for the Planet Mars. He had said, of course, that it would take from 35 to 40 days before the "Interstellar" could negotiate the trip from the Moon to Mars, but nevertheless I became more and more impatient as the days wore on.

At last on the evening of the 42d day, at 11 o'clock on the second, the peculiar, unmistakable high whining spark suddenly broke in my ears. After the long nervous strain, the loud whistling spark, almost took me off my feet and I could hardly hear the first words, I was so excited. In a few seconds the whistling spark died down, and Münchhausen's dear, sepulchral voice sounded once more in my faithful receivers. And how loud it was! It was positively uncanny to think that I was listening to his "canned" voice, which perhaps 10 or 12 hours before had been hurled through the ether some 55 million miles away from the Moon, there to be registered phonographically on a telegraphone.

"Three Shafts of an Intense Yellow Ray Were Turned on us, and It Was the Peculiar Properties of This Ray Which Had Made us Captives to the Martians' Superior Intelligence. . . . ."

And now the Baron's voice through the wireless telephone sending plant on the Moon, 238,000 miles away from me, was talking! The thought made me shiver.

"Hallo, Alier," it came in a sympathetic voice, "how is old mother Earth and yourself? Too bad there is no return 'circuit,' for I would love to hear your dear voice. It's over 44 days since I have last heard it. Yet it can't be helped. Well, you must be satisfied to listen to me, without being able to talk back; but I'll try to be as explicit as possible, so that you will not be in a position to ask questions.

"Well, my boy, the trip from the Moon to Mars was entirely uneventful. As soon as we had our bearings we made straight for the Red Planet, the Mysterious. Flitternix and I took watches alternately and as we had learned from our former experience how to handle the 'Interstellar, the trip became more or less monotonous. We had a little trouble at the start with the switching of the Marconium netting, for it proved rather a puzzle to gravity-insulate the 'Interstellar' from the combined attractions of the Sun, the Earth and the Moon, and at the same time having the Planet Mars alone 'pull' us. This bothered us considerably for several days and we made but little headway during that period. Finally when the Moon, Earth and Sun, in the order named, were in a straight line, with Mars almost overhead, our speed rapidly increased and on the evening of the fourth day the 'Interstellar' was entirely gravity-insulated from the Moon, Earth and Sun. We were then 'falling' towards Mars at the rate of 20,000 miles an hour. Within 10 days our speed had increased to over 50,000 miles an hour, and the Earth which from the Moon appeared 14 times as large, as the Moon appears to you, had shrunk and shrunk till it looked like a small bright red disc. Mars in the meanwhile became rapidly larger and redder and soon it appeared like an ochre disc. At the end of the 35th day, when our speed had increased to 78,000 miles an hour, due to the proximity of the planet, the Earth had become a bright star in the firmament, somewhat brighter than the other stars, but a pitiful sight compared to what it had looked when seen from the Moon. But remember that the Moon is but 238,000 miles distant from the Earth, while we were now over 50 million miles away from it. Quite a little difference!

"The next day, the 36th since our start, we were but 200,000 miles distant from Mars, and the planet at this distance was indeed the most gorgeous sight either Flitternix or myself had ever witnessed. Mars looked now almost as big to us as the Earth does when viewed from the Moon. If the Earth when so viewed is a wonderful spectacle, the planet Mars when seen at such a small distance is simply over-

IS Mars really inhabited by intelligent beings? Are conditions on this Planet such that life can be sustained on it? Some of the foremost thinkers in astronomical matters answer these questions in the affirmative.

The Spectral Analysis has revealed to us of what gases and matter the Sun is composed. By means of those piercing instruments *Logic* and *Deduction,* we are enabled to tell what is going on on Mars. This story advances some new ideas on the subject and we have a hunch that you will enjoy this installment.

whelming in its splendor. We saw a full red disc, dazzlingly illuminated by the distant Sun's rays. Like the Earth, Mars has a pink fringe running around the edge —its atmosphere. The continents stand forth in an ochre red, intermingled with dark green patches. Faint lines run over the entire face of the planet, like cobwebs —the famous Martian canals. At the top a brilliant white cap is observed—the north polar ice fields.

"But the most wonderful sight to us was Mars' two little moons. Flitternix calls them toy moons! Of these we had the best view the next day, when we were but some 10,000 miles distant from Mars.

*†"The Planet Mars has two tiny moons, christened Phobos and Deimos by terrestrial astronomers. They were discovered in 1877 by Professor Asaph Hall, of the Washington Observatory, and they are so minute in size that only the most powerful telescopes on Earth reveal them. The largest, Phobos, is some 36 miles in diameter, while the smaller, Deimos, is but 10 miles in diametr. The latter is such a ridiculously small world that a pedestrian would walk around its equator in a single day! An automobile, given a fair road, could circle this entire world in one hour, without exceeding its speed limit!

"Phobos, the largest moon, is less than 4,000 miles from the surface of Mars and revolves around the latter in the remarkably short time of 7 hours and 39 minutes. Consequently the Martians witness the spectacle of their largest moon going through all its phases in 7½ hours! In a single Martian morning, therefore, Phobos can be seen to rapidly change from new moon to first quarter, then full moon, then last quarter and finally again new moon; and all this in 7½ hours! A unique feature about Phobos, too, is that it revolves quicker around Mars than the latter revolves upon its own axis. Mars turns around its axis in 24 hours, 37 minutes and 22 seconds. Thus the Martian 'day' is almost 38 minutes longer than the terrestrial day. During one Martian day, Phobos therefore has spun more than three times around Mars! As seen from Mars, Phobos appears about as large as the Moon appears to inhabitants of the Earth. Deimos, the smaller moon, is 12,300 miles distant from Mars. Whereas its larger brother takes but 7½ hours to revolve around Mars, Deimos requires 132 hours to complete its circuit, or almost six days. Deimos, however, is so far removed from Mars and it is such a tiny object that to the Martians it really does not appear as a moon at all, as we understand that term. For it must be apparent that if we view an object measuring 10 miles across from a distance of 12,300 miles, we can hardly expect to see much. For that reason Deimos, when 'full,' appears only about slightly larger than the planet Venus appears to you as seen from the Earth. Therefore the Martian nights are not brilliantly illuminated by two large moons, as some writers would have you believe. To the contrary, the Martian night is very much like the terrestrial night, except that Phobos when full appears to shed more light on Mars than the Moon sheds on Earth. For the Martian atmosphere is considerably thinner than the terrestrial one, and for that reason it does not absorb so much light.†

"After circling around Mars at a height of 10,000 miles for some time, we finally decided to make a landing. By careful maneuvering and switching of our anti-gravitational Marconium netting, we finally descended to a height of but five miles from the surface of Mars. On account of the etherless zone of the Marconium netting when switched on, we could, of course, not see what was beneath us at all times, for light does not pass through an etherless zone. We therefore had only momentary glimpses of the planet during the short seconds when the current in the netting was switched off. This constant switching on and off of the current reduced our speed to almost nothing, and we were thus slowly approaching an open plain which we had picked out and which appeared like part of a desert, and probably sandy enough to effect a soft landing of the 'Interstellar.' From our momentary glimpses we had become more than convinced that the planet must indeed be inhabitated by intelligent creatures. We had snatched a good view of a wonderfully built city; had seen sections of the mysterious long waterways and their attending strips of vegetation, otherwise known as the Martian canals, and had also observed ponderous air craft by the thousand and curious structures near the canals that looked like gigantic pyramids.

"Had we still doubted that Mars was inhabitated we were taught differently in a few minutes, for things began to happen rapidly.

"When we were still about two miles from the Planet's surface, suddenly as if by magic, everything before our eyes became yellow. At the same time a peculiar numb sensation came over our bodies and we were hardly able to move hand or foot. Simultaneously the machinery of the 'Interstellar' became unmanageable, and looking through the lower portholes we could see that we were rapidly coming closer to the planet's surface, at the same time moving in a totally different direction from the one we originally were heading to.

"With some difficulty we managed to look up towards the top port windows and we saw a marvelous sight. Three circular massive, what looked to us like metal aircraft, spaced equal distances apart, were floating in space. The three flyers formed an equilateral triangle while in the exact center, but about one mile lower down than the flyers, our 'Interstellar' was floating. Three shafts of an intense yellow ray were turned on us and it was this light, or rather the peculiar properties of the rays which had made us captives to the Martians' superior intelligence.

"We reasoned that these floating forts must be used for defensive purposes on Mars, and we agreed among us that the best thing we could possibly do was to submit ourselves entirely to the Martians' will. Indeed, we were so helpless that we could not have offered any resistance, even had we wanted to do so. We, therefore, calmly awaited developments, for we reasoned instinctively that we would not be harmed. Nor were we mistaken in this view.

"The yellow rays guided the 'Interstellar' over a vast distance and at the end of an hour we were gently deposited on a huge grassplot in a fairyland 'City.' The instant that our flyer's broad landing belt touched the ground the yellow rays disappeared and immediately our normal facilities were restored once more. We were free to move and to act.

"We lost no time in unbolting our steel door, and in our anxiety to get out in the open, all three of us, Flitternix, myself and Buster, our fox terrier, almost tumbled over each other. I admit that on a historical occasion like this the first time a human being sat foot on another planet, we should have appeared more dignified as, for instance, Christopher Columbus did when he first landed on San Salvador. Sad to relate, however, there was nothing dignified nor solemn to the occasion of our landing, and this was partly due to Buster. That infernal dog insisted on running between our feet and succeeded in tripping Flitternix just as he placed his foot on the ground; if it had not been for me he would have sprawled all over the grass.

"It is a good thing that the Martians have a keen sense of humor, for the crowd that had collected around our flyer began to laugh uproariously in a queer, characteristic Martian falsetto voice. I admit that we offered a sufficient cause for amusement, the professor in his old Prince Albert and myself attired in my costume of 1797. However, we quickly managed to pull ourselves together and we blinked around us in unconcealed amazement.

"Although the Martian air is very much thinner than the Earth's atmosphere, we experienced but little trouble in breathing for our stay in the rarified air of the Moon had taught us how to breathe in thin air. We noticed immediately that the air was very pure and we did not cough once, as was the case of our landing on the Moon. The Martian air seemed rich with ozone, and we could not rid ourselves of the idea at first that we were breathing the strong air of a pine forest.

"But what held us spellbound for some minutes was the Martians themselves. I am not sure whether they were not as much astonished as we were; for as we found out later, the Martian can conceal his emotions far better than the proverbial Indian. While I was still staring at the nearest Martian with my mouth wide open, Flitternix, who had recovered first from his surprise, nudged me and said: 'Didn't I tell you?'

"Only then did I remember our discourse of the previous day, when we were speculating together as to the probable appearance of the inhabitants of Mars. I remember now that Flitternix had said something like this:

"We have seen on Earth that animal life is possible under the most adverse conditions. We find life at the North Pole in the most awful cold, and we find life at

* In order to disinguish facts from fiction in this instalment, all statements containing actual scientific facts will be enclosed between two † marks.—AUTHOR.

the equator in the most intense heat. We find life in the thinnest mountain air, and we find life at the bottom of the ocean. Particularly the latter is interesting for even up to a few years ago scientists of note denied that a fairly large creature such as a fish could withstand the enormous pressure of water at the bottom of an ocean. For the scientists argued that the fish would be crushed to death by the thousands of tons of water above it. Not only that, but it was furthermore argued that as it gets colder as one descends into the depths of the ocean the temperature finally drops below the freezing point of fresh water. How then could a fish live in such an abode? It was simply impossible. The fish might just as well live in a frying pan. The arguments were strong indeed against the possibility of life at the bottom of the sea.

†"'But then a man by name of Challenger came along and invented a deep sea dredge. No sooner had his expedition begun to dredge than they fished from the bottom of the ocean the most astounding specimen of deep sea fish built on a plan to withstand enormous pressures. True, they were dead when they arrived at the surface of the ocean, but this was expected, for as soon as the enormous pressure to which the fish was accustomed was taken away, he naturally burst inside. So our "wise" scientists with their beautiful logic were wrong once more and the impossible, as always, was very much possible.†

"'I mention this only in passing, to show you that life can accustom itself to *almost any condition.* There are indeed but few exceptions to this rule to my mind. Now, then, we have absolutely no right to believe that the little planet Earth, among the billions of worlds, should be the only fortunate one on which life thrives. †Arrhennius has demonstrated already how life is propagated from one planet to another. This famous philosopher has shown, that minute life carrying spores so small that they cannot be seen by the naked eye are carried through space, propelled by the pressure of the sun light till they strike another heavenly body. If the conditions are suitable the spore will germinate in time and life will spring up—if it is not there already—on that world. It has been proved that these spores can exist in an absolute zero and in a perfect vacuum for years, without losing their germination power—another proof how nature protects life under almost unbelievable conditions.† Therefore to say that there is life only on the Earth is not only idiotic in the extreme, but it also reveals a total lack of appreciation of the wisdom of Almighty Nature.

"'Now, then, it is an undisputable fact that plants, animals as well as humans, are entirely dependent upon their surroundings. If, for instance, you take an Eskimo and transplant him and his family on an island under the equator, his white color will change into black in a few generations. Likewise evolution shows that the human body very quickly adapts itself to the tasks imposed upon it. Thus a man whose grandfather and father were hard-working laborers, will nine times out of ten inherit a bony as well as robust body and a relatively small brain. Whereas a man whose grandfather and father were mathematicians nine times out of ten will have a comparatively small boned body, which is far from robust, but his brain will be large.

"'Surroundings are everything and given time they will transform man or animal into different beings than they were originally.

"'Now let us apply this reasoning to Mars and let us see what we will find. †To begin, it has been proved beyond dispute that Mars has an atmosphere, which although thinner than that of the Earth, is probably thick enough to sustain human life even as we know it. Professor Lowell has proved that the mean temperature on Mars is about 47 degs. Fahrenheit. In some sections as, for instance, near the equator, the temperature can surely not be less than 65 degs. F. It was argued in former years that, on account of the far greater distance Mars is removed from the Sun than the Earth, the temperature must be far below zero. Recent astronomical researches, however, completely disproved this. As a matter of fact, Mars proper receives really more heat than does the Earth for the following reasons: The Martian atmosphere is much thinner than the terrestrial, consequently the Sun's rays pierce it with far less loss than is the case on Earth. Then, too, there are no clouds on Mars to cut off almost 50 per cent. of the received Sun's rays, as is the actual case on Earth.

"'Then again the Martian day is almost exactly as long as the terrestrial. Also due to the inclination of the Martian axis, which is almost exactly the same as the one of the Earth, the seasons are exactly like the terrestrial ones except that they are twice as long, because the Martian year is just twice as long as the terrestrial one.†

"'Now, then, we know that the planet Mars, due to its small size, is a vastly older world than the Earth. Civilization on Mars must date back several hundred thousand years. The law of evolution teaches us that we must therefore expect a very cultured as well as accomplished race.

"'As our terrestrial evolution shows, the human head is growing larger and larger all the time. It must have been the same on Mars, for conditions here are almost the same as those on Earth. We must, therefore, expect to find a race with enormous heads. As the air is thinner on Mars sound will not carry as well as in a thicker atmosphere. We, therefore, will expect big funnel-like ears on the Martians to enable them to hear well. But a big head almost invariably has big eyes; from this we may safely deduct that the Martians have large eyes. But there is one important difference of physicial conditions on Mars, as compared with those on Earth, and that is gravitation. For what weighs one pound on Earth weighs but 0.38 pound, or a little over one-third pound, on Mars. Less bodily weight makes for excessive growth for the reason that gravity pulls less on the body frame. A little calculation based upon the above gravitational figures leads us to suspect that the average Martian should be about eight feet tall. As the sunlight is very much stronger on account of the thin air on Mars, the Martian unless he is in the shade most of the time has probably a dark skin, which may be as red as that of a North American Indian or as dark as that of a West Indian.

"'As the air is so thin on Mars and as oxygen is needed in large quantities for such big bodies as the Martians', we will not be surprised to find that the Martian has an immense torso, to accommodate his ponderous lungs. The latter must be doubly large in order to sustain such a large body and also to work over quickly the small percentage of oxygen in the thin air. But large lungs also invariably require a large nose, as we know from experience, on earth. Consequently, if the Martians have a ponderous nose, don't be surprised, for evolution shows us that animals breathe through their noses as a rule.

"'As to the Martian's hands, it is probable we will find them rather small in proportion to the rest of the body. The Martians have probably advanced so far that manual labor has been abolished for hundreds of generations. It is almost certain that as everything must be done with machinery, manual labor is absolutely unknown to-day on Mars. This naturally, in the course of several thousand years, begins to tell and the hands must shrink. We will therefore expect that the eight-foot Martian has a hand rather smaller than ours. Again, as no physical labor of any sort is performed by the Martian, his arms are probably thin and muscleless.

"'As to his feet, we shall find them to be very large in all probability. They must support a tall and rather heavy body, and they, therefore, must provide sufficient leverage to enable the Martian to walk properly. Not alone for the latter reason must the feet be large, but also on account of Mars' small gravitational attraction; for if the Martian's feet were small, he could not secure the proper foothold to propel his body, he would be hopping instead of walking.

"'Therefore when we behold the first Martian we will probably find him to look totally different from a human being, and while my reasoning as to his probable appearance may be inaccurate in spots, I am sure that on the whole I will be correct.'

"So spoke Flitternix.

"He was right, marvelously right. His

SYNOPSIS

I. M. Alier, an eccentric young scientist of Yankton, Mass., who claims as his own many new as well as startling inventions, far ahead of anything as yet discovered, owns the largest radio-telephone plant in the country. One evening he hears strange noises over his phones and immediately a sepulchral voice is heard. It is Münchhausen, one of the greatest yarn and story tellers of all times. Münchhausen explains how it came about that he did not die in 1797, as popularly thought, and he furthermore gives unrefutable proof that his home is on the moon at present.

Alier wants to know why Münchhausen went to the Moon and how. The latter then explains how Prussia persecuted him and how he went over to the Allies and succeeded in capturing Berlin in a wonderful manner. However, it was not a complete success, so the Baron left Europe for America. He immediately constructs a machine which is to take him into space to the moon. Münchhausen has discovered how to neutralize Gravity by means of Electricity, and he applies this invention to his space flyer, the *"Interstellar."* The machine proves a success; it responds and is lifted with tremendous speed towards the moon.

Queer things are discovered on the way to the Moon, among others that bodies lose all their weight inside of the *"Interstellar."* Finally a landing is effected on the Moon in a desert, but great hardship is encountered on account of the Moon's rarified atmosphere. The party then leaves for the nearest mountain range, where they discover a huge subterranean cave and a lake filled with luminous fish. Bread trees are also discovered. Münchhausen next gives a vivid description of the Earth, Sun and the firmament as viewed from the Moon; he also explains how the continents and oceans of the Earth appear from the Moon. He then tells of the ponderous meteors which continually crash down on the Moon. Finally one falls down near him and the resulting concussion hurls Münchhausen in a bottomless crater, which goes straight through the Moon. He falls clear through to the other side, but his momentum brings him back to the starting point, where he is saved by his companion. They then decide to depart for the Planet Mars, but they leave behind them an automatic Wireless Plant, the "Radiotomatic," which will relay the messages from Mars to the Moon and thence to Alier. A popular lecture on Mars is also given by Münchhausen.

THIS STORY STARTED IN THE MAY ISSUE. BACK NUMBERS WILL BE SUPPLIED AT 10c. EACH POSTPAID.

Warfare of the Future

The Radium Destroyer

THE European War has clearly demonstrated what a tremendous part modern science plays in the offense as well as in the defense of the contending armies. It has often been said during the past twelve months that this is not a war so much of men as of machines. Nothing could be truer. In fact, it might be said that this is a war of infernal machines against more diabolical machines.

It has been stated editorially in this journal that there will be war always, or at least till we arrive at a period when some scientific genius (or shall be call him devil?) invents a machine which at one stroke is capable of annihilating one or several army corps. When that time arrives, soldiers, no matter how courageous, will think a long time before they will offer themselves to be slaughtered by the hundred thousand.

In the meantime, probably for many generations to come, the war death-dance will go on without any doubt whatsoever. Humanity simply has not advanced to such a state where disarmament is possible. Our real civilization only dates back less than 100 years, and as human progress is extremely slow, it may take a thousand years and more before humans will learn how to trust each other implicitly. As long as we require policemen and jails to keep us out of mischief, we are not able to take care of ourselves and we cannot call ourselves emancipated—we are still held in bondage by the brute in ourselves, which threatens to break out at any opportune moment, as is witnessed in the present war.

Therefore, the pacificists, particularly those in our country who think that this is the "last war" and who go around shouting peace at any price, are not only a sorry lot, but they are cheerfully oblivious of the teachings of history as well as of human evolution.

These good people would shout murder if you dared suggest to them to dismiss at once all policemen and patrolmen of their home town, but they would trust a strange nation implicitly from making war on this country, simply because that nation pledged itself on a piece of paper not to make war!

If the present war is ghastly with its poison shells, its deadly chlorine gas, its bomb-throwing aeroplanes, its fire-spraying guns, its murderous machine guns, etc., what can we expect of the wars of the future?

What will happen when the scientists of a hundred years hence begin making war on each other?

Suppose that by that time our scientists have solved the puzzle of the atom and have succeeded in liberating its prodigous forces. Imagine that at that time one atom can be disintegrated at will, instantly into another, what will happen? The results will simply be overwhelmingly astounding and almost incomprehensible to our present minds.

It has been calculated that if we could liberate the latent energy at present locked up in a *copper one cent piece* we would be enabled to propel a train with 50 freight cars over a distance of 600 miles!

Now, then, bearing this in mind, let us imagine that 100 years hence some scientist invents a means to unlock atomic forces, and how to control them. We can see him stepping to the throne of his future War Lord (if such still exist then), addressing him in this fashion: "My Lord, with the means of my invention the world is yours; will you make yourself the first Master of this Planet?"

The War Lord promptly asks for a secret demonstration of the new *"Atomic Gun,"* and what he sees intoxicates his imagination to such a degree that he decides to make war on the entire world as soon as his generals have assured him that enough atomic guns have been manufactured to make success certain. And one beautiful spring morning our War Lord finds a perfectly logical pretext to make war on a few nations, and the latest war dance is on.

Within a few hours the first atomic gun, popularly known as the *"Radium Destroyer,"* has crossed the enemy's frontier.

The Radium Destroyer is mounted on fast moving auto trucks and is controlled entirely by Radio energy. No man is within a mile of the Destroyer—it is too dangerous to be near it when in action. A young lieutenant with phones clapped over his head and who follows the Destroyer in the *"Control Auto,"* and who gets his own orders from the General Staff by Wireless, guides each and every motion of the distant Radium Destroyer simply by moving certain keys and switches in front of him.

Soon his Destroyer has arrived in front of the enemy's first line of concreted steel trenches, protecting the land behind them. In front of the trenches the ground has been purposely cut up to impede the progress of ordinary vehicles. The General Staff, of course, knew this, and built the Destroyer accordingly. Our friend the lieutenant stops the Destroyer's truck and moves a lever. Immediately the Destroyer hops from the truck and begins to jump with amazing speed over the cut-up ground, in grasshopper fashion. A few hundred feet from the well-concealed concrete trenches the Destroyer is made to halt. Our lieutenant moves a few switches, turns a knob and presses a key—then lo! the inferno begins.

A solid green *"Radium-K"* emanation ray bursts from the top of the Destroyer and hits the concreted steel trench. Our front cover gives but a faint idea of what happens. The Radium-K emanation has the property of setting off spontaneously the dormant energy of the Atom of any element it encounters except lead. So when the ray hits the trench it went up in dust, concrete, steel, men and guns behind it, everything. After spraying the trench lengthwise for a few minutes it is gone completely. Only a dense cloud of vapor hanging in the air remains.

The fleet of Radium Destroyers now enters through the gap, destroying everything in their path. No gun can hit the Radium Destroyer for ere the gun can get the proper range, the Radium-K Ray has hit the gun or the ground below it and has sent it up in vapor, including the men behind it. As a demonstration, the Commanding General asks that the first town encountered, a city of 300,000 souls, be vacated within three hours. The terrorized inhabitants are forced to comply with the request, whereupon a dozen Destroyers line up on the hills and spray the unlucky city with their fearful rays. Within five minutes the entire city, houses, churches, bridges, parks and everything else have gone up in a titanic Vapor cloud; only a vast crater in the ground where the thriving city one stood remains.

After this demonstration the enemy sues for peace; resistance would be folly. The country is conquered. Within a fortnight the War Lord has conquered the entire world and has proclaimed himself as the First Planet Emperor.

What happens afterwards when the secret of the Radium Destroyer is discovered by the War Lord's enemies is another chapter, so we will desist!

The above may read very fantastical and extremely fanciful. It is, however, not only very possible but highly probable.

Modern Science knows not the word Impossible.

ANENT WARLIKE INVENTIONS.

It is one of the anomalies of warfare that the machinery for fighting and killing has been brought to its present ghastly perfection not by swashbuckling, bloodthirsty soldiers, but by the mild-mannered, peace-loving civilians, says the *Review of Reviews*. True, both army and navy officers have exercised their ingenuity to heighten the terrors of battle, but theirs are rather academic improvements on the more daring contrivances of civilian mechanics and engineers.

Who gave us the turreted ironclad? Not a naval officer, but Ericson, a marine engineer. Who invented the machine gun, which squirts death every day on a dozen European battlegrounds? Not a colonel or a captain, but Hiram Maxim, a brilliant American mechanic. Who gave the battleship its quick-acting gun-elevating mechanism? Not an ensign or a commodore, but Janney, an American mechanical engineer. Who invented the motors for turning turrets rapidly? Not a lieutenant, but H. Ward Leonard, one of Edison's former assistants. Who planned the submarine? Not a Hull or a Nelson, but Robert Fulton, an artist.

So, one after another, the really important, the really epoch-making inventions comprising the mechanism of warfare prove to be the conceptions of romantically imaginative but lamb-like private citizens. Usually their contrivances are anything but perfect. They must be developed, and it is in their development that the professional soldier has been most serviceable.

It is thus not only with the guns and submarines of war, but also with the telephones and electric lights of peace; for the inventions that have made the United States and other countries commercially great came not from within given industries, but from without.

Always it is a dreamy pioneer, an intrepid free-lance, aflame with enthusiasm, who enriches his country with a radically new labor-saving device or way of utilizing energy. Morse was a portrait painter when he first turned his attention to the telegraph; Bell was a teacher of deaf mutes when he began his experiments with the telephone; Edison was a patentee of telegraphs and phonographs when he gave us the incandescent lamp; Marconi was a mere lad with a liking for physics when he conducted his first successful experiments in wireless telegraphy.

With the single conspicuous exception of Edison not one of the inventors who have blazed new trails gave to the world devices that could be marketed at once. Development was necessary—development by less brilliant intellects identified with the industries that were benefited.

WIRELESS ON CAPE COD.

The United States Navy will establish a wireless station on Cape Cod especially equipped to guide vessels along the Atlantic coast in time of fog.

When the Lights Went Out on the "Bella."

By A. Troubleshooter.

QUITE a few months ago, or, to be more exact, several years ago, the writer, who for the present must use the above nom de plume, had some unique experiences in overhauling the electric lighting equipment and generating plant on one of the numerous banana boats which ply between the port of Philadelphia and the West Indies. Probably a few reminiscences may be of interest in this direction, as the author had several quite out-of-the-ordinary problems to contend with in endeavoring to fix up the electric lighting equipment on this ship. She was built in England and answered to the name of "Bella."

It may be said to start with, and so that the reader will understand some of the problems encountered, that all of the wiring on this steamship consisted of a *toughly armored* copper wire, which had but a very thin rubber insulation placed between the "central" copper conductor carrying the current and its outer spiral *steel* wire armor. The dynamo room was located amidships in a compartment of the main engine room, and from this point, where the switchboard was also located, the various circuit wires and cables were led out through holes cut in the steel walls of the various compartments and decks to different locations about the ship. All of these lead wires and cables were armored, as aforementioned, and groups of them, containing often as many as 10 to 15 wires, were run along the steel hull of the boat or on the underside of the steel decks and subdecks, where they were firmly held in place by means of heavy brass clamps screwed fast to the steel plates.

The "beautiful" job of chasing out a ground on one of these circuits can be readily imagined, considering that such grounds were so common on many of our visits to the steamship while she was in port that often 15 to 20 grounds would be encountered and have to be cleared up in a couple of days before the "good" ship sailed on its return voyage for more bananas and "grounds."

Sometimes the whole group of these wires would have to be released from their numerous clamps for a distance of 100 or 150 feet before the grounded wire itself would be finally separated and distinguished from the others in the bunch. It was then, of course, replaced by new wire, and in some cases entirely new circuits were run in conduit or pipe.

This vessel carried a good size searchlight projector on the navigator's bridge above the pilot house and was supplied with electric current through two large size stranded copper cables, which were rubber covered and also finished with a heavy braided outer coating. These cables were *strapped* onto the steel walls of the boat and compartments, and one of the largest size "grounds" ever seen in captivity was presently discovered, and existing on one of these searchlight feeders.

The ground was tested at the switchboard in the dynamo room with a magneto and, of course, no great trouble was thought to be in store for the "trouble-shooters," as it was thought possibly the cables had by *electrolysis* become grounded at some point along their course. But, lo and behold! when this cable was traced from the switchboard it followed the wall of the engine room forward toward the front of the vessel and disappeared through a tightly fitting bushing in the steel wall of the engine room. At this moment it was thought that by simply going up to the deck and re-entering the "hold" through the coal bunkers that this cable would be in sight again of course. We supposed it simply passed through a ½-inch steel wall *only,* but instead it passed directly through a steel "bulk-head" about 10 feet thick, and the only way to get inside that "bulk-head" was to cut a hole through the steel shell of same. If it had been possible or convenient at the time I suppose we trouble-shooters would have been at liberty to use an oxy-acetylene flame to cut a hole through the "bulk-head." This problem was finally cleared up by running a cable up to the top of the engine room and along the deck, and so on up to the searchlight on the "bridge."

"Electrical Trouble-Shooting on the Good Ship 'Bella' Was Somewhat Exciting, to Say the Least."

Moreover, this job was not only that of a trouble-shooting expedition, but also about 50 per cent. of the time was occupied in killing multifarious and multitudinous myriads of a heterogeneous mob of "scorpions" and "centipedes," some of which were large enough to fill a soup plate. The greatest variety of poisonous "bugs" and other kindred *animals* of this character that were ever encountered in the writer's experience were met with on this memorial trouble-shooting raid. All sizes and colors of spiders, from those as large as a 5c. piece up to those ½ foot in diameter were frequently met with in our travels about the boat, especially at night, when we often explored the cavernous depths of her hold by the scintillating illumination of a smoky coal-oil torch, which manifested an exasperating habit of "extinguishing" itself automatically about four times a minute, more or less; usually more. Thus it behooved us to carry a large supply of matches in our pockets, as it was no small joke to be way down in one of the lower decks without a light or even a match at night, when about 5,000 rats used to hold pow-wows in the center of the floor.

One of the most exciting explorations conducted on this steamship was about the "steenth" visit we made to her and which became necessary in order to repair the *stern signal light,* which was secured to the rail about the deck. In order to get at the wire supplying this *stern* light it was necessary to crawl into the sail and paint storeroom in the stern of the boat, and which was packed full of canvas and other miscellaneous "junk" to within about 1½ feet of the ceiling, or, rather, the underside of the deck. The writer crawled in on top of these sails and whatnots in this instance for a distance of about 40 feet. This hair-raising and adventurous excursion, which was accomplished by wiggling along on the stomach, was also accompanied by much muscular exercise entailed by the necessity for manipulating one of those *famous,* forever smoking, coal-oil torches in one hand, while in the other a five pound ball-pean hammer served to snuff out the life of about 400 regular sized (4 to 6 inch) bandy-legged spiders, and also several dozen 12-inch centipedes thrown in for a good measure. This may sound somewhat "tame," but when it is realized that a bite from one of these centipedes or spiders (which thrive, of course, primarily in the West Indies, where the bananas grow) means death in 10 minutes or less, it will be seen that this was "some" job.

When the trouble-shooting "staff" first tackled this boat problem, with her numerous grounds and other complaints, they were, needless to say, *some tall land-lubbers,* and it very shortly became necessary for the rapid expedition of the work that they pick up the *language* of the ship, such as "for'd" and "af't," and it was very funny at times when some of the electricians would get so mixed up with the various locations of circuits about the ship that they did not know when asking one of the crew for information whether they were going in the right direction or not. The "staff" that endeavored to care for the "Bella's" diseases and complaints had a large variety of experiences before they got finished with the job, and some of these included being hoisted up the main mast in a boatswain's chair, which consisted of a piece of planking with a rope secured to same at either end and which was then fastened to a single rope passed through a tackle block at the top of the mast. One of the boys really got so used to this "bobbing up and down" on the main mast that he could always smell trouble a mile off, especially on a clear spring day, and emanating *particularly* and *only* from one of the "signal" lamps at the peak of the mainmast.

To cap the climax, and because the trouble-shooters had not finished up all of the circuit troubles on board on one of

(*Continued on page* 373.)

What the Housewife Should Know About Electricity.

By L. Shaw, Jr.

"I WANT to buy an electric fan," said the young woman with a sweet voice and smile that blended perfectly.

The salesman was equally affable. With a reciprocative smile retorted:

"Yes, madam, 'A. C.'or 'D. C.?'"

The radiant countenance changed as if by magic to one of perplexity, which was plainly evident by the intended purchaser nervously biting her lips.

The salesman's query resembled much the ever-mystifying technical phrases of the family physician.

The lady in question realized that she should have been versed in the matter of buying an electric fan, but being probably the first one she had purchased, accounted for ignorance on the subject. However, it calls to mind one clear and important fact: That since the use of electricity has entered into the household something in a primary way should be learned about it. Ignorance or indifference may cause much annoyance and often fatal results.

The average housewife has an insight as to the workings of her sewing machine and a general layman's knowledge about coal gas; then why not know a few simple imperative things concerning electricity?

Automatically the second question arises: "What should the housewife know about electricity?" The incident of the electric fan answers one query. The kind of current supplied to the house, whether it is "alternating current" ("A. C.") or "direct current" ("D. C.") should be known. The next essential thing to know is the "voltage."

Taking chances is poor policy where electricity is involved. This was only too well realized by the woman who bought a 110-volt fan and connected it to a 220-volt circuit. The fireworks which resulted afforded much amusement to the children and the maid who witnessed the display on a date that was nowhere near the fourth of July, but the husband who paid for the fan did not seem to think it such a funny incident.

Voltage and kind of current are imperative bits of information to one who would purchase any heating or electro-mechanical appliances, such as the former, an electric stove, percolator, sad iron, soldering iron, or the ordinary Mazda or carbon electric lamp. In heating devices the kind of current is not so essential as being versed as to voltage. The latter is important. In the second instance, while there are electric fans and vibrators which are "wound" to take either alternating or direct current, it is more common for such apparatus to be made to work on one or the other current. Knowledge of the voltage is absolutely essential in both instances cited.

As it is probable that the reader of this magazine is of the mere male sex, the writer humbly suggests that his audience make an earnest attempt to enlighten his mother, sister or wife (or intended spouse) with a few simple, common facts about the general uses and application of the electric current common to the household.

In order to show how much enlightenment is necessary another case of no less import than already cited is recalled to the mind of the writer.

The Lady From the Limousine Gave Me an Imperative Order to Send "12 Festoons Like Those," Without Even Thinking of Voltage, and Disappeared Forthwith.

About two Xmastides ago, during the rush so common at that time of the year, a lady whose limousine and livery which stood outside and general appearance bespoke of money and culture, stepped to the counter where I happened to be assisting during the holiday rush and in apparent hurry picked me out and demanded in a very pompous manner that she wanted some "Christmas tree" lights (festoons). Incidentally I had been demonstrating a large festoon to a prior customer, but they were of the battery type. I was unscrewing the bulbs with the intention of replacing them into the box and laying them near by for the next customer. Without the least opportunity to make intelligent inquiries as to the type of lights she wanted my lady, with the breezy ways, in a Napoleonic fashion pointed to the battery festoon to which I alluded, threw down an engraved visiting card, flew out of the store and before I had time to realize it the limousine had disappeared. I obeyed her commands, sending by special messenger 12 (eight-light) festoons. My only guide being the command and the daintily engraved card upon which was scribbled: "12 festoons" (whoever wrote it had found out at least that they were termed "festoon"), but had apparently forgotten to write the voltage and left it to the discretion of the salesman. Even the most intelligent discretion used is sometimes miscarried. In this instance it might have been that the lady wanted the battery type for her country home, where oil lamps were still in vogue. Or she might have desired to present them to a friend or relative not so fortunate as to have electricity in the house.

To make a long story short, the 12 battery festoons were returned the day after Christmas, every lamp of which was completely burned out, accompanied by a curt note, criticising quite openly the fact that the writer was not a mind reader and adding insult to injury by demanding a credit for the goods, also gently reminding that the Yuletide in a Fifth avenue mansion was completely and wantonly obliterated. On Fifth avenue, as might be known, 110 volt current is used. Merely as a matter of courtesy my firm adjusted her claim, although it can be clearly seen that the breezy limousine lady was too busy and indifferent to see that she gave an order correctly. It is even more important where a hasty delivery is desired, to make sure that an order of this kind is properly given.

The electric meter or the label on an ordinary electric lamp will quickly determine the kind of current and its voltage. A few brief intelligent questions at time of purchase and studying printed matter, which often accompanies such purchase, will often obviate considerable inconvenience and perhaps accidents—often fatal.

So get busy Mr. Man and tell the women folks something about electricity. It may save you money.

COMPARATIVE COST OF CANDLE AND ELECTRIC LIGHT.

Engineers of the New York Edison Co. have recently concluded a series of tests showing the comparative costs between candle light and electric light. In spite of the fact that candles may be purchased as cheaply as a cent each, this is the most expensive illuminant available.

One cent will furnish 2.68 candlepower-hours of candle light. For the same money and using the drawn-wire Mazda lamps 120 candlepower-hours may be obtained, while the recently perfected gas-filled lamp will give 192.3 candlepower-hours.

The figures are the result of tests with six candles of the ordinary commercial types. Four were tallow and two were sperm. They varied from 4.875 inches to 5.75 inches in length, and were from 0.75 to 1.125 inches thick. Three cost one cent each, two cost two cents each and one cost 3.5 cents.

One of the one-cent candles burned 2 hours and 22 minutes, another burned 2 hours and 24 minutes, while the one-cent sperm candle lasted 3 hours and 47 minutes. The two-cent tallow candles lasted 4 hours and 24 minutes and 5 hours and 31 minutes, respectively. The 3.5-cent sperm candle lasted almost 9 hours. The cost of electricity was computed at 8 cents per kw.-hour.

MARCONI PLANS CONTROL OF AIR.

Wonderful stories are being whispered of a new Marconi invention. It is declared the inventor of wireless telegraphy has found a way to utilize Hertzian waves in such manner that aeroplanes can be brought to a standstill and held immovable in the air. Experiments ,so the report goes, have been conducted with great secrecy until the invention has been perfected and soon will be in use. The mind picture presented of air machines held stationary in the air while guns of the enemy below were shooting them to pieces offers a new thrill of horror for followers of war news.

Something About Selenium

SELENIUM is one of the most puzzling elements known to the scientific world, due to its extraordinary property of varying its electrical resistance when exposed to light. This phenomenon has been known for many years, but the commercial application of this property possessed by selenium has not been properly appreciated up to the present time.

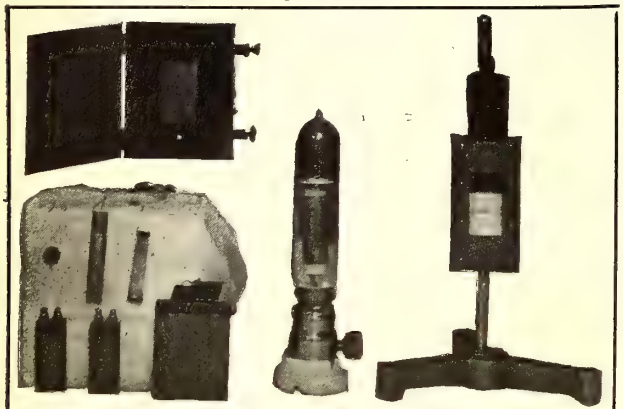

Fig. 1. Several Specimens of Successful Selenium Cells.

It is the purpose of the writer in preparing this article to make known the properties and enumerate some of the useful applications of selenium, which undoubtedly will be valuable to the readers who are interested in scientific research, as there is a promising field for the use of this marvelous element.

This peculiar substance, discovered in 1817 by Berzelius, an eminent Swedish scientist, is a by-product from the distillation of sulphuric acid from iron pyrites (a sulphite of iron). The proximity of the earth and moon suggested to Berzelius the name "Selenium," after the Greek "selene" (moon); this being the result also of the striking similarity of the properties of selenium with those of tellurium, which is a term derived from the Latin "tellus" (earth). It is a metallic element of the sulphur group and has neither taste nor smell. It melts at 212 degrees Centigrade, and if allowed to cool rapidly from its molten state it forms a brown amorphous mass, and in this condition it is a high-class insulator; it is said that a small stick represents a resistance equivalent to a wire stretching for about 250,000 miles. The reddish vapor produced by boiling selenium, which has a decided smell of radishes, is exceedingly poisonous, and care should be taken when experimenting with it when it is in this boiling state. In commercial form, selenium exists in sticks resembling a gray sealing wax, and if it is to be used for making selenium cells it must be chemically pure.

Selenium cells are usually made by winding two bare conducting wires side by side around a piece of mica, slate or porcelain and coating them with a thin layer of selenium. An excellent description of how such a cell is made is given in the August, 1914, issue of this journal. Such cells vary in resistance from 2,000 ohms or more in the dark. This depends mainly upon the thickness of the selenium coating and the amount of light acting upon it; *also upon the very important annealing of the cell.* In Fig. 1 is shown an illustration of a number of types of selenium cells, including the Bidwell, Ruhmer, Giltay, Webb, Clausen and Bronck, Mercadier and Fritts.

The two cells to the extreme right and left are modifications of Shelford Bidwell's cells; the one in the upper left-hand corner is the Ruhmer tube form of the Bidwell type. The one to the right is a Giltay cell. The four tiny ones shown against the white background were made by Mr. Webb, which are also forms of Bidwell's cell, while the center one is of the Fritts gold-foil flat type, which is extremely sensitive. William J. Hammer has patented an exhausted cylindrical cell made of quartz, so as to allow the ultra-violet rays which will not pass through the glass to readily affect the selenium, which is coated over the surface of a copper tube mounted on a central support; over the selenium is a thin tube of metal such as aluminum foil, thin enough to allow light to pass through. The copper and aluminum connect to the two electrodes.

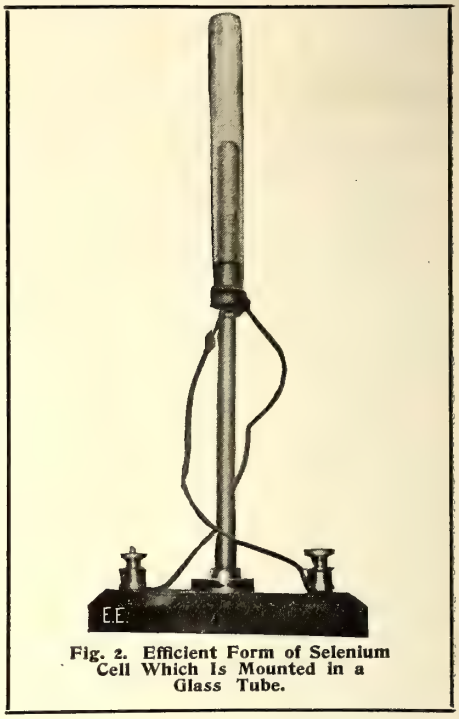

Fig. 2. Efficient Form of Selenium Cell Which Is Mounted in a Glass Tube.

A very sensitive selenium cell was made by Samuel Cohen, and is illustrated in Fig. 2. It consists of a number of circular metallic discs separated by mica, and the sides are coated with a thin coat of selenium. The complete unit is placed in an exhausted glass bulb

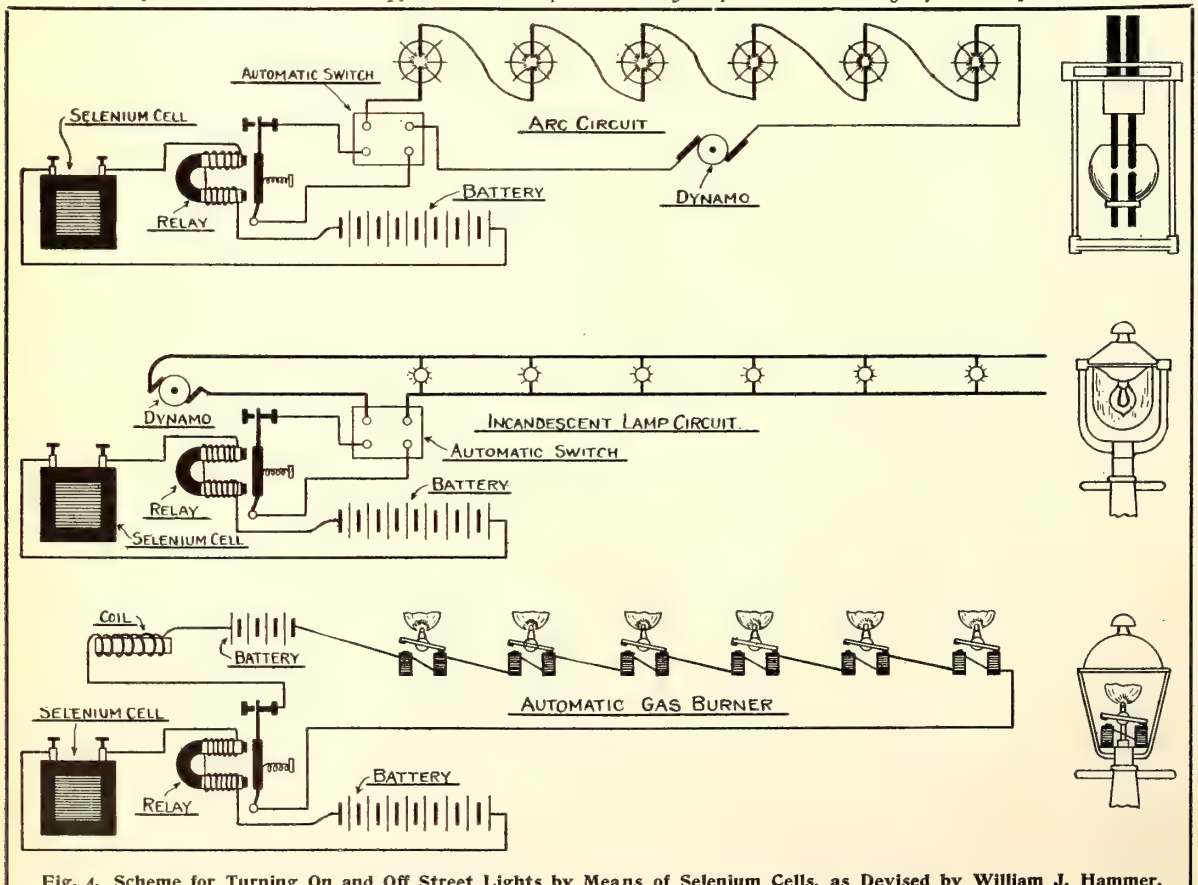

Fig. 4. Scheme for Turning On and Off Street Lights by Means of Selenium Cells, as Devised by William J. Hammer.

as shown. A small concave mirror is placed behind the cell for concentrating the light at the rear of the selenium surface.

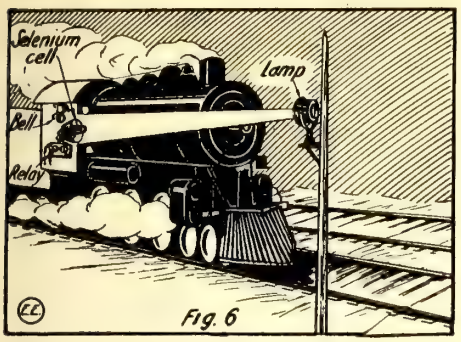

Fig. 6. Selenium Cell Applied to Safety Stop for Railroad Trains.

Having thus briefly glanced over the properties of this element and certain types of cells, we are now ready to consider some of the commercial applications of the selenium cell, some of which already have been worked out in actual practise.

Fig. 3 depicts the general connection of a selenium cell, battery relay and its secondary circuit. The selenium cell is connected in series with several cell batteries and a relay. As soon as the cell is placed in the dark its resistance is increased, consequently decreasing the current in the relay coils. The secondary circuit is therefore open, but as soon as some source of light is brought near the selenium the resistance drops, thereby allowing additional current to flow through the windings, which attracts the relay armature and in turn closes the secondary circuit. This is the fundamental circuit of most devices which are operated by selenium, and the principle holds the same as in this case.

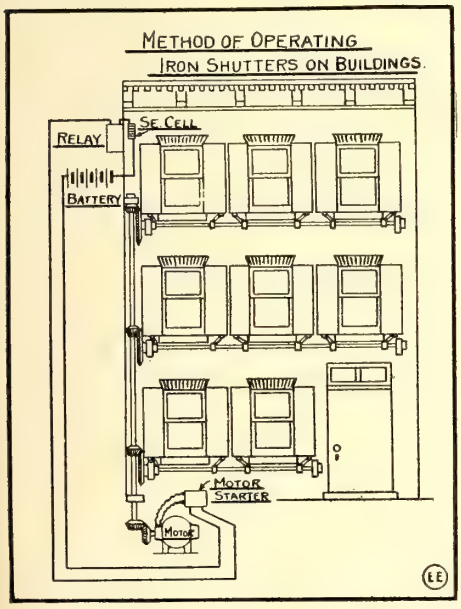

Fig. 5. Two Schemes for Opening and Closing Window Shutters at Sunrise and Sunset by a Selenium Cell.

A very interesting and practical application of this element is in the automatic lighting and extinguishing of street lamps. Fig. 4 shows a schematic arrangement which has been actually demonstrated by William J. Hammer. This scheme he submitted in 1886 to the convention of the Edison Association of Illuminating Companies at Rochester, N. Y., during a discussion upon "Metering Versus Contract Systems." Such a method of utilizing selenium cells to control relays and magnets, which would turn off the gas lights on the approach of day and turn them on again at night, would solve the problem of employing a squad of men necessary to do this work at present.

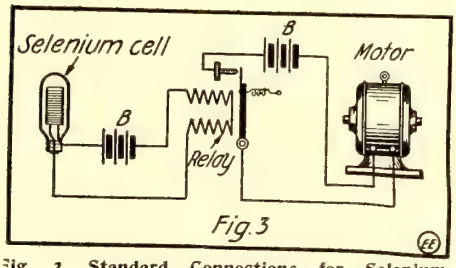

Fig. 3. Standard Connections for Selenium Cell and Relay.

Two other applications of selenium devised by the same inventor, similar to the device just described, are an automatic window shutter, illustrated in Fig. 5, that will close the shutters at night and reopen them in the morning automatically, and a very striking use of selenium in the protection of safes, storage rooms, etc., where the selenium cell is so placed in the room that whoever enters with some illuminant will be detected by means of the cell. Thus, if a burglar should enter the apartment the light from his lantern will be caught by the cell, which will actuate a bell signal, thus giving an alarm, enabling the police to surround the premises.

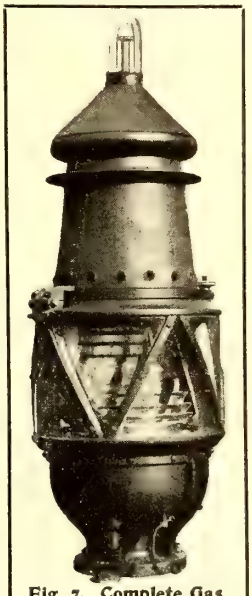

Fig. 7. Complete Gas Buoy With Selenium Cell Control.

Automatic signaling to engineers on railroad trains, etc., can readily be accomplished by the proper use of selenium cells, and Fig. 6 depicts such a device which consists of a searchlight placed some distance away from the signal block. The apparatus on the train constitutes a selenium cell, placed as perceived, with a relay properly connected in series with some source of current, and a bell or any other signaling device. Now let us suppose the train, traveling at a high speed, approaches the signaling block. The engineer's attention, for some reason, is drawn away from the block, which shows a distress signal. This negligence may perhaps result in a tragic accident. On the other hand, let us suppose that such a device as above described were installed on the train and a searchlight placed about 600 yards before the block. Now, when the train passes this lamp it will immediately cause the selenium cell to close the relay, thus ringing the bell, which would be an announcement to the engineer that the signal block was being approached. Of course this particular scheme would be used only nights. In this way some fatal accidents might be avoided. A more elaborate device was devised by Mr. Hammer, whereby a bell was rung, the whistle blown and the brakes set automatically when the semaphore and signal light showed that the line was blocked. His system is arranged to operate both night and day. A system of this nature is very practical and, if properly developed, will undoubtedly prove quite successful.

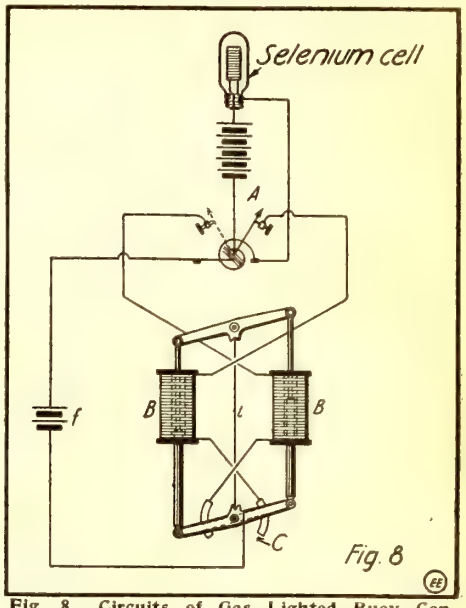

Fig. 8. Circuits of Gas Lighted Buoy Controlled by Sun's Rays Affecting Selenium Cell.

Still another practical application of the selenium cell has been made by the late Ernest Ruhmer, of Berlin, Germany, in connection with a Pintsch gas buoy. A large number of these have been built containing a supply of compressed gas which would last for one month. But it was necessary to burn these lights day and night, it being impracticable by reason of the distance at which they were placed and the frequency of the storms, etc., to turn off the gas so that it would not burn during the day.

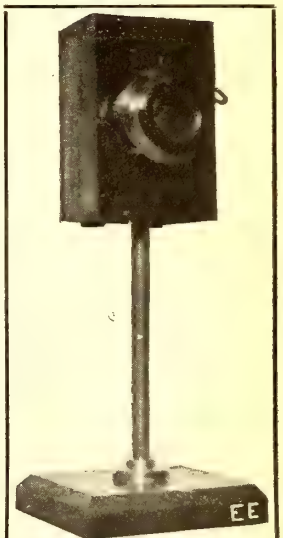

Fig. 10. Special Selenium Cell Device for Timing Photographic Shutters.

Mr. Ruhmer, however, placed one of his selenium cells in the top of such a buoy, connected with a switching device which, as soon as the sun rises in the morning, causes the selenium to reduce

its resistance, thus causing the mechanism to turn off the gas. It is again turned on, due to the increase of resistance of the cell, by the approach of nightfall, or also, if so desired, in the case of darkness due to a storm or fog. A buoy containing sufficient gas for one month could thus be made to do actual service without recharging from three to five months. Such a buoy is shown in Fig. 7. Mr. Ruhmer told Mr. Hammer that upward of 100 of these buoys had been made and had given excellent satisfaction.

The arrangement of the circuit, as originally devised by Mr. Ruhmer, is shown in Fig. 8. The voltmeter needle A has been replaced by the relay. B, B are two large "sucking" solenoids for operating the gas valve. A single dry battery is interpolated in the selenium cell circuit as usually employed. This battery will last for years and, with its relay, is placed in the bottom of the buoy and arranged to be absolutely waterproof.

Sir William Crookes has constructed an exceedingly interesting type of his well-known radiometer, in which he has coated the revolving vanes on one side with selenium and on the other with chromic acid. He found that the white light from a sperm candle repelled the selenium, while the yellow light of the wax candle repelled the chrome, thus indicating the relative absorptive powers of the different substances for rays of different refrangibility resulting in mechanical motion.

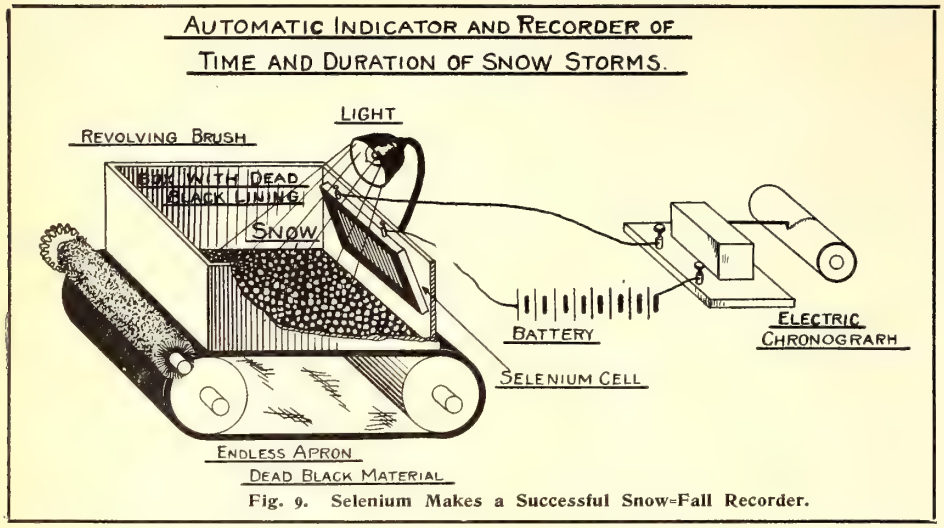

Fig. 9. Selenium Makes a Successful Snow-Fall Recorder.

Prof. Barnard, of Lick University, employed experimentally a selenium cell as a device for automatically detecting comets, and Minchin has employed the selenium cell quite extensively in his astronomical investigations.

A very ingenious device, using this wonderful element for recording electrically the amount of snowfall which occurs during a certain period of time, was devised by Mr. Hammer and is illustrated in Fig. 9. It consists of an endless black belt or conveyor, mounted on two reels and forming the bottom of a box as depicted. A selenium cell is placed above this belt and is connected with a suitable battery and an electric chronograph, or instrument for measuring time intervals. A small circular brush is placed near one end of the belt for removing the snow as the belt is slowly revolved by the pulleys. The complete apparatus is placed outdoors with the exception of the recording device, which in this case is the chronograph. The drums are now started. As long as it snows, the snow upon the slowly moving belt will reflect the light produced by the electric bulb upon the selenium cell and in turn indicate on the chronograph, and as soon as it stops snowing the black surface of the belt absorbs the light, thereby preventing the selenium cell from obtaining sufficient light; consequently it will not show upon the scale of the recording instrument. Such a device is very practical, as it will show exactly and accurately the time when it snowed and how often it snowed during the night, it being a simple matter to keep the record during the daytime. At present there is available for the Weather Bureau only an instrument which measures the depth of the fall of snow in a box protected from the wind to prevent drifting.

A very striking experiment has been performed with selenium by S. Cohen in recording the speed of photographic shutters. The apparatus is shown in Fig. 10, and virtually consists of two selenium cells, properly compensated with a Wheatstone bridge and galvanometer, whose needle is placed upon a chronograph cylinder having a proper scale divided in fractions of a second. The operation of this device is as follows:

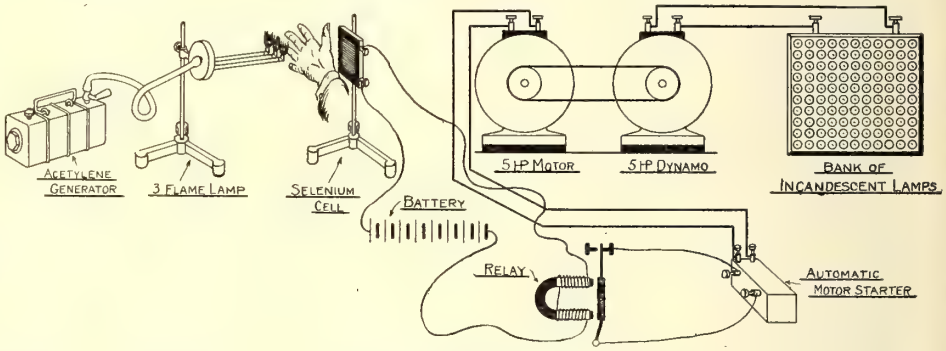

Fig. 11. Arrangement as Used by Wm. J. Hammer for Controlling a 5 Horsepower Motor by a Wave of the Hand.

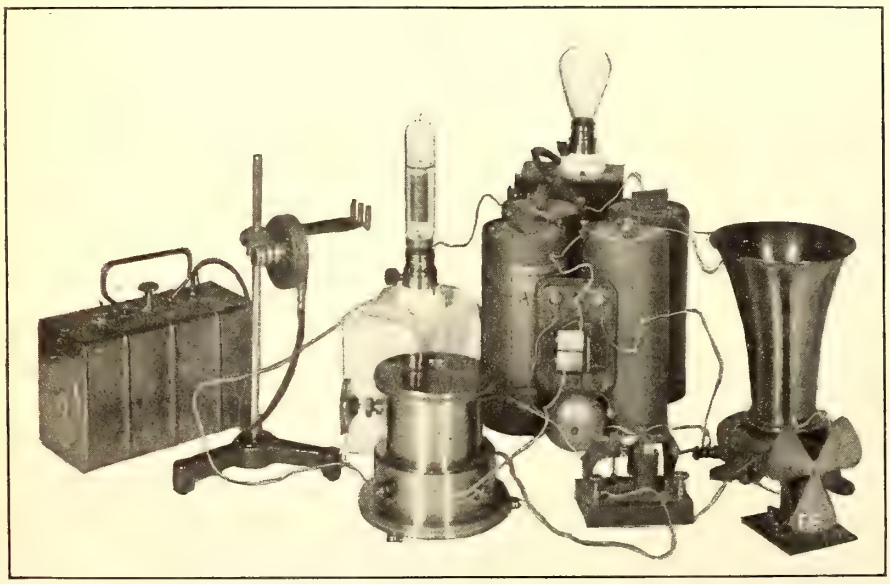

Fig. 12. Selenium Cell and Auxilliary Apparatus for Laboratory and Lecture Demonstrations.

The Wheatstone bridge is very finely adjusted and a light from an incandescent electric lamp is placed near the shutter; the chronograph is started and the shutter is released. The small amount of light which passes through the shutter acts now upon the selenium cell, thereby reducing its resistance and in turn unbalancing the complete circuit. Momentarily, in turn, it deflects the galvanometer pointer. This is recorded upon the scale of the chronograph. The time is then read by the length of the line made by the needle. This device has been worked out in practise and it is another achievement in electric speed indicating devices.

Still another wonderful experiment was performed with the selenium cell by Mr. Hammer at the joint meeting of the American Institute of Electrical Engineers and the American Electrochemical Society, April 17, 1903. The amazing feat accomplished by him was starting and stopping a five-horsepower electric motor by a mere wave of his hand in front of a selenium cell. The apparatus used in this experiment is shown in Fig. 11. It consists of an acetylene generator supplying gas to a burner placed before the cell, as shown. The cell is connected with a relay

Wireless Telephony Now From Washington to Honolulu.

THE most wonderful feat in wireless telephony was accomplished on the night of Sept. 29 last, when the human voice was projected through the ether from Washington, D. C., to Honolulu, a distance of 4,900 miles!

Views From Left to Right: Dr. Lee de Forest in His Laboratory. Dr. de Forest Holding One of His New Regenerative Audion Bulbs of the Type Used in 4,900 Mile Radiophone Talk. Top Right: Shows Mr. Theo. N. Vail, Talking From New York to San Francisco by Wireless (via Arlington). Bottom Right: Progression From First de Forest Audion Detector at Right, to Latest Oscillation Tube Generator at Left.

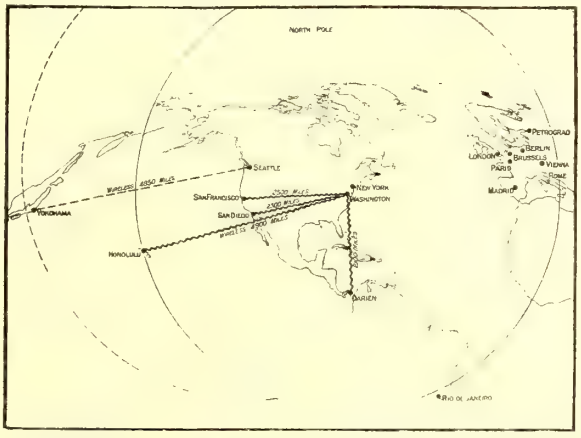
Only a few hours earlier wireless telephonic communication had been established between New York City and San Francisco, a distance of 2,500 miles, which was heralded as an epochal innovation.

Secretary of the Navy Daniels has announced the successful transmission of wireless telephone messages from the United States naval radio station at Arlington to the naval radio station at Mare Island, Cal., a distance of about 2,500 miles. All that was necessary to carry on this transcontinental wireless telephone conversation, he said, was to connect the receiver and transmitter apparatus of the special telephone outfit with the radio apparatus and send the message.

Captain W. H. G. Bullard, U. S. N., who is in charge of the Arlington station, and other officers of the navy conversed with officers of the navy on duty at the Mare Island yard in San Francisco.

The demonstration was the result of experiments that have been in progress for some time, and their success is expected to have a revolutionary influence on communication between American naval vessels and shore stations. By means of this perfected apparatus, which probably will be installed at all naval radio stations, it is expected that officers of the navy on land will be able to carry on wireless telephone conversation with officers at sea. Captain Bullard stated that the apparatus had been perfected to the point where a person on shore might carry on a long distance wireless telephone conversation with a friend on a transatlantic liner in mid-ocean, whenever shore station and liner were equipped with the necessary apparatus. In his formal announcement, Secretary Daniels said:

"I am pleased to announce the successful outcome of experiments which have been carried on for the last few months by the American Telephone & Telegraph Company and the Western Electric Company in co-operation with radio stations under the jurisdiction of the Navy Department by which long-distance wireless telephony has been made possible.



Speech has been successfully transmitted from the Arlington radio station to the radio station at Mare Island, Cal., and there successfully received, thus making possible conversation without wires over a distance of approximately 2,500 miles, the first time this great distance has been covered by wireless telephony. In the first experiments the voice was successfully transmitted by radio to Mare Island from Arlington, the return answers and communication being made over the transcontinental land telephone line. This was successfully accomplished in the presence of officials and engineers of the Western Electric Company, a representative of the Signal Corps of the army, representatives of the technical and operating departments of the Navy Department and a few other interested parties.

"After this successful demonstration, conversation originating in New York City was transmitted over the land wire to Arlington, there automatically connected to the radio transmitter which carried the voice to Mare Island, where it was clearly and distinctly received, and answers and other conversation were from there transmitted over the transcontinental line to the originating office in New York.

"The conversation was carried on by the president of the American Telephone & Telegraph Company, Mr. Vail; the vice-president, Mr. Bethell, and Mr. Waterbury, one of the directors, while at Mare Island were officials of the Navy Department, John J. Carty, chief engineer of the American Telephone & Telegraph Company, and representatives of the Western Electric Company.

"Every official taking part in this demonstration is enthusiastic about the results and the possibility of developing this system as an extension of the telephone system to ships at sea. The fact that the voices can be started on a land wire and automatically transmitted to a voice radio transmitter holds out hope that persons should readily be put in touch by telephone with others at sea through some central transmitting station.

"The use of such long distance wireless telephone communications in naval or military operations is still in an undeveloped state, but it is expected valuable use can be made of the wonderful demonstration; but aside from such considerations the department and its officials feel proud that they have been interested co-operators in the first practical development of this last march in the wonderful science of radio communication."

Radiotelephonic Range Chart, Showing How Speech Was Flung Through the Ether, 4,900 Miles From Washington to Honolulu, Corresponding to Distance Between Seattle and Yokohama.

Photographing Sound Waves Electrically

By Robert H. Moulton

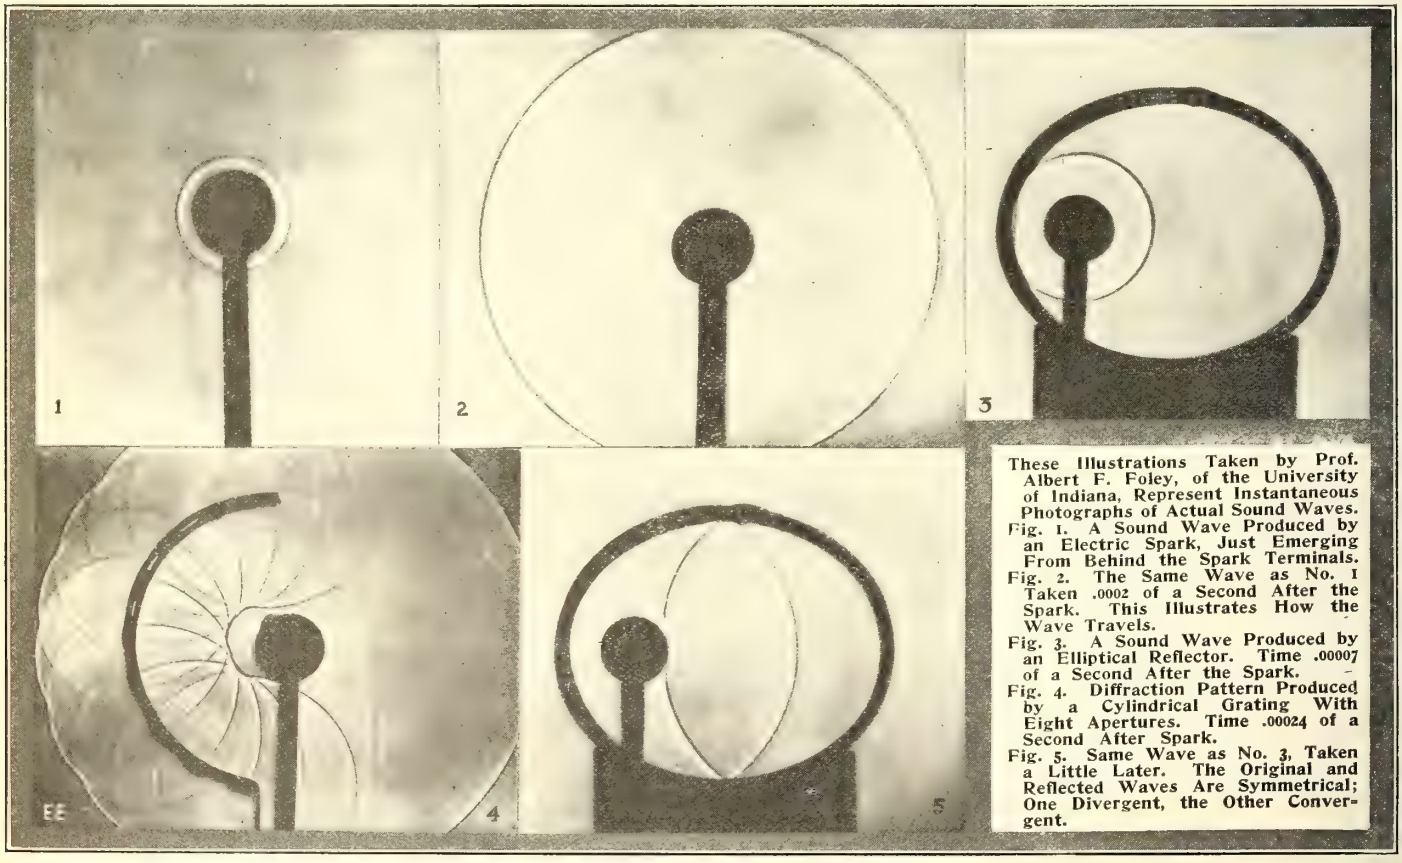
The man who has had his troubles photographing an automobile traveling at the rate of 70 miles an hour, or about 100 feet a second, will best appreciate the difficulties faced by Prof. Albert F. Foley, of the University of Indiana, when he attempted to photograph a "sound wave." Professor Foley successfully accomplished the feat and, what is more, his pictures were sharp and clear, which is something that cannot be said of most photographs of automobiles going at full speed.

To emphasize the greater obstacles overcome by his methods, it may be stated that photographs of racing automobiles are usually taken at a distance of 50 feet or more and the cars, of course, may be plainly seen, while the objects photographed by this scientist were only 2 feet away from the camera and are moreover invisible to the naked eye.

His method of photographing sound waves was suggested by the "twinkling" light of the stars, a phenomena caused by the light passing through air layers of varying density, due to varying temperature; in reality the light of the stars is absolutely constant. In like manner sound waves in air are waves of condensation and refraction—that is, series of regions of varying air density. Since, then, the light from a star will be bent from its straight line path when it passes through such region, Professor Foley reasoned that sound waves produced between a point source and a photographic plate should cast shadows on the plate. The only thing necessary then is to photograph this shadow.

While this sounds simple and easy enough, it must be remembered that a sound wave travels at such great speed (or 1,125.69 feet per second at 20 deg. Centigrade) that in order to secure a sharp image of its shadow the light illuminating this shadow must not last longer than *one-millionth of a second.* Moreover, while the light does last, it must be *a thousand times* as strong as the light ordinarily employed in taking a photograph with a camera whose shutter works at a speed of one-thousandth of a second, and it must be turned on at *exactly* the right time or the sound wave will be out of range of the photographic plate.

Professor Foley arranged a large electrical machine capable of producing an almost continuous stream of electric sparks a foot or more in length, and each of such energy that is caused a loud report. In the circuit through which the sparks were to pass he made two spark gaps or breaks and in front of the first gap, nearest the electrical machine, placed his camera containing the photographic plate.



The action that results when a spark passes through the circuit may be described as follows: At the first gap the spark generates a sound wave directly in front of the photographic plate.

By the time that the sound wave has traveled outwards a few centimeters from the source the second or illuminating spark occurs at the second gap. The light from this spark is refracted as it passes the sound wave on its way to the photographic plate, thus throwing a shadow of the sound wave on the plate. To make the light of the illuminating spark sufficiently intense to give a clear image on the plate the electric charge is first stored in a large capacity of Leyden jars charged to a high potential, and then discharged between magnesium terminals placed in a glass tube like a short gun barrel, to direct the light, toward the plate. The details of this process are given below.

This physicist has a remarkable collection of these sound wave photographs, which show the waves in the process of being reflected from plane and curved mirrors, being brought to a focus by convex lens and made divergent by concave lenses, and, in fact, doing everything demanded by the sound wave theory.

The sound wave is produced by an electric spark gap S, which will be called the sound gap. The light is produced by a second spark at the illuminator gap I, which will be called the light gap. If the sparks at I and S are simultaneous the light I passes S before the sound wave emerges from behind the spark terminals. If the time interval between the sparks is any considerable fraction of a second the sound wave at S passes out of the field before the light from I reaches S. But when the interval between the two sparks is properly timed the sound wave at S casts its shadow on the photographic dry plate P.

The spark gaps S and I are connected in series to the spark knobs K, K_0, which receive sparks from T, T_0, the terminals of a large electric induction machine having four rotating mica plates 30 inches in diameter, driven by a variable-speed electric motor. The length of the spark gaps T-K and T_0-K_0 is adjusted by sliding T and T_0 horizontally, or by moving K and K_0 vertically. Glass plates G and G_0, about 20 centimeters square, are fastened to a wooden bar on rod R, arranged so that it can be rotated on a horizontal axis. In the position shown in the figure the plates are directly between the spark knobs T and K and T_0 and K_0, thus preventing a spark. A quarter turn of the handle rod R removes the plates and allows the spark to pass. In practise, however, it was found best to make the spark gaps T-K and T_0-K_0 just long enough to prevent sparking when the glass plates are out of the field.

These Illustrations Taken by Prof. Albert F. Foley, of the University of Indiana, Represent Instantaneous Photographs of Actual Sound Waves.

Fig. 1. A Sound Wave Produced by an Electric Spark, Just Emerging From Behind the Spark Terminals.

Fig. 2. The Same Wave as No. 1 Taken .0002 of a Second After the Spark. This Illustrates How the Wave Travels.

Fig. 3. A Sound Wave Produced by an Elliptical Reflector. Time .00007 of a Second After the Spark.

Fig. 4. Diffraction Pattern Produced by a Cylindrical Grating With Eight Apertures. Time .00024 of a Second After Spark.

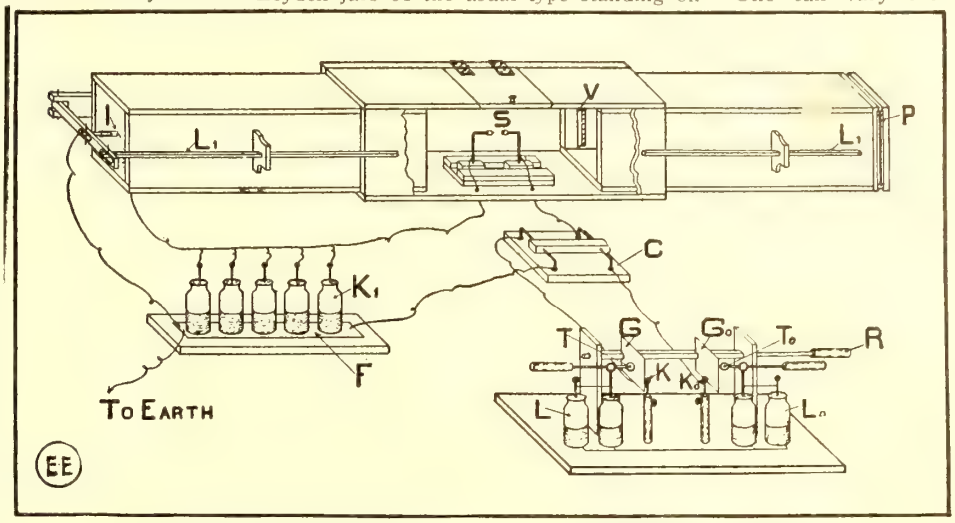


Fig. 5. Same Wave as No. 3, Taken a Little Later. The Original and Reflected Waves Are Symmetrical; One Divergent, the Other Convergent.

Rotating the rod then causes a spark just as the edges of the plates pass through the gaps.

To get a strong sound wave at S and an intense light at I, the sparks to the knobs K, K_0 should be heavy; consequently from one to three Leyden jars L, L_0 are put in multiple with each of the jars on the machine itself. Most of the work is done with one additional jar connected to each of the machine jars.

The knobs K. K_0 are connected to the gaps S and I through a large commutator C. Thus the direction of the spark at the gaps is readily changed. It was found that the apparatus worked about equally well with the spark in either direction. The chief effect of reversing the spark direction appeared to be a slight change in the time intervals of the sound and light "sparks."

The sound gap S is in series with the light gap I, nevertheless the spark at S occurs before the one at I, because of the capacity K, which is in multiple with the gap I, as shown in the figure. The capacity K_1 consists of from two to eight Leyden jars of the usual type standing on a sheet of tinfoil F, with one coating connected to earth. The time interval between the sound and light sparks depends on the capacity K_1, the greater the capacity the greater the interval. However, it is not at all necessary to have here a variable condenser or one made up of small units. One can vary the capacity K_1 between rather large limits and still keep the proper time interval by varying the circuit in other ways. The time interval is increased by decreasing the capacity L, L_0; by decreasing the length of the spark gaps T-K and T_0-K_0. One can vary the capacity K by 100 per cent. and readily maintain an approximately constant time interval between the sound and light sparks by merely changing the length of the light gap. The length of this gap is adjusted by the lever arrangement L_1, L_1.

Layout of Apparatus Used by Prof. Foley in Photographing Sound Waves.

DANIELS NAMES NAVAL ADVISERS.

The make-up of the Naval Advisory Board of Inventions, the organization of experts who will contribute their inventive genius to the navy, of which Thomas A. Edison is to be the chairman, was announced by Josephus Daniels, the Secretary of the Navy, on Sept. 12 last.

The board will consist of 23 members, including Mr. Edison, who was selected by Mr. Daniels to serve as the presiding officer of the board.

The other 22 members of the board, who were chosen by ballot by 11 of the principal scientific societies of the country whose members deal with those branches of science on which the navy is thought to be dependent for invention, are:

W. R. Whitney, L. H. Baekeland, Frank Julian Sprague, Benjamin G. Lamme, R. S. Woodward, Arthur Gordon Webster, A. M. Hunt, Alfred Craven, Spencer Miller, William Le Roy Emmett, Matthew B. Sellers, Hudson Maxim, Peter Cooper Hewitt, Thomas Robbins, Howard E. Coffin, Andrew J. Riker, Henry A. Wise Wood, Elmer A. Sperry, William L. Saunders, Benjamin B. Thayer, J. W. Richards and Lawrence Addicks.

The first general meeting of the board was called on Wednesday, Oct. 6, in the office of Secretary Daniels in Washington.

In announcing the names of the members of the board Secretary Daniels made the following statement:

"Desiring to make available the latent inventive genius of our country to improve our navy, a short while ago I requested Mr. Thomas A. Edison to become chairman of an advisory board of eminent men who would make up the board. Mr. Edison, with the patriotism characteristic of American inventors, accepted the call to duty. The plan adopted for selecting the members of the advisory board was as follows:

"I requested 11 great engineering and scientific societies to select by popular election two members to represent their society on the board. The result has been most gratifying. I have received the nominations of all these societies and have accepted them, and it only remains to have a meeting, organize and determine the method of procedure in order to utilize to the best advantage of our navy this mobilization of the talent and genius of our country. The response of the societies invited to co-operate in the great undertaking indicates the patriotic enthusiasm awakened by this call to duty."

Personnel of the Board.

These are the members selected by the societies and accepted by the Secretary:

American Chemical Society—W. R. Whitney, Schenectady, N. Y.; Massachusetts Institute of Technology, '90; director of research laboratory of the General Electric Co., where he has been the moving spirit in the perfection of metallic electric lamp filaments and the development of wrought tungstens. L. H. Baekeland, Yonkers, N. Y.; University of Ghent, '82; in private practice; founder of the Nepera Chemical Co., 1892, and inventor of photographic paper.

American Institute of Electrical Engineers—Frank Julian Sprague, New York City; Naval Academy, '78; consulting engineer for Sprague, Otis and General Electric companies; founder of the Sprague Electric Railway Motor Co. and concerned in establishing first electric trolley systems in the United States. B. G. Lamme, Pittsburgh. Ohio State, '88; chief engineer of Westinghouse Electric and Manufacturing Co, and a prolific inventor.

American Mathematical Society—Robert Simpson Woodward, Washington, D. C.; Michigan, '72; president of Carnegie Institution and an authority on astronomy, geography and mathematical physics. Arthur Gordon Webster, Worcester, Mass.; Harvard, '85; professor of physics of Clark University and an authority on sound, its production and measurement.

American Society of Civil Engineers—Andrew Murray Hunt, New York City; Naval Academy, '79; consulting engineer; experienced in the development of hydroelectric, steam and gas plants. Alfred Craven, New York City; Naval Academy, '67; chief engineer of Public Service Commission and formerly division engineer in charge of construction work on Croton Aqueduct and reservoirs.

American Aeronautical Society—Matthew Bacon Sellers, Baltimore, Md.; Lawrence Scientific School; director of Technical Board of the Aeronautical Society of America, and first to determine dynamic wind pressure on arched surfaces by means of "wind funnel." Hudson Maxim, Brooklyn, N. Y.; ordnance and explosive expert and maker of first smokeless powder adopted by the United States Government.

The Inventors' Guild—Peter Cooper Hewitt, New York City; inventor of electric lamp appliances to enable direct current apparatus to be used with alternating current circuits, and devices for telephones and aircraft. Thomas Robbins, Stamford, Conn.; Princeton; president of Robbins Conveying Belt Co. and inventor of many devices for conveying coal and ore.

American Society of Automobile Engineers—Andrew L. Riker, Detroit; vice-president of the Locomobile Co.; electrical and mechanical engineer and inventor of many automobile devices. Howard E. Coffin, Detroit; Michigan, '96; vice-president of the Hudson Motor Car Co. and active in the development of internal combustion engines.

American Institute of Mining Engineers—William Laurence Saunders, New York City; Pennsylvania, '76; chairman board of directors of the Ingersoll-Rand Co. and inventor of many devices for subaqueous and rock drilling. Benjamin Bowditch Thayer, New York City; Harvard, '85; president of the Anaconda Copper Mining Co. and an authority on explosives.

American Electro Chemical Society—Joseph William Richards, South Bethlehem, Pa.; Lehigh, '86; professor of electro chemistry, Lehigh University, and author of numerous works on electro metallurgy. Lawrence Addicks, Chrome, N. J.; Massachusetts Institute of Technology, '89; consulting engineer for Phelps, Dodge & Co. and an authority on the metallurgy of copper.

American Society of Mechanical Engineers—William Leroy Emmet, Schenectady, N. Y.; Naval Academy, '81; engineer with the General Electric Co.; designed and directed the development of the Curtis turbine; first serious promoter of electric propulsion for ships. Spencer Miller, South Orange, N. J.; Worcester Polytechnic, '79; inventor of ship coaling apparatus and the breeches buoy device used in rescues from shipwrecks.

(*Continued on page 364.*)

Some New X-Ray Apparatus

SEVERAL new X-ray apparatus have been recently developed and perfected whereby the efficiency of this electrical aid to surgery and medical men has been vastly increased. A number of these up-to-date X-ray apparatus will be described in this article.

One great difficulty in the generation of high voltage currents by an induction coil

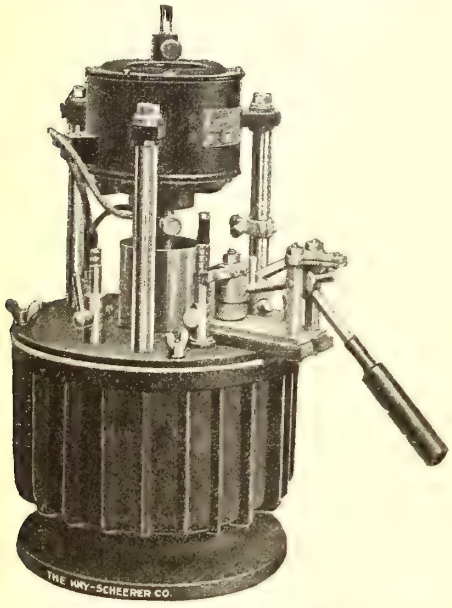

Fig. 1. Improved Type of Mercury Jet Interrupter.

or transformer for X-ray requirements lies in the device which produces the current interruptions when operated on direct current. Various types of interrupters have been built for this purpose, but none of them have proved very efficient. One of the latest interrupters of the improved mercury jet type and which employs illuminating gas for a quenching dielectric is depicted in Fig. 1. This particular interrupter consists of a small rotary pump, which throws a stream of metallic mercury against contact segments. The arc which is formed upon the break at the contacts is quenched by the gas, which is sent through the chamber. A condenser, of suitable capacity, is shunted across the interrupter terminals. The number of breaks per second can be regulated by varying the speed of the motor and also by the adjustment existent between the rotary and stationary segment.

A highly efficient heavy current chemical transformer (really an electrolytic rectifier) is portrayed at Fig. 2. This constitutes an ordinary rectifier of this class, employing extra large iron and aluminum plates immersed in an electrolyte of sodium phosphate (or bicarbonate of soda may be used). These chemical transformers can be satisfactorily employed in places where direct current is required, when A. C. is supplied from power companies' mains.

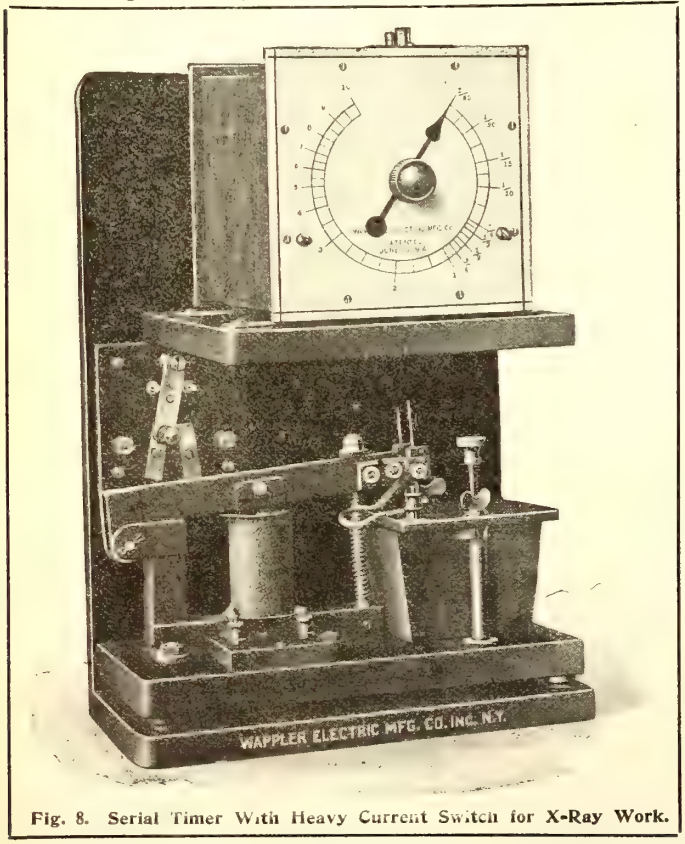

Fig. 8. Serial Timer With Heavy Current Switch for X-Ray Work.

These large rectifiers are inserted in the primary circuit of large (3-5 kw.) X-ray transformers to clip off half the cycle waves of the alternating current and thus produce in the secondary circuit a unidirectional or direct current of high potential. In other words, the negative pulses of current in the primary circuit are clipped off by the rectifier and pulses of positive current only are allowed to pass through the transformer. This does not give a true unidirectional or D. C. in the secondary, but by interposing high potential rectifier tubes in the secondary circuit before the current reaches the X-ray tube the much-desired high tension direct tube current is approximately developed. In the large machines pure direct current at 100,000 volts is produced by a revolving commutator of special design.

Another problem met with in the continuous production of X-rays is the generating tube itself, which becomes extremely hot when operated for periods of several minutes or even seconds; this is mainly due to the rapid ionic bombardment acting on the Anode electrode. Various shapes and sizes of Anodes and tubes were made to help eliminate this defect, but none of them have proven very beneficial, until the water-cooled Anode tube was devised. This is illustrated in Fig. 3, together with its water circulating apparatus. This consists of an electrically-driven pump built into a large water tank, to which two rubber tubes are connected from the tube, one for feeding in the water and the other for discharging it.

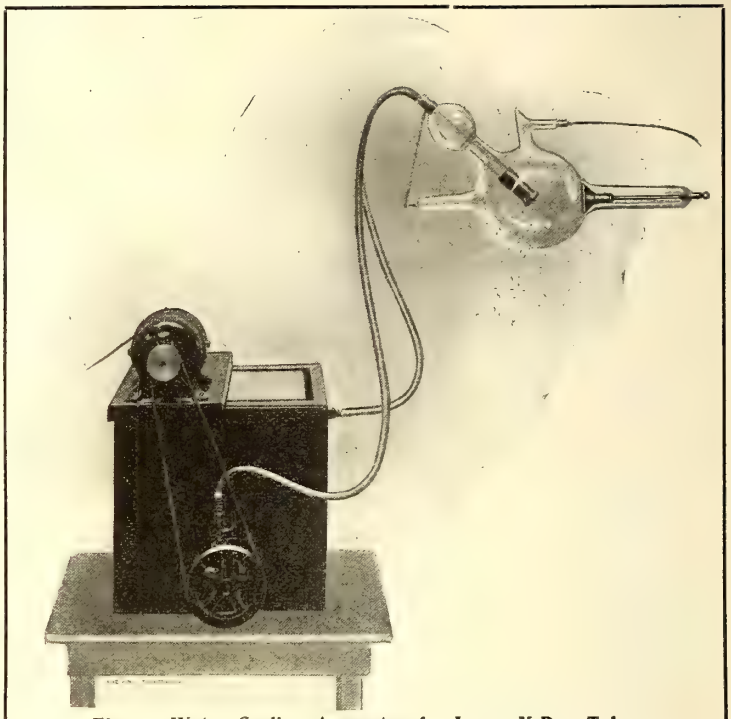

Fig. 3. Water Cooling Apparatus for Large X-Ray Tubes.

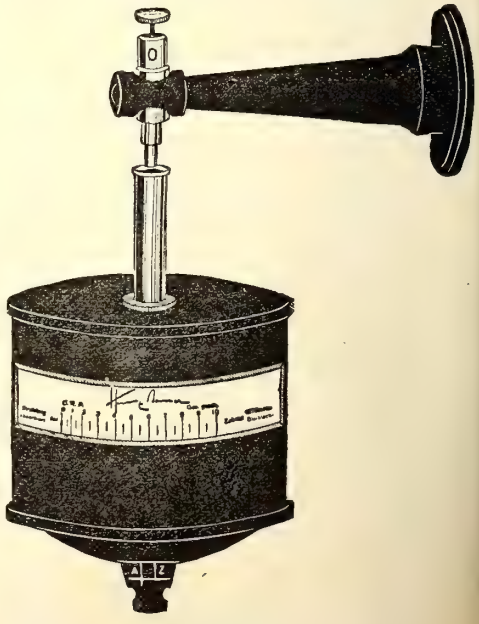

Fig. 5. Electro-Static Type of X-Ray Penetrometer.

In this way the Anode is constantly cooled by the circulating liquid. This scheme has showed remarkable results in allowing the tube to be manipulated for several minutes,

at full load, which often means 15 to 25 kilowatts.

A recent very neat instrument has been designed whereby the penetration of the X-rays through silver is taken. It is well known that these rays do not penetrate this metal appreciably and consequently a "meter" for measuring the *penetration of X-rays* has been invented. It is shown in Fig. 4, and is called technically a "Penetrometer." This instrument consists of a standardized tapered piece of silver, mounted on a lever which is movable in front of a fluorescent screen by means of a rack and pinion operated by a small knob in front of the instrument. A small graduated aluminum scale is provided so as to show exactly the penetration of the particular X-ray measured. The distance between the tube to be tested and the Penetrometer, at which readings are taken, is immaterial, as the radiance at a given distance has an even influence through the silver and aluminum; however, as a rule 12 inches from the wall of the tube allows the quickest readings. Another instrument for measuring the penetrating power of the rays is depicted in Fig. 5, but this is graduated in different units and is operated by a single wire, connected to the cathode terminal of the high tension machine. This is a different instrument than the one previously described, as the former depends upon the secondary voltage produced by the transformer. Inasmuch as the penetrating power of the tube depends upon the voltage, this instrument will show exactly the penetration of any particular X-ray tube.

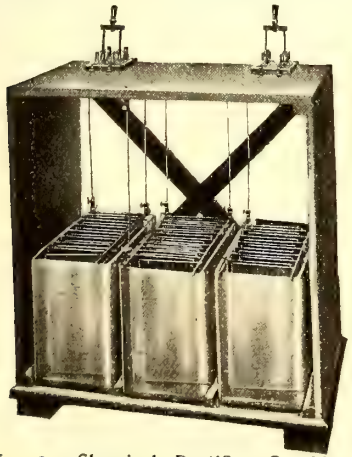

Fig. 2. Chemical Rectifier Capable of Handling Several Kilowatts.

We present two exceptionally good skiagraphic pictures which have been taken with different X-ray tubes. Fig. 6 shows the bare foot of a woman. Note the wonderful clearness of the bones and the fibrous structure of same; while Fig. 7 portrays X-ray photo of the right foot of a man, with shoe on, as will be readily perceived. Note the appearance of the skin of the foot in comparison with the leather of the shoe. Also observe the nails, the arch, lace tips and eyelets. This picture was taken with a ¾ second exposure; distance between tube and plate was 18 inches, while the tube was carrying 40 milliamperes of high potential direct current. The latter skiagraph was taken by Harry F. Ernest, the expert radiographer of the Kny-Scherer Co.

The illustration at Fig. 8 is of a new X-Ray serial timer, which will be found very useful to the medical profession engaged in making numerous skiagraphs. The timing of such X-Ray photos is very important. The dial indicator of this new instrument may be placed on any exposure time from 1/60 of a second to 10 seconds.

The Repeating Serial Timer is made up of an actuating mechanism which permits a pair of contacts to close an electric circuit through a magnet, and remain closed for a predetermined length of time, this being accomplished by the magnet pulling a pair of large contact surfaces together, closing the circuit through the transformer. At the expiration of the predetermined length of time the first circuit breaks, the magnetism collapses and the large contacts are separated by a strong spiral spring.

Fig. 6. Below: Skiagraph of Left Foot of a Woman. Such X-Ray Photographs Enable the Physician to Diagnose a Case Quickly and Correctly. Note That the Structure of the Bone Proper Is Observable in This Excellent Skiagraph.

Fig. 7. The Upper Skiagraph Depicts a Sidewise X-Ray View of a Man's Foot With Shoe On. Observe Particularly the Shoe and Flesh Outline; Also the Steel Brace in the Sole, as Well as the Nails. The Metal Eyelets and Cord Tips Show Up Plainly. This Picture Was Taken in ¾ Second, the Foot Being Placed 18 Inches From the X-Ray Tube.

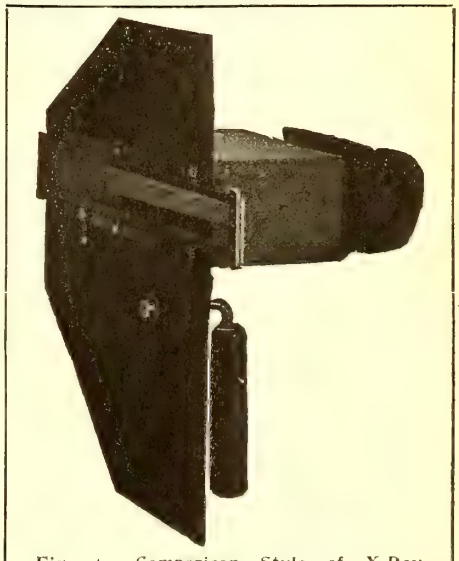

Fig. 4. Comparison Style of X-Ray Penetrometer.

READING ELECTRIC METERS WITH A CAMERA.

The truth-telling camera has found another and highly practical field of usefulness. Electric meters, gas and water meters will in future be photographed instead of read and and in place of figures furnished by sometimes very fallible inspectors a film record will supply authentic confirmation of the charge. This method of reading will also be much quicker and, with all possibility of error removed, a great saving in the time of inspectors and clerks as well as of consumers over disputed accounts will be effected.

A camera for the purpose has just been invented by the Eastman Kodak Co., and is known as the "Factograph." This novel camera is oblong in shape, measuring 4½ x 5¾ x 12½ inches—is made from selected mahogany, is equipped with a high grade anastigmat lens working at f.6.3 and a simple automatic shutter permitting exposures varying from 1/5 to ½ a second—within the judgment of the operator.

The camera is made in two compartments—the forward compartment being an electrically lighted chamber with an opening that fits over the meter dial. The reading is made by simply placing this opening against the meter and pressing downward on the exposure lever.

This one action automatically turns on the light, opens and closes the shutter and turns off the light. The shutter with each exposure locks automatically and remains locked until film for the next exposure has been wound into place, when it again flies automatically back to the "set" position.

Sample of Film Record as Taken by New Electric Meter Camera.

This prevents the possibility of a double exposure—likewise there can be no blanks, for the film cannot be wound off until the exposure is made. Winding reel and shutter are automatically unlocked. This eliminates the possibility of error from forgetting to turn the key or from turning the key before the exposure is made. The light

How the New Electrically Lighted Meter-Reading Camera is Used.

is furnished from two four-cell dry batteries stored on either side of the camera and supplying current to four 3.8 volt Tungsten miniature lamps.

The exposure is recorded upon special, sensitized paper; a special film or paper is supplied in the familiar cartridge form and is daylight loading—each cartridge carrying 75 exposures.

Storage space for two extra rolls is provided in the dark chamber of the camera in addition to the roll in position, permitting 225 readings to be carried within the body of the camera. A small drawer is provided in front which carries six extra lamps.

By pressing a small button which is located just below the exposure lever the lights may be turned on and the camera converted into a "flasher" for locating meters or finding one's way through dark cellars.

Special developer, furnished for the purpose, makes it possible to develop the film in 45 seconds. It is then ready for the reading by the bill clerk. No printing is necessary. The spools of film are opposed to a tiny mirror reeled up like a movie film, the clerk copying the records as they are mirrored. Identification of each meter is made possible by attaching the name and number to the meter. These are photographed with the meter reading.

In residence sections, through absence of the household, inspectors are frequently unable to gain access to the meters on the first call. For such contingencies cards are provided with the word "out" printed upon them. This card is photographed in place of the meter record and the information appears on the film in its proper order.

MISHAPS ATTEND USE OF WIRELESS ON AEROPLANES.

It has already been noted in many official and unofficial despatches that wireless telegraphy is frequently used both by the Royal Flying Corps and the Royal Naval Air Service. Most people are used to seeing wireless apparatus, which, whether used on board ship or on land, includes a series of long wires strung between masts or attached to a long pole in the ground.

These generally take the form of a single long wire on aeroplanes, which, when not in use, is wound up on a reel like the reel of a fishing rod, inside the machine. When it is intended to operate the apparatus the aerial is let out, the initial impetus being given to it by a lead weight like a plumb bob attached to the end.

Several hundred feet of this wire are let out, and it assumes a most curious shape in the air, because the weight of the plumb bob and of the lower portion of the wire naturally endeavors to hang down straight, whereas the resistance of the air through which the aerial is dragged always tries to pull it out horizontally behind the machine, with the result that the wire assumes a curve stretching out some distance behind the machine itself, says the editor of *The Aeroplane,* London.

When several hundred feet of wire are out, the air resistance actually amounts to quite a considerable strain on the reel, and consequently on the machine itself, though it is generally attached so that it does not interfere to any considerable degree with the fore and aft or lateral control of the machine. If, however, the engine stops suddenly, and the pilot has to make a forced descent, his operations are occasionally complicated by the resistance of the wire, which then is apt to act something like a brake on the machine's gliding path downward, unless it can be wound up fairly quickly.

In one case an officer who was experimenting with wireless as a passenger on a machine so fitted was quite badly knocked about owing to the necessity for winding in the wire. He was quite an experienced flyer, and had made a study of the best way to behave in case of an accident. In several such cases he had come out unhurt by the simple process of tucking his feet up onto the seat and rolling himself up as nearly into the shape of a ball as possible, so that when the machine turned head over heels he went over with it and his feet were not trapped by the front part of the machine breaking back on top of them.

In this particular instance he was so full of his duty that he went on winding away at the reel till the machine actually struck the ground. He had been obliged to steady himself with one foot against the floor of the front of the machine and wind up the reel on the left-hand side of the machine with his right hand. Consequently when the machine struck he pitched with all his weight onto his foot and was flung forward with his right arm against the front of the bodywork, the resulting damage being a broken leg and a broken arm. He has since concluded that under similar circumstances it is wiser to let the wire alone when he is near the ground and hope that it will catch in a tree or a hedge and break.

MASSIVE ELECTRIC GENERATOR HOLDS AUTOMOBILE.

The illustration shown herewith depicts an extra large electric dynamo built for one of the great automobile factories in Detroit. The massive size of this dynamo can be judged by the picture, which illustrates one of this concern's automobiles resting nicely on a scaffold in the center of the stationary field frame of the generator. This is one of several similar generators which will supply the current for the entire plant turning out these motor cars.

Huge Electric Generator Accommodates Automobile Within Its Field Frame.

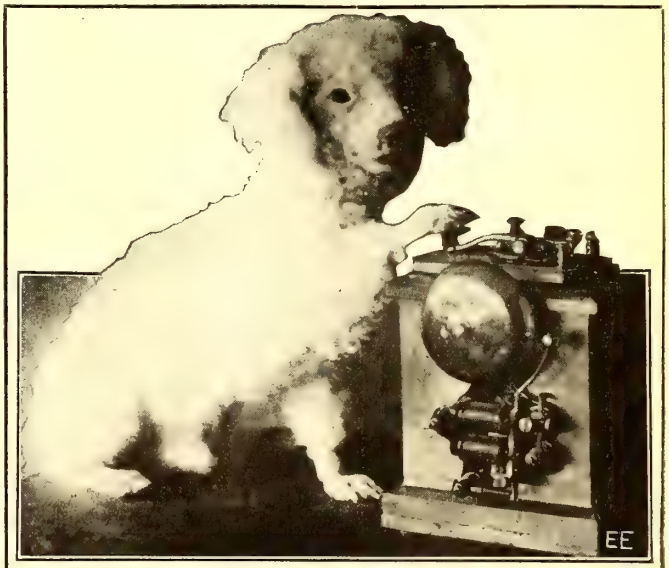
MIND-READING DOG IS A PUZZLE TO SCIENTISTS.

DECLARED by Western scientists to be one of the most remarkable dogs on record, Hector, a little French poodle, owned by C. J. Tryon, a mining engineer, of Arizona, has opened the eyes of students of psychology to new possibilities of the animal mind. Only two years of age, this dog has been trained not only to add, subtract, multiply and divide, but also to read the mind of his master, this being done, as explained by Professor C. L. Edwards, head of nature study work in Los Angeles schools, by the joint powerful concentration of both dog and man.

Numerous demonstrations have satisfied skeptical ones that there is no trick connected with the evidence of the dog's mental development, and investigators have come away with the conviction that, properly trained, the dog is a wonderful thinking and reasoning animal.

It was through reading an article by Maetterlinck, on the scientific mental training of horses in Germany, that Mr. Tryon conceived the idea of experimenting with the poodle he purchased in Los Angeles. He began by teaching the animal ordinary balancing tricks, and then finding Hector not only attentive and obedient, but a remarkably apt scholar, began to devote his time to the dog's mental training. It required patient drilling, but the results astounded him, for in a short time Hector was not only able to grasp the meaning of more than one hundred words and to obey their command with the proper action, but he showed evidence of being able to carry more than one idea or thought in his mind at the same time. "Hector, roll over!" Mr. Tryon would command, and Hector would proceed to do so. Then his master would order him to "roll over, sit up, shake your paws and bark," and after a little drilling the dog would perform all acts in their proper sequence. Once learned, an act, mental or physical, was never forgotten.

The dog's mathematical ability came merely as a matter of learning to distinguish and to apply on command the words "one," "two," "three," and so forth, just as he had learned to distinguish between "sit up" and "roll over," or between "pull it over" and "push it over." At the command "Count one!" Hector would be shown to tap a bell with his paw, once. At first the word "one" meant nothing, but after being stopped on the first ring of the bell he soon took note and tried to catch the word. At "Count two!" he would have to strike the bell twice, and these commands would be repeated until he mastered them.



Then came the combinations, "two plus two." It required patient, laborious effort on the part of his teacher, but gradually the little poodle learned to tap the answer for any plus combination that did not exceed twenty-five in total. Whenever he erred on any particular combination he was corrected immediately, and made to tap the right answer several times in succession, after separate commands, before any further progress was attempted. Hector simply learned that the command "Count two plus seven!" meant nine taps of the bell, just as he had learned that "sit up" and "roll over" meant a certain act on his part.

Mr. Tryon explained some of his methods and the success he has met with as follows:

"To start with," he said, "Hector has perhaps no more wonderful brain than a great many other dogs, but he has had the advantage of scientific training. From observations and experiments I had long become convinced that dogs could think and reason, and I was determined to prove it. Finding Hector, like most poodles, very attentive and ready to concentrate his whole thought on every word spoken, I put forth every energy in his mental development. It became a hobby of mine, and I thoroughly enjoyed what would perhaps tax the patience of the average man.

"Physiological experiments prove that the principal parts of a dog's brain are relatively located and have the same function as the human brain. Like humans, different dogs have certain well defined talents which can be developed to a remarkable extent by continued training, providing, of course, that the dog has real brain capacity. Some humans cannot learn anything, and some dogs are the same way—naturally without brain capacity."

Recently Mr. Tryon has discovered that his French poodle has a remarkable faculty for reading his thoughts. Not being a student of mental telepathy, Mr. Tryon is at a loss to explain it, but on many occasions he has concentrated his thoughts on a certain number and, fixing his gaze on Hector, has silently commanded him to "count" that number. And Hector has invariably approached his tapping bell and counted the number correctly.

"Hector," the Dog That Taps an Electric Bell Intelligently, It Is Said.

High Frequency Currents and Apparata

EVER since 1891, on which memorable date Nikola Tesla, the wizard of high frequency electrical phenomena, delivered his famous lecture before the American Institute of Electrical Engineers covering his discoveries and experiments in

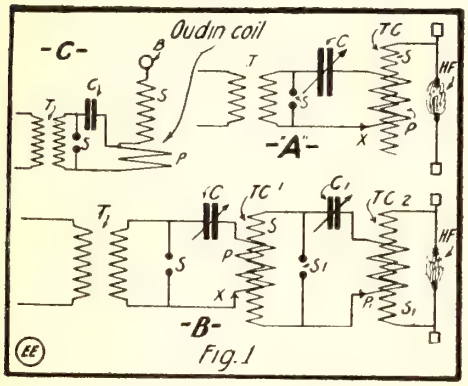


Fig. 1. Diagrams For Oudin and Tesla Coil Hook-Ups.

this wonderful field of science, the greatest scientists of the whole world have been busily occupied in developing and perfecting apparatus of this nature for various purposes, including invaluable electro-therapeutical applications, wireless telegraphy, etc. Possibly the electro-medical profession has benefited more by the discoveries in this little known field of electrical science than any other branch of workers.

In this article will be outlined a few of the more interesting arrangements and types of apparatus which can be employed for the production of ultra-high frequency, high potential electric currents, and which, as is generally known, can be taken through the body without feeling any appreciable pain. It is these high frequency currents, which oscillate at anywhere from 100,000 up to 1,000,000 or more times a second, which are utilized in the many electrical stage acts touring the country and which probably most readers have seen at some time or other. The apparatus described in this article produces high frequency currents of th's character, and many pleasing, startling experiments can be made therewith, similar to those shown by the stage lecturers and college professors.

At Fig. 1 there are outlined at A, B and C the principal hook-ups and layouts of apparatus necessary for the production of these ultra-high frequency currents. At Fig. 1A is depicted the regular Tesla coil circuits with a step-up transformer, T, spark gap S, glass or other high tension

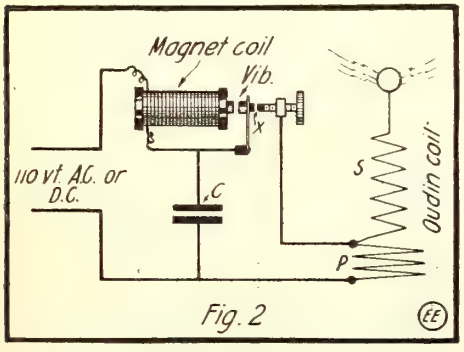

Fig. 2. Collins-Sanchez High Frequency Generating Circuit.

condensers C, preferably of the adjustable type, and TC the air-core Tesla transformer. At P the primary of this Tesla coil is indicated, while at S is shown the secondary winding. The high frequency current discharges take place between the electrodes at HF. To properly tune the closed oscillating circuit SCP the condenser C should be made adjustable as aforementioned, and also the primary inductance P should be variable by means of a clip X. This permits the capacity and the inductance of this circuit to be altered until maximum results are obtained in the Tesla coil secondary.

In some cases resort is had to a compound Tesla circuit as depicted in Fig. 1B. Here the usual step-up transformer excites the circuit SCPX. The secondary S of Tesla coil TC¹ then charges or excites the second closed oscillatory circuit S¹C¹P¹, the final high frequency discharge taking place from the secondary S¹ of the No. 2 Tesla coil.

Where a discharge of great intensity is desired the usual hook-up for a high frequency outfit is indicated at Fig. 1C. Here the same symbols refer to similar parts as just explained, and for this Oudin coil arrangement one end of the secondary S is joined to the primary coil P; the other end of the secondary coil is connected to a brass or copper ball B. This scheme is different from those shown at A and B, Fig. 1, in that the secondary is placed at the end of the primary and not inside of same, as is the case in the regular Tesla coil arrangement.

While on the subject of high frequency schemes and circuits for same, it will undoubtedly be of interest to cover one of the latest plans for this kind of work, or the Collins-Sanchez high frequency generating circuit, as outlined in Fig. 2. This constitutes the idea now utilized in a large majority of the extra compact style high frequency sets supplied for physicians' requirements, etc. To begin with, a small-size and very well-insulated Oudin coil consisting of primary and secondary P and S is made use of. The secondary, as understood from diagram at Fig. 1C, connects to a metal ball or other electrode as observed, and its other free terminal is joined to the primary P. High frequency currents are caused to be generated and to oscillate around the circuit CXP, which comprises a mica or other fairly high voltage condenser C, a vibrating spark gap X and the primary coil of the Oudin transformer P. The vibrator X carries extra heavy silver contacts and the iron armature of the vibrator spring is attracted by the magnet coil as perceived. Thus this vibrator performs two functions, viz., it serves to interrupt its own (magnetic coil) circuit as supplied with current from 110-volt direct current or alternating current, and also it serves as a spark gap for the high frequency oscillating circuit CXP. These high frequency currents thus produced are transformed by induction into the secondary circuit of the Oudin coil S. This type of apparatus gives a very powerful and steady uni-polar discharge, and the current thus generated is much in use nowadays for ultra-violet ray treatment, excitation of X-ray tubes, etc.

A great many experimenters possess a high voltage wireless transformer rated at ½ kw. or more and giving anywhere from 12,000 to 15,000 volts at the secondary terminals. For those possessing such a transformer, and also for those who may be interested in building a fair-size high frequency outfit and who can easily purchase a suitable transformer of the size aforementioned, the following data is suggested. The Tesla coil here described will produce

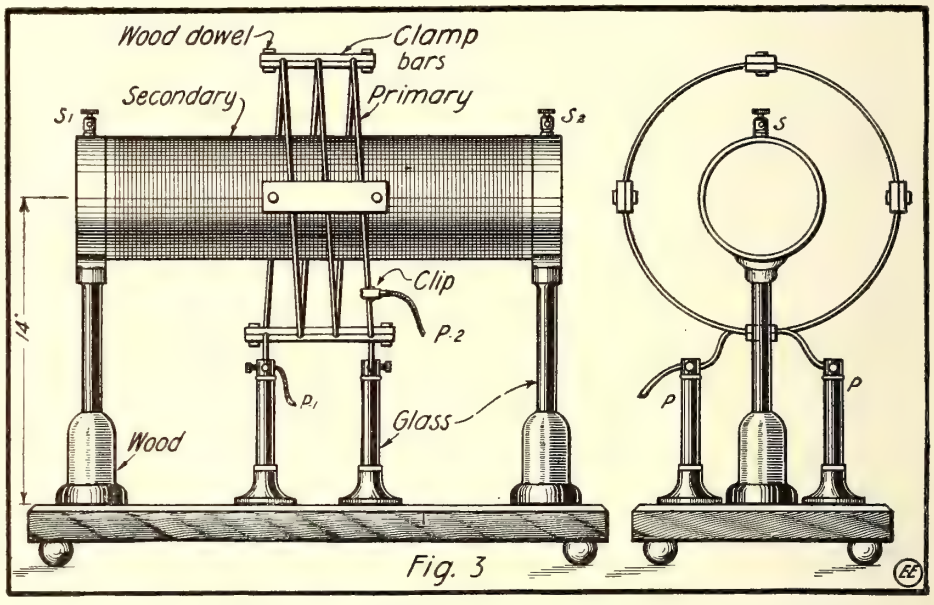

Fig. 3. A Well Designed Tesla Coil, Suitable for Use on ½-Kw. High Potential Transformer.

12 to 15-inch high frequency sparks from the secondary when excited by a transformer of the type just mentioned.

Besides the transformer in question, there will also be required a suitable glass plate condenser or the equivalent made up of Leyden jars, and also a spark gap, which shall preferably be of the rotary type so as to be well cooled. A quenched spark gap proves very efficient for this class of work.

Fig. 3 shows the appearance of the Tesla coil design here proposed. The base of same may be made of some well-dried wood, and th's had best be boiled in paraffine wax so as to exclude all dampness. Upon this base are placed glass supporting rods for the secondary and primary coils, and this will be found to give the very best efficiency where such high frequency, high potential currents are to be produced.

The primary coil is composed of four to six turns of about No. 4 B. & S. copper, brass or aluminum wire (stranded best), and these convolutions of heavy wire are wound to a diameter of about 12½ inches, spacing the turns about 1½ inches apart.

The primary turns are held in shape by four wax impregnated wooden clamps, as perceived. Also a clip is provided for one lead of the primary so that the number of turns in circuit, and consequently the inductance, may be varied in tuning up the set.

The secondary coil may be composed of a cardboard cylinder 24 inches long by 5 inches in diameter. This is provided with two binding posts at the end of same, as shown, and the winding comprises one even layer of No. 26 enameled or silk-covered magnet wire, each turn being spaced from its neighbor the thickness of the wire itself to improve the insulation. This can be done easily in a screw-cutting lathe.

This coil should be hooked up as per diagram, Fig. 1A. Regarding the glass plate condenser suitable for this ½-kw. size high frequency coil, and considering that the exciting transformer is rated at 12,000 volts (secondary), with a frequency of 60 cycles, then .06 microfarads condenser capacity is required. If ⅛-inch common glass is used in making this condenser about 5,333 square inches of such glass is required. This is coated on both sides with tin-foil; 1½ inches margin should be allowed around every tin-foil leaf on the glass plates. If the foil can be made 24x20 inches on each plate, then 11 such plates will be necessary for this outfit.

At Fig. 4 are shown a number of details which can be followed more or less exactly in making up a suitable condenser rack to hold these glass plates. This rack may be made up of wax impregnated wooden pieces, and inside of same there are placed two hard rubber strips in either side of the frame, which strips are slotted as perceived, so that the glass plates may rest edgewise in these slots, thereby reducing current leakage to a minimum. By looking at the top view of the condenser frame it is seen that two metal strips run along the top hard rubber strips and a series of binding posts are mounted on these metal pieces. From each bindng post there runs down between the glass plates a brass wire carrying a spring contact shoe, detail of which is shown in sketch at Fig. 4. It is thus perceived how each alternate foil-leaf on the glass plates receives a positive and negative charge. The terminal lead wires T1 and T2 should be hooked up to the condenser frame as in diagram, i. e., to opposite end of the metal strips, so that the high frequency inductance will be balanced, no matter how many condenser plates are in use. The number of plates in use can be varied by simply sliding them out of the rack, or also by removing one or more of the spring contact shoes.

Regarding the details of rotary spark gap suitable for this outfit, they are illustrated at Fig. 5. Any small motor operating on battery or 110-volt current is to be utilized in driving the rotary spark disc B. This disc is made up in the regular fashion as employed for wireless sets, but the plan here advocated is a very good one, especial- from the air-cooling point of view.

This design calls for a ⅛-inch zinc or other metal disc about 6 inches in diameter, and 12 spark plugs are cut into the disc as detail sketch B portrays. These sparking electrodes are cut on three sides and then the lug is bent up. All of these lugs when finished should be filed off or turned off in a lathe, so as to be perfectly true. This operation, however, had best be postponed until the disc is firmly screwed or riveted to a central hard rubber insulating hub, as drawing shows. The spark disc is held securely to the motor shaft either by means of a regular hub or by means of hexagon nuts threaded onto the shaft. In front of the revolving spark wheel are mounted two stationary electrodes, and detail sketch A shows how the ends of these are filed down so as to correspond with the thickness of the rotating disc electrodes. It is well to force a few cooling vanes (washers) tightly on the ends of the stationary electrodes as indicated. A marble base is best employed for mounting the motor and stationary electrodes with their upright standards. There are thus two spark gaps in series in this design. It is well to have a rheostat in series with the spark gap motor, so that the speed of same may be adjusted, and also the spark frefrequency, in tuning up the complete high frequency sets.

When all of these parts have been properly made up or assembled and the diagram followed as per Fig. 1, there should be very little trouble experienced in producing a heavy high frequency spark 1 foot long or more, depending upon the adjustments of the circuit. The spark gap, condenser and primary coil clip X should be adjusted one after the other or alternately until the maximum resonance is obtained in the circuit as manifested by the production of the largest spark in the secondary circuit.

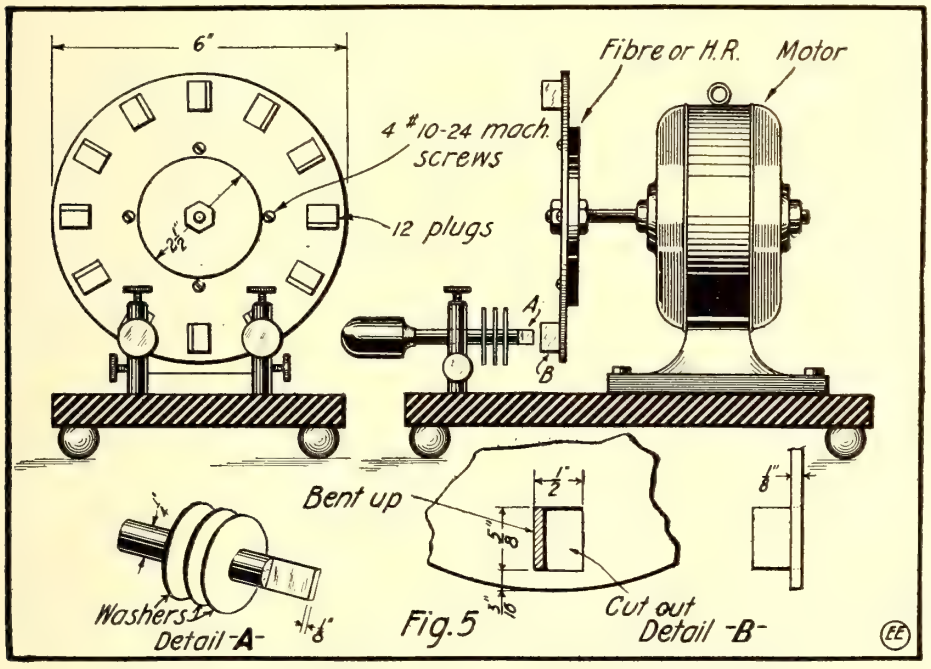

Fig. 5. Details of Rotary Spark Gap for ½-Kw. High Frequency Coil.

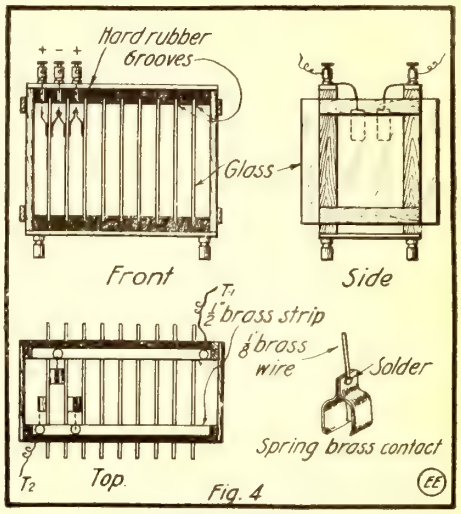

Fig. 4. Constructional Details of 12,000-Volt Glass Plate Condenser.

There is appended to this article a short bibliography of the more important articles which have appeared in *The Electrical Experimenter* on high frequency currents, and also a number of the best books available on the subject.

For those vitally interested in this subject it will be well to purchase one or more of the books mentioned. A few experiments of general interest are cited below.

An experiment not very well known, although dating from the time of Tesla's first lecture on high frequency currents, is that which demonstrates how a motor may be operated on one wire, and in some cases without any wires connected to it. Upon this and other experiments employing very powerful currents Tesla has taken out a number of patents on the *wireless transmission of energy* through space.

At Fig. 6 is depicted Tesla's scheme for a one-wire motor. One terminal of a small-size high frequency Tesla coil is hooked up to a coil of wire wound on an iron core and in front of which is placed a delicately mounted metal disc, which can rotate upon its axis as perceived. The other end of the magnet coil is connected to a metal plate suspended in the air and which picks up energy out of the ether, presumably. When the Tesla coil is excited in the usual way the high frequency current passes through the magnet coil, magnetizing the iron core, and the rotating disc starts to move. Thus we have a single

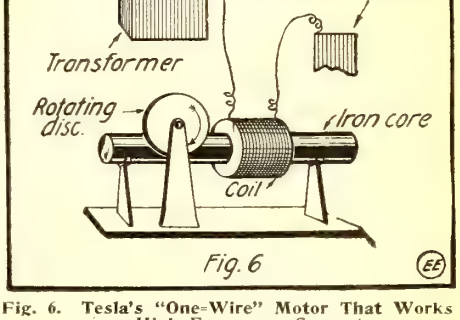

Fig. 6. Tesla's "One-Wire" Motor That Works on a High Frequency Current.

Stepping Stones for Junior Engineers

OUR young boys and young men who are mechanically and electrically inclined have to-day wonderful facilities opened up to them in order to train their minds on elementary engineering matters. There are, for instance, books on most every conceivable subject in the engineering and allied branches of science, electric toys and other apparatus which can be purchased cheaply, etc.; but there probably never has been a more distinctly practical and self-educating device brought out for the purpose aforementioned than that involving the use of miniature steel stampings made in the form of girders, beams and other necessary accessory parts.

The illustrations herewith will give some idea of what can be done by young boys, even 10 years of age, with these miniature steel beams and accessories. There are several large companies supplying excellent outfits of this type, with which it is possible to lay out and build sky-scrapers, wireless towers, railroad steam shovels, Ferris wheels, etc., in complete replica. While the present steel pieces making up these miniature construction outfits are quite light and also low in price as regards the initial cost of same, it is hard to conceive of anything more eminently practical and instructive. It is true that, while most boys can gain considerable education by reading the numerous books available on subjects in which they may be interested, it is also equally true that to gain a thorough and practical knowledge the actual work must be done in some form or other by the student himself.

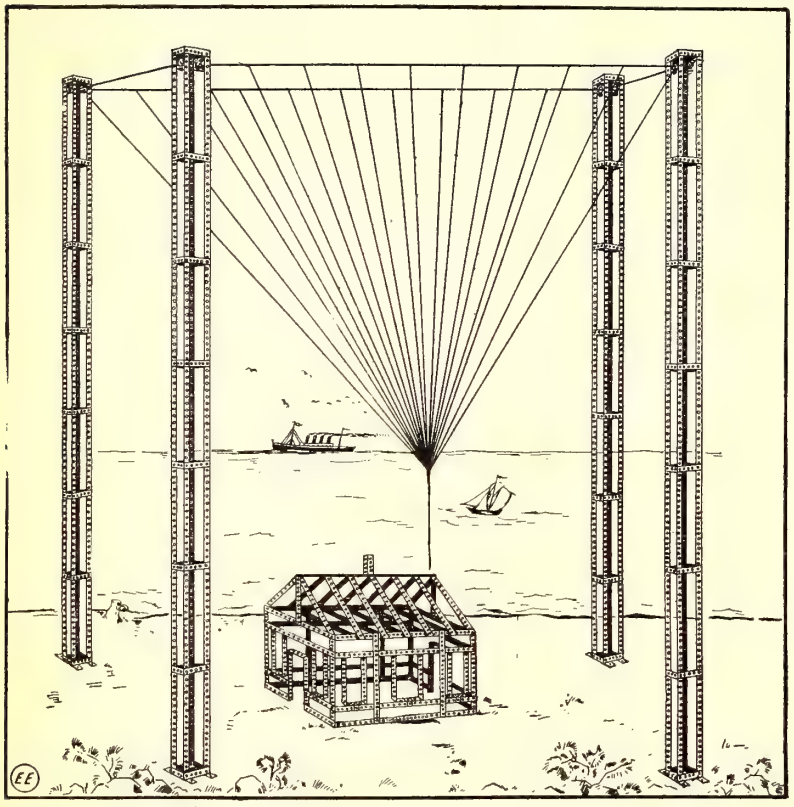

Fig. 1. Model Transatlantic Radio Station Constructed From Toy Girders.

These "stepping stones for junior engineers," as they may be called, are equally well adapted for training the mind of youthful embryo electrical, mechanical and civil engineers. At any rate, if the young student does not intend to follow up any of these professions, he will gain a practical knowledge of how building framework, towers and other miscellaneous mechanical parts are to be fastened and laid out in order to insure the greatest rigidity and strength, which knowledge all of us should have indeed.

Our illustration at Fig. 1 shows how four miniature steel masts may be constructed from these metal girders, and in this way a very good wireless aerial can be made up in replica, as perceived. Such an aerial as this would also be of good use for wireless demonstration sets utilizing the well-known coherer receptor, and particularly when these sets are used in lecture rooms and theaters where a small aerial 4 to 5 feet high or even less will suffice. The aerial may be made of copper wires No. 18 or No. 20 gauge, and a couple of insulators may be placed in the supporting towers as sketch shows. It is also possible to very easily build a miniature radio station building to be placed at the foot of the masts, as seen in sketch.

For the junior engineer there is probably nothing more interesting than the wonderful steam and electr shovels such as were used in excavating the Panama Canal, and as used throughout the country for railroad work in clearing away hills and embankments. Fig. 2 shows how one of these may be made up very nicely from these miniature steel beams. The shovel may be made to operate by an electric motor, and also a dry cell can be placed on the truck framework. If it is desired, a speed-controlling rheostat may also be mounted on the truck. To make this more complete it is well to place the whole machine on a length of track as shown in sketch. With a little skill and care this device will prove of unending interest to the boy mechanically inclined, and it will scoop up a heap of dirt in short order. The forward beam carrying the scoop proper is mounted so as to rotate, and thus each scoopful of dirt can be lifted and swung away from the truck before emptying, or it can be dumped into an empty freight car placed alongside of the shovel, thus following out railroad construction in some detail. Preferably an electric train should be used for hauling the dirt away, and in this way quite an elaborate engineering project can be carried out very nicely by one or more boys.

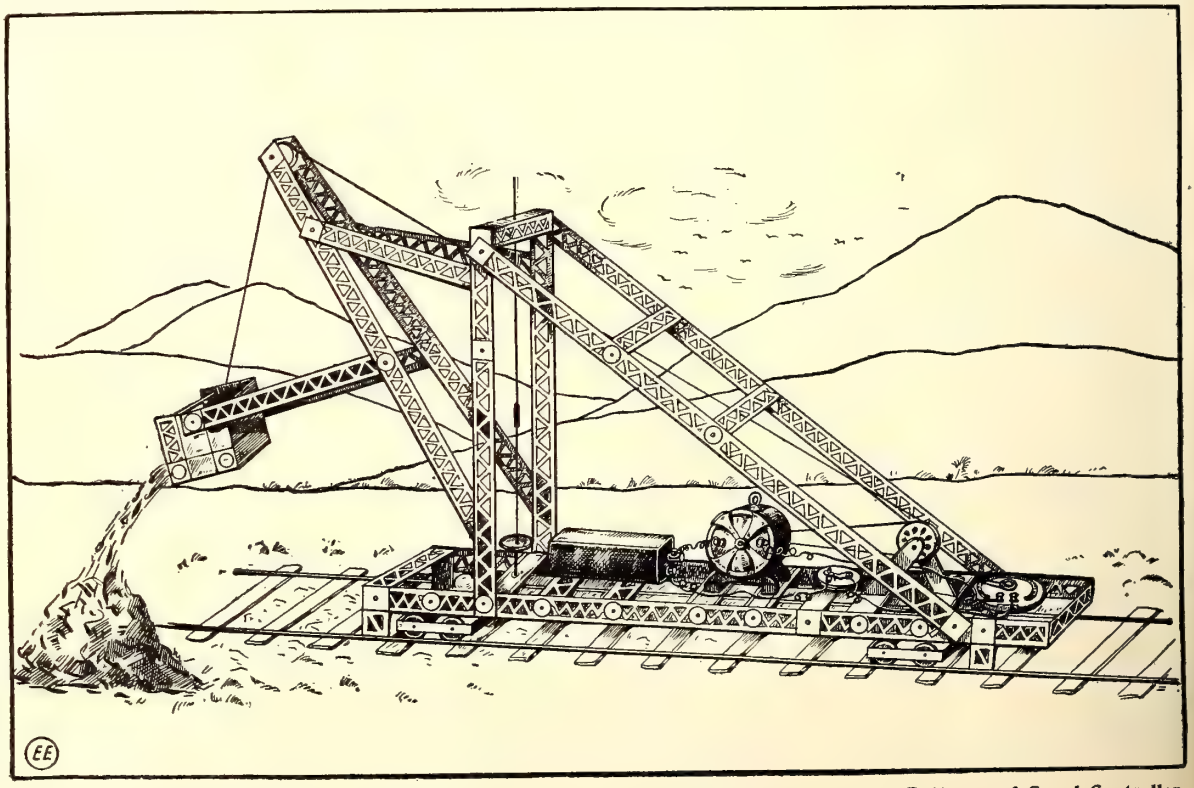

Fig. 2. A Realistic Steam-Shovel Composed of a Battery Motor, Some Miniature Girders, a Battery and Speed Controller.

At Fig. 3 is depicted details of construction for an elevator in a building, and this is moved up and down in a very natural manner by means of an electric motor, together with a rheostat, switch and battery, as observed. There is practically no limit to the number of different designs such as these which can be worked out in an excellent manner by making use of a small steam engine or electric motor and a quantity of these miniature steel beams and the variety of odd parts, such as gears, pulleys, etc., supplied with them.

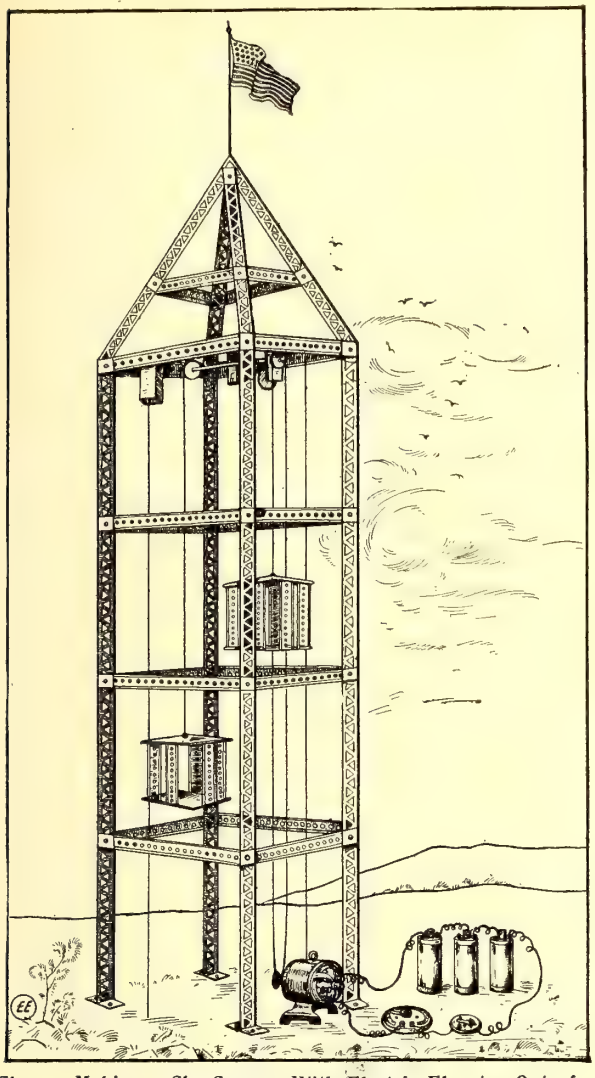

Fig. 3. Making a Sky-Scraper With Electric Elevator Out of Miniature Steel Beams.

HOW SUN SPOTS MAY BE CAUSED.

BY PROFESSOR G. W. COOPER.

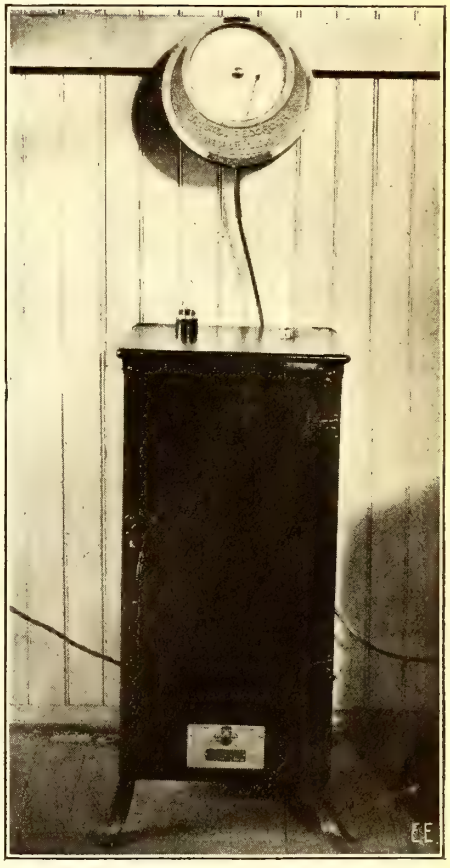
As we gradually descend into a mine, toward the center of the earth, the temperature rises so rapidly that many scientists believe that the center of the earth is a molten mass, caused by pressure or gravitation. When we realize that the sun, 93,000,000 miles away, attracts the earth with sufficient force to hurl millions of tons of water on our coast line, and that gravitation decreases as the square of the distance increases we can partially realize the tremendous attraction at the center of gravity of the sun. The center of gravity, like the magnetic poles of the earth, is not stationary but is continually shifting. If electric fluid is composed of electrons, and is universal, the electrons at the center of gravity must be under a heavy pressure, and if the center of the earth becomes a molten mass under pressure, moving electrons under tremendous pressure at the center of gravity must become luminous and throw off heat.

This theory would account for the sun as a luminous body, as a source of heat, as a powerful magnet, and also for the electrical disturbances seen near the sun during a period of sun spots; and if possible under these conditions for the sun proper to have a blackened crust on its surface, holes torn through these luminous electrons by gases would account for the sun spots and the fiery streamers that are hurled thousands of miles out into space. If we wish to carry this theory further, it is possible that these same little luminous electrons will account for the rings of Saturn, the Northern Lights and our Equatorial Light.

NEW FORMULA IN CALCULATING CURRENTS.

Probably the most accurate method of determining the value of the strength of an electrical current in absolute measure is by means of the Rayleigh current balance, in which the current to be measured is passed in series through two parallel circular coils of unequal radii, one of which is suspended from the beam of a balance. The distance between the planes of the coil is varied until the force of attraction between the two coils is a maximum, and the value of the force is obtained by adding weights to the other arm of the balance until its equilibrium is restored. Since the maximum force obtainable depends on the ratio of the radii of the coils alone, and not on their individual dimensions, it is only necessary to determine further the ratio of the radii of the coils, and this may be done with great accuracy by electrical means.

The constant of the instrument—that is, the maximum force per unit current for the coils in question—has been obtained in the past by interpolation between values of the force, calculated for various assumed distances of the coils, in the neighborhood of the critical value for which the force is a maximum. For although the general formulas of Maxwell and Nagaoka give the value of the force for any two given coils, at any assumed distance, with great accuracy, no formula has been heretofore published for calculating at what distance the force becomes a maximum. To supply this lack there is derived in a paper just published by the Bureau of Standards, entitled "The Calculation of the Maximum Force Between Two Parallel, Coaxial, Circular Coils," a formula which gives the critical distance as a function of the ratio of the radii. The latter part of the paper is devoted to the development of methods for facilitating the calculations. The formulas are illustrated by numerical examples and tables, and the new formulas are shown to give results in agreement with those derived by more indirect and laborious method of interpolation.



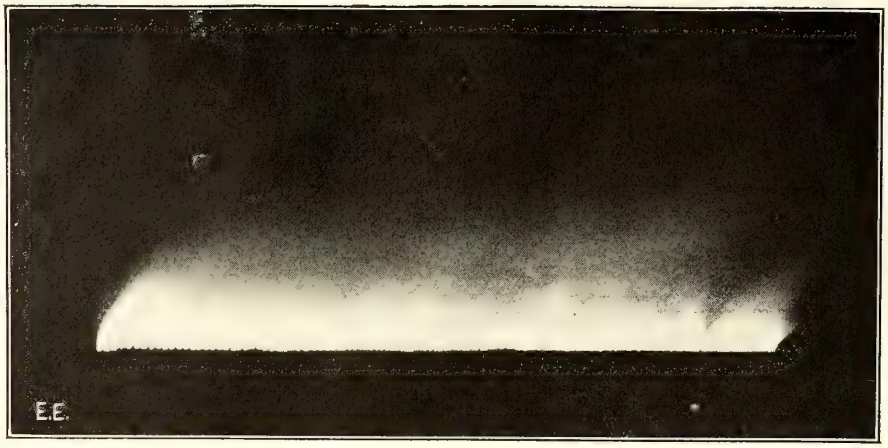
AUTOMATICALLY CONTROLLED ELECTRIC OVEN FOR TESTING SHRAPNEL.

Among the many varying applications of electricity constantly being brought before the public, and one of the most interesting at this time, in view of the conflict now raging among the leading nations of Europe, is an automatic thermostatic controlled electric oven.

This oven is for use in one of the Government arsenals in Pennsylvania for the testing of shrapnel shells. In the testing of these shells it is necessary that a temperature of 120 degrees Fahrenheit be maintained continuously for 24 hours. This control of temperature is obtained by means of a compact type of thermostat which makes and breaks the heating circuit. One contact point is carried by the expansion member of the device and the other is adjustable by means of a thumbscrew which extends outside the case. A condenser across the contact points holds the arcing down to practically nothing.

The oven is fitted with a mercurial thermometer for indicating the temperature. It is also fitted with a pilot lamp, connected in parallel with the heating element, to indicate when the current is on and off. On a continuous test for 24 hours the temperature of the oven did not vary more than one degree. This temperature reading is shown on the recording thermometer just above the oven in the accompanying illustration.

The oven is of especially rugged construction and is designed to withstand hard usage. The heating element is of the familiar type as used in electric ranges, and is rated at 200 watts.



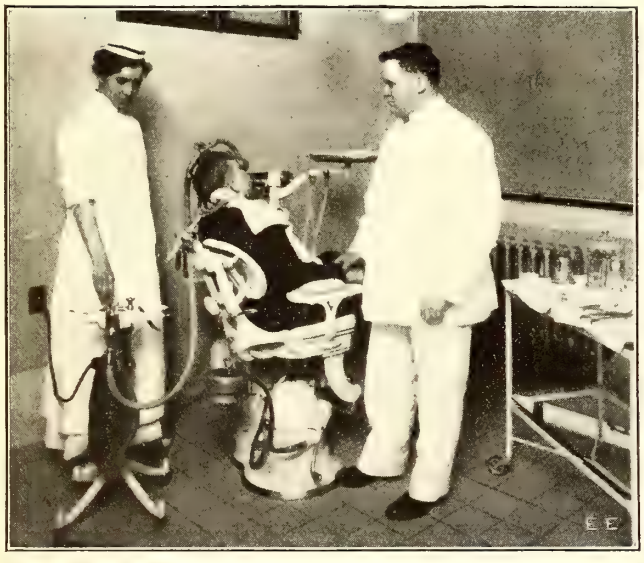
Electric Oven With Automatic Heat Control for Shrapnel Testing by U. S. Government.

Electric ovens have been found to be superior to any other method on account of the perfect heat distribution. They can be used for a number of purposes, such as enameling, baking cores, drying, etc.

ILLUMINATED STEAM CURTAIN GIVES WONDERFUL EFFECT AT AT NIGHT.

The illustration herewith shown portrays the remarkable effect produced at night by a brightly illuminated steam curtain, as erected under the supervision of a corps of Harvard University students, the work having been in charge of Theodore C. Brown, of Harvard.

This installation was employed in a wonderful outdoor show entitled "The Pageant of Lexington." This steam curtain served the same purpose as a regular theater curtain when the different scenes and tableaux were being assembled. The entire entertainment was planned on such a large scale that the only way the curtain effect could be produced, it seemed, was by the employment of a steam curtain as the photograph herewith illustrates in a vivid manner.



Mighty "Steam" Curtain Illuminated at Night. It Served for a Regular Theater Curtain.

The illumination for the Lexington pageant was planned by the engineers of the Edison Lamp Works of the General Electric Co., at Harrison, N. J., and it, in its entirety, involved the use of dozens of very powerful searchlights, besides a large number of powerful tungsten lamp banks and other sources of electric illumination unknown in their magnitude to the regular theater stage.

ELECTRICITY AND THE 20TH CENTURY DENTIST.

Electrical apparatus is being utilized more and more every day to aid our surgeons and particularly dental surgeons. In the photograph herewith is depicted an up-to-date electrically equipped dental operating room in a well-known hospital located in Boston, Mass. All articles in this operating room are furnished in the most sanitary way even to the chairs which are finished in porcelain and enamel.

Electricity Aids the 20th Century Dentist.

Electrical foot control rheostats are conveniently placed about the chair in which the patient sits and also an electrical respiratory device is provided while the nurse in the picture is seen operating this particular machine. This is used as an aid in the painless extraction of teeth. All drilling, cleaning and grinding of the teeth is performed by an electrically driven drill fitted with a flexible shaft enabling the dentist to hold the drill at any angle desired. Special forms of miniature "searchlights" help the operator to examine any remote part of the mouth and to work with ease and surety.

EXPLOITATION OF FINLAND'S WATERFALLS.

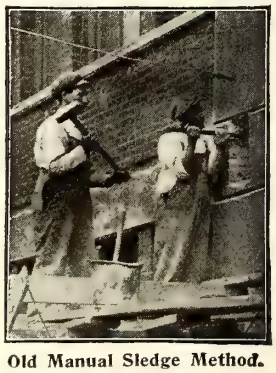
The Petrograd Joint Stock Company for Transmission of Water Power has made application to the Governor of Vyborg for permission to exploit the water power from the waterfalls of Rouhialasky. It is proposed to build a dam reaching from one bank to the other, with five passages of 46 feet in width for the water currents, of a depth of 58 feet. According to the calculations of the Finland Hydrographic Bureau, the flow of water is 42,000 cubic feet per second, and can be directed through four passages. The project provides for the erection of nine aggregates of turbines of 10,000 horsepower each.

Water power is the most efficient available.

EFFICIENT ELECTRIC HAMMER.

One of the special applications of electricity comes in the use of electric hammers, replacing the man with the sledge or hammer and star drill and the air compressor with its piping and hose.

The line of hammers that is made by one of the leading electrical manufacturers can be operated at a power cost that is practically negligible, ranging from two cents to five cents an hour and depending upon the size of hammer used. The equipment investment is small, only the first cost of the tool having to be considered.



To use one of these hammers it is only necessary to connect the tool to the nearest lighting outlet or wires. The low first cost of the equipment, combined with the ease of operation, makes its use advantageous and practicable, not only where pneumatic tools have heretofore been used, but on a large class of work whose magnitude did not make it economical to install an air outfit.

A man with an electric hammer may be expected to do about as much work as six men working by hand. This is easily explained by the fact that a man with a hammer strikes from 50 to 80 blows a minute, while the electric tools strike from 1,400 to 4,000.

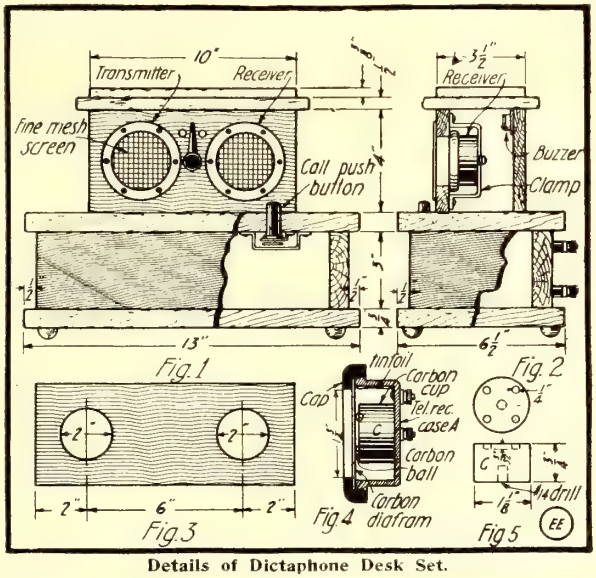
These electric hammers have long since passed the experimental stage and are being used successfully by companies installing switchboards, pneumatic tube systems, piping, railings, sprinkler systems, fire escapes, fire doors, etc. One large contractor tells of the great saving through the use of these tools in taking out the mortar between bricks for repointing, another of using them in breaking up old engine-bed foundations and sidewalks. Paint mills use them for dressing mill stones, ice plants and central stations for chipping scale off condenser tubes. In fact, wherever a rapid succession of blows makes for saving, these electric hammers are being used successfully. They operate on the reciprocating electromagnetic system and provide a much-desired implement for this class of work.

Improved Electric Hammer.

Old Manual Sledge Method.

New Electric Hammer Method.

THE CONSTRUCTOR



How to Build a Dictaphone Desk Set

By Homer Vanderbilt

THE desk telephone outlined below is a first-class instrument, very novel and new, besides being of easy and simple construction. Furthermore, the use of this instrument is different from the ordinary telephone, in that the receiver and transmitter are not brought into contact with the party using them. One may communicate with another party by merely placing the apparatus at a suitable distance on the desk and talk in the usual way without holding the receiver to the ear.

The case may be constructed, as shown in Fig 1, from some hard wood, such as oak, walnut or mahogany; the base of which is hollowed out, so that the ringing key and contacts may be placed inside. It should then be glued or screwed together, using flat head brass screws for the purpose, which will make a very neat job. The front wooden piece is made as depicted in Fig. 3, and into the two holes are placed the transmitter and receiver. The transmitter is of the "Dictaphone" type, as illustrated at Fig. 4. The case is built from an old watch case receiver, with the usual parts removed.

The cap is placed in a lathe and the hole made larger with a boring tool, until it measures 1¾ inches in diameter. This increases the area of the diaphragm; thereby also increasing the sensitivity of the transmitter. The carbon cup, C, is made up from a circular carbon rod 1⅛ inches in diameter and ¾ inch long. Five holes are drilled with a No. 14 drill on one face of the carbon, as Fig. 5 shows. These holes must be *exactly* drilled. The two faces of the carbon rod, C, must be exactly parallel with each other, as the operation of the transmitter is entirely based upon this point. In order to do this it is advisable to have it turned in a lathe. The bottom hole for fastening it is now drilled with a No. 14 drill, and then some melted sealing wax is poured into it. While still soft an 8-32 brass screw is inserted and the wax is then allowed to cool. This finished, it is placed in the receiver case and a carbon diaphragm placed over it, with a sheet of tin-foil pressing on the diaphragm in order to make contact. Test the circuit to see that the cup does not touch the diaphragm and if O. K. fill the holes in the cup with small carbon balls (not grains) about the size of the head of a pin, procurable from electrical supply houses. The diaphragm is now replaced and securely fastened and the tin-foil is connected to a binding post, as depicted in Fig. 4. The transmitter is now tested by connecting a telephone receiver in series with a battery.

Details of Dictaphone Desk Set.

After completion and test of the transmitter it should be placed back of one of the holes in the front wood piece and securely fastened by means of a brass strip, as Fig. 2 illustrates. The hole is then covered neatly with some coarse mesh screen.

The receiver is of the watch case pattern and also of the low resistance type. A 75-ohm receiver is obtained and the permanent and electro-magnet removed. The coil is rewound with 120 feet of No. 26 enameled wire and then replaced in the case without the permanent magnet. The connections of the coil are made in the same manner as the previous winding. After this has been done it is placed behind the second hole in the cabinet front and fastened in the same way as the transmitter. A screen is put over it, as illustrated in Fig. 1.

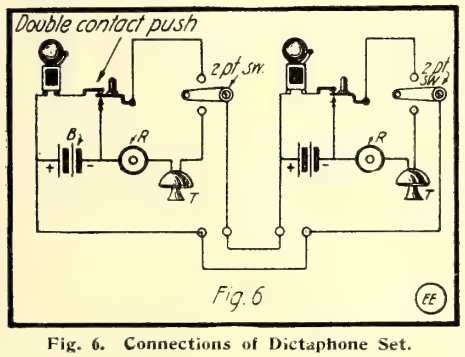
The ringing key, or "double contact" push button, which is located in the lower box, can be made in any form and no further description is necessary. A buzzer for calling is placed on the inside back of the case, as indicated in Fig. 2, and also a 2-point switch for the circuit is mounted on the front, as seen.

Fig. 6 outlines the connections for two sets of apparatus. Several of these outfits can be successfully used in circuit if desired. Three to four dry cells are usually sufficient for each station on 50 to 75 foot circuits.

Now, with the above apparatus completed, close the switch and press the push button. This rings the party at the other end of the line; and with both parties situated at about 6 feet from the telephones, conversation can be easily, distinctly and audibly conducted.

This new method eliminates the tiresome holding of the receiver and, above all, holding of the mouth near the unsanitary and (sometimes) germ-carrying transmitter.

As the current used is quite heavy, a large wire must be used to connect the two stations together. For stations 20 feet apart No. 18 B. & S. wire will do. For a distance of 50 feet use No. 16 wire; for a distance of 100 feet use No. 14 wire; for a distance of 200 feet use No. 12 wire.



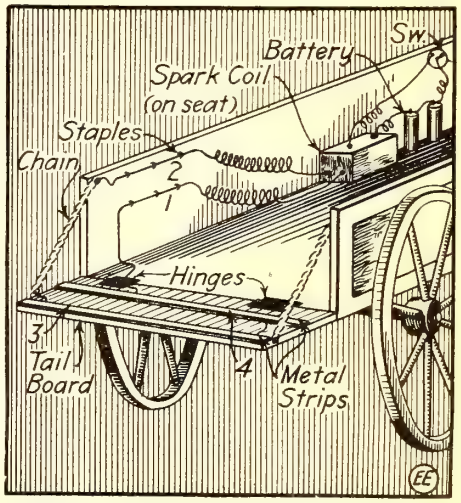


Fig. 6. Connections of Dictaphone Set.

A "KID CHASER" FOR WAGON TAIL-BOARDS.

For truck drivers and others who are often annoyed by children stealing rides on tail-boards, the following scheme will be found efficacious in the prevention of this dangerous nuisance.

All that is required is a small spark coil giving ½-inch or greater spark, together with batteries and controlling switch, which may be mounted on the back of (or under) the seat of the wagon. Two high-tension wires are carried along the frame of the wagon, as 1 and 2 indicate in sketch. One wire is joined to the hinge of the tail-board or simply direct to a metal strip 4. A second metal strip is placed across same at 3, and this is joined to the high-tension cable through the supporting chain, as sketch indicates.

Spark Coil to Keep Children Off Wagon Tail-Boards.

Now, when the youthful joy rider mounts the tail-board the driver can throw in the switch and the pleasure trip is abruptly terminated. Contributed by T. W. B.

Construction of an Inductive Tuner

By Milton B. Sleeper

Part II—(Conclusion)

Coupling Adjustment.

The back and side views of this unique control are shown in Fig. 10. On the same shaft with the handle is fastened a square brass tube. Inside this is a square rod. To prevent its interfering with the secondary taps it is bent out. The upper end, which is flat, has a round tube going through it parallel to the shaft of the handle. When the instrument is assembled a rod held

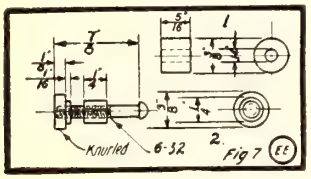

Fig. 7. Details of Binding Posts.

tightly by the screw eyes on the end of the secondary turns in the tube (see Fig. 3). As the handle is turned the square rod slides in or out of the tube, because the rod at the top must travel in a straight line, while the guides inside the primary keep the secondary from turning. Oil all the moving parts; there is no current carried in this adjustment.

Binding Posts.

Referring to Fig. 7, these binding posts are composed of four parts: a screw, a hard rubber bushing, a nut and a thumbnut. The bushings must fit tightly in the holes in the case; a little shellac will make them stick. The connections on the inside should be neatly soldered to the under side of the screw head. Then the nut is screwed tightly on the bushing. Outside connections are clamped by the knurled thumbscrews. This makes a neat and leakproof binding post.

Coil Center Pieces.

Fig. 8 gives the size of these pieces. In turning them up, bore the ½-inch hole in the center first; then turn them on a wooden face plate which has a little mandrel to fit tightly in the hole. If the hole is not exactly in the center of the pieces the secondary will not be concentric with the primary. Take (A) first. After shellacking and rubbing it down fasten it in the left-hand end of the primary tube with strong glue. To fit properly in the box the end of the tube must be at right angles with its axis.

Before fitting (B) each secondary tap must be fitted with soft rubber tubing to insulate and protect it from rubbing. When this is done pull all the taps out at the left-hand end of the coil and bind them together with string ¼ inch from the coil. Leave two or three inches of the binding string on the taps. In (B), between the slit and the center, make a small hole, just large enough to pull the loose ends of the binding string through it. Now bend the taps where they are bound and pull the ends out of the right end of the tube.

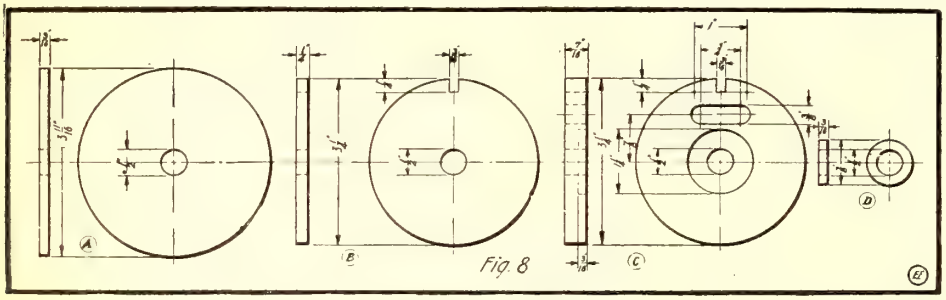

Fig. 8. End Discs of Secondary Coil.

When (B) is glued in place fasten the binding cord through the little hole, so that the taps will be held firmly to the wooden end. This is to prevent their breaking off from bending back and forth as the secondary is moved. The taps should come at the top of the coil. At the bottom of (B) fasten a little brass piece X that will slide between the guides inside the primary. Put in the piece (C). Divide the taps into three or four bundles to go through the hole in the end piece. That is all there is to do with the coils at present.

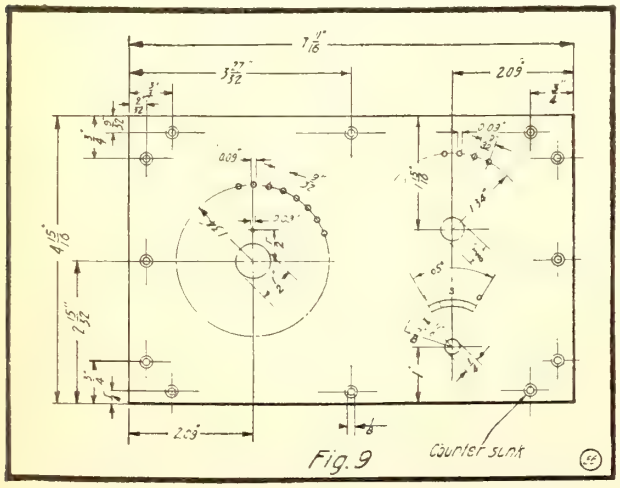

Fig. 9. Switch Lay-Out for Inductive Coupler.

Cabinet Front.

Fig. 9 gives the dimensions for the front. Great care must be used in laying out the holes for switch points. Always make a dent with a center punch first, otherwise the drill point will run over the rubber. They should be laid out with a pair of sharp-pointed dividers. First make a circle 1.34 inches in diameter. Then, by experimenting, the exact distance can be found to separate the holes. If the circle is just 1.34 inches in radius 9/32 inch will go in the circle just 30 times. The holes for wood screws are countersunk just enough to make the screw heads flush.

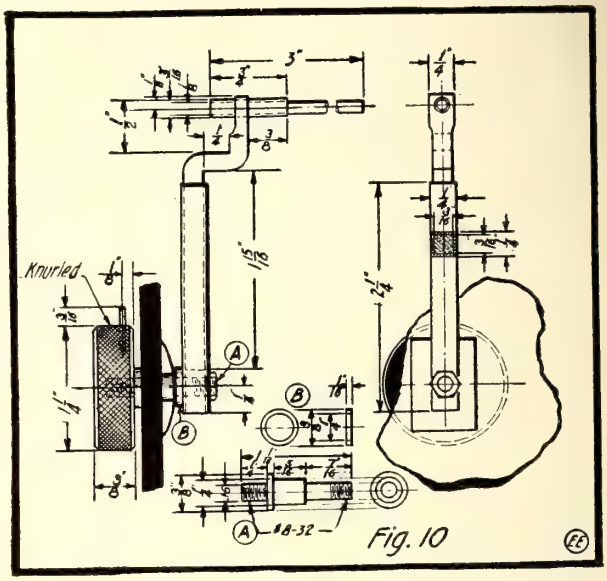

Fig. 10. Arrangement of Secondary Coupling Lever and Knob.

In laying out the scale for the coupling handle, score the hard rubber with the dividers. Then with a very fine brush fill in the scratches with white paint. This makes the scale stand out clearly.

Connecting the Taps.

When the switches are all fastened to the front it is time to connect the taps. By all means use lugs for this. The right size can be obtained from Clapp-Eastham. As each one must be soldered to the wire, it is advisable to get some very soft solder which can be melted by the heat of a match. There are several kinds on the market. Start at the left of the coil with the compensator taps, otherwise you will get into trouble. Cut off the taps a little *longer* than is necessary to reach from the coil to the switch. Do not take any chances on finding, when you put the coils in the case, that the taps are too short. Slip a piece of rubber tubing ⅜ of an inch shorter than the tap over the wires. Then solder on the lugs. It is best to try this on a separate piece of wire, for some difficulties may be encountered. When the compensator connections are made (see (2) Fig. 4) do the same to the other taps.

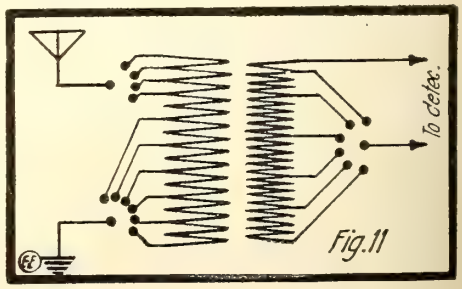

Fig. 11. Hook-Up for Coupler.

Starting with the tap from the seventh turn, fasten it to the top switch point on the large circle. Go around in order until the last one is connected to the thirteenth point. Test the coil with a buzzer and battery to see that the winding is all right. Do not touch the secondary taps until the coils are fastened in the case.

Fastening the Coils.

Now, when the case is put together, except the top (look at Figs. 2 and 3) to see where to fasten the slide tube. First put the primary, secondary and small end piece (D, Fig. 8) on the tube, with the coils in the center. Do not fasten the front on yet. Spread *cold* glue thinly on the primary end piece and the piece (D). Press them against the ends of the case, estimating the distances shown on the drawings. Quickly, before the glue can set, put two or three screws in the front—just enough to hold it in position. Take the rod which is to go through the screw eyes X on the end of the secondary and put it through the tube of the coupling adjustment (see Fig. 3). If the tube and screw eyes do not line up perfectly turn the primary or piece (D) until they are in alignment, otherwise the guide will bind against the wooden strips in the primary. Read these directions carefully before attempting to put the coils in; if you do not know just what to do beforehand you will make bad work of it. The secondary taps may now be joined. Move the secondary all the way inside the primary. Then run the taps under the long staple provided for their support, and up to the switch points. These, too, must be soldered. Do not forget, however, that the *left-hand* end goes to one of the binding posts on the right side of the case. If the taps become mixed test them with a battery and buzzer. By comparing the sounds of the buzzer the order of the taps can be determined. The copper strip from the spring of the secondary switch goes to the other binding post. The strip from the spring of the primary switch and a strip soldered to the contact of the compensator go to the binding posts at the left of the case. The compensator connection must be supported so that it will not interfere with the movement of the contact.

Fig. 11 shows the connections in the receiving circuit.

(NOTE.—The publishers shall be pleased to furnish the names of the manufacturers supplying Nos. 13, 14, 47, 60 on receipt of two-cent stamp to cover postage.—ED.)

LIST OF PARTS.

No.	Name.	Pieces.	Material.	Size.	Remarks.

HINTS TO THE AMATEUR.

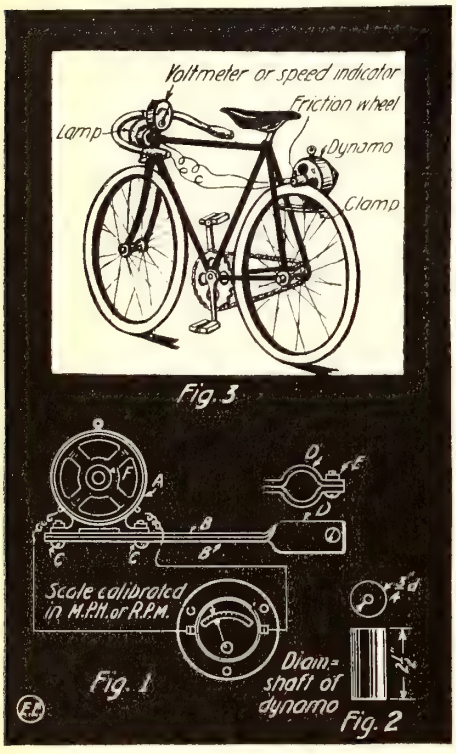
It is indeed surprising what a wealth of electrical material for the experimenter may be found around telephone exchanges, local electric shops and garages. Material such as porcelain parts, magnets, wire, slightly used dry batteries and many others, which will delight the experimenter with a somewhat flattened pocketbook, may often be obtained for the asking.

In one instance a wireless amateur received a complete head set and enough wire for an aerial in this way, while I have used with success for six months, on my 1-inch spark-coil set, dry batteries which were discarded from an automobile. A No. 8 B. & S. covered line wire, which had been thrown away at a power house, was utilized for making a dandy helix. The insulation was removed by hammering on it, causing it to separate from the wire, or it could be burned off.

The center binding posts of "Columbia" dry cells may be used for taps on a loose coupler, after being cleaned by placing in a diluted solution of sulphuric acid and then filing the heads quite flat.

The cup on the center of the "Ever-ready" type of dry cells may be used on a detector for holding the crystals, while the wax on the top of dry batteries may be remelted and cast in paper molds to make a variety of knobs.

Enough magnet wire for a loose coupler may be secured by asking for a burned-out "telephone bell" *with magnets,* at a local telephone office. A friend of mine secured, gratis, an old automobile ignition spark coil at a garage, and has used it for sending message one-half mile nicely. Contributed by WM. R. COTTRELL.



GERMANTOWN RADIO ASSOCIATION.

The Germantown Radio Association, of Philadelphia, Pa., would like to receive a few "sparks" from those interested in radio work. The club is now located at 5801 Germantown avenue, Germantown, Philadelphia, Pa., and meets on the third Monday of each month.

HOW TO BUILD AN ELECTRIC SPEEDOMETER.

A most interesting application of electricity is represented in an electric speedometer, an instrument used for denoting the speed of vehicles or any other moving object.

This type of speedometer consists essentially of two parts, viz., a direct-current generator of low amperage, which is driven

Electric Speedometer for Bicycles.

by friction or gearing from the wheel of a vehicle, for instance, and a voltmeter connected directly to the generator.

The dynamo, Fig. 1, may be an 8 or 10 volt machine. Now make the supporting parts, which consist of two iron clamps B B, attachable to the dynamo frame by means of bolts C C. The curved part D is used to fasten the dynamo to the vehicle, such as a bicycle frame, tightened by another stove bolt E. Any other suitable means can be employed in fastening the dynamo.

A small rubber friction wheel is next made, and it is shown in Fig. 2, no explanation being necessary, as all the required data is given. It is driven tightly on the dynamo shaft and is to be placed in contact with the driver wheel.

The recording device consists of an ordinary voltmeter, but another scale is substituted for the original one and calibrated in speed units, such as "miles per hour" or R.P.M., etc. The method of calibrating the voltmeter is as follows: Obtain a standard speedometer and place on the driver wheel, and at the same time secure the dynamo near the same driver and connect it to the voltmeter. Now start the vehicle wheel running (on a frame) and observe the scale on the standard speedometer, and note the position of the voltmeter needle. At that point mark a line, and the same figure as the standard speedometer is showing. Various points should be thus checked off in the same manner by running the vehicle wheel slower or faster.

This device can be used as a tachometer or revolution per minute indicator, the one point that must be remembered being to use a standard R.P.M. indicator as a means of calibrating.

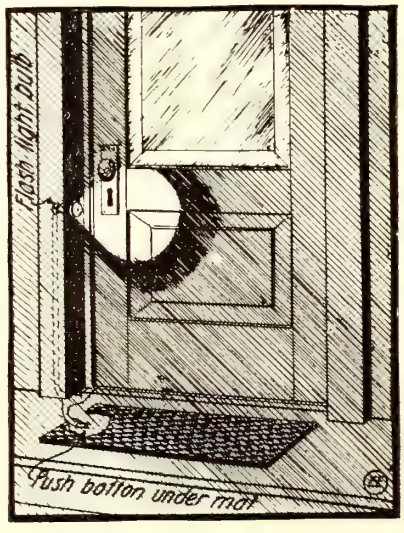
The voltmeter should be placed in a convenient place, so that the operator may cast his eyes on it very quickly. On a bicycle a good place is on the handle bars, as shown in Fig. 3.

This speedometer can also be used on automobiles, carriages, motorcycles and any other form of vehicle. It is useful indeed for testing machinery of all kinds. The calibration can be performed by calculation, aided by a common hand speed indicator. A small telephone magneto serves very well for this stunt, but then the voltmeter must be an A. C. instrument. Contributed by

SIDNEY SISSELMAN.

AN ELECTRIC KEY HOLE FINDER.

For those gentlemen who are inclined to stay out too late in the evening, or rather *morning*, and who often experience considerable trouble in locating the keyhole in the front door of their domicile, the following wrinkle may be of interest:



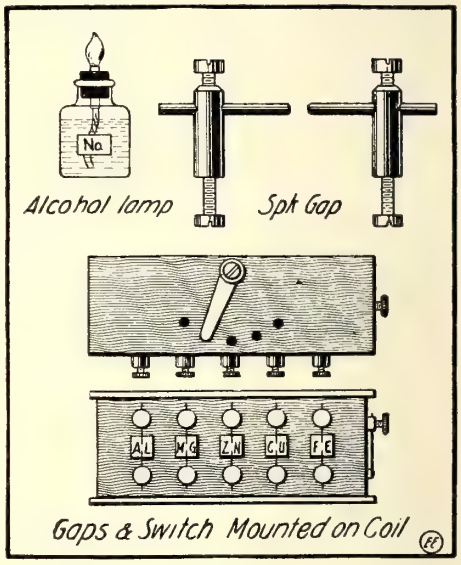
I notched out a small hole in the side of the door frame on my front door and placed in it a miniature battery lamp receptacle and a small Tungsten flashlight bulb. A battery may be placed in the cellar similar to a bell battery, etc., and ordinary bell wires, preferably fished up inside of the door frame, or otherwise neatly concealed, lead from the lamp socket to a circuit closer placed under the front door mat as the sketch shows. This circuit closer may be purchased at any electrical supply store and can be located under a certain corner of the mat, etc., so that the home-comer will possibly sooner or later place his foot on the proper part of the mat, and thus flash on the lamp which illuminates the keyhole.

It is hoped that this novel idea will be found welcome to many brother "Elks." Some nifty stunt. Eh! what?

Contributed by

ALBERT GALLAGHER.

It is generally admitted that the hardest problem is to find the keyhole in the "wee small hours" of the morning. The writer of this article presumes, evidently, that the rapidly oscillating movement of the feet



An Electric Light Finds the Key-Hole For You.

very shortly will locate the proper contact spot on the mat.—Ed.

CHARACTERISTIC FLAME COLORS OF METALS.

When a gas containing metallic ions is heated to incandescence it exhibits a color and a spectrum which are characteristic of the metal which it contains. Each of the 60 or 70 known metals has its own *flame color* and *spectrum*. With the alkali and alkaline-earth metals, it is only necessary to heat a salt of the metal in order to obtain the colored flame. With all the others, however, the metal itself must be volatilized, which can readily be performed by the electric arc or spark.

The exhibition of these various flame colors is an interesting and rather spectacular experiment. For the metals of the first division the apparatus is very simple. An alcohol lamp, which can be easily made out of a small bottle, a cork, a metal tube and a wick, is provided for each metal and labeled. In the alcohol of this lamp a salt

Apparatus for Testing Flame Colors of Different Metals.

of the desired metal is dissolved. The chloride is the most convenient, both because it is the commonest salt and also because it is soluble in alcohol. The salt must be chemically pure, for if it is not it is sure to contain traces of sodium, whose brilliant yellow flame quite obscures that of any other metal.

The presence of traces of sodium in atmospheric dust and moisture may be proved by holding almost any object (an iron nail for instance) in the colorless Bunsen flame, which will be turned yellow for a moment. If the salt dissolved in the alcohol is chemically pure, however, the flame of the alcohol lamp, instead of being colorless, will be yellow, violet, green, orange or deep crimson, according to the metal used. In a darkened room this is very striking. The colored flame, when examined with a spectroscope, shows the characteristic lines of the metal.

For showing the metals of the second class a series of small spark gaps are used; the electrodes of the different gaps being made of the metals to be examined. The gaps are put into operation, one at a time, by means of a suitable H. T. multi-point switch. The electrodes should be very close together, almost touching, so that the "spark-ball" may be formed. A very brilliant flame is produced in this way. It may be examined with a spectroscope, the same as the alcohol flame.

Below is a list of the more common metals and their flame colors:

FIRST GROUP.

Sodium, Na	Yellow
Potasium, K	Violet
Calcium, Ca	Orange
Barium, Ba	Green
Strontium, Sr	Crimson

SECOND GROUP.

Magnesium Mg, Aluminum, Al.	Dazzling white
Zinc, Zn	Blue
Copper, Cu	Green
Iron, Fe	Reddish yellow

The Amateur Radio Station Which Aided Uncle Sam

A Complete Description of the Wireless Station of Mr. Charles E. Apgar—Full Details of the Audion Amplifier Circuit and the Inductance Coils Are Here Given

By Charles E. Apgar

SINCE the publication of the article on recording Sayville radio signals phonographically in the September, 1915, issue of the *Electrical Experimenter*, so many inquiries have been received by me from interested amateurs and others concerning many details of construction, circuits, etc., that I thought that possibly a more complete statement concerning the station and the work accomplished would be welcomed by many readers. Also since the station has been so generously referred to in the daily and technical press since July 18, 1915, a brief history of the station itself will surely be of interest.

Fig. 1. Top View Depicts Mr. Chas. E. Apgar Receiving Wireless Messages at His Wonderfully Efficient Experimental Radio Station Located at Westfield, N. J.

Lower Photo Shows Mr. Apgar in the Act of Actually Recording a Long Distance Radio Message on a Phonograph Cylinder. This "Canned Wireless" Has Helped Uncle Sam Immeasurably.

Not many years ago, less than five, when looking over a magazine in a stationery store on Broadway, New York, I noted in the back section some zig-zag lines and drawings (diagrams of radio circuits). The magazine was immediately laid aside with the thought: "What nonsense to print such crazy stuff which only an expert can understand."

About a month later the New York Herald published a letter signed "Amateur" stating that on the previous evening (Election night, November, 1910), he had copied the Herald's wireless Election returns and knew the results of same before 11 p. m. of that evening. Comments by the editor followed, stating that "Amateur" was a cashier in one of Wall Street's well-known banking houses; the name and address were also given. This was my first stopping place when again reaching the city.

This cashier soon discovered that I didn't know a tuning coil from a detector, so he gave me a copy of the latest catalogue of one of the leading experimental wireless supply houses. Careful study of this and recalling the zig-zag lines and drawings in the magazine (Modern Electrics), to which recourse was made, gave me sufficient insight as to the requirements of amateur wireless telegraphy to make a "try-out" about one month later (Dec. 11, 1910). I shall never forget with what satisfaction I made my final connection on that memorable evening. In less than one minute I heard O. H. X (now W. H. B.) Seagate and one other station. Contrasting this with the experience of some amateurs (who, as I have read, often spend a month or more fooling around before getting a single signal), to say I was satisfied is putting it mildly. Of course, the whole family was called in—even the cat—whose "meow" was about as near to a wireless signal as anything I had ever heard.

Having caught the fever and having some constructional ability, my instruments were home-made, excepting the detector stand and silicon (purchased from the E. I. Co.) and 'phones. After installing this set on a suitable operating table and getting reasonably familiar with tuning operations, even to picking up Cape Cod (old M. C. C., distant about 250 miles), I decided to look into the matter of sending signals. I found a single unit automobile spark coil among some electrical junk, connected this to my aerial through some wire wound around a box and having no sending key, tapped on one of the binding posts with one of the battery wires to see if it would buzz. It did. Then without knowing why, I tapped off the call "B. Q.," whom I had heard sending to other amateurs. "B. Q." lived many blocks away, but after a reasonable time the door bell rang and, much to my surprise, there was B. Q. in person. Said he had heard me call him, and though it was near midnight, came around to see what I wanted. This experience led me to believe that an efficient sending set would not be difficult to make. I soon began constructing a ½ K. W. open-core transformer, also a suitable condenser, using aluminum sheets and old photographic plates; an ordinary spark gap at first, but later a rotary, capable of breaking 960 per second. Getting rather tired of hearing "How's my spark?" "Do I sound better now?" I decided to turn my attention to improving my receiving apparatus. In all seven different tuning coils and loose couplers, each possessing some special feature, have been made (see Modern Electrics, January, 1914). Variable rotary condensers were next constructed and, being dissatisfied with the unstableness of crystal detectors, I decided to try out an audion during August, 1913. Having some knowledge of the effects of magnetism on electricity in a vacuum, I placed a magnet near the audion, when instantly the signals seemed about ten times louder. Here was a discovery—to me at least. A new 150-foot steel mast loomed up, as well as other extravagant expenditures—all to come from the proceeds of this discovery—but a short time spent in the city library brought me to earth again. I still have my aerial in the trees.

The use of the magnet was continued for some months with gratifying results. Many stations, with the use of a small horn on the receiver, could be read about 50 feet from the 'phones. Having been able so definitely and satisfactorily to produce loud incoming signals, the matter of amplification occurred to me. I tried out various types of microphone transmitters. Best results, though far from satisfactory, were obtained by a certain form of carbon transmitter, using a low voltage current. Signals from many stations, when using this circuit after some modifications and giving careful consideration to sound resonance, could be plainly heard and read all over the house.

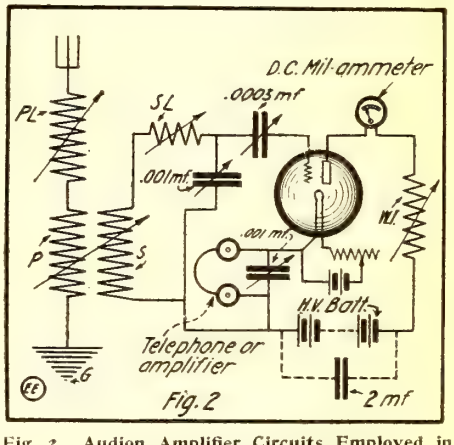

Fig. 2. Audion Amplifier Circuits Employed in Mr. Apgar's Radio Station.

Naturally the matter of making permanent records occurred to me about this time. I bought a second-hand phonograph, and on Oct. 28, 1913, made my *first record*

of wireless; this being "press," sent out by the New York Herald station at the Battery in New York. Following this and until about October, 1914, many records were made of N. A. A., N. A. H., W. C. G. and other stations. By the adoption of the audion circuit discovered by Mr. E. H. Armstrong, the receiving efficiency of my outfit was enormously increased, as well as being enabled to bring in many undamped wave stations, including W. S. L., W. G. G., N. A. A., N. B. A. and others. Interesting phonograph records of several of these undamped stations have been made.

The photograph of my station is shown in Fig. 1, which consists virtually of a loose coupler, primary and secondary loading coils and three variable condensers connected to an Armstrong circuit as perceived in Fig. 2. The dimensions of my inductance coils are as follows: Primary of coupler is 10x5 inches and is wound with No. 22 S. S.; the secondary is 10x4¼ inches, wound with No. 28 S. S.; the secondary loading coil SL is 22x3½ inches and wound with No. 30 S. S., while the wing inductance WI has No. 30 S. S. for its winding. The capacity of each condenser is given in the diagram.

A direct current milli-ampere meter is connected in series with the grid circuit as shown and signals* can actually be read by observing the movement of the needle. An amplifier of my own invention is connected in place of the regular 'phones and a low resistance receiver with horn is coupled to the amplifier. The same 'phone can be placed over the recorder of a phonograph and thereby messages may be copied on a record. Fig. 3 illustrates the phonograph which has recorded all the Sayville "secret code" messages—note the telephone receiver on the reproducer.

My aerial is 600 feet long, the wires starting 10 feet apart and ending 18 inches apart (fan shaped); the average height is about 50 feet. With this set I am able to tune to 4,000 meters without any aerial inductance coils, and if loading coils are connected in the circuit I am able to receive stations of over 9,000 meters wave length.

While the September, 1915, issue of this magazine has given rather a full account of the work done at the request of Chief W. J. Flynn, of the U. S. Government Secret Service Bureau, probably the addition of a few other details will make the account more complete.

A short time before being asked to do this work a business call was made on Chief Radio Inspector W. P. Krumm at New York City, and during a conversation on amateur plants in general he expressed a desire to visit my station. During this visit, which soon followed, the general efficiency of the station was demonstrated, also many phonographic records of wireless signals were reproduced. Hence when Chief Flynn consulted W. P. Krumm about the *checking up of Sayville* I was called in on the matter and told to "get busy." The work of making the records began each night at 11 o'clock and continued for two or three hours, dependent on the accumulation of messages at the Sayville station. The next morning a translation of the records was made and a copy of them turned over to Chief Flynn, which permitted of immediate comparison with the censored message records received by other departments of the Government. Later on all the phonograph records made were delivered to the Secret Service Bureau at New York City.

* One of our editorial staff has recently witnessed this experiment with the milliampere meter. Signals were reabable by merely observing the needle. One of the greatest feats ever produced by any amateur is receiving N. A. A. 600 feet from the 'phones, which is an actual result accomplished by Mr. Apgar. He has received the "time signals" from Arlington in the open street, full of shade trees and while noises of all kinds were in the vicinity. Of course, if these conditions did not prevail the signals would undoubtedly be heard at a much greater distance.—EDITOR.

New Pocket Wireless Set

One of the latest developments in the wireless field is a small, pocket-size wireless instrument which can be used for transmitting or receiving such messages over distances of one-quarter to one-half mile and more. This particular apparatus as shown in our illustrations has been perfected by Dr. H. Barringer Cox, of New Bedford, N. Y. The inventor himself is seen in our illustrations, the one at the right depicting Dr. Cox in the act of receiving a wireless message by means of the apparatus strapped about his waist as perceived, and the antenna consists of a hollow tube held in the hand.

The left-hand view discloses how the apparatus may be worn under the coat, and it is held in place by a belt, as becomes evident. The 'phone and head-band can be hooked in the belt very readily, and it is suggested by Dr. Cox that this outfit would undoubtedly prove of great value for the soldiers in the field. He intends to loan his invention to the European armies now at war. Such an outfit as this can be worked over such distances as aforementioned and should prove of extreme value to the men in the trenches or on the open field for transmitting and receiving orders, etc., as the enemy would not very easily take notice of such a well-concealed wireless instrument as this, even though the operator was in sight. The apparatus comprises an especially sensitive detector, together with the usual high resistance head 'phone and a tuning coil with condenser. A flexible wire joins the watch-case telephone receiver to the tuning coil case, and another flexible conductor joins the hollow metal tube held in the hand to the instrument proper. In some cases the tube has been placed in the ground and messages received and transmitted in this way. When the metal tube is held in the hand, as shown in the right-hand photograph, it would undoubtedly be best to make a ground connection by means of a wire connected up with a metal plate on the bottom of the shoe.

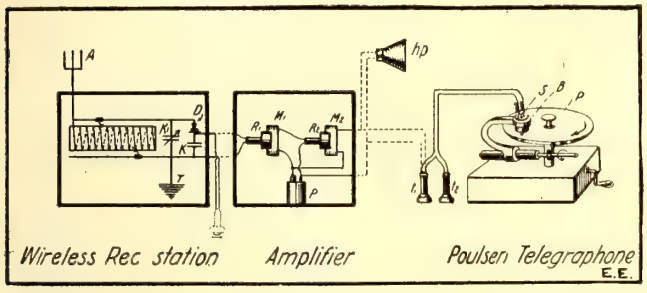
MARCONI ABSORBS ENGLISH POULSEN INTERESTS.

A syndicate representing Marconi interests has acquired the Poulsen-Padna rights, and in due course the Poulsen system will become part of the Marconi organization.

According to this report, an important option in connection with the British Poulsen wireless rights lapsed recently, though fresh arrangements would quite possibly have been made. In the meanwhile, however, the syndicate representing the Marconi interests, recognizing no doubt what a formidable rival the Poulsen system would be in the future if it remained independent, has stepped in and made an offer which apparently has been accepted.



For the present, owing to Treasury restrictions, formation of a subsidiary company and other financial arrangements for the completion of the deal cannot be put through, but after the conclusion of peace it may be looked upon as certain that Poulsen will be under the Marconi banner.

The Poulsen system of wireless telegraphy, worked out by Valdemar Poulsen, of Copenhagen, eight years ago, is said to be a much faster means of communication than that of Marconi. In 1907 Professor Poulsen also talked by wireless between Copenhagen and Berlin, some 250 miles, and proposed to establish a wireless telephone service to America, via Ireland. The Poulsen patents in the United States are controlled by the Federal Telegraph Co., of San Francisco, Cal.

A MACHINE THAT CAPTURES AND HOLDS WIRELESS TALK.

When one contemplates the marvel of sculptured sound on a graphophonic record, and realizes that from the cold vorticity of line there may magically spring the golden lilt of the greatest song voice that the world has ever heard, then comes the conviction that we are living in the days of white magic.

This is simply by way of introduction of a greater marvel yet—a marvel of marvels, so to speak, regarding the reproduction of sound. It is the application of the Poulsen

System for Recording Wireless Telegraph Signals on Telegraphone.

telegraphone to the writing and the recording of wireless messages. And as the voice is now being sent over considerable distances by way of the ether, it has to do. in its logical extension, with the human voice.

Contradictory as it may seem, this new method of writing and recording wireless communication uses recordless records—that is, they cannot be seen and read by any of science's aids to the eyes. A wire is the only thing an observer may see.

The Poulsen invention, you may probably know, is a magnetic phonograph which records sound vibrations, not by actual needle marking on a plastic disc, but by variations of magnetism in a steel disc. You can note the concentric lines made by the needle on a familiar musical record, but the steel wire used by Poulsen looks precisely the same after a song or a sentence has been stored up in it.

Imagine a dead piece of metal, with no visual indication of how it is accomplished, holding human speech imprisoned in its cold confines and music and sound vital to the progress and enlightenment of the world!

THE VOICE IS STORED IN MOLECULES OF METAL. And here is a baffling mystery in this storage. Precisely what the nature of it is man shall not know, we are told by authority, until the mystery of magnetism is fully solved.

The wizard responsible for the new and wonderful discovery is named Dosne, and Lucien Fournier, in describing his achievement, naturally speaks first of Poulsen's earliest model. It was then constituted by a bobbin of steel wire which was made to turn under a receiving coil. The wire records speech magnetically and it is reproduced in a telephone receiver when the coil that has been influenced passes a second time under this receiver.

The device used by Mr. Dosne differs from this early model by replacing the steel wire with a steel disc turning under a light soft-iron needle forming part of the electro-magnetic receiver of the apparatus.

This apparatus moves from the edge to the center of the disc during the inscription, so that the record is spiral, like that on a graphophone disc.

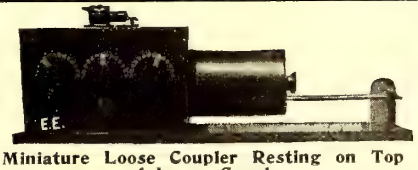
The Poulsen device cannot be used for recording wireless signals; the coil connected with the needle planned for use as a telephone record needs modification for adaptation to the new kind of work required of it. Mr. Dosne has taken account of this necessity, and has conceived the ingenious idea of powdering the steel disc with a finely divided magnetic substance—iron reduced by means of hydrogen—in the hope that this powder would collect along the magnetized traces left by the soft-iron stylus.

In these conditions, although at first the reinforcement appeared scarcely sensible, it was possible to prove that it existed, in a very original manner, at the wireless laboratory of the Eiffel Tower station at Paris. During the experiment signals from Cleethorpe and from Clifden were heard, but the disc recorded only the first, which were the loudest. But, after the employment of the powdered iron the Clifden signals were recorded.

Our diagram shows Mr. Dosne's plant. It includes a wireless receiver with a crystal detector; the telephone has been removed and replaced by an amplifier. Finally the Poulsen telegraphone is connected, in the place of the loud-speaking telephone, to the amplifier.

In these conditions it suffices, to record a message received at an ordinary wireless station, to start the steel disc rotating in order that the fluctuations of the current, passing through the combined telephones and miscrophones of the amplifier, may determine in the coil of the Poulsen apparatus a variable magnetic field, of which the little soft-iron needle constituting the core of the coil forms a part.

The message is read by placing the ear at one of the telephones of the Poulsen apparatus, which, after the registration, behave like simple receivers and repeat the message.



It should be noted that the speed of recording a message may be modified for repetition. In fact, the disc may be made to turn at a greatly reduced speed if one is not well trained in sound-reading; but in this case the signals lose in intensity. On the other hand, if the speed of reception is greater than that of record, the signals gain in power.

The same disc may serve indefinitely if it is not desired to preserve the record.

THE SMALLEST LOOSE COUPLER.

What is probably the smallest loose coupler ever built and suitable for actually receiving wireless signals is shown in the photograph. It is perceived resting on top

Miniature Loose Coupler Resting on Top of Large Coupler.

of the large coupler, which latter measures about 2 feet in length. The large coupler is fitted with three primary switches, and same is capable of tuning in wave lengths up to 9,000 meters when used with a fair-size aerial. The miniature loose coupler resting on top of the larger instrument is so small that it will fit in the hand nicely without projecting beyond the fingers. It is complete in every way, being fitted with a primary tuning slider as well as with a six-point switch on the movable secondary, accurately wound with comparatively fine magnet wire. This small coupler has been used a number of times and operates very efficiently in bringing in wireless signals. It is capable of tuning in wave lengths up to about 200 meters when used with a small-size antenna.

CONCERNING GROUND ANTENNAE.

It may be interesting for the amateur radio readers of your magazine to know what success I am having using a ground antenna.

I laid two stretches of No. 18 insulated bell wire directly on the surface of the ground in my back yard (in Boston), the length of each stretch being about 25 feet. The lead-in was taken from the middle, thus forming the shape of a "T." The instruments I use are a single-slide home-made tuner, galena detector, 75-ohm telephone receiver and an E. I. Co. loading coil. With this aerial I receive the Boston Navy Yard and a number of stations around the harbor. I had some correspondence with an experimental radio station here regarding this "ground antenna," and they advised me that this type of aerial has a directional effect; that is, if it runs due north and south, stations east and west cannot be heard. I advised them that my aerial runs directly sideways to the Boston Navy Yard and I receive messages right along from this station. They wrote and told me that my not encountering directional effect with this ground antenna is due to one of two things—either the wires are so far short of the proper length that I get forced oscillations, or else there are local electric wires that neutralize the actual direction of my wires. I shall be pleased to hear from any amateur who experiments with this type of aerial. Contributed by P. J. LEARY.

NEW ORLEANS RADIO OPERATORS MAKE FINE RECORD.

Complete success greeted the recent initial attempt of the radio operators at the New Orleans Naval Station to flash a message to the Government wireless station at Darien, C. Z.

The test message was sent at 10 o'clock in the morning, and Chief Operator McKean, of the local naval station, had no difficulty in communicating with the men in charge of the station on the Canal Zone. The distance between here and Darien is approximately 1,600 miles, and the operator on the Canal Zone stated that the signals from New Orleans were so strong as to almost affect the ear drums.

The sending of the long-distance message to the Panama Canal by the New Orleans Naval Station marked an epoch in Government radio circles. It means that the final link in a chain of wireless stations to connect the United States and points in the tropics, as well as our possessions in the Pacific, has been completed.

Two 300-foot steel towers and an exceptionally powerful set contribute in making the New Orleans radio station one of the best yet completed. A force of 16 operators will be required in handling the radio equipment when the station has been brought up to its full strength, it is said. Most of the dispatches flashed through the air from the ships in Mexican and other tropical waters are expected to be handled directly through New Orleans.

HOW WIRELESS WAVES TRAVEL AROUND THE EARTH'S CURVATURE.

MOST people probably do not stop to consider what a great depth of earth exists between two modern long distance radio-telegraphic stations

Fig. 1. Illustrating the Vast Depth of Earth Between Two Transatlantic Radio Stations.

when they are in communication with each other as, for instance, is the case between Sayville, L. I., U. S. A., and Nauen, Germany, located near Berlin. The approximate distance between these two modern high powered wireless stations is 4,000 miles and, as Fig. 1 shows, the curvature of earth lying between these two stations has a chord height of 348 miles. At either station the lofty steel towers supporting the aerial wires, from which the waves are liberated or sent out, only have a height of from 600 to 800 feet in any case. This, of course, is a very, very small percentage of the depth of the earth's curvature intervening between the two stations, as will be perceived.

Several theories have been brought forth from time to time in the progress of the radio art as to the probable method by which such long distance wireless telegraphic signals are *propagated around* one-fifth and even one-quarter or more of the earth's circumference. Many scientists claim that the waves glide over the surface of the earth, as shown in Fig. 2 at A A A. This is based on the consideration that the earth's surface acts as a charged conductor and thus serves to guide the waves, so to speak, in their path between the stations. Of course, the waves radiate, practically speaking, equally in all directions from a given point (as about an aerial) in the form of a circle. Only the half loops are supposed to glide over the surface of the earth, as Fig. 2 indicates; the

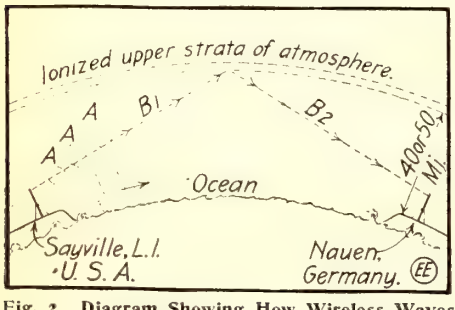

Fig. 2. Diagram Showing How Wireless Waves Are Propagated Over the Earth's Surface.

complement half waves of those shown being, of course, in the earth proper.

It was formerly believed in the early days of wireless telegraphy that the wireless signals were propagated between stations (which were located sufficiently far apart so that the mast of one could not be seen at the second station) by means of what was termed the "bound" ether, locked up or permeating the earth itself and also all other solid bodies with which we come in contact daily.

According to the latest scientific theories of all bodies, even including cast iron, steel, etc., these really consist in great part of etheric electrons; the relative percentage of solid particles in same being extremely small. This theory was at one time strongly advocated by the famous English scientist and investigator, Sir Oliver Lodge.

After much research and experimental work, which has progressed sufficiently to give some basis upon which to stand, some of the leading scientists of the day, including Dr. J. A. Fleming and others, now hold to the *reflected wave* theory to account for long distance radio telegraphy.

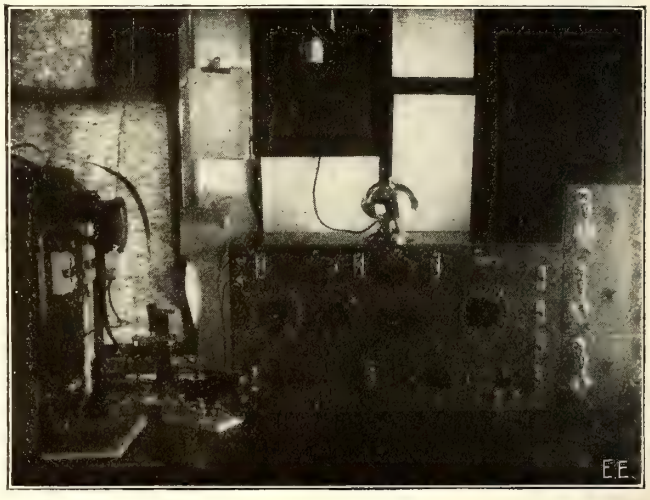
This is supposed to take place as follows: As we know, the atmosphere of the earth, roughly speaking, extends upward to a depth of 40 or 50 miles. At these high altitudes the atmosphere becomes very highly rarefied and it is suspected that a very strong ionization of the electrons in these upper strata of the atmosphere takes place. This electrification of the upper strata is caused by the electro-magnetic effect of the sun's rays, according to these theories.

It is believed that, considering such long distance radio transmission as 4,000 miles, the etheric waves, as propagated from a station like Sayville, L. I., strikes upward, due to the earth's curvature. The waves are then reflected from the highly ionized upper strata of the atmosphere; also it is thought further that the reflected wave, such as at B^2, is the one that is intercepted at the distant receiving station, say at Nauen, Germany.

AMERICAN RADIO LEAGUE WIRELESS STATION.

By Frank C. Perkins.

The accompanying illustration shows the equipment of the American Radio League relay wireless station. This station is in operation at New Rochelle, N. Y. The aerial is of the inverted "L" type, having an average (two wire) height of about 65 feet and a length of 180 feet. All the parts of the aerial are extremely well insulated and very strongly installed to prevent damage by wind and sleet. Standard phosphor bronze wire and commercial insulators are used.



It may be stated that the transmitting set consists of a 1-kw. transmitter, with a condenser capacity of .006 mfd. (three standard Navy jars in parallel). The rotary gap employed has 12 moving points and two stationary electrodes and turns at 8,000 R.P.M. This allows the use of the above small condensers and gives the short wave necessary for 200-meter work in the primary circuit, which together with close tuning through an efficient oscillation transformer, with fair looseness of coupling, allows heavy radiation on a single peaked wave.

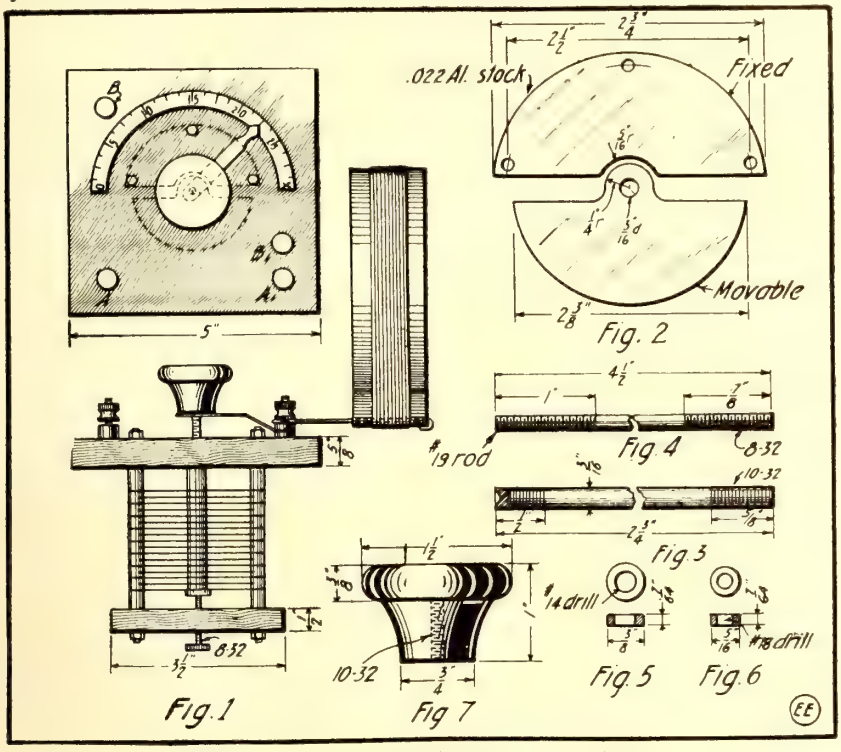
It is held that repeated tests show a transmitting range of between 350 and 400 miles under any sort of normal conditions. Under very good atmospheric conditions 800 to 1,000 miles is not at all difficult with this set. The transmitter is contained in a polished wood cabinet, a corner of which may be seen in the extreme left of the picture.

There is a special loose coupler used for waves up to 3,000 meters or a little over. This loose coupler has a very long secondary of high inductance value, which permits tuning without using much capacity across the secondary in that circuit; practically no capacity is used and this method has been found to permit of much longer distance in working, especially with audions. Also the loading coils used load both primary and secondary, and particularly endeavor to balance up the secondary circuit with the use of very little capacity. This method is one of the secrets of the remarkable sensitiveness of this set.

It is of interest to note that No. 24 wire is used for both primary and secondary of the loose coupler. A two-step amplifier of the Audion type is used in connection with an Audion detector. This amplifier embodies some original ideas in its details of construction.

It is pointed out that there is an original arrangement of knob switches in the amplifier circuit that allows (for the first time in actual practise) a change from the receiving on the detector alone to any step of the amplification instantly, without removing and replacing telephones or disturbing any adjustments. This method of producing instantaneous amplification and the reverse is of great convenience and importance. The whole station was designed with the idea of service on long-distance radio "relay" work, and is remarkably efficient in operation. A comparison of effects may be had by noting that Key West station, NAR, can be heard and copied easily 15 feet from the ordinary telephones, while Arlington, NAA, has been copied over 100 feet distant from a loud-speaking telephone when this was hooked up in the circuit. Regular work has been done with stations using 1-inch coils at a distance of nearly 50 miles.

Excellent Radio Relay Station of the American Radio League, at New Rochelle, N. Y.



TO INSTALL WIRELESS AT CHICKASHA, OKLA., HIGH SCHOOL.

The Chickasha (Okla.) High School will install a wireless telegraph dispatching and receiving station for use in the school work. The station will have sufficient power to receive messages from the Arlington wireless station on the Eastern coast and from ships 300 miles out in the Gulf of Mexico. The station is now ready for business.

How to Build a Wave Meter

By Samuel Cohen

MANY radio experimenters have an idea that the construction and manipulation of a wave meter is a difficult matter and therefore they do not usually build one. However, the construction and operation of a wave meter is so simple that the novice operator may use it.

Details of Wave Meter Condenser and Inductances.

First and foremost, a wave meter is an instrument comprising an inductance and a variable capacity and an indicating device, such as a telephone receiver or vacuum tube.

This article deals with the construction of a wave meter, which was recently built and calibrated by the writer. The builder of this instrument does not necessarily need to calibrate his wave meter, but he should construct it according to dimensions given.

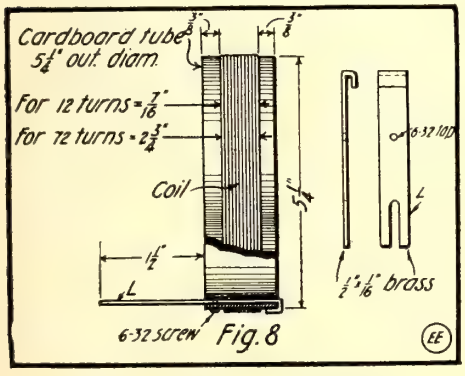


Fig. 8. Inductance Coil Make-Up.

The writer advises the consultation of a good text-book treating on the manipulation and construction of these meters before building such an instrument.

The first thing to build is the condenser, which is of the rotary air dielectric type. Very little explanation is necessary for the description of this condenser, as all the details are plain and self-explanatory. Fifteen rotary and 16 fixed plates of No. 20 B. & S. gauge aluminum are made according to dimensions, as shown in Fig. 2. The rotary plate shaft (3-16-inch diameter stock) is shown in Fig. 3 and stationary plate rods, of which there are three, are made in the same manner, as is shown in Fig. 4. Two sets of washers are constructed, namely, the rotary plate washers, as shown in Fig. 5, and the stationary plate washers, as Fig. 6 illustrates. When all these parts have been made accurately assemble the condenser, Fig. 1. The rotary plates are regulated by means of an 8-32 set screw. The knob, Fig. 7, is made of any insulating material, preferably hard rubber.

This variable condenser has its 180° scale marked off in 30 equal divisions. Its maximum capacity with the rotary plates totally intermeshed with the fixed plates is .000795 micro-farads. At 15 scale divisions the capacity would be half this value in microfarads. The wave length can be calculated from the usual formula:

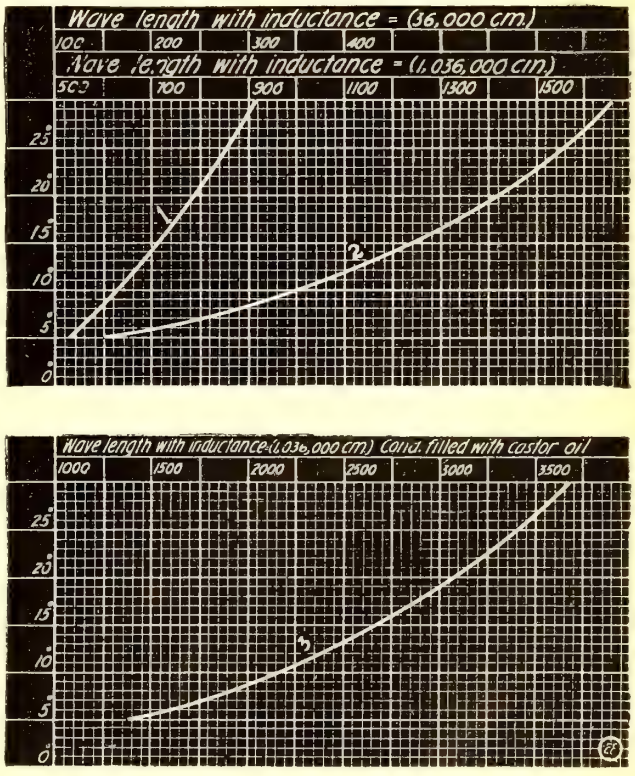
$$\text{W.L. in meters} = 59.6 \times \sqrt{\text{L. cms.} \times \text{C. m.f.}}$$

We now come to the inductance coils, of which there are two. These are shown in detail as to their make-up at Fig. 8, and some substantial cardboard tubing or wooden rings are to be used, which have an exact outside diameter of 5¼ inches. Two such "forms" or rings are necessary and the smaller inductance coil consists of 12 turns of No. 20 B. & S. enameled magnet wire, wound on very evenly, with the turns close together. The second or larger coil consists of 72 turns of the same size magnet wire, wound on evenly, with the turns close together. The coils may receive a few coats of black shellac to help hold the windings firmly in place. It is also a good idea to bind the coils with white linen tape or with cord, so as to protect the wire from injury.

Both coils are provided with two brass or copper attachment straps L. The drawing at Fig. 8 indicates how these plugs are attached to the card board tubes by simply bending one end of them over as indicated, and a No. 6-32 machine screw is passed through a hole in the other side of the cardboard ring into a tapped hole in the brass strip. These strips should be about 1½ inches apart, and the two terminals of the coil in either case soldered to them, one terminal to each plug. The slots in the ends of the strips are fitted, of course, to the binding post of the wave meter at A^1, B^1.

These inductances correspond to those made by the writer and which are designed from standards as made up and tested on a Siemens & Halske inductance bridge at the radio laboratory of the College of the City of New York. The small or 12-turn coil has 36,000 cms. inductance, while the 72-turn coil has 1,036,000 cms. inductance.

Fig. 9 depicts three curves plotted for different wave lengths, corresponding to different condenser readings. Curve 1 was plotted with the small inductance coil, while curves 2 and 3 represent the use of the large inductance coil. It is very easy then to determine the resonance points of the wave meter by reading the scale setting of the condenser and referring to the curves herewith reproduced. Care should be taken not to use the wrong curve, as they have entirely different values.



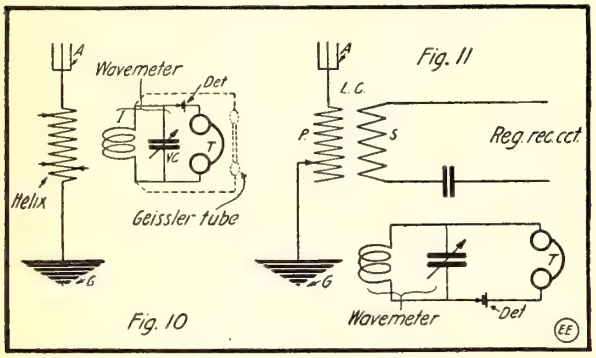


Fig. 9. Wave Length Inductance and Capacity Curves for Use With Wave Meter.

The curve No. 3 was plotted for those desiring to measure waves up to 3,500 me-

ters in length or more. To use this curve and its equivalent wave lengths as given, the variable condenser of the wave meter must be placed in a glass or other jar, so that the moving and fixed plates will be immersed in castor oil. This raises the capacity of the condenser about five times, and hence gives us greater wave length

Figs. 10 and 11. Diagrams for Using Wave Meter on Transmitting and Receiving Circuits.

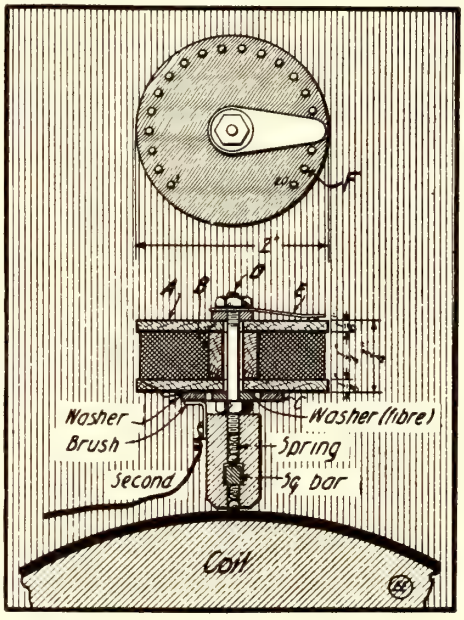
ranges with the same inductance coil, i. e., 72-turn coil, with 1,036,000 cms.

The diagrams at Figs. 10 and 11 indicate how the wave meter is hooked up. At Fig. 10, used, say for measuring the sending wave length, the inductance coil I of the meter is held *just close enough* to the sending helix so that a *readable sound* is heard in the telephone receivers T. The variable condenser is regulated or turned until the loudest signals are heard. This is the point of resonance in the wave meter circuit, and the corresponding wave length value for this setting of the condenser is read off from the curve 9. If the condenser reading was, say 20 degrees with the large inductance coil in use, then by noting the wave length vertical line intersecting the curve 2 (for large inductance) and the (air) condenser horizontal line, it is seen that the wave length is 1,420 meters.

In a similar way the wave length is measured at a receiving station (see Fig. 11). The wave meter inductance coil is placed in sufficiently close proximity to the loose coupler coils until the incoming signals can be heard in the meter 'phones. The variable condenser is then turned until the signals are heard loudest and this condenser setting in degrees, referred to the curves in Fig. 9 as explained above, gives the equivalent wave length in meters.

Another common method in vogue for measuring received signal wave lengths is as follows: When a certain station is tuned in sharpest on the regular receiving set the instruments are left alone as they set. Then the wave meter is brought near the coupler, etc., and by exciting the wave meter circuit (by connecting a buzzer vibrator across it) it is possible to hear the meter oscillations by induction in the 'phones of the regular receiving set. When the meter signals are heard loudest, then it is set to the wave length corresponding to the setting of the receiving apparatus.

From the data here given it is possible to easily build a wave meter with any rotary condenser, using the standard inductances here cited.



LOADING COIL MOUNTED ON SLIDER.

A miniature loading coil which is placed on top of the loose coupler slider can readily be made, and at the same time have a fairly large wave length. This instrument has been tested out in several commercial radio stations very successfully.

By referring to the drawings herewith given the construction will be quite evident. First comes a circular form A, Fig. 1, which is made of some insulating material, preferably hard rubber, and turned out in a lathe. The dimensions are given. Next mark out a circle having a radius of 1⅜ inches and on it lay out evenly 20 points, and then set in them 20 brass nails having $\frac{3}{16}$-inch shank. After having done this obtain a 1-inch brass or copper washer C and mount it carefully on the circle, as shown. It is fastened in place by means of three brass screws. This ring is used to connect one of the end connections of the winding by a brush, as shown in Fig. 1.

A ¼-inch hole is next drilled in the center of the reel A, and into it force a brass tube ¾ inch long having an internal diameter of $\frac{11}{32}$ inch. Into this brass tube the shaft D is placed, which is made from brass stock, and details are shown in Fig. 2. The contact maker is now made as in drawing 3, which is then soldered to the shaft as seen.

Now, being finished with all the necessary details, the winding is next to be considered. There are 20 sections to be wound on the coil. The first winding consists of 10 turns of No. 36 D. C. C. magnet wire.

Loading Coil Mounted on Tuner Slider.

The one end of this coil is brought to the brass washer C and firmly soldered, while the other end is soldered to the shank of the first brass tack. The second winding consists of 15 turns of the same wire, and the connections are made with the first tack, while the other joins on to the second tack. All the other windings are made in the same way, and each winding is increased by five turns.

The shaft is then screwed on the slider and carefully adjusted to see that the coil rotates easily and that the switch blade makes contact with each point.

Now connect the aerial wire to the brush binding post, while the coil end wire joins the regular receiving circuit. By turning the reel the wave length is regulated, and also the slider can be moved back and forth. This method of tuning is very efficient and at the same time saves some space, besides enabling two operations to be accomplished by the hand in one position.

[*This device has been developed by the Eugene T. Turney Co., which has patents pending on it.*]

ELECTRIC VARNISH.

Powder some common sealing wax in a mortar, place the fragments in a bottle and cover with alcohol. Keep in a warm place until all the sealing wax is dissolved. This varnish may be used to cover magnets and other parts of electrical apparatus.

Electric Cement.

Melt equal parts of beeswax and rosin together and stir in one-fourth of their weight of red ochre, stirring until well mixed. This cement is used for fastening the metal portions of electrical instruments to their insulating supports, etc.

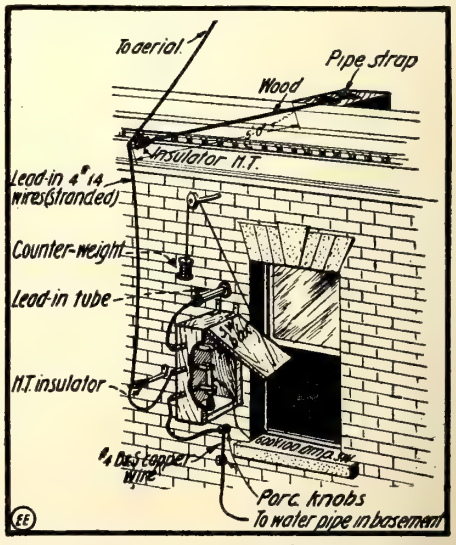
ALEXANDER V. BOLLERER.

THAT LIGHTNING SWITCH.

Every good amateur wireless station has a *lightning switch* to ground the aerial with. The switch is used because it dissipates static aerial currents before they have had time to accumulate into a heavy charge, and thus prevents damage to the building and apparatus.



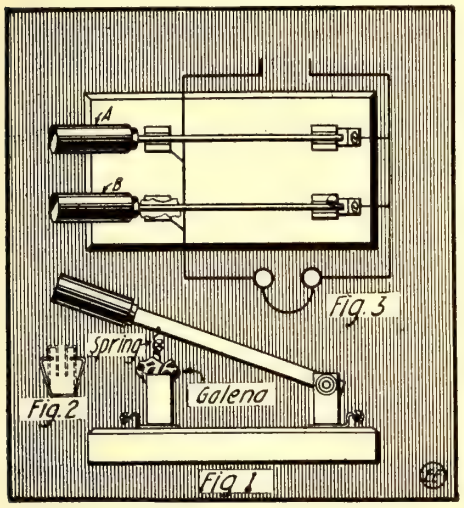
The wire from the switch to earth should be a No. 4 B. & S. (about ¼ inch diameter) copper conductor, connected on the outside of the building and taking a straight course to the ground proper.

This "ground" should consist of a 12-foot by 1-inch diameter iron pipe driven into moist earth, or a 10-inch square piece of copper buried 6 feet deep. Some amateurs use a connection made to a well-pump (iron pipe), but in any case the connection must be soldered and taped.

A 100-ampere, 250 or 600-volt S. P. D. T. switch is specified, with the aerial connected to the blade, the ground to one jaw and the apparatus to the other jaw. This switch may be obtained from any electrical supply company, but in order to stand the sending voltage the base should preferably be made of marble or porcelain. The cheapest way to do this is to buy a slate-base switch and remount on marble yourself.

If the aerial proper is composed of four No. 14 copper wires, then the lead-in should consist of four No. 14 copper wires or a No. 6 B. & S. solid wire, stranded cable being best, of course.

In order to protect the switch from being broken, it should be fastened with screws in a box with a hinged cover, and the lead-in fastened by an insulator before it reaches the switch.



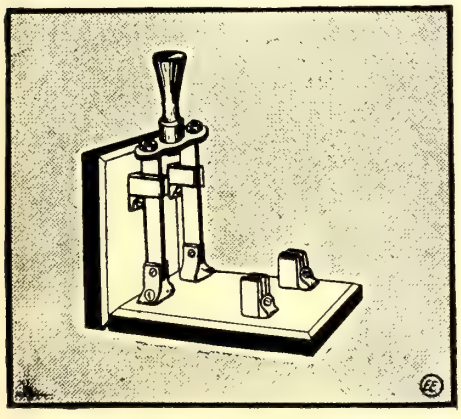
Practical Method of Installing Lightning Switch.

Rain can be prevented from running down the lead-in by making a half loop in it. Contributed by
WM. R. COTTRELL.

AN EFFICIENT DETECTOR.

I give herewith sketch and description of a simple yet efficient detector, made from a double-pole single-throw switch, which I am sure will be found useful to the amateur.

Detector Made From Knife Switch.



Procure a double-pole, single-throw knife switch; unscrew the hinge post and place a washer between the base and post, so as to allow the switch blade to be swung from side to side to facilitate the adjustment. Before replacing the switch blade, solder on it a fine wire coil of either phosphor-bronze or brass, to make contact with the crystal. Now take jaw post and bend it into shape to hold the crystal, as shown in Fig. 2.

This completes the detector; the other switch being used to short-circuit the detector while sending or it may also be converted into a detector. If the constructor has means of short-circuiting the detector on the antenna switch, and does not need the added detector, he may use a single pole, single throw switch, and will not have to change blades, as in the case of the double-pole, single throw switch, where the double blade will have to be substituted by the single blades. Connections are shown.

Contributed by WILLIAM GUIER.

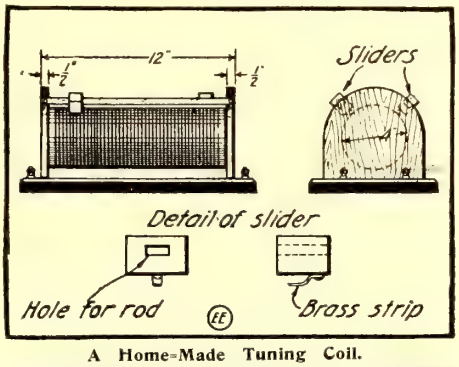
A HANDY AERIAL SWITCH.

The following instructions will be found very serviceable for constructing an efficient and simple aerial switch at a very nominal cost. This switch may be thrown

Aerial Switch Composed of 2 D. P. S. T. Knife Switches.

from transmitting to receiving, and vice-versa, very quickly and satisfactorily.

Obtain two double pole, single throw switches and from one remove the arm and place the lugs over the arm and lugs of the other. Then tighten to whatever pressure desired. Set the switches at right angles and fasten to either a wall or table. If desired, a special base may be made for this purpose, as sketch indicates. This should be composed of a block of wood, ½x3½x6 inches long, screwed at right angles to another block, ½x3½x6½ inches long, the corners of which may be beveled to produce a neater effect. Contributed by D. K. WALKER.



A HOME-MADE TUNING COIL.

The amateur is often hampered by the lack of funds and therefore the tuning coil herewith described will be found beneficial in overcoming this embarrassment.

First a cylinder 4 inches in diameter is made from cardboard and coated with paraffine to insure perfect insulation, or, better still, a wooden cylinder may be used. This cylinder should be 11 inches long and wound with a layer of 20 to 22 copper wires with cotton covering. (Enamel wire will also be found effectual). A rod is now heated red hot and drawn along the coil, thus burning off the cotton insulation in two straight lines, each about ¼ inch wide; these bare strips forming paths where the sliders make contact. For enamel insulation sand paper serves to remove the coating along the slider paths.

A convenient size frame of ½-inch stock is then constructed, across the ends of which are placed two brass slider rods, with a slider on each. These sliders are made from pieces of brass or copper with holes to fit the rod, contact being produced by fastening (soldering) a strip of spring brass or copper onto the under side; while at the top a piece of hard rubber should be firmly fixed to prevent the coil from being grounded through the body. (Sliders can be purchased very cheaply from any supply house). The binding posts can be procured from old dry cells, and in the drawing herewith is shown the make-up, there being four terminals. By properly following the above directions, good results may be realized with this coil.

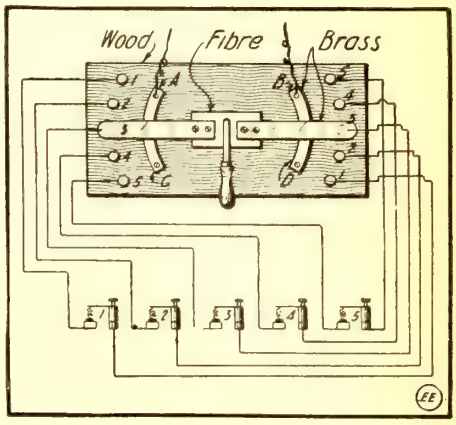
A Home-Made Tuning Coil.

SMOKE STACK SUPPORTS WIRELESS AERIALS.

The big smoke stack at the Brush Electric Co.'s power plant at Galveston, Tex., was probably never intended by its designer to be used as a mast to hold wireless aerials, but it has proved a wonderfully good thing for the purpose, and messages are now being transmitted from the top of the smoke stack to points as far away as Vera Cruz.



Except for the wireless on the army transport Buford, which was in continuous operation all through the recent storm, the Marconi wireless plant at the Brush power house was the only wireless in the city connecting Galveston with the outside world.

The Marconi aerials went down during the height of the storm and Manager Campbell immediately got busy looking for another place from which to operate.

A HANDY DETECTOR SWITCH.

I have found the following switch very desirable for throwing one of a number of detectors into circuit.

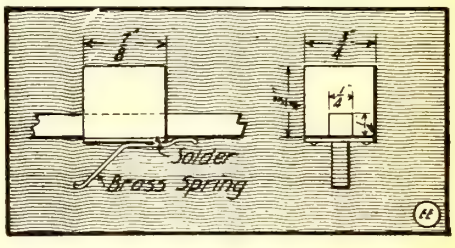
This can be easily made by placing some exploded cartridge shells on a wooden base, as shown in sketch, and connecting these to the two pieces of brass by means of the brass strips, indicated in sketch

Unique Detector Switch.

attached. The sliding brass strips are riveted onto a piece of sheet fiber, through which is bored a hole. A rod is passed through and connected to the wood base. It is then bent, and if desired a handle may be attached.

The figures from 1 to 5 represent the bullet shells and numbers of detectors; and the letters A, B are the connections for the phones and instruments.

Contributed by GORDON SCHAUB.



A SIMPLE TUNER SLIDER.

The following articles are required to make this handy little slider:

A piece of hard wood ⅞ in. x ¾ in. x ¾ in., in which a groove ¼ in. x ¼ in. is cut to allow slider to pass through. A sheet of tin or copper ⅞ in. x ¾ in. is fitted over this groove, and screwed or nailed on, as the constructor sees fit. On this is soldered the slider contact, which has been properly shaped and a ½ in. projection allowed, in order to make contact with rod.

This slider works very easily when the slider contact is made of a thin but flexible piece of brass or phosphor bronze. The hard wood handle is now given a coat of shellac and the slider is ready for use.

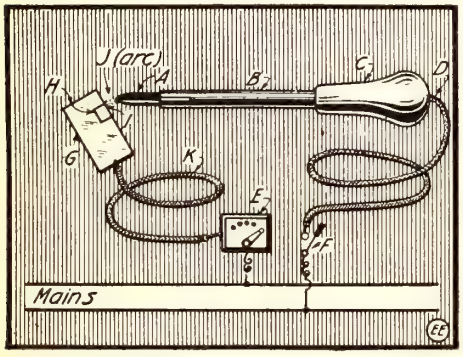
Tuning Coil Slider Made from Wood.

THE CHAMPAIGN, ILL., WIRELESS CLUB.

The Champaign Wireless Club, of Champaign, Ill., was organized Aug. 4, 1915. It has nine members: Maurice Lee, president; Walter Thornhill, vice-president; Joseph Tipiword, secretary; Ernest Mills, treasurer, and T. McHown, S. Hall, S. Bostic, O. Bucker and N. Chatman.

HOW TO MAKE IT

This department will award the following monthly prizes: FIRST PRIZE, $3.00; SECOND PRIZE, $2.00; THIRD PRIZE, $1.00.



The idea of this department is to accomplish new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best ideas submitted a prize of $3.00 will be given; for the second best idea a $2.00 prize, and for the third best a prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings.

FIRST PRIZE $3.00.

AN ELECTRIC SOLDERING IRON.

The following is an electric soldering iron that I have found very useful and particularly accessible for niches, corners or tight places, as well as for use in ordinary soldering.

At A is a small carbon pencil, forced into the end of a copper tube B. C is a small wooden file handle, drilled out, so that the copper tube can slide in snugly.

Arc Type Electric Soldering Iron.

At D is seen a single covered conductor soldered on the copper tube B. A small variable resistance coil to regulate the current is depicted at E, while F shows a switch for breaking the circuit. G is the piece that the article H is to be soldered to and I represents the soldering flux; or if desired, solder may be used with acid, provided a small piece is cut off and placed on the article to be soldered. At J is shown the "arc" formed by closing the circuit and holding directly over the article to be soldered. K is another insulated wire to be grounded to the article being soldered.

This iron may be made either large or small, as the builder sees fit. I have had fair success with it and feel sure that other amateurs will also find it efficient.

HAROLD SPAULDING.

TO BORE HOLES IN GLASS.

The following method of making perforations through glass may be of interest:

Take an old triangular file and break off its tip about ½ in. from the end. Place the shank end of the file in a brace and use it as a drill. The glass should be drilled slowly, using kerosene as a lubricant. At first it may be found rather difficult, but after once starting the shape of the file causes it to act as a reamer.

Contributed by W. R. COTTRELL.

FURNITURE POLISH.

Herewith is submitted a formula for making a cheap furniture polish, which will be found very efficacious: One-half gallon gasoline, ½ gallon light lubricating oil, 2 drops of oil of cedar.

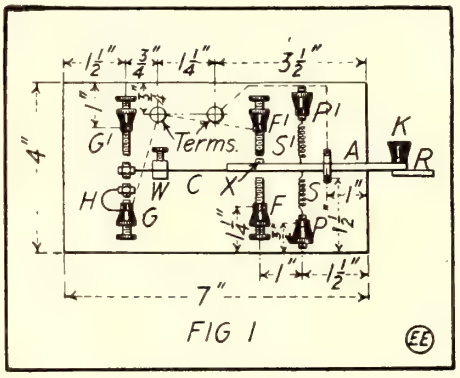
Contributed by MONROE MILAN.

SECOND PRIZE $2.00.

AN AUTOMATIC TRANSMITTING KEY.

I give below a description of an automatic key, which, although it may appear complicated, is really very simple.

The first consideration is the base. This is made of oak 4x7x⅞ inches, with ten 5/16-inch holes, drilled and countersunk, as shown in Fig. 1. The lever A, Fig. 1, is composed of a ¼-inch square brass rod, drilled and tapped, as shown in Fig. 2. The contacts X and F¹ (Fig. 1) are for *dashes*. A small silver piece about 3/32 inch in diameter is soldered to the center of the lever, ½ inch from the end at "X." The other contact is soldered to the screw in the post F¹. Two inches from the end a 3/32-inch



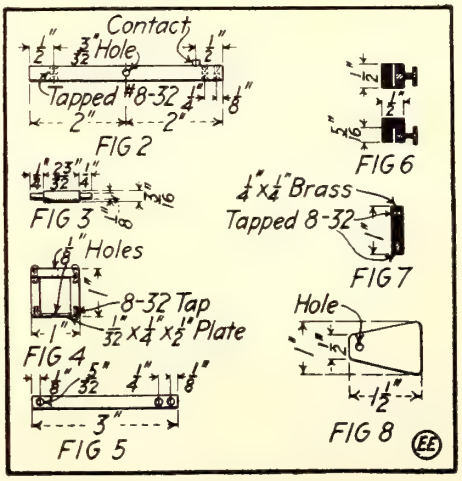


Fig. 1. Assembled Automatic Telegraph Key.

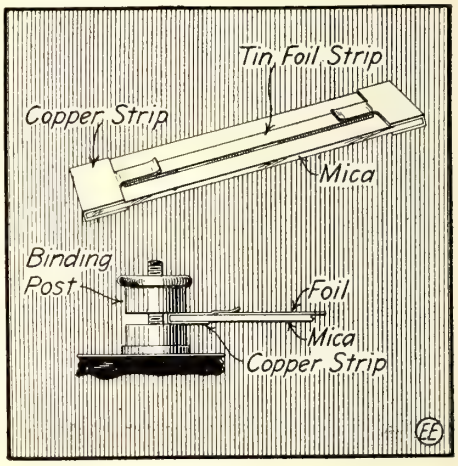
hole is bored, and into this is forced a steel pin, as Fig. 3 depicts. This pin forms the pivot which carries the lever. The bearings are shown in Fig. 4, while R, Fig. 1, is a piece of ⅛-inch hard rubber or fiber sheet, finished as illustrated in Fig. 8. This

Details of Parts for Making Automatic Telegraph Key.

is fastened to the lever by an 8-32 screw ¾ inch long. At K may be seen a hard rubber key knob.

The spring C, Fig. 1, is made of phosphor bronze about No. 32 or 34 B. & S., and measures 3⅛x¼ inches. This makes contact with a 3/32-inch diameter round piece of silver, soldered into a brass cup and bolted on to the spring through a 3/32-inch diameter hole. The weight W is made of brass, ½x½x½ inch. A slot is sawed in the center of the bottom 5/16 inch deep. A set-screw is then placed in one side. The spring H is a U-shaped piece of phosphor bronze 1 inch long and ⅞ inch wide. On one side of the "U," the silver contact is soldered and a 3/32-inch hole is drilled in the other side. The spring is fastened by means of an 8-32 screw to the post G. The four posts F, F¹, G, G¹, Fig. 1, are each 1 inch long by ¼ inch square, as shown in Fig. 7. A ⅛-inch hole is drilled ½ inch deep in the bottom of each and tapped for an 8-32 screw. Four 8-32 screws, with knurled heads and lock nuts about 1 inch long, are required for these posts. The posts P and P¹, Fig. 1, are similar to the others, except that a hole 3/32 inch in diameter is drilled through the post at the top. The screws to which the springs are fastened slide in these holes. The two screws are without heads, but are fitted with knurled lock nuts.

The springs S and S¹, Fig. 1, are made of No. 28 phosphor bronze wire. They are ⅛ inch in diameter and ½ inch long. One end of each spring is attached to one of the screws and the other end to the lever.



Connections are made between the posts F¹ and G and one binding post; also be-

THIRD PRIZE $1.00.

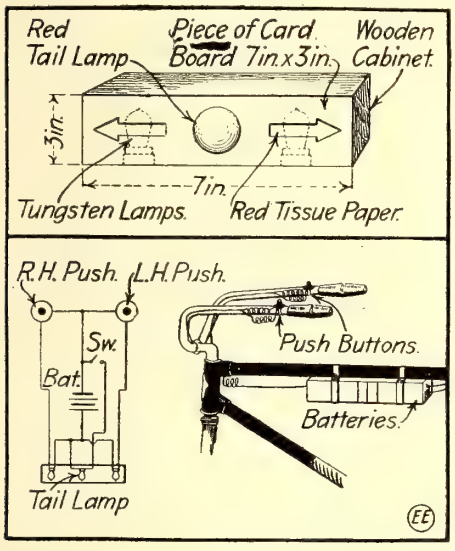
FUSES FOR BATTERY CIRCUITS.

A small fuse for battery circuits may be made of a small piece of tin-foil. The tin-foil is cut in the form of a narrow strip and connected between two binding posts. Its size will vary according to the current it has to carry. Contributed by

W. R. COTTRELL.

Battery Fuses Made from Tin-Foil and Mica.

tween the lever bearing and the other binding post.



The speed at which the signals can be made may be varied by moving the weight W along the spring.

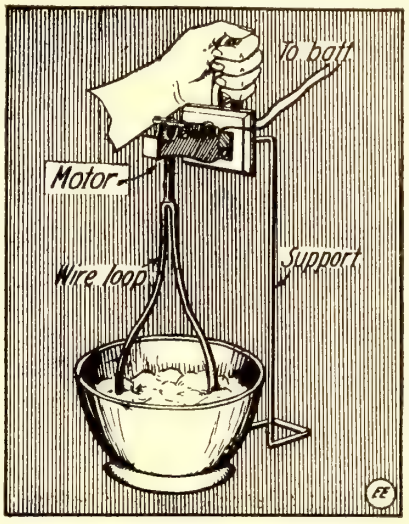
"SAFETY FIRST" ON THE MOTORCYCLE.

Here is a simple little attachment, the employment of which will insure riders of motor vehicles against accident when turning sharp corners or when driving through dark roads in the country, or otherwise. This device constitutes a "red" rear lamp and two red arrows, which are brilliantly illuminated by the touch of a button. The construction is as follows:

First make a small-sized wooden cabinet about 7x3x3 inches. Take a piece of cardboard cut to the above dimensions, and with a sharp knife cut out, with the aid of a ruler, two arrows, leaving a square space in the center for the rear light. Then procure some red tissue paper, or better, some red glass and glue firmly against the frame of the arrows and rear lamp on the cardboard; cover and allow to dry. Now screw in three miniature lamp receptacles in the base of the cabinet; fasten the lamps, make

Electric Signal for Tail-End of Bicycles and Motorcycles.



necessary connections and tack the cardboard cover on the frame of cabinet with carpet tacks. The wiring is very simple and the battery may be clamped on the main bar. Two push-buttons, as used on automobiles, are attached to both handlebars and set in connection with the corresponding light.

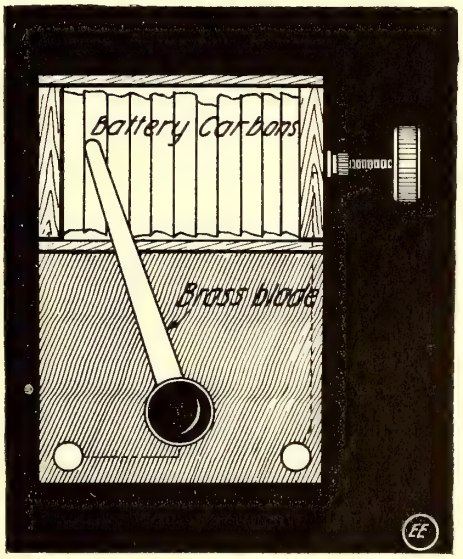
Whenever it is desired to turn in a certain direction (either right or left) the corresponding button is pushed; the light flares up and any approaching vehicles or pedestrians are informed of the intentions and whereabouts of said motor vehicle, thereby obviating all danger. Contributed by WILLIAM WARTON.

SIMPLE ELECTRIC EGG BEATER FITS ANY BOWL.

A very simple electric egg beater can be made at home and at small expense, as shown in the drawing. The egg beater is so constructed that it fits bowls of varying sizes, thus adding to its convenience and effectiveness

All that is needed is a "toy" electric motor and three pieces of stiff wire. One piece for a handle, one for the blades and the third for a leg or support as shown in the illustration. The motor may be operated by dry batteries or may be attached to the electric light system in circuit with a "bell-ringing" transformer. If batteries are used they should be placed on a shelf or on the back of the table attached to the

Home-Made Electric Egg-Beater.



motor by a flexible wire of sufficient length to allow the beater to be used on any part of the table. A small switch should be placed on the motor or within reach of the left hand.

This machine will beat any number of eggs in a very short time and it does not get "tired." Contributed by HAMILTON A. HOOPER.

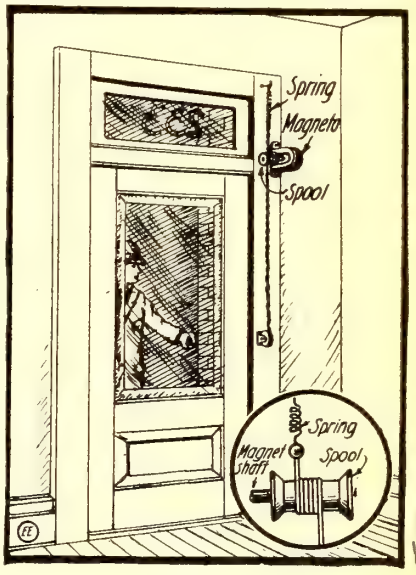
A USEFUL CARBON BATTERY RHEOSTAT.

Anyone desiring a cheap but extremely efficient rheostat will find that this one will exceed their expectations, both for simplicity of construction and for efficiency in the regulation of battery current.

All that is required to build it is a hard wood baseboard, a number of flashlight or other battery carbons and a switch handle. The carbons are placed in a rectangular compartment made by screwing small strips of wood on both sides and ends of the space they occupy. A strip of wood may be laid across the top to prevent them

Old Battery Carbons Form Useful Rheostat.

from being forced out of place. A hole is then drilled on one side, into which a threaded brass rod is tightly fitted. This rod must have a knurled thumb nut with which to turn it. A brass nut should first be put on the rod, to which is soldered the wire for connection with the binding post.



The switch handle is now placed in the center of the remaining space; a block of sufficient thickness being set under it to bring it on a level with the upper surface of the carbons, i.e., with the end of the lever resting on them. Any number of carbons may be used, but it has been found that the more employed the more sensitive will be the regulator.

The regulating screw must come in contact with the carbon near it, or the connection may be made from the carbon itself. By sliding the lever over the carbons, different resistances may be obtained nicely, while the screw serves to adjust each step with fine precision.

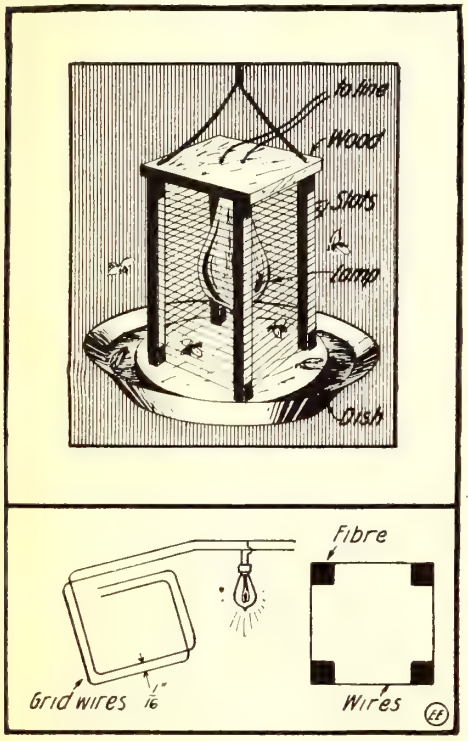
Contributed by SELMER WICK.

THE MAGNETO ELECTRIC DOOR BELL.

The disadvantages of the common electric door bell often outweigh its advantages. The batteries are continually running down, due to excessive use or a short circuit, and the button seems to be an irresistible temptation to every youngster

A Magneto Door Bell Saves Batteries.

who delights in sticking a pin in it to keep the bell ringing. Although the bell-ringing transformer does away with battery trouble, it leaves much to be desired.

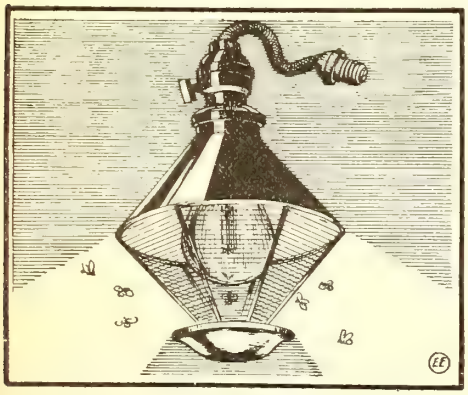


To eliminate all these mishaps I have designed an easily constructed magneto door bell. Purchase a second-hand magneto and a polarized bell. Remove the two brass gears from the magneto and put a small spool on the shaft of the magneto.

The magneto is mounted above the door as per sketch and a cord fastened to the regular pull bell is passed around the spool several times, a tack is driven in to keep it from slipping and the free end of the cord is fastened to a strong spring, hooked into a screw-eye, and screwed into the top of the door frame. Wires are run from the magneto to the bell, which is located in any convenient place. These wires may be quite small, as the bell will ring through an enormous resistance.

A study of the diagram will show that a pull on the handle of the bell will spin the magneto armature and when the handle is released the spring will pull it back, ringing the bell in both cases. Contributed by THOMAS W. BENSON.

ELECTROCUTION TRAP FOR INSECTS.

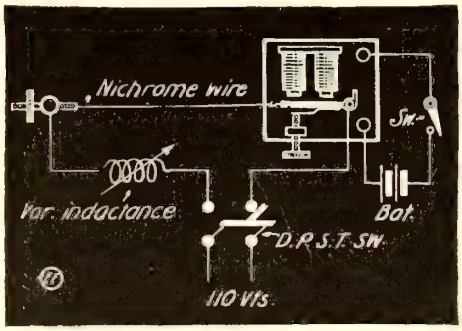


A German inventor has devised a very interesting electrocution trap for insects. Upon an insulated frame of either prismatic or globular form two naked metallic

One Type of Electric Insect Destroyer.

conductors are coiled in a spiral with about 1/16 inch or less space between the windings. The two conductors are connected with a source of electricity in such a manner that the current cannot circulate until it is actually used in killing an insect. This is one of the advantages of the apparatus; obviously no electrical energy is wasted.

Insects are attracted either with sugar water or any other sweet substance. At night time electric lights can be used. The glare of shining metallic parts will also serve as an additional attraction. As soon as the insects touch the bait or the light, and come in contact with any two of the naked wires, they are electrocuted at once and drop down to the bottom of the trap. The current passes only for an instant and is very feeble.



Another Form of Electric Insect Trap.

The sketch herewith depicts how, with a few pieces of horn fiber rod carrying the net of twin wires, with a lamp inside it, one of these useful devices can be made. A tin pan can be fastened to the bottom of the fiber strips in which to catch the dead insects. The top support can be of wax-impregnated wood or of fiber. Slots should be cut 1/16 inch apart in the strips to accommodate the two bare wires. No connection exists between the wires until the insect "crosses" them.

Our second illustration shows a similar style electrical insect trap or annihilator, and in this case the fiber or other strips supporting the two parallel, oppositely charged electrical conductors, are tapered as shown. At the base of these fiber uprights supporting the two charged wires is suitably secured a small cup, in which honey or some other insect delicacy may be placed. An electric bulb, as usual in this class of apparatus, is placed inside the wire cage as in the previous design described above. A single switch may control both the light and the grid wires, as becomes evident.

MECHANICAL WAVES MADE VISIBLE ELECTRICALLY.

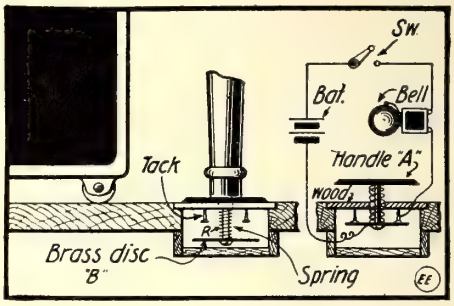
The following is a description of a novel and very interesting experiment, which is very easily performed, showing the stationary mechanical waves on a heated electric wire. Resistance wire is used to render it luminous, therefore the room should be darkened to obtain the best effects. I have tried two sizes of "Nichrome" wire; No. 19 gauge, of which about 12 feet was used, and about 6 feet of No. 24. The exact length for 110 volts may be determined by the experimenter; or, better still, a variable impedance coil may be used, in which event, the length of wire need not

Making Mechanical Waves on Wire Visible.

be so exact. At any rate, the wire must be between a dull red and a white heat.

To produce the motion of the wire a buzzer is used to set up mechanical waves. Not having a buzzer on hand I used a bell with the clapper rod cut off as short as possible and the end bent to form a hook. The resistance wire is fastened to the hook, where one side of the 110-volt circuit is connected. The wire is stretched out to the desired length, where the other side of the circuit is connected; the impedance coil being in series with it, as diagram shows.

The switch for the buzzer circuit should now be closed and the room darkened. By means of the adjustable impedance coil regulator switch the wire should be raised to the desired temperature and tightened up again, as it expands when heated.



By varying the tension of the wire the waves may be observed. When the correct tension is obtained it should be kept constant. The loops or anti-nodes, and nodes of motion. can be easily seen. The loop is the maximum of motion, which is easily observed, as it cools quicker and will be at a "red heat" when the node is "white."

During the course of one experiment the wire broke. In my haste to repair it I made a loose joint. The resistance of the joint being high, it became luminous, while the rest of the wire remained invisible. The fantastic shapes and figures emanating from the juncture produced a very beautiful and spectacular effect in the darkened room.

A "SAFE" BURGLAR ALARM.

Its mechanism is so simple and accurate that it can be thoroughly relied upon. The only thing necessary is to chisel out neatly one of your floor boards near your safe or valuables, about 2 inches in length. To make the device, bore a hole in a block of wood big enough so as to admit rod "R" as shown. On the top end fasten a hard rub-

Removing Chair From Spring Switch Gives Alarm.

ber disc "A." At the bottom end a disc of spring brass. Fasten two common tacks and make necessary connections. Explanation: Place a chair on the side of your safe as shown in figure so that one of the legs rests on the top of "R." You have now set the alarm. As soon as the intruder comes to the safe he removes the innocent looking chair, which naturally is in his way, and the pressure of the spring in the device consequently pushes up the shaft, whereupon the brass disc "B" is connected with the bell and closes the circuit. But the initiated can remove the chair as he pleases, provided the switch is off.

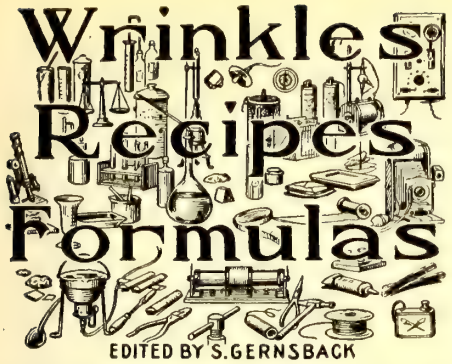
TO RENEW DRY CELLS.



Dry cells, if not too far spent, can be renewed by drilling (not punching) a hole (A) between the binding posts (B-B) and pouring chemically pure ammonia into it. The hole is then sealed up with wax and as efficient service as when it was new can be obtained from the renovated

Method of Revitalizing Dry Cells.

battery. The ammonia will cost little if bought in jars at a time and preserved for future use.

Contributed by A. BEL JEA.

Under this heading we will publish every month useful information in Mechanics, Electricity and Chemistry. We shall be pleased, of course, to have our readers send us any recipes, formulas, wrinkles, new ideas, etc., useful to the experimenter, which will be duly paid for, upon publication, if acceptable.

FORMULA 15.

Blackings for Boots and Shoes.

1. *French Paste for Patent Leather.*—Take 6 drm. of *Pure Wax*, 2 oz. of *Olive Oil*. The wax has to be melted in a water bath. Mix thoroughly by stirring; heat moderately. Add ½ oz. of *Oil of Turpentine* and ½ oz. of *Oil of Lavender*. The mixture will form a paste, which should be put in boxes before it becomes cool. Apply with a linen rag. A very good paste, which keeps the leather *soft and restores the gloss.*

2. *Dressing for Tan Shoes.*—Take 1 oz. of *Annatto*, 1 oz. of *Gamboge*, 1 oz. of *Acacia*, 2 oz. of *Catechu*, 2 oz. of *Hydrochloric Acid*. Add water enough to make 40 ounces.

3. *Polish for Tan and Russet Shoes.*—1 oz. of *Dark Yellow Wax*, 3 oz. of *Oil of Turpentine*, 1 oz. of *Palm Oil*, 15 min. of *Oil of Mirban*. Melt the wax and oil together, add the turpentine, and, when nearly cool, the oil of Mirban.

4. *French Boot Blacking.*—Dissolve 150 parts of *Wax* and 15 parts of *Tallow* in a mixture of 200 parts of *Linseed Oil*, 20 parts of *Litharge*, 100 parts of *Molasses* at a temperature of 250° F. After this add 103 parts of *Lampblack*. When cool dilute the mixture with 280 parts of *Spirits of Turpentine*, and finally mix with a solution of 5 parts of *Gum Lac* and 2 parts of *Aniline Violet* in 35 parts of *Alcohol*.

5. *German Boot Blacking.*—Melt together 90 parts of *Ceresine* (or *Beeswax*), 30 parts of *Oil of Spermaceti*, 350 parts of *Spirits of Turpentine*, with 20 parts of *Asphalt Varnish*. Add 10 parts of *Borax*, 20 parts of *Lampblack*, 10 parts of *Prussion Blue*, 5 parts of *Nitro-Benzol*.

6. *Self-Shining Blacking.*—Dissolve 8 oz. of *Gum Arabic* in 8 oz. of best *Black Ink*; add 2 oz. of *Olive Oil*. Mix thoroughly and then add 4 oz. of *Strong Vinegar*, 3 oz. of *Brown Sugar*, 2 oz. of *Alcohol*.

7. *Waterproof Blacking.*—Melt together 3 oz. of *Beeswax* and 3 oz. of *Black Resin*; then stir in 1 pt. of *Boiled Oil*. When it has cooled a little add 3 oz. of *Oil of Turpentine*.

8. *Russian Waterproof Boot Blacking.*—Melt 1 oz. of *Beeswax*, ½ oz. of *Suet*, 2 oz. of *Olive Oil*. Add ½ oz. of *Lampblack* and stir till cool. Warm the boots and apply the blacking.

9. *Liquid Shoe Blacking.*—5 oz. of *Animal Charcoal*, 4 oz. of *Molasses*, ¾ oz. *Sweet Oil*. Triturate until the oil is thoroughly incorporated, then stir in ¼ pint of *Vinegar* and ¼ pint of *Beer Lees*.

10. *Finishing Blacking.*—Mix together ½ oz. of *Gelatine*, ½ oz. of *Indigo*, 1 oz. of *Logwood Extract*, 2 oz. of *Crown Soap*, 8 oz. of *Softened Glue*, 1 qt. of *Vinegar*. Heat the whole over a slow fire and stir till thoroughly mixed. Apply with a soft brush and polish with a woolen cloth.

S. G.

A GOOD SILVER-PLATING SOLUTION.

This solution will be found of excellent use in silver-plating different parts of electrical apparatus, jewelry, etc. Copper, Brass and German silver articles only can be plated.

Cut a silver quarter into small pieces and place in a porcelain or glass dish. Place the dish, uncovered, in a pan of warm water and add ½ ounce of nitric acid to the metal. Let dish stand in the water until metal is all dissolved. Now add ½ gill of water and one teaspoonful of fine salt. Let the precipitate settle and filter. Add more salt to the filtrate, and if any more precipitate falls filter again. Wash the precipitate on the filter paper until the water shows no acid when tested with filter paper. Add one pint of water to the precipitate and four scruples of potassium cyanide. Great care must be used in handling the cyanide, or the solution after it is added, as it is a deadly and almost instantaneous poison. Put a piece of zinc about 2x1x⅛ inches in the solution and it is ready for use.

No electric battery is needed. Simply clean the articles to be plated in a hot potash solution and rinse good in boiling water. Immerse in the solution for about ½ minute, allowing the article to rest on the zinc. Wipe dry with a cloth and repeat. Heavier coatings can be given by repeating. Articles will take a high polish and wear fine.

Contributed by E. E. ZANDER.

A HANDY SPIRIT LAMP.

All that is needed to make this useful little spirit lamp are: An old ink or mucilage bottle, a wooden cork, a small tube, a piece of asbestos and an old lamp wick.

Useful Alcohol Torch.

The cork should be made of hard wood and as seen in the diagram should have a hole bored through its center. Through this a piece of metal tubing about 1½ inches long is inserted. There should be a notch cut in the side of the cork to admit air.

A piece of asbestos should be procured (a piece of an old asbestos shingle will do) about one inch in diameter with a hole bored through the center to admit the tube. The wick, which may be flat, should be run up through the tube to the desired height. Wood alcohol should be used as fuel as it gives intense heat and little smoke.

Contributed by HARRY RIDINGER.

CONVERSION OF RECIPE FORMULAS.

Sometimes amateurs see a formula or recipe which they might want to use, but cannot do so because the ingredients are expressed in "parts." A part in the sense of the word might mean anything. If specified in solids, it might mean anywhere from a grain to a ton; or if in liquids, might mean anywhere from a drop to a barrel; but if one should keep to the unit and use multiples it would be impossible to make a mistake.

For example, if the formula should say: Use 1 part of nitric acid, 2 parts of potassium bichromate (saturated solution), 5 parts of water (apologies to S. G. in *Electrical Experimenter*, April, 1915, under "Wrinkles, Recipes and Formulas," No. 3); all that is necessary would be to designate the exact quantity that the part represents; then, if one grain for solids and one minim for liquids should be used, the above formula would work out as follows: Nitric acid, 1 minim; potassium bichromate, 2 grains, and water, 5 minims. Of course, this can be multiplied to any proportion.

For further reference the following table will also be found very useful:

No. of parts.	Grains.	Minims.	*Grams., or c. c.
1	1	1	1
2	2	2	2
3	3	3	3
4	4	4	4
5	5	5	5
10	10	10	10
20	1 scr.	20	20
50	50	50	50
60	1 dr.	1 dr.	60
100	1 dr. 2 scr.	1 dr. 40 min.	100
250	½ oz. 32 grs.	1 dr. 40 min.	250
500	1 oz. 62 grs.	½ oz. 10 min.	500
1,000	2¼ oz. 16 grs.	2 oz. 40 min.	1,000
2,500	5½ oz. 94 grs.	5 oz. 1 dr. 40 min.	2,500
5,000	11¼ oz. 79 grs.	10 oz. 3 dr. 20 min.	5,000
10,000	1 lb. 6¾ oz. 49 grs.	20 oz. 6 dr. 40 min.	10,000

*Metric system: Figures for grammes and cubic centimeters are the same.

It would be advisable for experimenters to copy the above table and put it in a convenient place in the laboratory, as it will be found very helpful for the rapid calculation of parts into liquids or solids, as the case might be. Contributed by

A. WILSDON.

CANNED HEAT.

Canned heat, a new discovery, is nothing else but solidified alcohol. The alcohol is suspended in a soap mixture so that it may be used for heating purposes and still not be open to the dangers from alcohol when burned alone.

Solidified alcohol may be made according to the following formula: Stearic acid, 8½ grammes; caustic soda, 1-35/100 grammes; alcohol (grain or denatured), sufficient quantity to make 100 grammes.

Dissolve the stearic acid in about 50 grammes of alcohol by the aid of heat. Dissolve the caustic soda in about 40 grammes of alcohol. Mix and warm until the two solutions combine. Pour into suitable moulds. The moulds ordinarily used are friction-top tin cans capable of holding three or four fluid ounces. To ignite, the cover is removed and a lighted match held over the solid mixture. To extinguish, the cover is slipped on the can. Care should be taken not to tip over a lighted can, as when the mixture is burning it becomes a semi-liquid and, therefore, a source of danger if spilled. When the fire is extinguished and the mass allowed to cool the contents of the can again solidifies. The soap itself does not burn but is left in the can after the spirit has been consumed. WITH THE AMATEURS

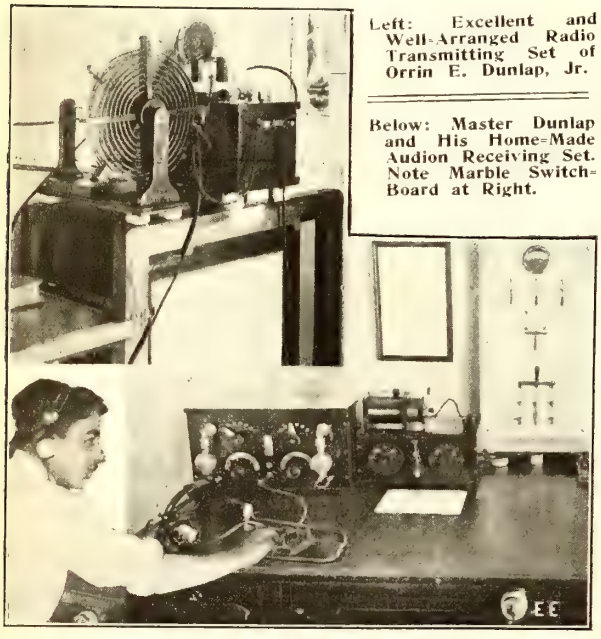
Our Amateur Radio Station Contest is open to all readers, whether subscribers or not. The photos are judged for best arrangement and efficiency of the apparatus. To increase the interest of this department we make it a rule not to publish photos of stations unaccompanied by that of the owner. Dark photos preferred to light toned ones. We pay each month $3.00 prize for the best photo. Make your description brief. Address the Editor.

AMATEUR RADIO STATION CONTEST.



Monthly Prize, $3.00.

This month's prize winner.

RADIO NIAGARA STATION.

The accompanying photographs show the radio Niagara station and serve to clearly show the exterior appearance of the apparatus, so that only a brief description of details need be given.

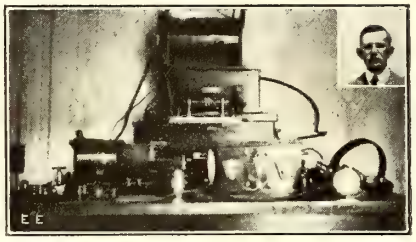
The complete receiving equipment is home-made, having been built by myself. In the rear of the audion cabinet is a 1 to 1 ratio transformer for the amplifier. In place of the flashlight cells, which are so commonly used with the audion, I use ordinary dry cells which have been discarded from automobiles. There are two sets; 44 cells in a set. The tuning apparatus is mounted on a separate mahogany cabinet and can be used as a *portable set* if necessary. With this set I have heard Colon, Key West and many other distant stations.

Left: Excellent and Well-Arranged Radio Transmitting Set of Orrin E. Dunlap, Jr.

Below: Master Dunlap and His Home-Made Audion Receiving Set. Note Marble Switch-Board at Right.

The transmitter consists of a ¼-K. W. Blitzen transformer, rack type condenser, made up of 10 double flint glass plates. Only four plates are employed on ¼ K. W. The oscillation transformer is the AMCO type. The rotary gap is of the Clapp Eastham type.

I worked I. Z. L. of Northampton, Mass., regularly throughout the winter. The signals have also been heard in Vineland, N. J., Waynesfield, O., and at Ann Arbor, Mich.



The aerial consists of six wires, 85 feet long, 70 feet high.

ORRIN E. DUNLAP, JR

Niagara Falls, N. Y.

MR. GITTELBAUER'S RADIO SET.

My radio transmitting set comprises: A ½ K. W. transformer, 2 units each ¼ K. W., plate glass condenser, fixed gap, oscillation transformer, "Boston" type sending key, aerial change-over switch, pilot lamp and a protective device across the 110-volt line to provide against kick-backs.

Mr. Gittelbauer and His Neat Radio Set.

The receiving set includes: Loose-coupled tuner, aerial loading inductance, Audion detector, galena and silicon detector, also a "Crystaloi" detector with a cohering inductance.

Normal sending range 40 miles. Normal receiving range 500 miles, but can copy high power stations 1,200 miles.

The aerial consists of three wires (stranded copper) 70 feet long, stretched between two poles 52 feet high at one end, 46 feet high at other end. Ground: Three pipes, each driven 10 feet into moist earth. Aerial when not in use is grounded through a standard 100-ampere knife switch.

I hold a first grade commercial license, in addition to amateur license, and am a member of the American Radio Relay League. My official call is "2 A. Y."

FREDK. GITTELBAUER.

East Rutherford, N. J.

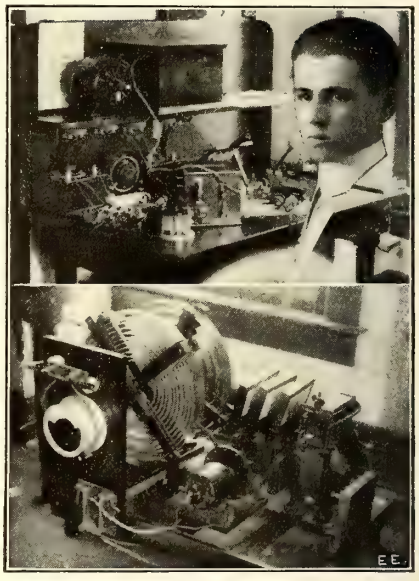
AMATEUR OUTFIT OF BERT ROUTLEDGE.

I give you herewith a photo and description of my wireless station. Some of the apparatus is of commercial make, while the others are home-made. The transmitting apparatus comprises the following: One-inch spark coil, rotary and open spark gaps, two Leyden jars, helix, key and necessary switches.

Radio Station of Bert Routledge.

For receiving, I use successfully a loose coupler, two loading coils, variometer, two variable condensers, one fixed condenser, silicon and galena detectors, 2,000-ohm head-sets and buzzer to test out detectors.

My aerial consists of four wires, each 95 feet long, spread 2 feet apart. It is 55 feet high at one end and 45 feet high at the other. I also have a smaller aerial for sending. The war has effected the temporary closing of my station.



BERT ROUTLEDGE.

Sydney, C. B., Canada.

ROY C. BURR'S RADIO STATION.

The following is a description of my amateur station:

My aerial is made up of 7-strand No. 22 copper cable, 65 feet long and 50 feet high, located on a hill. For ground I use a large copper plate buried 10 feet in wet clay, also gas and water pipes. For sending I use 888 watt Thordarson transformer, 6 Murdock condenser sections, Blitzen rotary, oscillation transformer, Precision H. W. meter and 2 resistance rod kick-back preventers. All connections are of heavy copper bar and transmitter is mounted on plate glass base. 1 K. W. glass plate condenser and rotary quenched gap of my own construction are also included in this set.

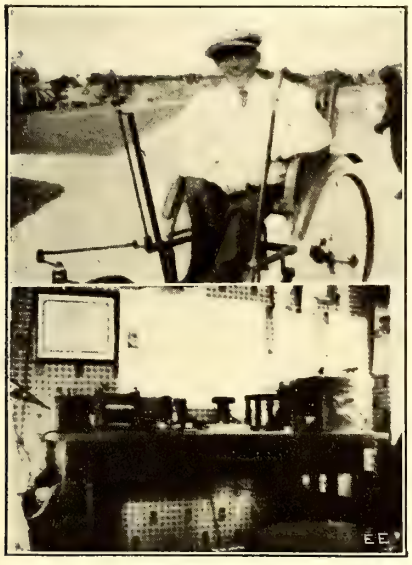
Excellent Radio Equipment of Roy C. Burr.

My receiving set constitutes the following; 2 .01 M. F. variables, type D Clapp-Eastham tuner, R. J. 5 audion and galena detectors. Switch is provided for changing from audion to galena or vice versa. Five Blitzen duplex loose coupled loaders increase the tuning range considerably.

With the above set I have listened to a number of stations very clearly, including

such stations as 2 J.D. (New York City), 8 Q.J. (Detroit, Mich.), 9 B.D. (Superior, Wis.), 9 X.N., and many others.

This is a star station for the American Radio Relay League, and also a member of the Central Radio Association. Any experimenter who would like to communicate with this station is cordially invited to do so, my call being 8 R.D.



Norwalk, O. ROY C. BURR.

WIRELESS EQUIPMENT OF HAROLD C. SNOW.

Herewith I tender photos of my station and myself for entrance in your Amateur Station Contest.

The aerial utilized is of the "L" type, 90 feet long and 50 feet high, composed of 8 copper wires 2 feet apart. The receiving set comprises a Murdock loose coupler, rotary variable condenser, Perikon and Silicon detectors, 2,000-ohm head-set, and loading coil for long waves. With this set I am able to hear N.A.A. (Arlington) at all times of the day, and have frequently received signals from N.A.X. (Colon, Panama), N.A.R. (Key West, Fla.), N.A.W. (San Juan, P. R.) and N.A.W. (Guantanamo, Cuba), as well as many other Government and commercial stations.

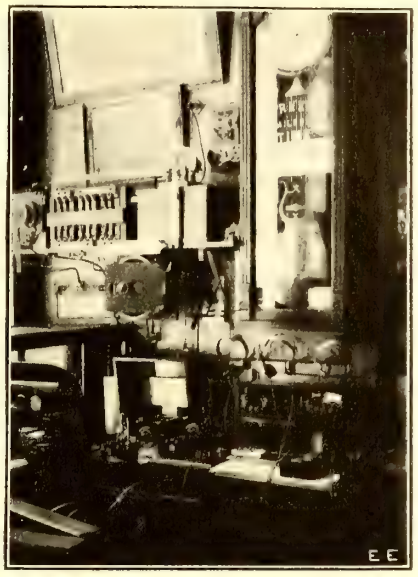
The transmitting set is composed of a Blitzen type ¼-k.w. capacity oscillation

Harold Snow Finds His Radio Set of Great Interest.

transformer, glass plate condenser and sending key; a quick throw switch is used to change from receiving to sending.

I have a First Grade Amateur License and my call is 4 G.A. I shall be very pleased to hear from any other wireless operators.

HAROLD C. SNOW.



Swampscott, Mass.

W. O. HORNER'S TRIPLE VALVE STATION.

The photo herewith shown depicts my new transmitting and receiving station. My station comprises a 1-k.w. Clapp-Eastham transformer, condenser, rotary spark gap, improved oscillation transformer, hot wire ammeter, kick-back preventer and Blitzen wave-meter.

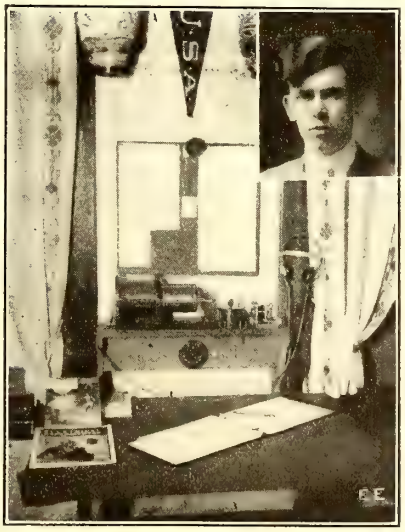
With this set I have heard Arlington time signals during the day 15 feet from the 'phones, and the 10 P. M. night signals as far as 90 feet during cold weather.

The triple valve audion receiver case is solid mahogany. I have been experimenting with the 1st or tuning audion, and find by placing a permanent magnet around the bulb on a line with grid and wing and by delivering the proper or exact amount of current to the filament, the bulb will suddenly begin to oscillate, and I can then pick

Efficient Radio Station of W. O. Horner, on Which Time Signals Are Audible 90 Feet from 'Phones.

up several *undamped* wave stations on the Atlantic and Pacific coasts.

W. O. HORNER.



Cleveland, Tenn.

STANLEY CARROLL'S EFFICIENT RADIO OUTFIT.

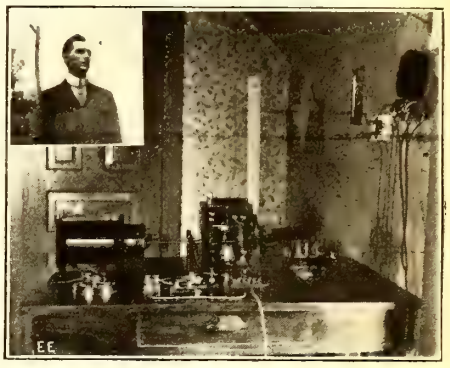
The following is a description of my wireless receiving station located at Marietta, O. My set comprises an "Electro" professional loose coupler. A Murdock variable condenser and its silicon detector, No. 322, with condenser inside it, with suitable capacity, and the "Electro" loading coil. My range at night includes Key West and Arlington. My aerial is of No. 14 wire, 112 ft. long, of four strands, with 7½ ft. spreaders, 90 ft. high at one end, 65 ft. at the other. Aerial points westward. Am going to build a new aerial this fall just twice the size of my present one, and intend to get a ½ kilowatt sending set.

STANLEY W. CARROLL.

Marietta, Ohio.

Stanley Carroll and His Wireless Set.

Do you realize that with his issue *The Electrical Experimenter* contains 72 pages?



WIRELESS STATION OF C. E. LAWSON.

Herewith is a picture of my wireless receiving set and aerial, which I hope to see published.

The receiving set comprises the following instruments: 2,500-meter loose coupler, 5,000-meter E. I. Co. loading coil, Junior fixed condenser, 2,000-ohm "Electro" amateur head set, "cat-whisker" galena detector, Murdock fixed condenser, Audion detector, pole-changing switch for throwing quickly from one detector to another, "Electro" baby switch for breaking crystal detector circuit when using Audion, and also marble-base lightning switch (not shown in illustration), in order to conform to underwriters' rules. Audion batteries are concealed in drawer of table. All woodwork is mahogany finish. On the right end of table will be seen my wire telegraph set.

The aerial consists of six strands of "Antenium" aerial wire, is 30 feet high at one end and 20 feet at the other end, 75 feet long and connected loop fashion, "L" type, in order to get the maximum wave length for receiving from high-power stations. My ground is No. 4 copper wire soldered to water pipe, and is about 15 feet long.

With the above set I can hear, any night in the year, the time signals from Arlington, Va., and Key West, Fla. I have also heard the Sayville, L. I., station at night, at

Particularly Neat Radio Station of C. E. Lawson.

favorable times of the year, and can hear the U. S. Naval stations at Charleston, S. C.; New Orleans, La.; Savannah, Ga., and Beaufort, N. C., as well as various near-by and smaller amateur stations.

This is, I consider, a very good record for so small an aerial, and I believe is due to the fact that all my connections are soldered and the wiring as simple and direct as possible.

I would like to exchange photos of my set with other amateurs.

CLARENCE E. LAWSON.

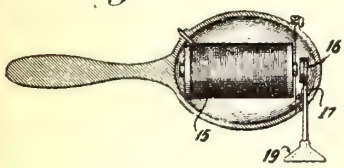
Cleveland, Tenn.

NEW RADIO CLUB IN BANGOR, ME.

The Penobscot Radio Club, of Bangor, Me., was organized recently and the following officers were elected: Harold Grant, president; Roy N. Johnson, vice-president; William J. Anderson, secretary and treasurer.

The other members are: William Hall, Cornelius Sullivan, Wainwright Reed and Edward Frey.

All the members have up-to-date apparatus. Meetings are held weekly at the home of the president. The club members would like to communicate with other radio clubs and exchange photos of amateur sets with other amateurs. Address all communications to William J. Anderson, 122 Lincoln street, Bangor, Me.



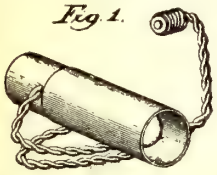
LATEST PATENTS

A. C. Massage Vibrator.

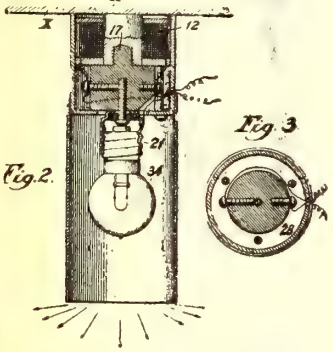
(No. 1,149,099; issued to Leo J. Wahl and Edward W. Wahl.)

The patentees of this device intend that it shall be used on alternating current circuits and in this

Fig. 1



way a vibratory electro-magnetic force is caused to act from the electromagnet coil 15 on to an iron armature 16, which is attached to a pivoted, spring mounted, arm 17. On the end of the arm is a rubber applicator cup 19. The operation of the device is self-evident and it is very simple, magnetically considered.

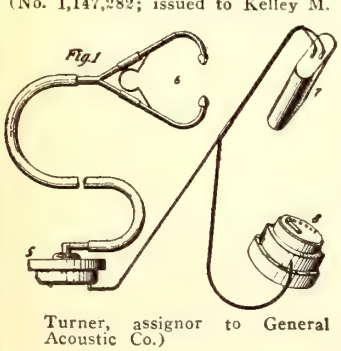


Portable Electric Trouble Lamp.

(No. 1,148,662; issued to Oliver C. Dennis.)

This invention provides for a small electric trouble lamp, suitable for use about automobile engines, ma-

Fig. 1.



chine work, etc., and includes a strong magnet coil mounted in the base of same. This magnet coil 12, is connected in multiple with the electric lamp itself and is thus supplied with current from a common battery, such as that used for ignition on the car. The central core of the coil 12, is of iron, as is also the outside shell surrounding the coil. The magnetic flux passes out of the core 11, through the iron body, on which it may happen to rest at X, and so back into the second pole face, comprising the outer shell.

Electric Stethoscope.

(No. 1,147,282; issued to Kelley M. Turner, assignor to General Acoustic Co.)

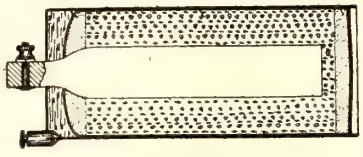


Fig. 1

An improved form of stethoscope, utilizing the well-known dictagraph principle and therefore being of remarkable sensitivity. The specially arranged microphone and controlling rheostat 8 co-acts with a loud talking receiver 5 and the vibrations of its diaphragm are reproduced acoustically through the tube and ear pieces 6. A small battery, of the flashlight type 7, provides current for this system. The inventor claims that several parties can listen to the heart beats and also to the actual character of the beats simultaneously; owing to the greatly amplified strength of the beats, as reproduced by this dictagraph apparatus. A much desired improvement it seems.

Electric Dry Battery.

(No. 1,147,753; issued to Leo J. Schatzel, assignor of one-half to Oscar V. Maurer.)

A new style of dry battery cell made up in the usual manner, as illustration shows. Improvement consists in using as a depolarizer a persulphate of one of the following metals: Barium, strontium, ammonium, copper, manganese, calcium, sodium, lithium or potassium. Of these, however, potassium persulphate is the salt of persulphuric acid, which produces the most marked results. Such batteries yield 2 volts and the life of the battery, as well as its recuperative powers, is said to be well above that of any common cell heretofore manufactured. Complete formulae are given in the patent for making the entire cell.

New Wireless Head 'Phone.

(No. 1,148,941; issued to Harry B. Wier, assignor to Western Electric Co.)

Several good features are incorporated in this patent for an improved wireless head telephone receiver. Firstly, the receiver is adjustable to practically any position desired, by means of the swivel frame and trunnion 35 and 36.

Fig. 1

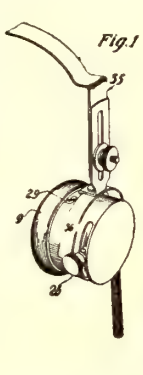

Fig. 2

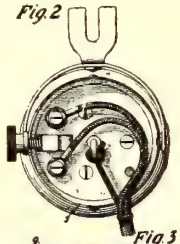

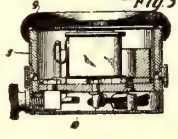

Fig. 3

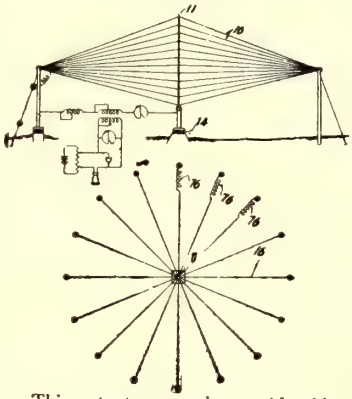
Secondly, the magnet poles may be adjusted to a greater or less distance from the diaphragm by means of a sliding thumb nut 26, attached to a threaded base plate 10, adjustably mounted inside the receiver shell. The nut 26 can be clamped at any position desired and the receiver is thus adjustable for different signals and frequencies. Further, the cap 9 and the inside shell 5 may be removed from the base shell by means of a bayonet joint 29.

Search-Light for Revolvers and Guns.

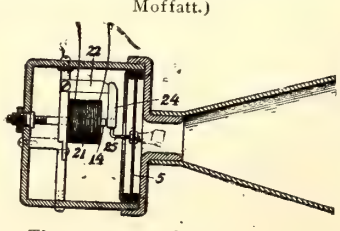
(No. 1,149,705; issued to Eugene S. Ward.)



A modified form of electric flash-

light with small size battery, which may be contained in the handle of a revolver, etc. The flashlight bulb is placed in a metal tube attachable to the under side of a revolver or gun. This tube has a sliding tube on same, so that the lens which it carries can be focused for the best results in any case.

Wireless Antenna.



(No. 1,147,010; issued to Reginald A. Fessenden, assignor by mesne assignments to Samuel M. Kintner and Halsey M. Barrett.)

This patent covers in considerable detail the special form of umbrella antenna for radiotelegraphy, as used by Prof. R. A. Fessenden, at the Brant Rock station in Massachusetts. The illustration shows how the various guy wires 16, spaced radially about the 400-foot steel pipe mast 11, form a part of the aerial proper. The entire mast rests on an insulating glass base 14, and the patent covers methods for either using or not using the steel pipe mast as part of the aerial system. Also powerful spring shock or mechanical tension absorbers 76 are mentioned to be inserted in each guy wire, so that the mast will have great flexibility and resilience, mechanically considered. The guy wires are, of course, highly insulated, as becomes evident in view of the fact that they form a part of the antenna proper.

Loud Speaking Telephone Receiver.

(No. 1,152,536; issued to Albert S. Moffatt.)

The patentee of this new loud-talking telephone receiver arranges an electro-magnetic circuit in the shell of same, as perceived. The diaphragm 5 is resiliently mounted and is actuated so as to reproduce sounds by means of a lever 25, connected to the soft iron armature 24. The position of the fulcrum lever 22 may be adjusted, and it is thus seen that owing to the difference in leverage thus obtainable that it is possible to greatly amplify the movement of the armature 24. Thus it is possible to make a satisfactory electro-magnetic telephonic reproducer. Also the pole 14, of the electro-magnet 21, is adjustable as to its position, as will be observed.

Electric Pilot and Night Lamp.

(No. 1,147,949; issued to Eliot Keen.)

Fig 1

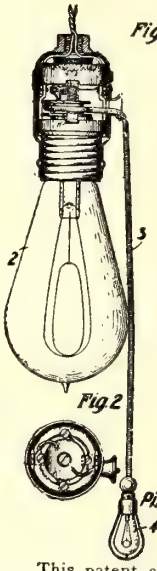


Fig 3

Fig 4

Fig 5

Fig 2

Fig 6

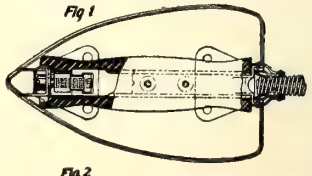
This patent covers a special form of pull socket in which the pull cord is arranged to comprise a flexible double conductor. To the end of this twin flexible pull cord is attached in a protective casing or cage a small pilot lamp 4. Either the large regular lamp 2, or the small pilot or night lamp 4, may be switched on by alternating pulls on the cord 3.

Electric Sad Iron.

(No. 1,148,627; issued to Edward E. Rose.)

New style of electric sad iron, providing a very neat and efficient

Fig 1



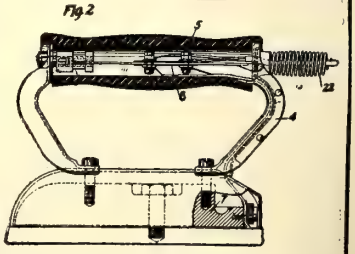


Fig 2

arrangement for leading in the double conductor cord. The double conductor cord passes through a protective spring 22, adjacent to the insulating handle 5. A connection block 6 is placed within the hollow handle and two lead wires run down through the hollow handle frame 4, to the heating element 7.

COPIES OF ANY OF THE ABOVE PATENTS SUPPLIED AT 10c. EACH.

Phoney Patents

Under this heading we will publish hereafter electrical or mechanical ideas which our clever inventors, for reasons best known to themselves, have as yet not patented. We furthermore announce the grand opening of the

PHONEY PATENT OFFIZZ

For the relief of all suffering daffy inventors in this country as well as the entire universe.

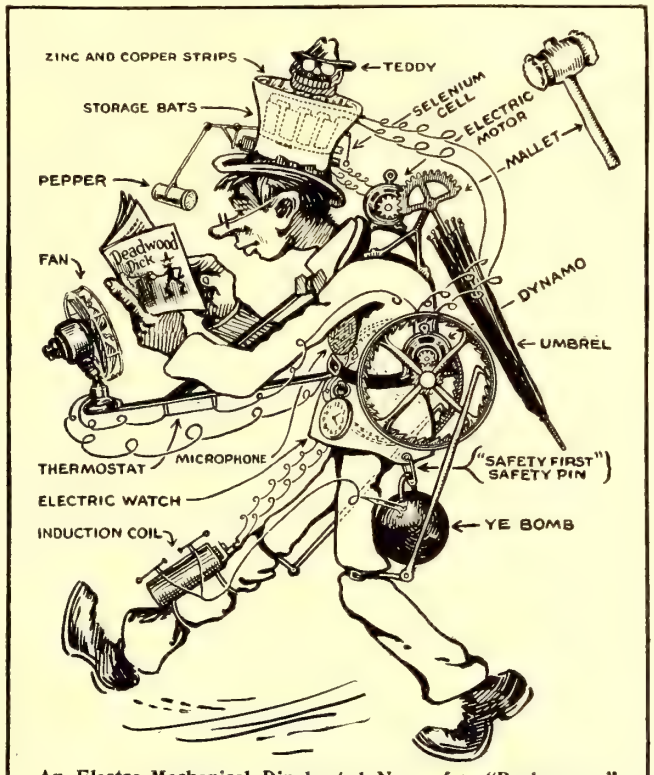
We will revolutionize the Patent business immmediately and OFFER YOU THREE DOLLARS ($3.00) FOR THE BEST PATENT. If you take your Phoney Patent to Washington, they charge you $20.00 for the initial fee and then you haven't a smell of the Patent yet. After they have allowed the Patent, you must pay another $20.00 as a final fee. That's $40.00 ! ! WE PAY YOU $3.00 and grant you a Phoney Patent in the bargain, so you save $43.00 ! ! When sending in your Phoney Patent application, be sure that it is as daffy as a lovesick bat. The daffier, the better. Simple sketches and a short description will help our staff of examiners to issue a Phoney Patent on your invention in a jiffy.

PHONEY PATENT OFFIZZ

U. R. WRIGHT OF WHEREATIN VA.

No. Umsteen hundred and forty 'leven. **BOOKWORM'S NURSE** **Pat. applied for 10 minutes 'fore lunch.**

Specification of Phoney Patent—Application Sandpapered September the Tooth



To those who—consarn it all, here goes:

I, U. R. Wright, of the Burg of Whereatin, Va., do hereby swear dreadfully, and affirm firmly that I have invented means whereby and by which a confirmed Bookworm may be relieved of all anxiety about reading too late at night, getting wet in the rain, getting overheated or run over by vehicles.

Full description of this wonderful apparatus follows:

A small but powerful dynamo is strapped to the small of the back. On each end of the shaft is an aluminum flywheel covered with fly-paper and having teeth around the inner edge of the rim. Pawls fastened to the legs of the wearer engage these teeth and spin the dynamo when the victim walks along either fro or to, hither or thither. The current thus generated is led by small wires to storage batteries concealed in the high stove-pipe hat which goes with the outfit. So a man, thus fitted out, really has "*bats* in his belfry." The top of this hat is the most ingenious part of the whole mechanism. It consists first of a shallow hard rubber pan, shaped much like a friction tight molasses bucket lid. In this lid are laid narrow strips alternately of copper and zinc, these being connected in parallel. On top of this is an image of Theodore Roosevelt, rampant, carved from a lump of copper sulphate or bluestone. More about this later.

Between the shoulders of the unfortunate is an umbrella which normally hangs down, closed, behind him. On the handle end of the umbrella is a segment of gears which engage with a small motor. Now the action is thus: When a shower starts, and the Bookworm is ambling along, face buried in a volume of "Deadwood Dick," the rain drops trickle over the Bluestone image of "Teddy," partly dissolving him and covering the zinc and copper strips with bluestone solution, thus forming an electric cell. (The bluestone image, after months of constant use, will acquire a likeness to William Jennings Bryan.) The electric current thus set up actuates a switch which cuts in the storage battery to the motor which hoists the umbrella. There is a tiny hole in the bottom of the hard rubber lid or pan which contains the zinc and copper strips so that the bluestone solution trickles very slowly out, and down the back of the wearer's neck. For this reason the patient must wear blue acid proof overalls. When all of the solution has run out, the switch is released and the umbrella is automatically let down to its normal position.

An Electro-Mechanical Dingbusted Nurse for "Bookworms."

Strapped to the chest (if he has one) of the victim is a small electric fan in circuit with a thermostat so when it is warm the thermostat starts up a delightful mountain breeze.

Reading so much a man is likely to forget to wind his watch, so an electric watch is provided. Injury to the eyes by reading in too dim a light is prevented by a selenium cell, which in dim light releases a switch operating an electro-magnet which pulls a lever to and fro rapidly, on the end of which is a pepper shaker. This shakes pepper in the eyes of the reader and thus calls a halt.

While crossing the street, interested in a book, one pays no attention to approaching autos and cars. A sensitive microphone worn on the person actuates a spark, which explodes a bomb under the coat tails of the bookworm, hefting him gently into the air, while the said vehicle saunters nonchalantly on beneath him upon its wonted way.

To prevent reading in bed too late at night, a 10-pound mallet is fastened in the umbrella socket, and at the appointed time the electric watch connects the circuit and the mallet descends upon the noodle of the victim, giving 40 swift swats, knocking him insensible till morning, when he is awakened by a shock of 10,000 volts from an induction coil.

In testimony whereof, I have hereunto appended my nom-de-feather this day, O Lord, preserve us from further attacks.

U. R. Wright.

By his attorney,

Stanley H. Covington,
Lynchburg, Va.

Witnesses: I. B. Darn, Whooda Thoughtit, Ischga Bibble.

INVENTION TO DETECT PRESENCE OF OTHER BOATS.

W. Lorenz, a jeweler of Buffalo, N. Y., has succeeded in perfecting two valuable instruments which have been accepted by the Canadian navy. One of the inventions is known as a "ship detector" on which he has been working two years.

The detector makes it possible for a ship properly equipped to ascertain whether other boats are within a certain distance, their direction and approximate location. The instrument works on the principle of wireless telegraphy. The vibrations of a ship being detected are communicated to the receiving apparatus through the vibrations caused by the machinery. The apparatus will work effectively, it is said, regardless of the number of ships within its operating radius. The other invention has not been made public.

NEW WIRELESS STATION AT CHELSEA, MASS.

On Sept. 15 the new wireless station at the Naval Hospital, Chelsea, was opened. It will be the most powerful on the Atlantic coast. The station at the navy yard will not be dispensed with, but will be run just the same. The new station cost in the vicinity of $125,000.

WIRELESS SYSTEM SAVES 500,000 LIVES IN A YEAR.

Fresh evidence of the value of the wireless as a saver of lives has been found during the disasters and threats of disasters following in the wake of the European war.

Repeatedly the Atlantic Ocean has been combed by wireless in its sending of warnings to threatened passenger ships. Although no figures are at hand, a wireless operator has just estimated that not fewer than 500,000 lives that would have been lost before the invention of the Marconi system have been saved by it since the beginning of the present year.

QUESTION BOX

This department is for the sole benefit of the electrical experimenter. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be published. Rules under which questions will be answered:

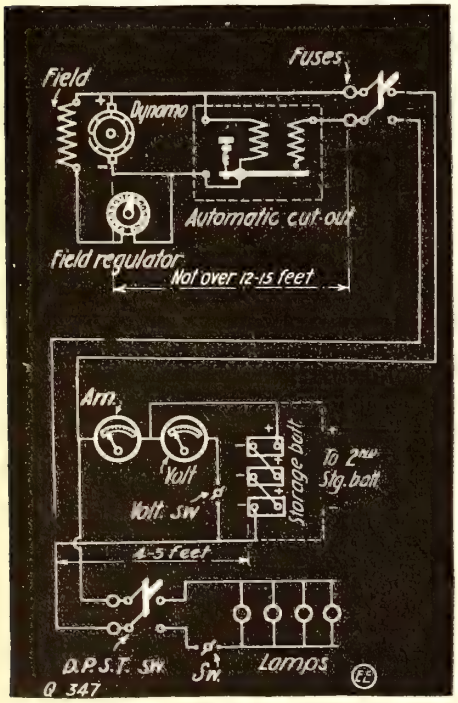
1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered.
3. Sketches, diagrams, etc., must be on separate sheets. Questions addressed to this department cannot be answered by mail.

MEASUREMENT OF FREQUENCY IN A. C. CIRCUITS.

(345) F. Callahan, ————, wants to know how the frequency of an alternating-current circuit may be measured.

A. 1. There are several ways of measuring the frequency in cycles of alternating-current circuits, but the usual and most direct method is that utilizing a standard "frequency meter" of the direct-indicating type. One of these, of the vibrating-reed type, costs about $65 for frequency measurements somewhat above and below 60 cycles.

FREAK RADIO RECEPTOR.



(346) J. M. Butcher, Medina, O., explains how he has picked up radio signals on a telegraph sounder without any detector.

A. 1. In most cases that have come to our attention and along the line you mention is has been found that the armature bar, etc. (of the telegraph sounder, for instance), has been so adjusted that it formed a *microphonic* contact which would pick up wireless signals; or also it would act as a reproducer of speech under certain conditions.

Quite possibly the dead wire circuit running from the sounder acts as an aerial, and wireless signals have been repeatedly picked up by using a telegraph or telephone circuit as an antenna.

BATTERY CHARGING CUT-OUT.

(347) L. J. Roche, Lafayette, N. Y., inquires about making a battery charging

Wiring Diagram for Storage Battery Lighting Plants.

cut-out for accumulator plants.

A. 1. The appended lighting plant diagram shows how the E. I. Co. automatic storage battery charging cut-out works.

You may experiment with this form of cut-out, and in designing the coil windings you should allow about 1,000 circular mils area of copper wire for each ampere which is to pass through the coils. Hence you can very easily design the coils by referring to a standard B. & S. wire gauge, as given in most electrical catalogs.

While one size of cut-out with certain windings on same will take care of a dynamo and battery outfit somewhat higher or lower in voltage than that which it is designed for, it becomes necessary to rewind the coils especially for the dynamo to be used when the dynamo varies 20 to 25 per cent. above or below the rating of the cut-out.

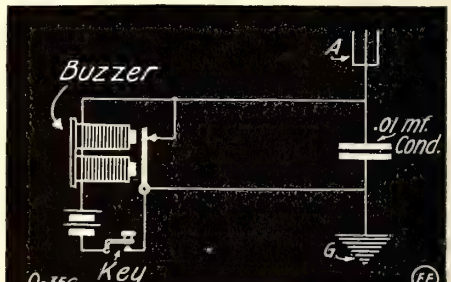
THE TUCKERTON, N. J., RADIO STATION.

(348) James S. ————, Washington, D. C., asks what form of high-frequency generator is employed at the Tuckerton, N. J., trans-oceanic wireless station operated by the Goldschmidt interests.

A. 1. The powerful radio station at Tuckerton, N. J., uses a Poulsen arc oscillation generator of about 60 k.w. rating.

Data on this and other powerful stations in this country is given in the Government "Radio Call Book," procurable at 15 cents from the Superintendent of Documents, Washington, D. C.

LOADING COILS.



(349.) R. A. de Vore, Atlanta, Ga., wants to know the number of turns necessary on tuning coils 3 inches in diameter to obtain the longest possible wave length with an aerial 300 feet long and 50 feet high. He also wishes to know the maximum additional wave length he can receive by using a loading coil.

A. 1. There is, generally speaking, no limit to the wave length you can receive by using large coils; that is, you can wind a coil 10 feet long, but such large coils are not properly proportioned. A properly constructed tuner has a length that is equal to about four times its diameter. A coil of this size, 12 inches long and 3 inches in diameter, wound with No. 24 wire, in connection with your aerial should have a wave length of about 2,500 meters, and you can add loading inductance both in the aerial circuit and the detector circuit to raise this wave length up to 7,000 or even 10,000 meters by using coils large enough. The usual practise is to put a condenser across the secondary circuit to increase its wave length.

CONDENSERS AND RANGES.

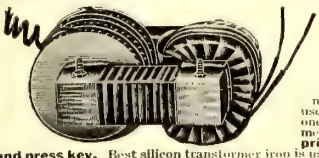
(350.) A. Paul Peck, Plainfield, N. J., asks several questions: 1. Whether glass plates can be used in receiving condensers. 2. The wave length of his aerial. 3. The distance over which he can receive with his apparatus. 4. How far he can transmit with a buzzer outfit.

A. 1. Glass plates can be used for receiving condensers and are suitable for such purposes, but their disadvantage is that they are rather bulky; otherwise they are superior to those made from paraffine paper.

Buzzer Used for Transmitting Radio Signals.

A. 2. The wave length of your aerial, 80 feet long, 20 feet high, with lead-in 15 feet long and a ground wire 20 feet long, would be approximately 160 meters.

A. 3. We do not make a practise of answering questions regarding the range over which wireless sets will receive, be-



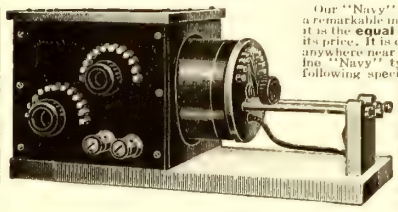
(*Continued on page* 354.)

EXPERIMENTERS READ EVERY LINE OF THIS INTERESTING AD-

We've prepared it with care and it's written for *YOU*. We want you to *know* the Electro-Set Co. We are anxious to have you *realize* what we are doing to make experimenting financially possible for every live American Boy. We haven't space to tell you all—you'll have to send for our catalogues to see this. We are taking this opportunity to introduce only seven of our regular specialties and 14 wonderful bargains in odd parts such as every experimenter needs and can use. One order will convince you what the Electro-Set Co. is offering. Get in touch with us *to-day*.

HERE IT IS AT LAST!

This 1-6 K. W. Closed Core Wireless Transformer..... **$6.95**

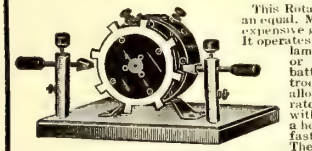


After months of experimenting and after making dozens of designs and models, we have finally produced a thoroughly practical closed core transformer to retail at $6.95, the price you formerly had to pay for spark coils and batteries.

Thousands of amateurs will welcome the advent of this instrument who either did not require ¼ K. W. power or who did not care to spend the money for it. The transformer will send messages for twenty miles not a wild figure, but an actual fact—if a good aerial is used. **Under extraordinary circumstances it will send** one hundred miles. No trouble with vibrators and adjustments, reactances or resistances. **Just connect the primary terminals to 110 volt, 60 cycle A.C. mains and press key.** Best silicon transformer iron is used in its construction.

It will throw a heavy crashing spark that, with proper condenser, will fill a gap with a ball of white flame ½ inch in diameter. This comparatively small but powerful spark will send **six times as far as a 1 inch spark coil.** The 1-6 K. W. Transformer is another **ELECTRO-SET triumph.** It was thoroughly tested in one of the most complete electrical laboratories in the country by competent engineers, who pronounced it perfect, for its size, in all particulars. You will be delighted with it.

No. 1000 1-6 K. W. CLOSED CORE TRANSFORMER, without case, shipping weight 10 lbs. . . **$6.95**
No. 1001 1-6 K. W. CLOSED CORE TRANSFORMER, in a beautifully finished mahogany case; impregnated with insulating compound and fitted with four posts; shipping weight 15 lbs. . **9.00**



Electro-Set "Navy" Loose Coupler

Our "Navy" Loose Coupler or Receiving Transformer is a remarkable instrument. In price it is **lower** and in quality it is the **equal** of almost any loose coupler, no matter what its price. It is certainly far superior to any we have seen at anywhere near its price. Think of being able to buy a genuine "Navy" type loose coupler at a low price with the following specifications usually only found in prohibitively priced transformers: Hard rubber secondary end with large turned brass contacts; hard rubber switch panel on the front of the primary coil with twenty large, turned brass contacts; primary enclosed in a dark mahogany finished covering on all sides; every contact soldered, assuring perfect connection; handsome mahogany finished base; lacquered brass posts and trimmings. The equal of this receiving transformer can not be found. It is the acme of efficiency at moderate price.

NO. 1698 "NAVY" RECEIVING LOOSE COUPLER; shipping weight 10 lbs. **$10.00**
NO. 1698 "NAVY" RECEIVING COUPLER; all wood construction. **9.00**

Type "A"

This Rotary Spark Gap is without an equal. Made like any of the more expensive gaps, but smaller in size. It operates in series with a 16 C. P. lamp on 110 volt alternating or direct current or from batteries. The Rotary Electrode is of cast aluminum alloy and is perfectly accurate. The wheel is mounted with genuine hard rubber on a heavy brass bushing which fastens to the motor shaft. The motor is a K. & D. series wound A. C. or D. C. Machine, small but **powerful.**

This Type "A" Gap, although especially designed for our extraordinary 1-6 K. W. transformer will readily stand any good ¼ K. W. instrument.

NO. 476 TYPE "A" ROTARY GAP, shipping weight 4 lbs. . . **$5.50**
NO. 477 TYPE "A" ROTARY GAP, wound to operate on 3 dry cells. **5.00**
NO. 478 THREE INCH ROTARY DISC ONLY, mounted on hard rubber, with brass bushing, ⅛ in. bole, shipping weight 4 oz. **1.50**

No. 611 Aerial Switch

This instrument is novel in design and convenient in operation. The base is dark mahogany finished. The copper bars are 8 inches long and are sawed, not drawn. Posts are provided on all contact jaws for connections. Three posts and bars are provided on one side for the purpose either of shunting the detectors when sending or cutting off the transmitting power when receiving.

This instrument is handsome in appearance and efficient in use. Suitable for powers up to 1 K.W.

NO. 611 AERIAL SWITCH,
Shipping weight 5 lbs. **$2.50.**

Electro-Set "Arlington-Tested" Crystals

When testing out a wireless receiving installation for the first time you want to know that your mineral crystal is sensitive. Then, too, why buy minerals on a gamble. **Be sure of results—good results.** Buy our **"Arlington Tested"** Crystals. Every one is tested for Arlington time signals. Each crystal comes sealed in an air-tight glass phial and is carefully tested before leaving our factory. **Only one crystal in 20 passes our examination.** Arlington Tested Crystals are the most sensitive you can procure. They are worth the price. Each one is individually examined and packed.

Electro-Set "Famous" Mineral Sets

One of the most interesting fields in wireless telegraphy is the experimenting with various combinations and methods of contact in detectors. We offer the following outfit especially designed for this purpose and packed in a neat box. Countless hours of interesting experimenting is offered to the amateur with this set. It includes five different minerals (galena, silicon, carborundum, bornite and molybdenum), each packed in a neat glass bottle; one universal detector cup; three pieces phosphor-bronze "cat whisker" wire; one polished wood detector base; one large binding post; one hard rubber knob; one brass rod with holder for wire. With this outfit it is possible to make many different kinds of detectors. It is ideal for the experimenter.

NO. 2100 DETECTOR MINERAL SET, as described, complete, postage paid. . . **$1.25**
NO. 2150 MINERALS ONLY, as above, five kinds, in bottles, postage paid. . . . . **.50**

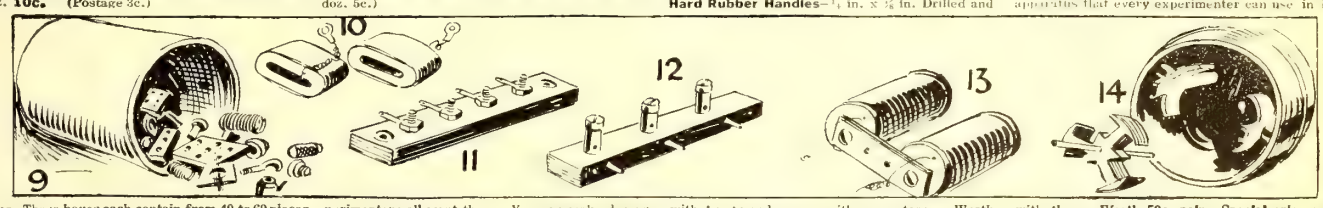
14 EXTRA-ORDINARY BARGAINS

Polarized Ringers—New, never used. Complete with 2 high resistance magnet coils wound with silk wire and a strong permanent magnet with ringer. Worth 60c. ea. Any experimenter can use one. Special price, ea. **15c.** (Postage 6c.)

Hard Rubber Knobs—Size 19-16 in. x ½ in. Drilled and Tapped for 6-32 screw. Handy for making apparatus. Worth 3c. ea., new. Special Price, per doz. **10c.** (Postage 3c.)

Telephone Induction Coils—Never used. Wound to 100 Ohms with primary and secondary coils, silk covered wire. Excellent shocking coil can be made with one. Worth 50c. ea. Special price ea. **09c.** (Postage 4c.)

Binding Posts—Handsomely nickeled, 5-16 in. x 1 in. over all. Complete with nut. Worth 6c. ea. Special price, per doz. **25c.** ea. **2½c.,** (Postage per doz. 6c.)



Telephone Relay Coils—Wound to 100 Ohms with size 36 silk covered wire. Complete with soft iron core. Wire alone worth 20c. Special price, ea. **09c.** (Postage 4c.)

Connecting Blocks—Hard rubber, size ¾ in. x 1 in. x 3-16 in. Have 6 holes for 6-32 mach. screws. Complete with 6 screws. Worth 12c. ea. Special price **04c.** (Postage 1c.)

Hard Rubber Handles—4 in. x ⅝ in. Drilled and tapped for 8-32 screw. Worth 4c. ea., new. Special price, per doz. **15c.** (Postage 3c.)

Horse Shoe Magnet—3 in. long, very powerful—useful for many experiments and for making instruments. Worth 15c. each. Special price **05c.** (Postage 3c.)

Here's A Dandy Chance—We have made up a number of boxes of small odd parts of electrical apparatus that every experimenter can use in his

shop. These boxes each contain from 40 to 60 pieces of odds and ends, such as rubber knobs, brass standards, hooks, binding posts, screws, units, thumb nuts, coils and miscellaneous parts. Some are new—some used, but all of them are useful to have around when you are making apparatus. They are just the kind of convenient parts to be able to choose from for your experiments. We've sold hundreds of them in our retail department. Experimenters all want them. You can make dozens of things with them.

No. 121—Handy Assortment. Prepaid **20c.**

75 Ohm Receiver Coils—Never used. Ready to put into any phone or to make receivers with. Wound to 75 ohms with silk wire. Worth 20c. pair. Special price, per pair, with connectors **06c.** (Postage 1c.)

Connecting Blocks—Made of genuine hard rubber, with 4 nuts and screws with connectors. Worth 15c. ea. Special price, ea. **05c.** (Postage 2c.)

Connecting Blocks made of genuine hard rubber with 3 handsome nickeled binding posts. Useful for dozens of things about the experimenter's shop. Worth 25c. They have never been used. Special price, ea. **09c.** (Postage 2c.)

Relay or Telegraph Magnets—In fair condition. Have been used but are in perfect shape. Wound to 80 ohms resistance. Make relay or telegraph with them. Worth 50c. pair. Special price with yoke, per pair **09c.** (Postage 5c.

Toy Motor Parts—Consisting of one iron case with pole pieces, 2 covers for same and one 3-pole laminated armature with shaft. All you need is a commutator, bearings, and wire to complete motor. Above parts worth 40c. set. Special price, **15c.** (Postage 6c.)

Note:—Commutator wire for above motor, extra **40c.** (Prepaid.)

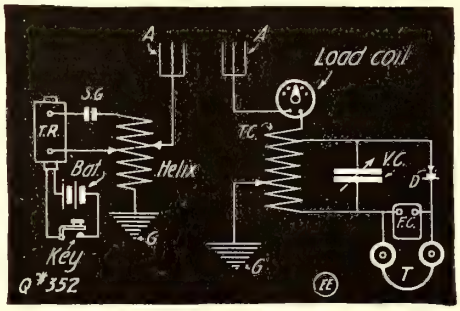
cause there are so many factors governing this. It is impossible to make more than a haphazard guess.

A. 4. The buzzer transmitter set illustrated will transmit about half a mile under ordinary conditions, but distances as high as five miles have been covered with same. A prominent New York firm is about to market a buzzer which they claim will cover distances of about 100 miles.

AERIAL AND GROUND.



(351.) Wallace Green, Hackensack, N. J., asks: 1. The effect of the height of an aerial above sea level. 2. The effect of grounding wireless apparatus and a telephone on the same water pipe.

A. 1. The height of an aerial above sea level will have a tendency to increase your range, but not in direct proportion, as it is the height above the ground which determines to a great extent the range. This is due to the fact that waves propagated into the ether have a tendency to follow the surface of the ground and not to continue in the same plane as the station from which they are emitted.

A. 2. The effect of grounding wireless apparatus and the telephone on the same water pipe will not be noticed unless the 'phone wires run very close to the aerial. In that case a large part of the energy from the transmitting set will be absorbed by the wires and will cause annoying noises in the receiver when using the 'phone.

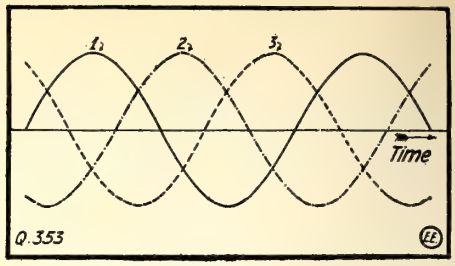
RADIO QUERIES.

(352.) W. B. Jones, Hampton, Va., asks: 1. For a hook-up for a transmitting apparatus and receiving apparatus. 2. If he

Radio Transmitting and Receiving Hook-ups.

can pick up Sayville and other such stations. 3. The standing of the Dodge Institute of Telegraphy and Radio.

A. 1. Attached drawing shows the method of wiring transmitting outfit, using quenched gap, ¼-inch spark coil. Hook-up for your receiving outfit is also shown.



A. 2. We cannot say positively if you can receive Sayville or not, but would advise you to listen for signals when the station sends press, which is between 8 and 11 p. m.

A. 3. We are assured that the Dodge Institute of Telegraphy has the best that can be obtained in equipment, and its faculty consists of experts in the line they are teaching.

A. C. MOTORS.

(353.) Earl Meldrim, Fort Edwards, N. Y., inquires the difference between one, two and three-phase motors, and which are the best to use.

A. 1. One-phase motors operate on an alternating current circuit that posseses but one wave; that is, it reverses at stated periods. The two-phase circuits generally consist of four wires, and the phases are 180 degrees apart; that is, the current in one set of wires is at maximum when the other is at minimum. The three-phase current consists of three waves combined on three

Three-Phase Alternating Current Waves.

wires, and the peaks of the currents are 120 degrees apart; this will be understood from the drawing. It gives a sketch of the current waves in a three-phase circuit. As to the best motor to use, it depends on the purpose to which the motor is being put. A three-phase motor has been found to be very practical, but requires quite an elaborate starting system; it has a good starting torque. This motor is what is known as the induction type; that is, the fields and the armature have no electrical connection. The two-phase motors operate on the same principle, but the windings are wound in two separate coils, not connected. The single-phase motor is generally of the synchronous type; that is, it starts as a series-wound direct-current motor, but on reaching synchronism with the supply current the connections to the armature are automatically cut out and the motor operates in synchronism with the alternating current supplying same.

HORSEPOWER QUERY.

(354.) Felix Washakas, Chicago, Ill., desires to know the horsepower of a motor required to move 100 pounds at a rate of 1,320 feet per minute on a level surface, and the amount of current it will take to run the motor.

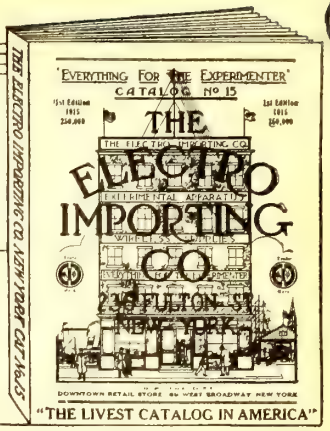
A. 1. As you do not give any clue to the coefficient of friction in your letter, we have figured out the required power of if the weight was being lifted vertically. It would require a 4-horsepower motor to move 110 pounds the required number of feet per minute in a vertical direction, but if the weight is mounted on wheels or rollers the power required will drop to about 10 per cent. of this amount. It will require 28 amperes at 110 volts to run the 4-horsepower motor, and if the power is to be applied horizontally the amperage will drop to 2.8 approximately, and the horsepower to .4.

AERIALS AND RANGES.

(355.) Edward Jones, Fairmont, W. Va., asks several questions: 1. The efficiency of the spiral aerial as compared to that of the straightaway. 2. The wave length of a spiral aerial 14 inches in diameter, 60 feet long, which contains 800 feet of Antenium wire. 3. What is the time of operation of the Sayville station. 4. What high-power stations should he be able to receive from. 5. The advantage of a large capacity variable condenser.

A. 1. We have had no experience with a spiral aerial. From reports, we believe it to be very efficient, but for all-round amateur work we advise the construction of a straightaway aerial, as it has given great satisfaction in the past.

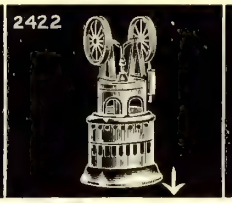
A. 2. The wave length of the spiral aerial containing 800 feet of wire will be between 1,200 and 1,400 meters.



A. 3. Sayville is still in operation, but is under U. S. Government control. It sends press every evening from 8 to 11.

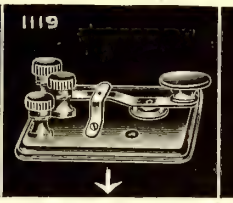
A. 4. You should be able to hear the N. A. I. and W. H. E. Marconi stations at

(*Continued on page* 356.)

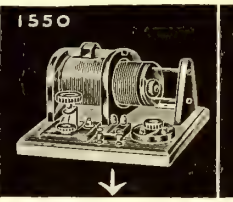


"EVERYTHING FOR THE EXPERIMENTER" IN THIS "THE LIVEST CATALOG IN AMERICA"

THE ELECTRO IMPORTING COMPANY CARRIES THE LARGEST STOCK OF EXPERIMENTAL, ELECTRICAL AND WIRELESS GOODS IN THE WORLD. *We are the originators of the Wireless Experimental business in the U. S.*, selling the first wireless outfit in 1904. Our wonderful facilities enable us to give you *delivery in 24 hours.* WHEN ORDERING GOODS FROM THIS PAGE ENCLOSE POSTAGE ELSE GOODS MUST BE SHIPPED BY EXPRESS COLLECT. The goods shown here are only a small part of our entire line which is fully described in our 275-page Cyclopedia Catalog, which weighs ½ lb., is 6¾x5¼ inches in size and contains 2,000 articles, 658 illustrations, 30 diagrams and tables, full Morse Continental and Navy Code Charts, besides "Treatise on Wireless Telegraphy," list of call letters of all U. S. Gov't and Commercial ship and shore stations. This wonderful Cyclopedia sent free if you send us 4c. in stamps or coin *to cover postage only.* WE SELL MERCHANDISE, NOT CATALOGS. *"Why buy Catalogs when the best is free?"* Use coupon below to send for Catalog, enclosing 4c. for postage only.



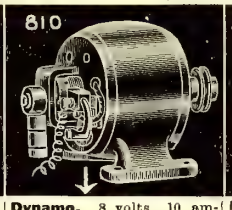
Boy Scout Knife. Has 2 excellent quality steel blades, stag handle and a chain to guard against loss. Chain is detachable at will. Length 3⅜ in. Sh. wt. 4 ounces. Price ..... **$.50**



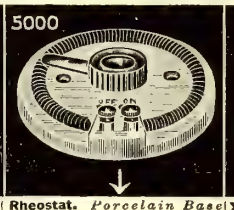
Upright Caloric Engine. Runs by hot air. Simplest model engine possible to construct. Is very durable. No steam or water used. Size 9⅓x4½. All cylinders of brass. Sh. wt. 2 lbs. Price..... **$.95**

Smallest Flashlight Made. Nickel case, tungsten lamp, long life battery. Gives a very powerful light, is very handy and fits in vest pocket. Size 2½x1¼x11-16. Sh. wt. 4 ounces. Price ..... **$.50**

Telegraph Key. Double circuit. Rubber comp. base and knob. Has three rubber comp. binding posts. Metal parts nickeled. Size 2½x3½. A wonderful value. Sh. wt. 1 pound. Price ..... **$.35**



Inter-Ocean Wireless Receiving Outfit. Has loose coupler, galena detector, Jr. fixed condenser and 7000 meter loading coil all mounted and connected on polished oak base. Size 10x12x 6½. Sh. wt. 10 lbs. Price **$8.00**

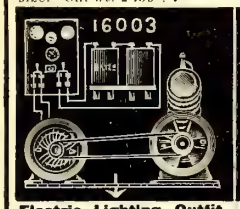


Wireless Detector. *Guaranteed to receive long distance messages or money back.* Base hard rubber comp. Metal parts nickeled. galena crystal supplied. Size 2x 1½x1¼. *Our cyclopedia sent free with it. Price prepaid* ..... **$.10**

Rugby Football. Made of Pebble grain leather, lined with duck. *Bladder guaranteed against accident, wear or abuse for one year.* Most wonderful value ever offered. Standard size. Sh. wt. 2 lbs **$.90**

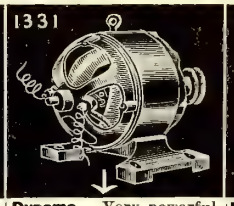
Dynamo. 8 volts, 10 amperes. Very heavily built for auto. ltg., charging batteries, electroplating, etc. Excellent power motor on 8 volts, made to last. Size 8x5½x5¼. Sh. wt. 20 lbs. Price **$9.00**

Rheostat. *Porcelain Base* (Pat'd). Resistance 10 ohms, maximum capacity 3 amps. continually. Invaluable for dimming lamps, regulating small motors, etc. Diameter 4 inches. Controlled by 1" knob. Disconnects on off side. Binding posts rubber comp. Sh.wt. 2 lbs. Price ..... **$.60**

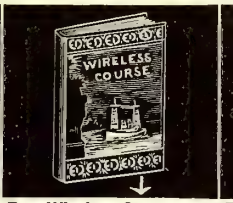


X-mas Tree Lighting Outfit. For 110 volt house current. Has 16 colored lamps, red, blue, white and green, arranged in two festoons. Absolutely safe and complete with cord and plug. Sh.wt. 3 lbs. Price.. **$4.05**

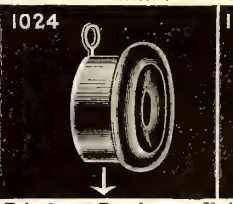
Hustler Motor. Runs wonderfully on one dry cell. Will operate small toys, beautifully finished and very strong. A wonder for the price. Size 3x3x4. Sh. wt. 1 pound. Price ..... **$.85**



Revolver Flashlight. Exact model of automatic revolver, shoots brilliant light when trigger is pressed. Contains tungsten lamp and battery in handle. Surprise your friends. Size 4x2¾ ins. Sh.wt. 1 lb. Price **$.95**

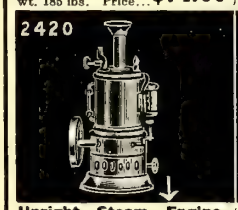


Electric Lighting Outfit. 8 volt 150 watt capacity. Includes generator, switch board with meters, etc., ¼ H. P. gasoline engine, storage battery, fuses, wire, belt, hydrometer and plans. Capacity 19 lights. Sh. wt. 185 lbs. Price... **$74.00**

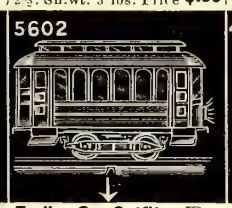


Radio Nitrogen Battery. *Gives 3 volts* and is same size as standard No. 6 dry cell. Wonderfully efficient. Made of extra high grade materials. Used for lanterns and experimental work. Size 6x 2½. Sh.wt. 3 lbs. Price **$.35**

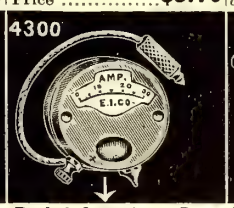
Dynamo. Very powerful, gives 6 volts 6 amperes, lights, 12 tungsten lamps, charges storage cells, runs as a power motor, etc. *Not a toy.* Size 6x6x6 inches. Sh. wt. 7 pounds. Price **$3.70**



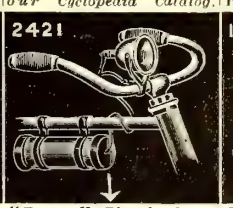
Free Wireless Course consisting of 20 lessons, total 160 page, cloth binder size 7x10¼ in. with 350 illus. 30 tables. *Coupons for this Free Wireless Course in our Cyclopedia Catalog.*



Telephone Receiver. 75 ohms. Hard rubber comp. powerful magnet. With two receivers and no battery, you can talk 500 feet. Size 2¼ x 1¼ inches. Shipping weight 1 pound. Price ..... **$.40**



"Presto" Hand Lamp. Fits on any dry cell and will burn for 50-75 hours. No danger and always ready. Supplied complete without battery. Reflector is adjustable. Size 6x3. Sh.wt. ⅞ lbs. Price **$.75**



Upright Steam Engine. Has water gauge, whistle, large balance wheel and will operate on kerosene and petroleum. Tested before shipment. Directions included. 11 in. High. Sh.wt. 3 lbs. Price..... **$.95**

Trolley Car Outfit. Wonderful value, will run on dry cells. Outfit consists of trolley car, controller, electric headlight and 15½ feet of straight and curved track. Car size 12x6x4. Sh. wt. 10 lbs. Price.... **$5.65**

Pocket Ammeter. Range 0-30 amperes. Pocket size. Finely nickel plated, accurate, dependable and handy. Invaluable for testing dry cells. Diameter 2¼ inches. Net weight 4½ oz. Sh.wt. 1 lb. Price... **$.80**

"Presto" Bicycle Lamp (electric). Operates almost *50 hours on one dry cell.* 2 inch reflector is fully adjustable. Fastens on handle bars. Battery container included but no battery. Perfectly safe. Sh.wt. 2 lbs. Price **$1.15**

Spark Coil. Gives 1 inch flaming spark on 6 volts. "Bull Dog" style that's copied but never equalled. Oak frame, platinum points. Rubber comp. binding posts. Size 7¾x5¾x6¼. Sh.wt. 6 lbs. Price **$4.00**

Printing Press (Self-Inking). Will print a form of 2½x1¾ in. Includes 5a font, of 175 characters, type case, gold and silver bronze, ink, cotton, cards, etc., with instructions. Not a toy. Size 14x 7¾x6½. Sh. wt. 25 lbs. Price..... **$3.00**

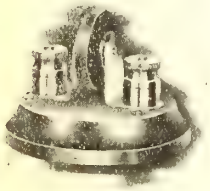
236 FULTON STREET, NEW YORK

Write your name and address in the Margin below

CRYSTALOI
THE NEW—BB—

The New Type -BB- CRYSTALOI is a SUPERSENSITIVE Detector comprising every accessory and refinement in A SINGLE UNIT

It consists of a highly finished African mahogany case in which is located a super sensitive Crystaloi cylinder of which the periphery protrudes through the top making it accessible for rotating to secure finest adjustment. A cohering inductance especially calculated and calibrated to the supersensitive cylinder. A fixed condenser with the exact capacity for this particular cylinder. A specially wound Buzzer of which the frequency is controlled by a knurled screw head mounted on the front of the case to produce a note that is best suited to assist in cohering the alloy in the cylinder. Two of the highest grade dry batteries to operate the Buzzer and a Buzzer control button which protrudes through the top of the case for accessibility.



With this carefully designed and calibrated instrument you have but to set it on the table, connect your phones and leads from your tuning coil and you are permanently and thoroughly equipped to engage in the most serious wireless work of the present day. Of course Variable Condensers can be added if desired.

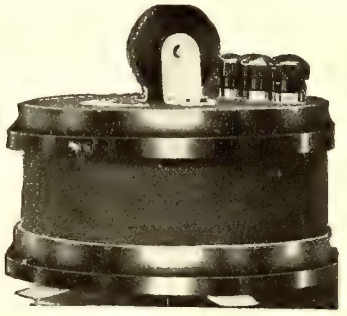
Dimensions 7½ x 5½ x 3½ high
Mailing Weight 3 Pounds. Price **$12.00**

— Other Types of the Crystaloi —

CRYSTALOI TYPE O
Very Sensitive

Dimensions 2¼ x 1⅞ in.
Mailing Weight 1 Pound.
PRICE, $3.50.

TWENTY-ONE HUNDRED MILES IS THE LATEST CRYSTALOI RECORD

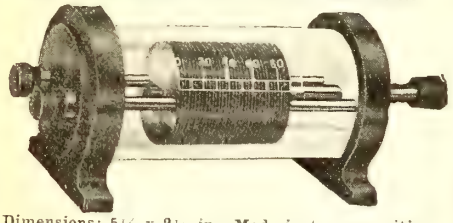


CRYSTALOI

A PERMANENT WIRELESS DETECTOR THAT HAS MADE A WONDERFUL RECORD

You will find wireless men on land and sea using Crystaloi Detectors in preference to any other detector made. They will not burn out or go dead and are ever ready to pick up the minutest currents that are in the air. They are sold under the Turney guarantee and are making their wonderful reputation on real merit. Send today for full description.

ORDER A CRYSTALOI TODAY AND STOP YOUR DETECTOR TROUBLES

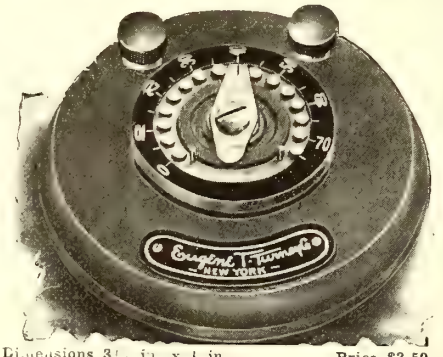


CRYSTALOI TYPE AA, Super Sensitive

Dimensions 4 x 3½ in.
Weight 2 Pounds. PRICE, $6.00.

OUR WIRELESS ACCESSORIES

THE NEW TURNEY VARIABLE CONDENSER



Dimensions: 5½ x 2½ in. Made in two capacities.
Type X—35 Plates. Price $3.50.
Type XX—50 Plates. Price, $5.00.
ORDER ONE NOW
and see what you have been missing.

The New Turney Variable Condenser meets all the requirements of the most exacting wireless man inasmuch as it has more capacity for its size than any condenser ever made. The great advantage lies in the fact that it is provided with round plates of a special alloy 1½ in. in diameter, of which the entire area is available for condensing purposes. This you will find in no other variable condenser.

The New Turney Variable Condenser possesses an absolute zero. This you will find in no other type of condenser. The plates are inclosed in a flint glass tube on which the scale is engraved. It is air and dust-proof and can not get out of order. The dielectric is air, therefore the efficiency is the greatest possible. The ends are of hard rubber composition and are highly finished. A handsomer and more valuable wireless instrument you never saw.

SEND FIVE CENTS IN STAMPS FOR COMPLETE CATALOG

THE TURNEY ROTARY LOADING-COIL

Dimensions 3½ in. x 1 in. Price $3.50.
Mailing Weight One Pound.

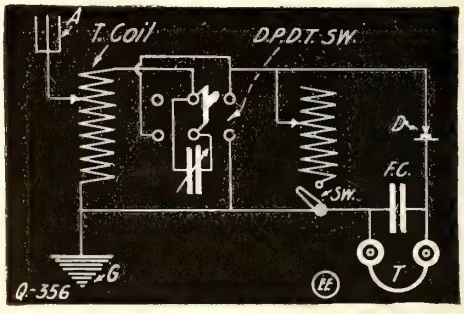
This is a radical departure from the accepted form of loading-coil for the reason that the entire coil with its switch points revolves while the switch blade remains stationary. This new form of construction makes a much neater and more compact instrument, and the rotating of the coil is a much more natural movement than turning the switch blade. It has a capacity of 4,000 meters divided into sixteen divisions of 250 meters each. When used with the ordinary loose-coupler will give a total capacity of about 4,600 meters. The entire instrument is of hard-rubber composition. The blade is of a silver alloy, which insures the maximum efficiency. The rotary coil has a knurled edge and is provided with a scale divided into sixteen equal divisions.

Eugene T. Turney Company, Inc., 2595 Third Avenue NEW YORK CITY

QUESTION DEPARTMENT.

(*Continued from page 354.*)

Philadelphia; you should also hear N. A. R., Key West, and N. A. X., Colon.



A. 5. The advantage of a large variable condenser lies in the fact that you may use large values of fixed inductances in your tuner, which means you may use fewer contacts on the switch of same and get very close tuning. A large variable condenser is generally placed across the primary of the loose coupler for long waves and switched in series with the aerial when you desire to receive short wave lengths.

MIGNON COUPLER AND DR. COHEN'S TUNER.

(356.) Reginald Pink, Bronx, N. Y., wishes to know: 1. The sizes of wire on a primary and secondary of the Mignon coupler. 2. If any of the variable condensers in Dr. Cohen's Navy set may be left out. 3. If the Wireless Association of America is still in existence.

A. 1. We are unable to supply you data upon the windings of the Mignon coupler, as this is a manufacturing secret and is not supplied to outsiders.

A. 2. We think you could use one variable condenser in Dr. Cohen's receiving hook-up by using a double-pole switch in

Wireless Receiving Tuning Diagram.

connection with it that will enable you to throw the condenser in series or in parallel with the intermediate circuit as shown in the sketch.

A. 3. The W. A. O. A. is still in existence, and you may obtain all information by writing to the Modern Publishing Co., 239 Fourth avenue, New York City.

THE TELEPHOT.

(357.) W. C. Culver, Indiana, wants to know: 1. Of what scientific value "seeing over a wire" is, or the Telephot. 2. Also a remedy for vibrator sticking.

A. 1. By the perfecting of an apparatus by which it is possible to see over a wire we would be enabled to transmit pictures with a great speed, not to mention the many industrial uses it could be put to. It will enable you to attend a moving picture show by merely going into your parlor and closing the proper switches. You would be able to sit comfortably at home and watch an automobile race 400 miles away. You no doubt know from practical experience when you are personally talking to anyone you can explain your meaning much better, as the expression of the features has quite an effect on the understanding of any information you are trying to convey; thus seeing over a wire would be, so to speak, personally interviewing a man who may be several hundred miles away.

A. 2. Regarding the trouble you are having with your vibrator sticking, would suggest that you clean the points and use a lower voltage on the coil, as it appears

to us that the vibrator has a tendency to weld the contacts together. This may be due to the condenser across the vibrator having become disconnected in some manner, thus causing undue sparking. As a rule vibrators stick due to either using too much current or not having a large enough primary condenser connected across the vibrator points.

ANTENNA QUERY.

(358.) J. Scott Wilson, Piqua, O., sends us a drawing of an aerial he intends to construct, and wishes to know the advantages of this type of aerial.

A. 1. Your aerial possesses no radically new features except the rat-tails, which are separated by means of a spreader where the lead-in is connected. This gives no distinct advantage, and we believe it will be better if you group the rat-tails 15 feet away from the aerial proper.

A SIMPLE ELECTRIC CHAIR.

(359.) D. Causey, Greenville, Ill., asks: 1. For the dimensions of a coupler, the coils to be stationary, using switches for tuning. 2. Where he can get a good tangent galvanometer. 3. If it is dangerous to operate a receiving outfit during a thunderstorm.

A. 1. The dimensions of a coupler of the type you ask about can comprise two coils 6 inches long, the larger one to be about 4 inches in diameter and the smaller to be about 3½ inches in diameter. These are wound with No. 24 and No. 28 wire respectively, and are mounted one within the other and leads brought out to the switches in the usual manner of wiring these couplers.

A. 2. You can get the address of the firm handling galvanometers from the advertising columns of *The Electrical Experimenter*.

A. 3. It is very dangerous to operate a receiving set during a thunderstorm, as the aerial acts as a lightning rod and will draw the lightning into the station, and the operator under these conditions is in danger of electrocution.

CHARGING STORAGE BATTERIES.

(360.) Raymond Johnson, Potter, Neb., wishes to know: 1. If storage batteries can be charged by gravity cells. 2. What size of wire to wind a five-bar telephone generator with to obtain 6 volts. 3. If he can make a good wireless ground by fastening the ground wire to a driven well 256 feet deep.

A. 1. Storage batteries can be charged by gravity cells, but it requires a long time for them to be fully charged. You should use sufficient gravity battery to give about 2 volts more than the storage cells for proper operation.

A. 2. By winding your magneto with No. 20 wire you will be able to get about 6 volts from same, and you can regulate the voltage by changing the speed at which you drive the machine.

A. 3. Fastening the ground wire from your wireless set to a driven well will give an ideal wireless ground, as you are making connection to moist soil.

LEAD SALTS AND THE X-RAY.

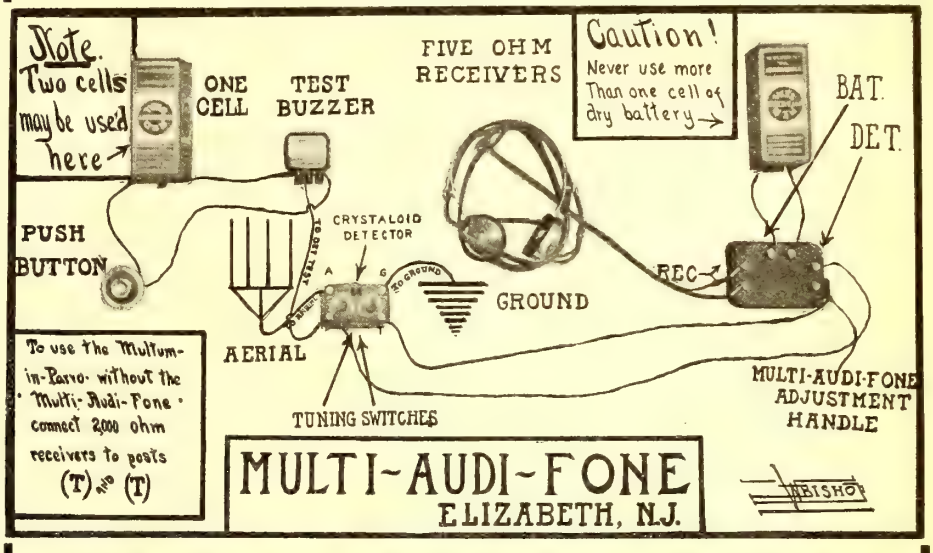
(361.) Eric C. Peters, Pennsgrove, N. J., inquires: 1. If all the lead salts have the effect of stopping X-rays. 2. Whether radium rays can pass through lead, or are reflected from it like a mirror. 3. He also asks several questions regarding the length

(*Continued on page* 359.)

Multi-Audi-Fone

The new wonder in the wireless world. It increases the Audibility 1,500 Times

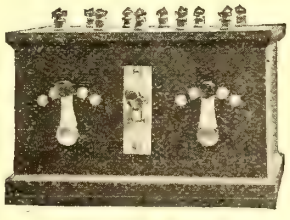
Read What Others Say



Messrs. Stickel & Stickel, of Connellsville, Pa., say: "We have given your apparatus a thorough test and find that they are all that you claim them to be."

Mr. D. L. Irvin, of Curwensville, Pa., says: "I was surprised with the results from it. Arlington and several other stations came in so loud that I could read them with the 'phones ten feet from my head."

Mr. Ralph Batcher, of Toledo, Iowa, says: "The results were even more than were expected, both at the convention and by other amateurs in Des Moines, who tested the apparatus, and other places."

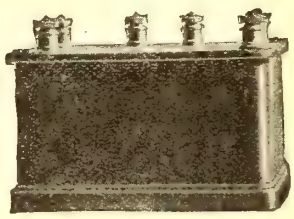


Mr. John Tucker, Jr., of Elizabeth, N. J., says: "After a thorough trial, am astonished at the results obtained . . . Combining, as these instruments do, the greatest degree of efficiency coupled with extreme compactness, they are, without doubt, the finest instruments offered to the amateur and professional wireless field at large."

W. O. Horner, of Cleveland, Tennessee, says: "I have been trying your Multi-Audi-Fone out as an Amplifier . . . I was more than surprised at its sensitiveness. It is certainly wonderful. . . . I stood at the rear of my store, one hundred and twenty-five feet from 'phones, and copied Arlington and Key West, also Tampa, Florida. I consider that some amplifying for way down here on Inland."

Multum in Parvo Receiver, including Crystaloi Detector and Buzzer - $20.00
Multi-Audi Fone, including our Specially Wound Head Set - - - - - $30.00
The Matchless Christmas Present. Our Complete Wireless Set, Only - - - $50.00

Talking Multi-Audi-Fone



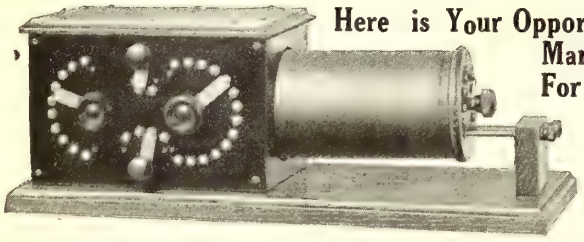
Size, 4½" x 5" x 7".

The amplification is so great with the Talking Multi-Audi-Fone that the signals can be read all over the five-story building from our laboratories, which are located on the third floor. If the windows are opened, the signals can be heard across the street, even when the trolley is passing.

Price, including horn - - - $100

Telephone Voice Multiplier

Size, 2¼" x 3¼" x 4½".



The Telephone Voice Multiplier has been made possible by applying the principle employed in our Multi-Audi-Fone to the telephone receiver. The voice can be distinctly heard coming over 1,000 or even 2,000 miles of wire that would be indistinct coming over 100 miles of wire. Buy a Multiplier and stop straining to get something you can't hear. **Price $15.00**

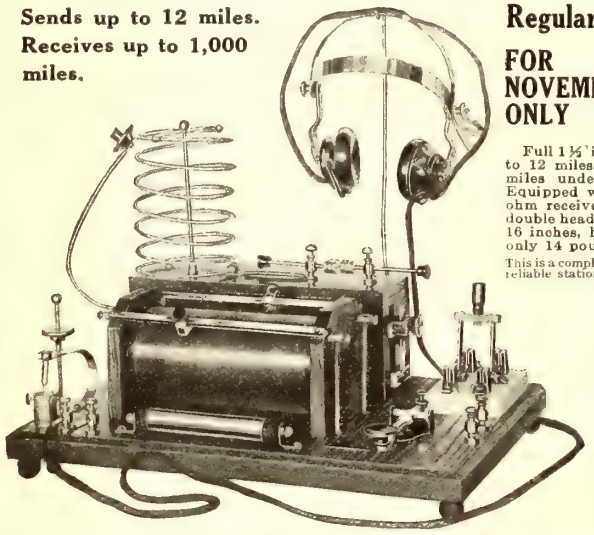
BIG REDUCTIONS FOR NOVEMBER ONLY

Save 25% If You Act Quickly

Here is Your Opportunity to Secure the Best Navy Type Loose Coupler on the Market. Regular Price - - - - - - $15.00
For November Only—Reduced to - - - - - - $10.00



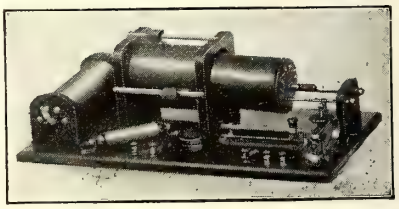
A brass lacquered 6,000 meter inductance tuner, perfect in every detail. Equipped with four point loading inductance which increases the wave length 4,000 meters over the average Navy Type Transformers. The primary winding has 24 taps—one switch controls the primary in groups of tens, the other controls one turn at a time—and is equipped with a dead end switch. Enclosed in a cabinet, the front of which is polished hard rubber. The secondary coil is wound with double silk covered wire and the inductance is varied by a ten point switch. With this coupler the very finest and most accurate tuning is easily and quickly secured. With a good sized aerial the reception of wave lengths up to 6,000 meters is possible.

All Finished Parts Ready For Assembling With Full Instructions - - - $6.50

Our No. 810 Complete Sending and Receiving Station

Sends up to 12 miles. Receives up to 1,000 miles.

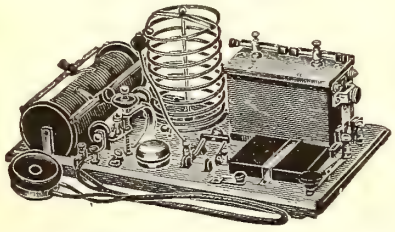
Regular Price $20.00
FOR NOVEMBER ONLY $14.00



Full 1½ inch coil type. Send up to 12 miles. Receives up to 1,000 miles under favorable conditions. Equipped with 2 double pole 1,000 ohm receivers, 6 feet silk cord and double headband. Size of base 12 x 16 inches, height 13 inches, weight only 14 pounds.

This is a completely equipped and thoroughly reliable station, mechanically and electrically perfect and ready for instant service. Nothing better in this class was ever constructed. The new improved tuning coil enables you to tune in or tune out any party you might desire, thus eliminating any interference. The set consists of a 1½ in. Spark Coil, 12 Flat Plate Condensers, our "Don't Jar Out" Detector, Buzzer and Switch to tell if your detector is working, Double Slide Silk Wire Wound Tuner for long wave station capacity, Fixed Condenser, Helix, Key, DPDT Switch and complete 2,000 Ohm Headset.

Receive The Time From Arlington



AND ALL NEWSPAPER AND SHIP REPORTS
OUR SPECIAL TIME SIGNAL RECEIVING OUTFIT REGULAR PRICE $10.85
$8.10

This is our new 1915 model made of the highest grade material obtainable. Double slide coupler for close tuning is wound with No. 24 green silk covered wire on the primary — the secondary with No. 28. There are 8 points to divide its capacity. A 3,000-metre loading coil placed between the coupler and the aerial by a switch that throws it in or out of the circuit enables you to receive amateurs with the coupler alone and long wave stations by the addition of the loading coil. One fixed condenser of proper capacity, improved universal detector, one buzzer test to test your mineral and potentiometer. This instrument is assembled on a highly finished oak base. All metal parts are heavy nickel-plated.
This station, with our Navy Type Loose Coupler, as illustrated above, ...$15.00

OUR No. 401 SENDING AND RECEIVING STATION

Regular Price - - - - $5.95
For November Only - - - - $4.95

Consists of ¼-inch coil, fluted end spark gaps, four plate secondary, one collapsible helix, one key, a two-slide tuner, fixed condenser, detector and buzzer test to test your mineral. This set is mounted on a highly finished oak base with all metal parts heavy nickel-plated. With a good-sized aerial, under favorable conditions, will send up to 3 miles and receive up to 300 miles.

FREE!

Complete Gem Station

Receives up to 300 miles. We will give absolutely free a Gem Outfit to every one who sends us the cost of the necessary equipment for it. This equipment consists of:

2000	Ohm Headset	$3.95
16	Insulators	.48
1	Ground Clamp	.10
500 Ft.	of A-1 Wire	1.20
20 Ft.	of Rubber Cable for lead in	.90
	TOTAL	$6.63

Send $6.63 at once and we will include the Gem Receiving Station Free. A splendid outfit for beginners.

QUESTION DEPARTMENT.

(*Continued from page 357.*)

of the wire used in an article on the telegraphone that appeared in the June issue of this magazine.

A. 1. It has been found that a mixture of granulated lead and linseed oil is the best lead salt to use in making garments that will protect the X-ray operator from the burning effects of the X-ray. Any cloth may be used for this purpose, but silk, being of such a fine texture, retains the salts much better.

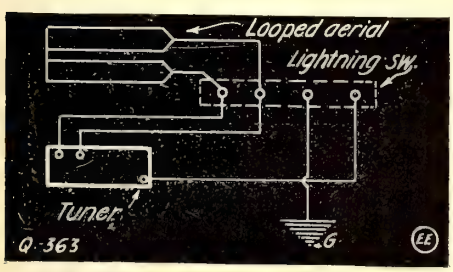
A. 2. Lead is opaque to all the radium rays and acts as a screen, absorbing them and having very little reflecting effect. This applies likewise to X-rays, as you may no doubt understand if we mention that a lead salt is used in making the gowns to protect the operator.

A. 3. The telegraphone was actually constructed for experimental purposes and only 200 feet of wire was used. You may use any length of wire you desire by increasing the size of the spools to hold it. You will be able to purchase steel wire from any dealer in electrical supplies, and he would no doubt be able to quote you prices on small gear wheels.

BLOCKING CONDENSER.

(362.) Frank Haverland, Jr., Madison, Neb., wants to know: 1. The wave length, power and time of operation of the Fort Omaha radio station. 2. Correct capacity for a blocking condenser to be used with a loose coupler.

A. 1. W. V. H. is under Government ownership and is likely to operate at any time of day. The power, we believe, is about 3 kw. and operates on a wave length of 600 meters.



A. 2. A blocking condenser for use with a loose coupler should have a capacity of .075 M.F. If the 'phones are connected across the condenser it is advisable to utilize an adjustable type for this purpose.

AERIALS AND LIGHTNING PROTECTION.

(363.) Allen Sjoholm, Chicago, Ill., asks: 1. How a loop aerial can be connected to a S. P. D. T. lightning switch. 2. Which type of aerial is best for sending and receiving—a loop or a straightaway aerial. 3. If a carborundrum detector requires a battery for its successful operation.

A. 1. A loop aerial cannot be connected to a single-pole double-throw switch for lightning protection, but by adding an extra clip as shown in the drawing it can be done. This protection can then be afforded by wiring the switch as shown.

A. 2. It has been found that the loop aerial is superior for receiving because it is a closed circuit and does not reradiate received energy, while the straightaway aerial is better for sending because it does not require an anchor gap in the aerial.

Looped Aerial Lightning Switch.

You may arrange an aerial switch so that you use a loop aerial for receiving and a straightaway for sending, as shown in the July, 1914, issue of *The Electrical Experimenter* on page 44.

A. 3. A carborundrum detector requires a battery of about 3 volts and a potentiometer for its proper operation, as it requires a close regulation of the voltage to get this detector adjusted to its most sensitive condition.

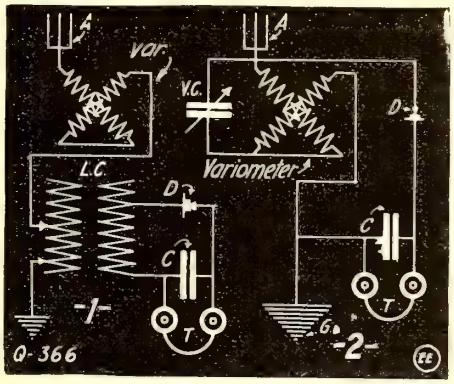
RECEIVING TUCKERTON.

(364.) Max Clinch, Lakewood, N. J., asks several questions: 1. The use of a tikker on damped waves. 2. Regarding detectors. 3. Schedule and wave length of the Tuckerton station.

A. 1. It is possible to receive time signals from N. A. A. (Arlington) by using a tikker, but it has been found in actual practise that a detector responds best to slightly damped waves. You should use the tikker when receiving from stations which use undamped waves, such as Tuckerton or the Federal Wireless Telegraph Co., which use the Poulsen arc system.

A. 2. It is generally admitted that the galena detector is the most sensitive of mineral detectors, while the ordinary Audion, particularly when used as an amplifier is really the most sensitive extant.

A. 3. The wave length of the Tuckerton station is very high, about 7,500 to 8,000 meters, and it has no special time for operating, being a commercial station, but can be heard nearly every evening about 11 o'clock.



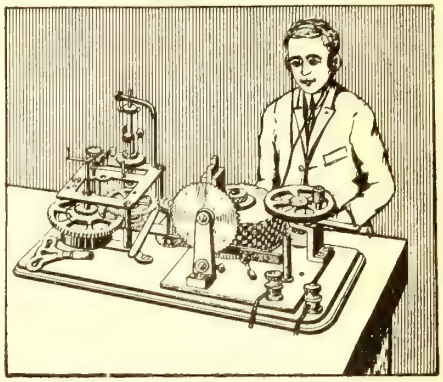
HOOK-UPS.

(365.) Clifton F. Taylor, Waltham, Mass., asks for a hook-up for a wireless outfit.

A. 1. Q. No. 355 shows the proper wiring for the apparatus you mention, but we would suggest the addition of a variable condenser to your outfit. This condenser is shown in the drawing and it increases the flexibility and range of the station vastly.

LINE INDUCTION AND VARIOMETERS.

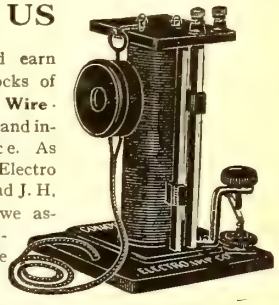
(366.) Casimir H. Jaraszewuz, Chicago, Ill., asks several questions: 1. Whether a current of 4,400 volts used for railroad work would affect a wireless set located 200 feet from the said circuit. 2. The principles and construction of a variometer.



Variometer Hook-Ups.

A. 1. Since your aerial is located at right angles to the wires carrying 4,400 volts, it will have little or no effect on your set beyond a humming sound that may be slightly noticeable.

A. 2. Drawing shows two connections for a variometer. The first illustrates a variometer used as a loading coil, and the second how it is used by the Telefunken Co. for tuning purposes. A variometer consists of two concentric coils of wire, each containing an equal value of induct-



LEARNING TELEGRAPHY

becomes simple when your instructor is the Omnigraph Automatic Transmitter. Combined with a standard key and sounder or Wireless Buzzer, it will send you telegraph messages at a slow speed, which can be increased at will to match the sending of an expert operator as you become more proficient. Adopted by U. S. Gov't. Made in 4 styles, from $2.50 up, all accurate. Circular free.

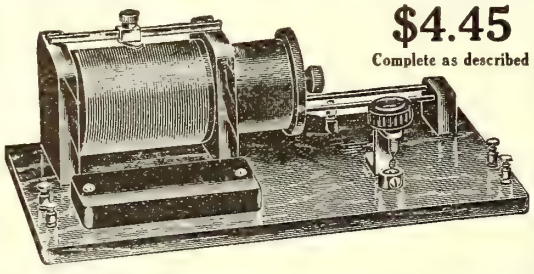
Designed for direct connection, 110 volts 60 cycles without resistance or impedance. Send 6c. for big new catalog.

Winger Elec. & Mfg. Co.
711 So. Dearborn St.,
CHICAGO, ILL.



A New, Efficient, Beautifully Finished Complete Receiving Set

LOOSE coupled, complete receiving set, primary wound with bare wire secondary wound with very fine silk covered wire. Secondary divided up by ten taps which are brought out on end piece, contact being made by a phosphor bronze rotary switch with a hard rubber knurled knob. A specially constructed detector allowing a very fine adjustment is one of the features of this station.

A fixed condenser of the exact capacity, specially constructed for this size loose coupler, greatly adds to the efficiency of this outfit. All parts built of solid oak and mounted on a solid oak base, beautifully finished.

This station will be sent complete as described with one 80 ohm double pole receiver, headband and cord. $4.45

Send stamp for our wireless catalogue, and free code chart of unbreakable fibre.

$4.45
Complete as described

Universal Wireless Co. 19A East 32nd St. New York City

All "Universal" outfits are sold with privilege of 10 days' trial and money back guarantee.

A BOUND VOLUME CONTAINING 12 ISSUES OF THE ELECTRICAL EXPERIMENTER FOR **75c.**

Bound in substantial green cloth; lettered in gold. Postage on 3 lbs. is extra. Book Department. A REAL BARGAIN. EXPERIMENTER PUBLISHING COMPANY, Inc., 233 Fulton Street, New York.

"Cigarette"

You Can Only secure the best in **FLASHLIGHTS** and BATTERIES by insisting that this trade-mark is on flashlight-case and battery. If your dealer cannot supply you with our product write directly to us for Catalogue A2.

BEACON

Beacon FLASHLIGHTS and **BATTERIES** are made in a wide variety of styles and shapes but only one quality—**THE BEST.**

"Ideal Fountain Light."

"Short-Circuit Proof."

BEACON MINIATURE ELECTRIC CO., 118-20 DUANE ST. NEW YORK BRANCHES: CHICAGO, SAN FRANCISCO

ance. The inner coil has a knob fastened to it, so that the planes of the two coils may be changed. The two coils are then connected in series, and when placed so that they help each other; that is, so that their respective magnetic fields are assisting each other, the inductance is at its highest value. As the inner coil is slowly turned out of the plane of the outer coils the inductance changes, and when turned through an angle of 180 degrees the two coils will be opposing each other and the algebraic sum of their inductances will be zero.

WAVE LENGTHS.

(367.) W. J. Gravely, Danville, Va., inquires: 1. About the stations that have the same sending range as the Arlington station. 2. The wave length Sayville is now using. 3. The sending range of the Wanamaker station in New York and its wave length.

A. 1. Stations on the Eastern coast having a range equal to the Arlington station are: Sayville (W. S. L.), Key West (N. A. R.), Colon (N. A. X.), Tuckerton (W. G. C.).

A. 2. Sayville uses a wave length of about 2,800 meters, and sends "press" to ships from 8 to 11 p. m. daily.

A. 3. The Wanamaker station, New York (W. H. I.), uses 2 kw. and has a sending range of about 250 miles under all conditions, and operates on a wave length of 600 meters.

INVESTIGATIONS IN LECLANCHE PRIMARY BATTERIES.

A new and commercially valuable investigation of the construction and chemical reactions of the Leclanche cell, the form of primary battery used so extensively for ringing bells, buzzers, etc., and in dry cells operating portable flashlights, bells, igniters, etc., has been undertaken by Ernest G. Crocker, of the graduating class in electrochemistry at Massachusetts Institute of Technology.

The polarization was found to be due to an alkali effect of ammonia, previously referred to as hydrogen, and experiments were made with different sizes of the grains of materials contributing the dry battery, and various ratios of one of the materials to the other for efficient work.

It was found that the fineness should be between 1/40 and 1/100 of an inch, and contrary to the custom of some manufacturers, the two constituents should be of the same size. The materials used are carbon and pyrolusite, and the quantity of the latter should be about 60 per cent. of the whole mixture.

Mr. Crocker found the best material for removing the alkaline effect is chloride of zinc. The practical result of batteries constructed according to the formulas deduced from the experiments is that they will remain more constant in current production under light continuous use.

PATENT ADVICE

Edited by H. GERNSBACK

In this Department we will publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Questions addressed to "Patent Advice" cannot be answered by mail. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

Telephone Lock.

(28) Henry Lewis, Toronto, Canada, has submitted a model and sketch of a telephone lock and desires to have our advice if it is patentable and whether it is a practical apparatus; it is to be used in locking telephones so that unauthorized parties cannot use it.

A. We have carefully inspected the model and drawings and find that as far as we can tell the invention is original. We think there is a good chance to obtain a patent on it.

We would, however, desire to caution our correspondent that up to this time telephone locks have not been very popular and they are hardly ever used at all for some curious reason.

Foreign Patents.

(29) Victor Stefano, Newark, N. J., wants to take out a patent, and he is particularly interested in obtaining patents also in Germany, France and England. He wishes to know if we can give him the addresses of some trustworthy attorneys in these countries.

A. It is common practise that if you take out a patent in this country that you let your attorney take care of your foreign patents also. Nearly all reliable attorneys in this country have corresponding attorneys in Europe, as well as the other continents, and they are in a position to do the work better for you in this manner than if you sent the patent direct to foreign attorneys.

Gun-Flashlight.

(30) Alfred S. Turner, Lynn, Mass., has sent us a description and draft of a gun-flashlight, the idea being that the flashlight is operated by means of a trigger before firing the gun.

A. This invention is not new and various patents have been allowed on precisely the same arrangement. We believe there is a concern in existence now that manufactures revolvers that have a flashlight mounted underneath the barrel, and from this you can see that there is hardly a chance of your obtaining a patent on this idea.

Nickel Plating Paste.

(31) Howard Armstrong, San Diego, Cal., has invented a nickel-plating paste and submits a sample of the paste to us. He wants to know whether a formula of this kind can be patented and whether such an article is in demand.

A. We have examined the paste in question and find that it works indeed very well and seems to give a good plating as far as we can tell. We have not made an analysis of the paste to find out what it contains, nor do we know if the nickel-plating will not peel off in time.

There is probably a good chance that a patent can be obtained on the formula, though we cannot be certain, for the reason that quite a good deal of this work has been done before.

A very large concern a few years ago started to sell some nickel, silver and gold powders which gave an electro-chemical deposit simply by wetting the powder. We understand that while the article was a very meritorious one, the company went out of business as there was probably not sufficient demand for the article. A large advertising campaign was carried on, but it seemed to be of no avail.

Incandescent Lamp.

(32) Alfred Schneider, Boston, Mass., has perfected an electrical invention covering an incandescent lamp and he desires to know whether he could go ahead manufacturing same or selling it to a manufacturer as soon as he has applied patent on the invention; he furthermore wishes to know how long it takes an invention to be patented at the Patent Office.

A. We most strongly advise against doing any commercial work on an invention or offering it for sale before the patent has been allowed. It sometimes takes years to get a patent, particularly in an art where much previous work has been done, as, for instance, in your invention. You are probably aware that there are hundreds of patents in existence on incandescent lamps and it is therefore almost certain that it will take a minimum of one year before the patent can issue. Of course, this is presuming that the invention is an improvement over something else. If, however, the invention is radically different from anything existing so far and presents a basic idea, it probably would take quite a little less time for the patent to issue.

As a rule we would caution inventors not to enter into any agreement with any firm or individual to manufacture an article which has not been patented. Only in extreme cases does such a course prove profitable. The reason for this is that very often the first idea of the invention is very crude and the article in question will stand quite a lot of perfecting. For this reason if an invention is given to a manufacturer and he should improve upon it in such a way as to alter the original invention the inventor would have no recourse in case the manufacturer desired to manufacture the article in question without paying the inventor royalties.

DODGES HURRICANE BY AID OF WIRELESS TIP.

The 85 passengers recently arrived at New York from Central American and West Indian ports on the United Fruit steamer Pastores wrote their thanks to Captain Henshaw for bringing them home in calm weather.

From the time the Pastores left Port Limon until she was reported off Sandy Hook Captain Henshaw received wireless reports enabling him to keep out of the hurricane's zone.

Book "Inventions—Patenting & Promoting" Free
Our co-operation with an inventor is, FIRST, to help him establish his rights before he discloses the idea to ANY attorney. SECOND, to give a frank opinion whether it will pay to patent his idea, based upon our extensive knowledge of manufacturers' wants and facilities. THIRD, to obtain for him a patent which is in reality a valuable monopoly. FOURTH, to advise and assist him in the profiting by outright sale, territorial grants, obtaining royalty, or independent manufacturing of the invention and FIFTH, aiding him to so profit by conferring with manufacturers, investors or distributors of machinery.
Before sending a sketch to anyone, sign, witness, and deposit in our fire-proof vault our document

EDITOR'S CHAT.

You will observe that we have increased the size of the *Electrical Experimenter* once more, the *fifth* enlargement in *seven months.* Nor are we going to stop, for there will be a further increase in pages next month. Where else can you find a similar 10c. magazine containing 72 pages, 118 illustrations and 120 articles? Where else can you find the latest and most up-to-date electrical matter and *such* illustrations as are presented month in and month out in this journal? You know by this time that each and every issue eclipses the one preceding it, and you know what to expect. If money and brains can produce a better magazine than ours, we would like to see it.

There will be some distinctly new features in the December issue, which we know will please the wireless enthusiasts—something entirely new; watch for it. There will also be some very original stories, up to our usual standard and even eclipsing former ones.

As you see, we are doing our utmost to please you and to give you the very best to be had anywhere, and all we ask of you to-day is your co-operation, to make this magazine still bigger, still better. Surely you have a friend or an acquaintance who perhaps has not seen the latest issue of the *E. E.* Why not help the good work along by sending his name to us TO-DAY, so that we can send him a sample copy?

Also, as we stated once before, we could never hope to publish such a wealth of matter if it were not for our advertisers. The advertiser "pays the freight" and he it is who has made the *Electrical Experimenter* what it is to-day, the foremost popular electrical magazine in this country.

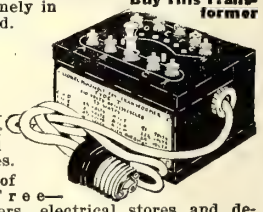
Is it therefore not up to you to patronize him to the best of your ability? We strongly urge you to send for the advertisers' catalogs and literature, even though you do not immediately intend to buy. Keep posted, keep up-to-date. Also remember that an "ad" is expensive, and for that reason the advertiser is not always in a position to state his full story in a small space. His catalog or literature is often as interesting as a magazine and frequently more interesting. It is your duty to possess it.

You see it's up to you if you want a still bigger and still better magazine. Can we count on your hearty support?

And lest we forget: Order your December issue now. It will be a hummer!

TO ESTABLISH WIRELESS IN NORTH.

To establish a line of wireless stations in Southeastern Alaska, which will afford that territory wireless connections with the world-wide wireless service which the Marconi company is planning, is the latest ambition of that corporation. Stations will be located at Ketchikan, Juneau, Sitka and Skagway and a low rate night letter service between Seattle and these stations will be established.



Boys—Here's Fun!

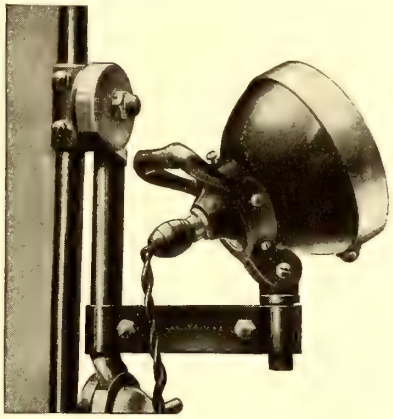
"The Secret of Success in Baseball" FREE

One year 25 cents, Half year 15 cents, Three months for 10 cents. Boys' Companion, 104 South La Salle Street, Chicago, Ill.



NEW AUTO SEARCHLIGHT WITH OUTSIDE FOCUSING ADJUSTMENT.

A new automobile auxiliary searchlight is provided with an outside set-screw focusing adjustment, which permits the use of any style lamp either Mazda or Nitrogen, regardless of size or voltage, and makes it possible to adjust the lamp instantly for any kind of beam without disturbing it in any way or removing it from its position.

Due to this accessible adjustment, the lamp may be transferred from one car to another of different voltage at will. It also enables the user to select a bulb to suit his requirements, and in case of accident to use any available bulb as a renewal. Should it become necessary to use the searchlight to take the place of the headlight, the width of the illuminated field can be increased as desired.

Another feature of this ingenious search lamp is the double curvature parabolic reflector which, though only five inches in diameter, produces as much beam candle power as any large automobile headlight, with even distribution of light.

A minor feature but one of considerable convenience is the design of the handle, which serves as a stand for holding the lamp in an upright position when detached for repairing tires, etc.

Auxiliary Searchlight for Autos.

BRITISH RELEASE AMERICAN WIRELESS OPERATOR.

C. J. Maisch, of New York, wireless operator on the Norwegian steamer Seattle and a native-born American citizen, who had been held in custody since the Seattle was captured near the Falkland Islands on March 14 last, has been released as the result of representations made in his behalf by the American Embassy.

The plight of Maisch was made known in July by the American Minister at Montevideo, Uruguay. The Foreign Office informed the American Embassy that the man had sailed on board the steamer Bangor from the Falklands. The next heard of him by the embassy was a report from the American consul at Plymouth, England, who said he had been held to give testimony in prize court in case the Bangor, which has been renamed the Seattle, arrived in Plymouth in charge of a prize crew.

WIRELESS FOR MEXICO CITY.

A wireless telegraph station has been erected in Mexico City, according to a cablegram received at the Carranza consulate from Vera Cruz, and radio communication between the capital and the outside world, it is said, will be established soon. Preliminary trials between Mexico City and Vera Cruz have been satisfactory, according to this report.

The newest ideas in cases are yours to choose from.

Auto Throttle Governed Engine for Every Work

There is no other four-cycle engine with automatic auto type of throttle governor on the market near the price. Unlike ordinary low priced engines it is not hit-once-in-a-while governed with irregular speed and wasted gasoline.

It fires every shot with speed regulated by exclusive auto-throttle govenor which means even, economical power.

It will operate electric light plant, pump water, run separator, churn or freezer, chop feed, operate machinery, in fact, it is "the engine for every work."

Hopper cooled complete ready to run, 2 H. P., for only $35. Direct to you from the factory. Write for catalog.

Don't pass it up—Cut it out.

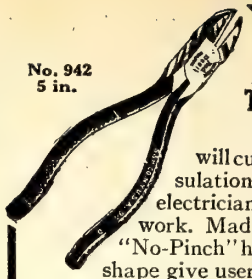
HIGH FREQUENCY CURRENTS.

(*Continued on page* 329.)

wire motor, and in further tests made by Tesla with very powerful apparatus it was found possible to make a device of this character operate with simply a ground connection and the other electro-magnet terminal joined to an insulated capacity or plate suspended in the air. He has also, by this and other arrangements, produced a *wireless light* which can be lighted at a considerable distance from the generating station. He claims in his patents that it is easily and simply possible to thus generate vast quantities of high frequency electrical energy and to transmit it for hundreds, nay, even thousands of miles, where it will be picked by an elevated capacity or aerial joined to a suitable translating mechanism, such as a transformer and motor, etc., having its second terminal connected to earth.

A fact not usually considered and which seems to possess considerable promise in this direction, as well as in many other lines of electricity's application, is that of *freezing* the high frequency or other circuits so as to reduce the resistance to an inappreciable value. Tesla mentioned this in one of his early patents over 20 years ago, and lately very commendable work has been done in this direction by Prof. Kammerlingh Onnes, of Holland. By suitable refrigerating apparatus of special type, which can produce a cold approaching that of absolute zero, or nearly so, it has been ascertained that if induced currents are set up in such a refrigerating circuit, then it is possible for that initial flow of current to pass on around that circuit for a very considerable period of time before it dies down to zero. In some of the later experiments it was found possible for such a current to oscillate around a circuit for many hours before exact measurements with a galvanometer, properly joined to the circuit, indicated that the current had depreciated in value to any great extent. This is an important point which as yet has remained undeveloped, and it seems very possible that it could be worked out with up-to-date and perfected refrigerating apparatus so as to be applied to wireless telegraph sets, particularly those employing high power, where there is a great amount of heating and considerable losses occasioned thereby. As is well known, in such high frequency circuits the resistance plays a very important part, as it acts directly with respect to the *damping* of such a circuit.

(*To be continued.*)



DANIELS NAMES NAVAL ADVISORS.

(*Continued from page* 323.)

American Society of Aeronautic Engineers—Henry Alexander Wise Wood, New York City; engineer and manufacturer of printing machinery and student of naval aeronautics. Elmer Ambrose Sperry, Chicago; Cornell, '76; founder of Sperry Electric Co. and designer of electric appliances and gyroscope stabilizer for ships and aeroplanes.

WIRELESS STATION AT FT. ADAMS, R. I.

Plans for the erection of a high power wireless telegraph station at Ft. Adams have become known with the arrival of material for the plant. This station, it is understood, will be the first of a projected chain of towers for communication between the principal army centers of the coast. The naval system already covers much of the coast line for that branch of the coast defense.

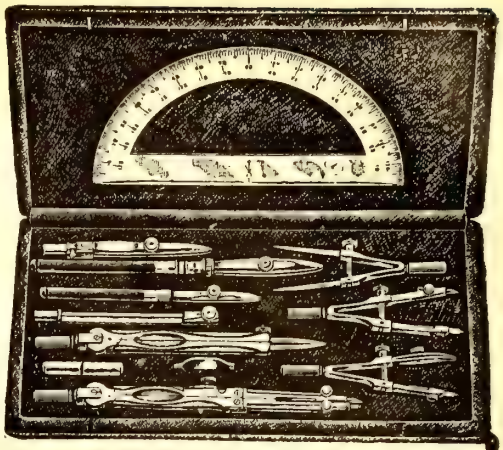
UNIQUE ELECTRICAL SOLDERING IRON.

The object of this new electric soldering iron is to form or generate heat directly at the point of contact, and only at the spot where the heat is needed for soldering purposes, whether it be electric wires, armatures or cable work.

You do not have to wait for the iron to get hot, as the instant the object to be soldered bridges the two carbon or carborundum high-resistance heating points these points glow with a white heat directly at the tips of the high-resistance material, therefore conducting the heat directly to the spot needed.

When the object is soldered, the moment the tool is taken from the work the current ceases to flow, as the circuit between the high-resistance points is opened; this creates a great saving of current and also time. The iron is always ready for use. The high-resistance points will last indefinitely, and if they should become injured can be readily renewed, say the manufacturers.

There is no loss of heat through conduction or radiation, as will be found in the old-style electric soldering iron. It is used in conjunction with a small transformer, and will solder from the smallest to the largest work, depending upon the amount of electrical energy that the iron and transformer are constructed for. Where it takes an ordinary electrical soldering iron of the old style to solder a No. 14 wire splice 10 seconds, this new iron will solder the same splice in from three to five seconds; in fact, any job can be soldered in less time with it than by any other means, whether it be a blow-torch, the old-style electric iron or acetylene gas generator.



New Electric Soldering Iron.

This iron is thoroughly covered by patents issued and pending in all principal countries of the world, and a new factory is being built for the sole purpose of manufacturing this new electrical soldering iron.

RUSSIAN COMPANY OF WIRELESS TELEGRAPHS AND TELEPHONES.

The annual general meeting of the Russian Company of Wireless Telegraphs and Telephones (Russian Marconi Company) was held in Petrograd on June 13, Vice-Admiral Bostrem, chairman of the board, presiding. The directors' report and accounts for the year ending Dec. 31, 1914, record a largely increased turnover in the business of the company, mainly due to orders received from the Russian Government. The company declared a dividend in respect of the year 1914 at the rate of 15 per cent., which was payable on July 13, The retiring directors, Godfrey C. Isaacs and P. I. Balinsky, were re-elected, and the meeting passed a vote of thanks to Mr. Balinsky and L. M. Eisenstein and their staff.

Free!

Complete Set of Drawing Instruments

YES, I will give you this complete set of drawing instrutments absolutely free. They are regular working instruments—the kind I use myself and they do not cost you a penny. And besides the instruments in this exquisite plush lined leather case, I will give you absolutely free a 20x25 inch drawing board, a 24 inch T-square, a 12 in rule, a supply of drawing paper, two triangles, a French curve, pencils, erasers, thumb tacks, etc., etc. A complete draftsman's working outfit. And I give it to the men who get my personal instruction absolutely free.

Be a Draftsman!

Draw $125.00 to $175.00 Per Month

There is an urgent demand for skilled draftsmen. Companies are issuing calls every day for men to fill positions paying from $125.00 to $175.00 per month. Work is light, pleasant and profitable.

Chief Draftsman Will Instruct You Personally

Pay as You Wish!

WHAT I want is the *right kind* of men. Don't bother about the expense. I charge a very small fee for training you to be an experienced draftsman. You can pay the small cost as suits you best. My object is to develop expert draftsmen.

I am Chief Draftsman of a large and well known firm. I have been doing the highest paying expert drafting work for a qaarter of a century and I know the kind of training that is demanded from the men who get the big salaries. I will give you personal instruction, deal individually with you and give you up-to-date, practical working plans just as your ability and advancement require. I train you by giving you actual work—practical work, the kind that you must be able to do in order to hold permanent, big paying positions. I will give you my indivdual instruction. If your work is right, I will advance you rapidly. If it is wrong, I will show you where, and make you do it right, and do all I can to make you an expert draftsman and designer in a short time. ***Write today without fail.***

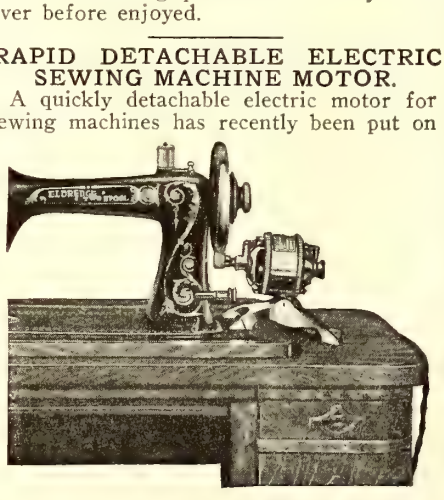
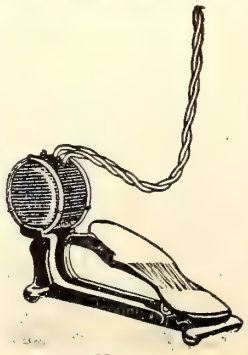
AN ELECTRIC RANGE FOR THE CHILDREN.

Playing "keeping house" has always been a favorite pastime with little girls. Just as the stove in mother's kitchen is



Toy Electric Range.

important in household work, so in play the toy stove is important to the miniature mother, although these stoves have until the present been only "make believes." Toys of the children are now being made to follow advances in the home. A striking example is a miniature electric range so devised that it is a practical little cooker. The range is 15 inches in height and is capable of cooking real food. It is equipped with an oven 4½ inches wide and 5 inches deep—big enough to hold a little roasting pan.



On top of the range a kettle can be placed, or food can be cooked in tiny utensils that come with the range. A long cord with plug is furnished to attach to any handy socket, and, best of all, there is a cord switch, which controls the amount of electric heat sent to the range. Little girls fortunate enough to get a toy electric range for Christmas will find "playing house" a more fascinating pastime than they have ever before enjoyed.

RAPID DETACHABLE ELECTRIC SEWING MACHINE MOTOR.

A quickly detachable electric motor for sewing machines has recently been put on

Above: Note Motor is not screwed to machine, but is held by friction. No screws or bolts are used.

New Sewing Machine Motor.

the market, and is herewith shown. The motor is small and compact and supported

Your Washing Done for 2c. a Week

Electric or Water Power Will Do the Work

I have built a new "1900" power washing machine. I consider this machine the most wonderful washer ever put on the market. Built entirely of high quality sheet copper, it is the strongest and most durable machine made. It is constructed on a brand new principle and I will guarantee that this machine will not tear clothes, break buttons or fray the edges of the most delicate fabric. It will wash everything from heavy blankets to the finest lace without damage to the goods.

This new "1900" washing machine can be connected with any electric socket instantly and is started and stopped by a "little twist of the wrist" and it will do your washing for 2 cents a week.

I also make a lighter power machine which can be run by water or electric power. On all of these machines the motor will run the wringer too. Just feed in the clothes and this power wringer will squeeze the water out so quickly and easily you will be astonished. It will save 50 per cent. time, money and labor every week. The outfit consists of washer and wringer and either electric or water motor, as you prefer, and I guarantee the perfect working of each.

I will send my machine on 30 days' free trial. You do not need to pay a penny until you are satisfied this washer will do what I say it will. Write today for illustrated catalog. Address: H. L. Barker, 6207 Court St., Binghamton, N. Y., or, if you live in Canada, write to the Canadian "1900" Washer Co., 355 Yonge St., Toronto, Canada.

Send your order to-day to
TECHNICAL PRESS ASSOCIATION
6-C Aeolian Hall - - - New York

Learn Wireless Telegraphy. There is an ever increasing demand for competent operators—this profession offers steady employment, at a good salary—wireless operators travel all over the world. **The PAINE Uptown BUSINESS SCHOOL 1931 Broadway, (65th) New York.** Send for Catalogue P.

on a special frame having four legs, on which two rubber plugs are set under each leg to prevent scratching the woodwork of the machine. These serve also in keeping the motor from moving around. The motor is pivoted upon a shaft, upon which a spring is so set that it forces the motor in an upward direction. A small cork pulley is fastened onto the shaft of the prime mover. This pulley is used for driving the hand-wheel of the sewing machine as the photograph illustrates. The tension of the spring keeps the friction wheel of the motor at a constant pressure against the hand-wheel of the machine, while the rubber plugs under the feet keep it from moving around. In order to remove the motor it is only necessary to press it down and pull it away. The motor runs both on alternating or direct current; it can also run in either direction, just by removing a screw and changing the position of the brushes on the commutator. A small foot-operated rheostat is furnished with this detachable motor, and this is depicted in the second illustration. This device can be used on any sewing machine, as there are no detachments nor screws needed for installing the motor.

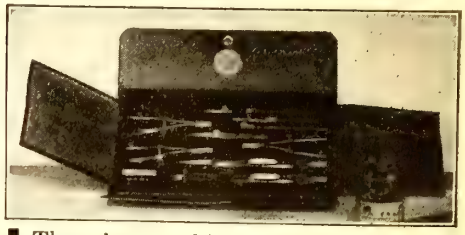
VOICE CONTROLLER FOR TOY ELECTRIC TRAINS.

The *controlophone* is a Twentieth Century toy. Simply talk to it and you can start and stop your electric trains, motors, etc., and light and put out miniature electric lights at will.

The controlophone will work on any

Voice Controller for Toy Railways.

voltage toy electric trains will run on, and it will also work on either alternating or direct current.



To operate this device by the voice, the word which operates it must be emphasized sharply, and it is best to make this the last word of the sentence, so as to keep the instrument from repeating. Take the sentence "Start the TRAIN." The word "TRAIN" must be pronounced sharply. Words like TRAIN—PLEASE —TWENTY—QUICK, or ones which can be forced, are the best to use.

After using the controlophone a short while, one acquires a code, whereby one can work certain words into any sentence.

If the train is at a standstill, you can say to the controlophone "Start the TRAIN." This will put the mechanism into action and the train will start and keep going until you say "Stop the TRAIN." It will then stop.

Diagrams for wiring are furnished by the manufacturers whereby you can say (no matter where the train is) "Stop the train at the station, PLEASE," and the train will stop.

Here's *YOUR* Chance to Learn
DRAFTING
This Complete $15 Drawing Outfit and Full Instructions in Mechanical Drawing **FREE**

There's a good job waiting for you. The country is facing greater prosperity than it has ever before experienced. Far-seeing men are getting ready for boom times. Get this training now and share in the coming prosperity. We make the way plain.

CHARLES W. MOREY
President of the College
and Head of a Large Chicago Firm of Civil, Mechanical and Electrical Engineers and Contractors.

Men Wanted AT BIG SALARIES

This is a rare chance for a few wide-awake young men.

On account of the rapidly increasing demand for trained draftsmen Pres. Morey has issued orders that instructions be furnished to a limited number of young men who are inclined along engineering or architectural lines. Read about this great offer below—then mark and mail the coupon.

STUDY AT HOME Devote your spare hours for a short time only and learn this profitable and pleasant profession, and get in the class drawing the big pay envelope. Hundreds of men are in daily attendance at this old established college. In your own home you can do the same work these men are doing, and the same experts that teach them will guide you toward the big job. These well-known engineers prepare your instruction matter. Your work is examined and approved by them. They know exactly the **practical training** you need and **they** train you. No books to sell. Live, up-to-date blue prints of work in actual construction. In your own home you work with plans of machinery, buildings, steel works, etc., actually being constructed in Chicago, New York and other large cities.

Electrical Drafting and Design

No other similar correspondence course in America has a resident college of National reputation back of it, nor a faculty of active experts actually engaged in municipal and corporation engineering work. These men know exactly the kind of ftraining you need because they are in constant charge of big work.

$45 COURSE FREE
IN MECHANICAL DRAWING

This College has set aside a limited number of Free Scholarships and will give the regular $45 Course in Mechanical Drawing Free with any one of the Home Study Courses named in the coupon below—this is in addition to the complete $15 Drawing Outfit which is also furnished to students free. Take advantage of this unusually liberal offer today, as it will be withdrawn when the allotted number of Free Scholarships has been awarded. It costs you nothing to get full information. No obligation on you.

11 Lessons of Course In Drugless Healing FREE!

Positively and absolutely free to you! Not one cent to pay now or later. To a limited number and for a short time only, we are giving 11 Complete Lessons in Mechano-Therapy absolutely free. There is no cost to you at all for these 11 complete lessons. **But you must act quick!** This remarkable offer is strictly limited As soon as a certain number of these sets of 11 lessons have been given we shall withdraw the offer. Don't wait a minute. Act now.

These Lessons Teach You

How to Treat Headache	How to Treat Catarrh
How to Treat Neuralgia	How to Treat Epilepsy
How to Treat Constipation	How to Treat Hay Fever
How to Treat Indigestion	How to Treat Paralysis
How to Treat a Sprain	How to Treat Pleurisy
How to Treat Dyspepsia	How to Treat Asthma
How to Treat Rheumatism	How to Treat Gout
How to Treat Lumbago	How to Treat Jaundice

Why We Make this Great Offer

We want the public to know the **real truth** about drugless healing. We want you to convince yourself by an actual and practical demonstration just what a marvelous curative force may be placed at your command We want you to see for yourself what tremendous opportunities have been opened to practitioners of Mechano-Therapy. You will see what has been done. You will see what can be done—by you! A Diploma in Mechano-Therapy offers you a profession of dignity, prestige, influence and wealth. No special training or experience needed. If you are ambitious and can read, the way to success is open to you. Take advantage of this lifetime opportunity.

Also Free! $15.00 Set of Eight Anatomical Charts

Each chart 30½x22 inches, lithographed in many colors. Shows 70 diagrammed illustrations of different organs and parts of the anatomy. Regular $15.00 set of charts. Now also free for a limited time only.

New Illustrated Book on Drugless Healing FREE

Thousands of Mechano-Therapists throughout the United States are making a big success. Let us tell you about them. Let us prove how you can easily make $200 to $500 per month and more. Write while this special 11 free lessons offer is open. Send free Coupon or your name and address on postal today, and receive, free, beautiful Colored Anatomical Chart, new illustrated Book on Drugless Healing which makes everything clear.

DETROIT SCHOOL OF LETTERING
Chas. J. Strong, Founder Dept. 3711, Detroit, Mich.

BOOK REVIEW

Craig's Q. & A. Book. (Questions and Answers about Electrical Apparatus). Revised, Third Edition. 1914, by James W. Craig and William P. Woodward. Flexible leather covers. 256 pages. 4½ by 6¾ inches. Pocket style. Profusely illustrated. Price $1.50. Supplied by Electrical Review Publishing Co., Chicago, Ill.

The third edition greatly revised and brought up-to-date of this practical handbook, written in question and answer form. This is one of the best books of its kind to be had and many valuable features are incorporated therein, such as illumination, D. C. and A. C. motors, transformers, watt-meters, integrating watt-hour meters, voltmeters and ammeters.

Power factor meters, compensated voltmeters, etc., are covered. Not only are ordinary questions answered, but a host of extremely practical yet unusual ones, such as, for instance, "Can a D. C. voltmeter of the Weston type be connected up to an alternating current circuit?" Such problems as these and hundreds of others on the commercial side of electrical matters are explained quite fully, so that the everyday electrician can grasp the underlying principle easily and quickly.

Wireless Telegraphy. By A. B. Rolfe-Martin, B.Sc. 1914. Cloth covers, 256 pages. 5½x7½ inches. 143 illustrations. Price $2. The Macmillan Co., New York, N. Y.

A new volume in radiotelegraphic literature which has many valuable points in it not commonly known to the average wireless man and especially the young experimenter or operator. The apparatus used in the Marconi and Telefunken systems for special purposes, such as magnetic non-sparking keys, microphonic amplifiers, lightning arresters, etc., are explained clearly with diagrams and sectional drawings. Many of the features incorporated have never been published before. The work starts with electromagnetic waves, condensers, coupled circuits, syntonic developments to date, etc. Also damping or decrement is discussed and the calculations cited for this work in a thorough manner. Directive radiotelegraphy, continuous wave systems, the various transmitting and receiving circuits now used, etc., are treated upon in a lucid way. Much can be learned from this volume by Mr. Rolfe-Martin, and it should be read by all those interested in any way in the art.

NEW OHIO RADIO CLUB.

There has recently been formed in Wooster, Ohio, a club known as the "Wooster Radio Club." The club has ten charter members and several prospective members. The officers are as follows: Morbet Lee, president; Wm. Strong, vice-president; George Limb, secretary; Paul Keehn, treasurer, and John Carlton, station inspector. We believe that the office of "station inspector" is practically new among amateur clubs. His duties are to inspect the stations of each member of the club at intervals of eight weeks and to report the conditions and improvements in same at the first meeting of the club following his inspection. He also inspects the stations of persons applying for admission and furnishes a complete description of such stations to the club. In case the applicant is found ineligible, it is the duty of the station inspector to inform him as to how he may fulfill the requirements of the club.

Tobacco Habit BANISHED in 48 to 72 Hours

No craving for tobacco in any form immediately upon taking **Tobacco Redeemer.** Don't try to quit the tobacco habit unaided. It's a losing fight against heavy odds and means a serious shock to the nervous system. **Let the tobacco habit quit YOU.** It will quit you, if you will just take **Tobacco Redeemer,** according to directions, for two or three days. It is the most marvelously quick and thoroughly reliable remedy for the tobacco habit the world has ever known.

Not a Substitute

Tobacco Redeemer is absolutely harmless and contains no habit-forming drugs of any kind. It is in no sense a substitute for tobacco. After finishing the treatment you have absolutely no desire to use tobacco again or to continue the use of the remedy. It quiets the nerves, and will make you feel better in every way. It makes not a particle of difference how long you have been using tobacco, how much you use or in what form you use it—whether you smoke cigars, cigarettes, pipe, chew plug or fine cut or use snuff. **Tobacco Redeemer** will positively banish every trace of desire in from 48 to 72 hours. This we absolutely guarantee in every case or money refunded.

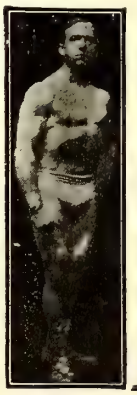
Write today for our free booklet showing the deadly effect of tobacco upon the human system and positive proof that **Tobacco Redeemer** will quickly free you of the habit.

NEWELL PHARMACAL COMPANY
Dept. 521 St. Louis, Mo.

I will send my 25c book

IMPROVE YOUR EYES

For 10c, stamps or coin



A high-grade exercise and massage method that strengthens and beautifies the eyes quickly.

Also a most beneficial system of exercises that will improve the muscles of the temples and sides of face, thereby facilitating mastication and vocal pronunciation. Completely illustrated. Entirely without apparatus.

Muscle Builder

A steel spring exerciser and chest expander, with a complete course of twenty-four selected exercises for developing all the muscles of the body. It is equal to any $3.00 exerciser. My price for a short time only, **$1.00.**

Prof. ANTHONY BARKER, 4560 Barker Building, 110 W. 42d St., New York

Oh, You Skinny!

Why stay **thin** as a rail? You *don't* have to! And you *don't* have to go through life with a chest that the tailor *gives* you; with arms of childish strength; with legs you can hardly stand on. And what about that *stomach* that flinches every time you try a square meal? Are you a *pill-feeder?*

Do you expect Health and Strength in tabloid form—through pills, potions and other exploited piffle?

You can't do it; it can't be done

The only way to be well is to build up your body—all of it—through nature's methods—not by pampering the stomach. It is not *fate* that is making you a failure; it's that poor emaciated body of yours; your half-sickness shows plain in your face and the world loves healthy people. So be *healthy—strong—vital.* That's *living.* Don't think too long; send 4 cents in stamps to cover mailing of my book, **"INTELLIGENCE IN PHYSICAL AND HEALTH CULTURE,"** written by the *strongest physical culture-instructor in the world.*

LIONEL STRONGFORT
Dept. C 115 Atlantic City, N. J.

DO YOU WANT TO KNOW

HOW TO DEVELOP VITALITY, ENERGY, ENDURANCE, NERVE STRENGTH, MUSCULAR STRENGTH PERFECT PHYSIQUE

SEND for my FREE Books

My FREE BOOKS, **"The Whys' of Exercise"** and **"The First and Last Laws of Physical Culture,"** tell you, if you are weak or underdeveloped, how to grow strong; if strong, how to grow stronger. They explain how to develop lungs and muscle, the strong heart and vigorous digestion—in short, how to improve health and strength internally as well as externally. Send TODAY—NOW—for these FREE BOOKS. Enclose 4c. in stamps to cover postage.

PROF. H. W. TITUS
56-58 Cooper Sq. Dept. 50 New York City

WIRELESS TELEPHONY NOW FROM WASHINGTON TO HONOLULU.

(*Continued from page* 321.)

sage was sent to Hawaii is greater than that between New York and London, New York and Paris, greater even than from New York City to the North Pole!

From New York to London is 3,740 miles; to Paris, 4,020; to Berlin, 4,385; to Bremen, 4,235; to Antwerp, 4,000, and to the North Pole, 3,435 miles.

Owing to the lack of adequate sending apparatus at Honolulu it was impossible to communicate back to Washington, but a cablegram announced the fact that the message had been received and distinctly heard.

The account of the successful experiment was given out by James D. Ellsworth, of the American Telephone & Telegraph Company. He said in part:

"Wireless telephony from the Atlantic seaboard to Hawaii, a distance of 4,600 miles, is an accomplished fact. By the special wireless telephone developments which have been made by the engineers of the American Telephone & Telegraph Company and of the Western Electric Company (which concern made all the apparatus for this remarkable long distance test, including the vacuum tubes), speech was transmitted from Washington to a wireless station near Honolulu. If anything further was needed to show the wonderful capacity of these new discoveries by the engineers of the Bell system, this last triumph, coming but a few hours after Mr. Vail, the president of the company, had talked by wireless from Washington to Mr. Carty, its chief engineer, located at Mare Island, is conclusive.

"That transatlantic wireless telephone communication is assured as soon as the disturbed condition in Europe will permit of tests from this country to there, is obvious when it is remembered that all scientists agree on the fact that it is much more difficult to send wireless telephone communications across land than across water. This wireless telephone message from Washington to Hawaii had to pass over the whole of the United States—a distance of 2,500 miles—before it encountered better wireless conditions which exist when sending over large bodies of water. For the purpose of this test the sending was done from the navy wireless station at Arlington, just outside of Washington. The receiving was done on a small wireless antenna specially erected for the purpose by the engineers of the telephone company, which, by permission of the naval authorities, was located at the naval station at Pearl Harbor, Hawaii.

"The message at Honolulu was received by Lloyd Espenchied, an engineer of the American Telephone & Telegraph Company, who had been sent there by Mr. J. J. Carty, its chief engineer, to take charge of the observations, the successful results of which we are now able to report.

"Another interesting feature of the tests was that, in a practical way, the ability to connect wireless telephone systems with wire telephone systems was shown. You have no doubt noted that Mr. Vail in his talk used a wire circuit from New York to Washington. At Washington, by the special means invented and developed by the engineers of this company, the wires were connected to our special wireless apparatus and to the navy's mighty wireless tower, where the message went wirelessly to its destination."

The exact apparatus used in this phonomenal test of the wireless telephone is being kept a secret owing to patent reasons,

Can You Accept a Position Paying $125 to $300 a Month?

ARE your services in demand today. Have you the training that equips you to hold a position paying $125 to $300 a month? Have you the same knowledge as the man who gets the fat pay envelope? If you are ambitious—**send the coupon below** and find out about the opportunities that await you in the profession of Signal Engineering. **Salaries are paid to men who know.** You can get just the kind of training you need to accept one of the big jobs, right in your own home—during your spare time. **We need men.** Do not delay. Send the coupon today for the book that tells you all about it.

Be a Signal Engineer

Be the man who gets the fat pay envelope. The profession of Signal Engineering is only in its infancy. There are thousands of miles of block signals to be installed. Signal Engineers, supervisors, inspectors and foremen are required to superintend this installation. Hundreds of maintainers and battery men are needed to maintain the systems already in use.

Your duties may take you from coast to coast. Railroad men are always in a fortunate position to travel and see the world because free transportation is liberally awarded. You can accept a position where you will be located steadily at one place, if you prefer—the position of authority—the high place and fat pay envelope may be yours. Send coupon for free Signal Book.

$125 to $300 a Month

That is an ordinary salary for Signalmen—many Signal Engineers make much more. In the Signal Department, supervisors, inspectors, maintainers, battery men, positions of authority paying from $75.00 a month up, all open to the men who have had the kind of training you can get right in your own home. Even while you are learning you may hold one of the positions in the Signal Department under a Signal Engineer.

We Need Men

The profession of Signal Engineering is calling to ambitious men. Our ranks are not overcrowded. **There are opportunities—golden ones, awaiting the men who answer the call.**

Block signal systems are no longer in the experimental stage. All over the country they are being installed. Some States have legislated to compel the railroads to install systems immediately. In our profession you will have the chance you have been looking for. We are calling you. Take immediate advantage of this wonderful opportunity. Don't fail to send the coupon today for our big free Signal Book and full particulars. Do it NOW.

Two Big Outfits FREE

Complete signal Engineer's Outfit and complete Draftsman's Outfit given away absolutely free to our students

Send Coupon for Big New Book

Put your name and address on the coupon or on a letter or a post card **now**, and send it to us. Absolutely no obligations of any kind. We will send you our big new Book absolutely free, and prepaid. Read about this fascinating profession. Read about the opportunities that await you. The book is free. Send the coupon for it now—it's the first step toward the realization of your ambition. Get your name and address in at once.

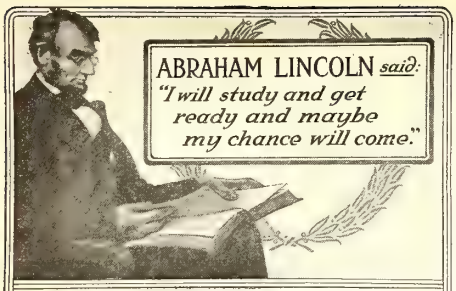
LEARN TELEGRAPHY and WIRELESS

¶ The confused condition of the commercial world has created a vast increase in the use of wire and radio. We believe that students who start now will reap the advantages of great opportunity created by the war.

¶ Send us 10c. (now) for our book on "Telegraphy and Wireless as an Occupation."



BOSTON SCHOOL OF TELEGRAPHY
18 Boylston St., Boston, Mass.

THE PANDICULATOR

This University discovery is the most important health invention of the century. It remakes and rejuvenates the Human Body. It produces normal spines. It frees impinged and irritated nerves, corrects contracted muscles, shortened ligaments; eliminates congestion, improves circulation and drainage of the body. IT WILL INCREASE THE BODY'S LENGTH.

THE PANDICULATOR CO.
Cleveland, O.

YOUR Chance Will Come

Born in a log cabin, Abraham Lincoln had little chance to acquire an education. But he was determined to succeed. "Some day," he said, "my chance *will* come." So he studied and got ready. And his chance *DID* come.

Your chance will come. Some day you'll be considered for promotion or for a good job in some other line of work. If you are ready, you'll go up.

And you *CAN* get ready. No matter if your schooling was limited—if you do have to work long hours. If you really want a better job, the International Correspondence Schools can train you for it at home during your spare time.

More than *Five Thousand* I.C.S. Students every year take the trouble to report promotions or salary increases due to I.C.S. help. What the I.C.S. have done for these men they can do for *YOU.*

Mark the Coupon NOW

Just mark the position or occupation you prefer and mail the coupon today. Finding out costs nothing.

etc. However, it is understood that an audion type amplifying detector was used at the receiving end, which apparatus boosts the strength of the received signal to a high degree. At the sending station a new form of vacuum trigger tube, devised by Dr. Langmuir and known as the Pliotron, played an important part. This tube, of which 300 were used in a bank, was described in a previous issue of *The Electrical Experimenter,* and permits a large amount of energy to be controlled easily by a simple microphone of the type used on the standard telephone desk set. A distinct trigger control circuit enables this to be accomplished in a simple and positive manner.

The following details of the apparatus used for transmitting wireless talk from Arlington to Honolulu are given through the courtesy of Dr. Lee de Forest. The transmitting plant comprised 300 regenerative vacuum tubes (each bulb measuring 7 inches in diameter), and these were excited on 250 volts direct current. The bulbs were arranged on six panel boards, 50 to a panel. Each panel consumed 50 kilowatts, thus making a total of 300 kw. of energy absorbed, and the net output to the antenna was 70 kw. at 150 amperes. Each bulb, in other words, produced ½ ampere of radio frequency current. The *trigger control* grids of each bulb were connected to the secondary windings of small transformers, the primaries of which were hooked up in series with a suitable battery and a microphonic transmitter. Thus when transferring land-line talk (as from New York to Arlington) to the wireless sending circuits the regular Bell telephone receiver at the other end was caused to act on the microphone and the latter created the varying changes in the vacuum tube circuit, which variations in current were manifested finally in the antenna itself. The microphone had only to care for a small current, or about ½ ampere, to be exact. Thus the vacuum tube principle, highly developed and perfected by such indefatigable workers as Prof. J. A. Fleming, Dr. de Forest, Dr. Langmuir, Messrs. Lieben and Riez and others, has apparently solved the wireless telephone problem, which indeed had bid fair to baffle the scientific men of the old and new worlds for many years to come.

U. S. IS LACKING IN WAR WIRELESS, SAYS DE FOREST.

The American army is so poorly equipped with wireless stations and facilities that it would be easy, in case of invasion, for an enemy to cut the ordinary telegraph wires and completely isolate the East from the West, Lee De Forest, the wireless inventor, said at a recent meeting of the American Defense Society in New York City.

"The United States," he added, "urgently needs a chain of high-power radio stations extending across the continent. One old telegraph cable is all that binds us to solutely indispensable, but the United would quickly be isolated.

"In aeroplaning, radio telegraphy is absolutely indispensable, but the United States has almost no aeroplanes to equip. But the navy is up to date in radio telegraphy."

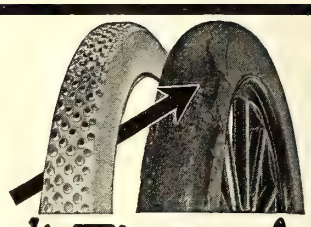
PORTABLE ARMY WIRELESS SENDS 44 MILES.

Army men at Fort Leavenworth record recently a record in having sent a wireless message 44 miles, using the United States Army's newest field apparatus, operated by the Fifth and Sixth divisions of Company A, United States Signal Corps. The older field radio machines seldom were capable of sending radiograms more than 35 miles.

LEARN THE AUTO BUSINESS

Earn a Splendid Salary

Over 3,000 graduates of our school are now receiving big salaries as Chauffeurs, Testers, Mechanical Experts, Demonstrators, etc., etc. There are greater opportunities **now** than ever before in the auto business—for properly trained men.



New 8 and 12 Cylinder Cars For You to Work on.

Up-to-Date Training in 4 Weeks

Our school gives you the most modern and complete training, including expert instruction on latest starting and lighting systems, newest types of motors, carburetors, etc., etc. Repairing, overhauling and driving high-powered cars. Get the benefit of our 11 years of experience and steadily increasing success—we are the oldest school west of New York—the best equipped, the most competent instructors. Tuition and board reasonable.

Don't Throw Away Your Worn Tires

You can get 5,000 miles MORE service from them.

For over three years European Motorists have been getting from 10,000 to 15,000 miles out of their tires by "half-soling" them with Steel Studded Treads, just as we half-sole our shoes when the first sole gets thin.

In the past 8 months over 20,000 American Motorists have followed their example and are saving $50.00 to $200.00 a year in tire expense.

Guaranteed 5,000 Miles without Puncture

Absolute freedom from tire worry—blowouts, punctures, rimcuts and rutwear eliminated—no matter whether your tires are old or new you should put on Durable Treads at once—they cover your tires from rim to rim—nothing can work in between—that's why we guarantee them as we do.

We Deliver Free—prepay the express and allow you to be the judge. Durable Treads are easily applied in your own garage in 30 minutes without extra tools.

Special Discount to motorists in new territory on first shipment direct from the factory. Mail the coupon today and we'll send you full information, sample, and copy of signed guarantee without any obligation to you.

BARON MÜNCHHAUSEN'S NEW SCIENTIFIC ADVENTURES.

(*Continued from page* 314.)

scientific prophecy, obtained by cold reasoning, reminded me of †Leverrier, the French astronomer, who by cold reasoning and mathematics on Aug. 31, 1846, predicted the existence of a new planet, Neptune, which no one had ever seen*†

"The Martian I was gaping at, who was standing nearest to me, was between eight and nine feet tall, a veritable giant. He had an immense head with a straight forehead at least seven inches high. His light blue eyes were about two inches in diameter and placed close together; moreover, they had a marvelously intelligent, as well as keen look in them, impossible to describe. Their hypnotic gaze held one spellbound and seemed to go clear through you.

"The long thin nose was enormous but harmonized well with the rest of the face; the complexion was somewhat brown. The large ears stood out straight and looked like enormous oyster shells, with the inside turned towards me. However, what caught my eye at once, was the strange 'caps' all Martians wore. These caps looked as if they were made of a flexible metal and from their back dangled what I thought to be a flexible metal wire. We were soon to know their purpose.

"The chest or rather the torso of the Martian was simply out of all proportions to the rest of the body. It was enormous, and made him look strangely top heavy. His arms appeared thin and emaciated, as did his limbs. His hands had each two thumbs and four fingers, the extra thumb being between the thumb and index finger, as compared to the human hand. The hand itself was very small; in fact, it looked much like a woman's hand on Earth.

"The feet were almost circular in shape and at least 1½ foot in diameter. The base looked very much like an elephant's foot, although the ankle was rather small and graceful, as compared to the big flat foot. The outside of the Martian's dress glistened strangely in the sunlight, and I felt sure that it must be made of a flexible metal, unknown to us. It fitted rather loosely and did not appear to have much style. The upper part of the body was enclosed in a sort of blouse like our young boys wear on Earth. The trousers looked like knickers, but went down to the ankles.

"While we were still gazing enraptured at these strange marvelous beings, we suddenly became conscious of our brains being filled with a wonderful sort of music which seemed to originate inside of our heads. Instantly, the Martians who had stood around in a haphazard manner, formed a lane, the center of which was formed by ourselves. At the one end we now perceived a colossal bewildering structure with a church-like appearance which seemed to turn around slowly on its axis. When its ponderous portals, measuring at least 200 feet in height, had swung around so that they pointed in our direction, the structure ceased revolving. Immediately the portals slid back and out stepped a distinguished looking Martian, taller even than his brothers. He was dressed like them, the only difference being that his metallic cap appeared yellow in color. Otherwise there seemed to be no difference in his attire.

"At a gesture two Martians stepped forward to us and taking off our headgear replaced them with the soft metallic caps. By this time the distinguished looking Martian had come up close to us and stood still, but five feet away. He next placed

*†Jean Joseph Leverrier, a French astronomer, on Aug. 31, 1846, in a paper to the Ecole Polytechnique, declared that he had computed the orbit of a supposed new planet still further removed than Uranius, the latter then thought to be the last planet in the solar system. Not only did Leverrier predict the new planet, but he also predicted it to be a star of the eighth magnitude. Most wonderful of all, however, he actually indicated where this new planet should be located in the heavens, and he asked that astronomers should look for it there. This Galle of the Berlin Observatory did on Sept. 23, of the same year, and he found the new planet within less than 1° from the spot indicated by Leverrier, *who had never seen the planet himself.* Leverrier had based his scientific prophecy upon certain observed irregularities of the Planet Uranius, although Neptune is 2,654,560,000 miles away from the Earth—an enormous distance.†

Do It Electrically

The applications of electricity are increasing every day. The man who has an exact knowledge of electrical science has ever growing opportunity for profit. Ten years ago practically all machines in use were run by steam engine and countershaft. Statistics now show that most of the machines used are now operated by the electric drive. A generation ago gas was the only known means for lighting and cooking. Now almost every modern house is lighted by electricity, and electric cooking utensils are coming more and more in use. Even the steam locomotive, that great achievement of the twentieth century, is being gradually replaced by electric power. Whether it be for driving machines, for railway transportation, for lighting, for heating, for cooking, for a thousand daily necessities, the watchword of the age is "Do It Electrically."

Hawkins Electrical Guides Will Show You How

Electrical knowledge means money to you and these books will show you how to get it. Hawkins Electrical Guides are the standard works on Electricity. They cover every single phase of the subject and they are written in a way you can understand. The text matter is arranged in questions and answers, and contains several thousand illustrations. No more groping for a solution of your electrical problem. You find the answer at once, clearly and concisely.

A Most Complete Library of Electricity at the Lowest Cost

Look at the titles and convince yourself that Hawkins Electrical Guides tell you everything you want to know in Electricity. They are a complete course in Electrical engineering, written especially for the ambitious man who is training himself for advancement, for the wide awake man who is likely to be called in for work outside of his regular line, for the man who needs at his elbow, for ready reference, an accurate up-to-date work on electricity. An examination of these books will convince you of their value instantly. They cost $1 per volume. They are a wonderful buy at this price, and they are the best electrical books at any price. Don't take our word for their merits. Fill out the coupon today and the books will be sent you absolutely **FREE** for your own examination. You have seven days full use before you pay a cent.

In Handy Separate Volumes The binding is in flexible black leather with gold edges—very durable and attractive. The books are easy to handle and easy to read. They fit your pocket and your pocket-book as well.

Shipped to You FREE

Send no money. Examine the books first. Decide for yourself that they are the most complete library of electricity ever published, and that you cannot afford to be without them. Every book is complete in itself. The price is only $1 per copy, but the complete set is the best bargain. Settlement can be made at only $1 per month. EIGHT NUMBERS ARE READY.

A FEW OF THE SUBJECTS

Magnetism—Induction—Experiments—Dynamos—Electric Machinery—Motors—Armatures—Armature Windings—Installing of Dynamos—Electrical Instrument Testing—Practical Management of Dynamos and Motors—Distribution Systems—Wiring—Wiring Diagrams—Sign Flashers—Storage Batteries—Principles of Alternating Currents and Alternators—Alternating Current Motors—Transformers—Converters—Rectifiers—Alternating Current Systems—Circuit Breakers—Measuring Instruments—Switch Boards—Wiring—Power Stations—Installing—Telephone—Telegraph—Wireless—Bells—Lighting—Railways. Also many Modern Practical Applications of Electricity and Ready Reference Index of the 10 numbers.

Easy Payments

Accept this great offer now—today. Each page—every illustration will convince you of the big value we are offering. See the books first, then decide. If you decide to keep them you can make settlement at only $1 monthly until paid for.

Big Money in Electricity

The electrical industries offer wonderful opportunities for boys with a liking for electricity. The salaries paid to trained men are large—promotion comes rapidly, and, best of all, the profession is not overcrowded.

The opening of new lines, from time to time, (such as wireless telegraphy and telephony), promise attractive and paying fields to those who wish to specialize. The *will to do* and *Special Training* will bring success to you.

The International Correspondence Schools of Scranton can help to make you an expert in electrical work. Hundreds of boys have already won success through I. C. S. help. You can do the same. Everything is made so clear that you can learn in your spare time, regardless of where you live or what you do. No books to buy.

There's big money in electricity. Get after it by marking and mailing the attached coupon today. Finding out costs you nothing.

(*Continued from page 371.*)

the tips of the fingers of both hands to his temples, which we took to be a salute. We hastened to respond likewise, but we must have executed the motion poorly, for a faint rather amused smile ran over the brownish features of the august Martian. He then turned around and with a motion some attendants bade us to follow the chief, which we did. He then entered the church-like structure and we followed him deferentially.

"Well, Alier, my boy, I guess the telegraphone wire must be almost full by this time. So I guess I will have to close for to-day. Now don't forget to listen in tomorrow night for there's a lot to be said about this wonderful planet. Good-night * * *."

A low rhythmic hum for a few seconds, then *click, click-click, click-click-click, click,* a snapping sound and the ether between the Moon and old mother Earth was undisturbed once more.

(*To be continued.*)

WIRELESS USED IN STARTING AUTO.

John Hays Hammond, Jr., has demonstrated that there is such a thing as wireless control from land of an object at sea, but it has remained for the Overland company to show that an automobile can be started from a distance by means of wireless telegraphy.

Proof positive came at the Indiana State Fair, where the motor of a Model 83 Overland was started every five minutes by a wireless spark from the Overland headquarters, five miles away in Indianapolis.

A complete wireless outfit—motor generator, transformers, relays and other paraphernalia—was installed in the show windows of the city salesrooms. This was connected with an aerial on the roof of the building, and by stepping the alternating current up from 110 volts to 16,000 volts the apparatus made it possible to send messages 300 miles.

The Overland car on exhibition at the fair grounds was fitted up with a receiving apparatus and the necessary automatic switches and relays for throwing on and off the electric current of the starter and magneto. An automatic switch was regulated so as to allow the car to run for 45 seconds, after which the magneto was cut off. The operation of starting the car was repeated at intervals of five minutes.

An interesting feature of the experiment was the fact that the entire operation of starting the car was accomplished without the aid of human hands.

WE TEACH WIRELESS BY MAIL

You May Learn Theory, Code and Laws of Radio Communication In Our School or at Your Home,

fitting you for positions paying good salaries with wonderful chance to travel the world over. It's the most interesting profession known and the demand for skilled operators is increasing. Send stamp for catalog which gives full information.

NATIONAL RADIO SCHOOL, U St. Washington, D. C.

SOMETHING ABOUT SELENIUM.

(*Continued from page* 320.)

operating an automatic motor starter, which is connected to a motor driving a five-horsepower dynamo, supplying a bank of incandescent electric lamps. The moment the cell is screened from the light the motor is stopped, and if the light is again allowed to fall upon the cell it completes the circuit, consequently putting the motor and dynamo in operation. Thousands of horsepower of electrical energy can thus be controlled just by a wave of the hand.

In Fig. 12 is illustrated a number of most interesting applications of the selenium cell (which were also shown at the aforesaid meeting) in conjunction with a battery and relay, used for starting and stopping a tiny motor, ringing a bell, firing a cannon, blowing a horn and lighting incandescent lamps.

In the early nineties Mr. Hammer designed a dirigible torpedo, which he has long ago described in several of his lectures on the selenium cell. The identical plan has recently been proposed by several parties for steering an "electric dog," etc. Mr. Hammer's device consisted of an arm protruding from each side of the torpedo, each arm carrying a selenium cell hermetically sealed inside a box and having a lens covering an opening in the rear, so that a searchlight of the vessel dispatching the torpedo could be thrown on the cell to the right or the one to the left, thus steering the torpedo to the right or to the left, so that it would attack the flagship which was constantly being blanketed by the other moving vessels of the fleet. The selenium cells were connected to a differentially wound relay connected with solenoids and a suitable battery, which turned the rudder and controlled the course or direction of the torpedo. The searchlight upon the enemy's vessels could not affect the selenium cells, as they would be exposed only at the rear of the containing boxes and would face directly toward the vessel dispatching the torpedo. The control of a torpedo could be maintained at a far longer distance with success by means of a searchlight and selenium cells than would be practicable by a torpedo controlled by wireless; there would also be less chance of interference and it would be far more reliable, efficient and economical. Mr. Hammer some years ago also proposed this method of control for a dirigible aerial torpedo and for dropping bombs therefrom, releasing them by means of the beam from a searchlight.

A number of ingenious methods for utilizing the selenium cell for seeing at a distance have been proposed, but none have as yet been worked out commercially. Selenium will undoubtedly play a very important part in some of the coming discoveries and inventions.

We are indebted to William J. Hammer, consulting electrical engineer, of New York City, for permission to utilize in this article certain copyrighted illustrations and descriptive matter taken from his book, "Radium, Phosphorescence, Fluorescence, Selenium, Ultra-Violet Light, etc."

LEXINGTON, KY., NATIONAL GUARD GET WIRELESSS EQUIPMENT.

Part of the equipment for the wireless station of the Kentucky National Guard arrived in Lexington recently. The plant will be erected on the Fayette National Bank building and is expected to have a range of 2,000 miles.

WHEN THE LIGHTS WENT OUT ON THE "BELLA."

(*Continued from page* 316.)

our last visits to the ship, the whole blooming bunch of us were nearly shanghaied out of the port of "Brotherly Love." This incident happened thusly:

All of the staff were down in the bowels of the ship busily engaged in clearing up grounds, our usual occupation, and the ship was supposed to leave the dock at noon. At 10 p. m. a movement was noticeable in the hold and at first this was not paid any attention to. However, a little later one of us ventured up to the deck hatch and, "man alive!" if we weren't scooting down the Delaware River as neatly as you please, headed for the ocean. Needless to say, it took about three shakes of a lamb's tail to cover the time period consumed in gathering our coats and tools together, and the captain then hailed a passing tugboat. We dropped over the side of the "fruiter" down a rope on to the tugboat's deck and shortly afterward were glad to set our feet once more on terra firma. No more hundred-legged, poison-spouting centipedes for us.

NEW WIRELESS TO HONOLULU.

The Government wireless station at the naval training station at Lake Bluff, Ill., was placed in operation recently, after a severe test which demonstrated that messages could be sent from there to Honolulu. The station is for the exclusive use of the United States Government and no commercial messages will be accepted. It will be utilized chiefly for the flashing of Government messages to the stations on the Panama Canal and San Francisco for the direction of the Pacific fleet and for relay to the Hawaiian Islands.

100 Edwin's GENUINE Havana Seconds $1.90

From Factory Direct To YOU By Ex. or Parcel Post Prepaid

Made of Imported Havana Picadura, from our own plantations in Cuba—leaves that are too short to roll into our high-priced cigars. They're not pretty, no bands or decorations, but you don't smoke looks. Customers call them "Diamonds in the Rough." All 4½ inches long. Only 100 at this "Get Acquainted" price. Money cheerfully refunded if you don't receive at least double value. In ordering mention mild, medium or strong. Our references, Dun or Bradstreet's or any Bank.

To each purchaser of 100 Edwin's Genuine Havana Seconds, we will, for 60c extra, send Edwin's "SAMPLE CASE" containing one sample cigar each of our 12 Best Sellers—all Bargain Values—priced up to $12.00 per 100. Include this in your order it's the biggest sample value ever offered.

Largest Mail Order Cigar House In The World

ACCEPT THIS BOOK FREE

IT'S INVALUABLE YET CAN'T BE BOUGHT

Just as you will receive it, cloth bound, size 7 x 10¼ ins., 160 pages, 20 lessons, 350 illus., 30 tables, with every bit of information on Wireless you can possibly want, besides valuable information on Electricity, Magnetism and Theory of them **—and it's FREE as explained.**

Will you take a 20 lesson Wireless Course absolutely FREE—even postage charge prepaid?

A course that tells you everything you can possibly want to know about "Wireless" starting off in Lesson No. 1 by explaining the Principles of Electricity. The Second and Third Lessons are devoted to magnetism, motors; generators and wiring. And then, by simple easy stages this wonderful Course takes you into "Wireless." The mysteries of "Wireless" are unfolded to you by the use of such simple language so skillfully used, that of necessity you must understand every word. The subject is not treated superficially, however, for there is a whole lesson devoted to the Theory and Mathematics of this epoch marking subject. To lend charm to the Course, the last Lesson (No. 20) is devoted to a history of Wireless and the men who developed it. The wireless course positively cannot be bought, but will be sent absolutely free with a full year's subscription (12 numbers) of the Electrical Experimenter at $1.00. It's the biggest dollar's worth you can ever buy anywhere at any time. Send for it to-day enclosing $1.00. Send **now** before you forget.

The coupon below is a convenient way. **But do it now.**

THE EXPERIMENTER PUB. CO., Inc.
Publisher
"The Electrical Experimenter Magazine."

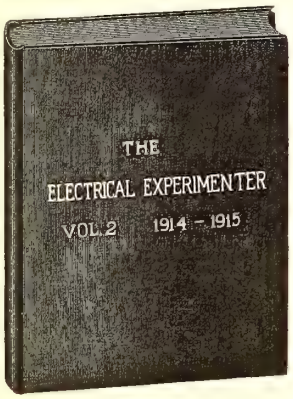
EXPERIMENTER PUB. CO., 233 Fulton St., New York

Gentlemen:

On your absolute guarantee that your 20 Lesson Wireless Course is just as described by you, you may send me same *FREE*. You are to send me this Course at once, all charges paid, and enter my name for a full year's subscription to the *Electrical Experimenter*, 12 numbers, for which I enclose *$1.00, the price of the Electrical Experimenter alone.

(If a 2-year subscription is desired, enclose $2.00.)

My name is.....



My address is.....

*Canada and Foreign Countries, $1.25—2 years, $2.50.

STOP!

We hereby present one of the greatest bargaine ever offered in electrical literature.

A complete volume of the *Electrical Experimenter*, bound in rich, dark green linen, stamped with gold letters at the extraordinary low price of

75c.

Volume contains twelve numbers, 240 pages, 350 complete articles, 550 illustrations, 396 questions and answers.

A world of electrical information; the entire electrical Progress for one year; the greatest reference book on current "Wireless"—all at a price as low as the *unbound* copies would bring. Mind you, the book is durably bound with heavy covers. You will be proud to have it in your library. We have only a few hundred copies, therefore be sure and order to-day. Shipping weight 2 lbs. Add a sufficient amount for postage.

NEW YORK CITY RADIO CLUB.

The Clarkson Radio Club, of New York City, wants for new members persons who are interested in wireless telegraphy and who seek to advance this science. For further particulars address Geo. A. Bracalone, Sec'y and Treas., 314 East 24th street, New York City.

RADIO FREQUENCY CHANGERS.

Of special interest was the paper on "Frequency Changers" read by Prof. J. Zenneck, of Germany, at the September meeting of the Institute of Radio Engineers, held at Columbia University, New York City.

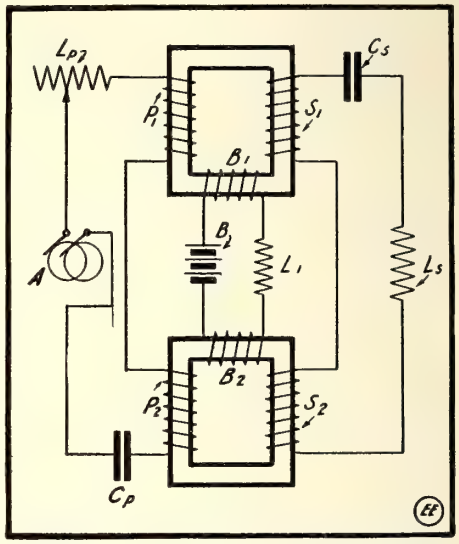
This is one of the latest developments in wireless telegraphy and one that may revolutionize our present methods of obtaining radio frequency currents of large power.

The apparatus, as explained by Professor Zenneck, consists of two closed core transformers as shown in the figure. The primaries of the transformers P_1 and P_2, are energized by an alternator A. The winding B_1 and B_2 are fed from a direct current source B and included in the circuit is a coil L_1, possessing a sufficiently high inductance to prevent any induced A.C. from flowing in this circuit.

It is important that the corresponding windings on these transformers have exactly the same number of turns and that the cores be exactly alike in all points of construction.

The alternator supplies a current of 500 volts at a frequency of 10,200 cycles and the primary circuit is tuned to this frequency by means of inductance Lp and Cp.

The core is magnetized to ½ of its maximum flux density by means of the direct current winding. The A.C. serves to bring this up to magnetic saturation point.



Under the above conditions the A.C. flux is superimposed on that due to the D.C. and the resulting current induced in the secondary has a higher frequency than the primary because of its peculiar wave form.

He showed that if the secondary windings are connected in series to oppose each other, the frequency resulting will be three times that of the alternator. This circuit is tuned by means of a capacity Cs and an inductance Ls.

Going one step further, the effects of connecting the transformers in parallel is to obtain a frequency just double that in the exciting circuit.

For satisfactory results, it is absolutely necessary to keep the alternator voltage constant after once adjusting the circuit to resonance. The speaker showed by graphic curves, that if the primary was de-tuned 3 per cent. the amplitude of the current in the secondary would drop to 25 per cent. of its maximum value.

An interesting point brought out in the discussion on this paper was the effect of eddy currents and hysteresis. The former were dropped from the calculations for by proper construction of the cores they would be reduced to a very small value. The effect of hysteresis was merely to increase the resistance in the primary circuit and did not effect results in actual practise.

Frequency Changer, Using Transformers Specially Arranged.

SEATTLE, WASH., RADIO TO BE EXTENDED.

Port Warden A. A. Paysee, at Seattle, Wash., has requested Mayor Gill to allow him a general public service license for the harbor department wireless, established recently at the port warden's office at Pier 1. At present the station holds what is known as a limited commercial license, and the local office of a steamship company is not permitted to send messages to one of its incoming ships. A general service license would allow the station to accept all such messages.

Scientific Exchange Columns

UNDOUBTEDLY you have at the present time some things for which you have no further use. Do you wish to sell these things or exchange them for something, for which you have immediate use? There is no surer and quicker way to do this than by advertising your articles in these columns. The **Very** people, the **Only** people, who could possibly have a use for your things read this journal. More than 40,000 interested people will see your ad. It is furthermore the cheapest advertising medium for you in the country. Dealers' advertising accepted in Opportunity Exchange Columns only.

The rates are: One cent per word (name and address to be counted) minimum space 3 lines. Count about 7 words to the line. **Remittance must accompany all orders.**

We reserve to ourselves the right to refuse any advertisement which we consider misleading or objectionable. Advertisements for the December issue should reach us not later than November 5th.

The Classified Columns of "The Electrical Experimenter" Bring Positive Results.

FOR SALE—Gernsback interrupter. This instrument is in good condition, having been used very little. Two extra rods given free with it. Write for particulars to Robert Zimmers, 2822 Broad Ave., Altoona, Pa.

FOR SALE cheap, the following: Electrose insulators, 2,000-ohm 'phones, variable condenser, Radioson, motorcycle lamp, switches, loading coil, new aerial wire, Murdock series transmitting condenser and other wireless instruments. All correspondence answered. John A. Irvine, Cannelton, Ind.

FOR SALE OR EXCHANGE—Mandolin, guitar, Winchester 22, 1890 model repeater rifle, Korona 11, 4x5 plate camera and outfit, small lathe, bayonets, breech loading small caliber Belgian shotgun, dynamo meter for testing strength of back and legs, hand grip dynamometer; want screw cutting lathe, 110-volt A. C. motor, bicycle motor attachment, offers. C. O. Higrholzer, 224 Seeley St., Brooklyn, N. Y.

FOR SALE—Loose coupler, $3; ½ K. W. transformer coil, $4; ½ K. W. condenser, $4; helix, $1.50; electrolytic interrupter, $1.50; rotary gap (battery), $5; stationary gap, $1; energy indicator, $1. All highly efficient. Luther Reiner, Dexley, O.

FOR SALE—Football, 50c.; Remlugton single shot 22, $3.50; 1½ H. P. steam engine and bicycle. Write Raymond Bender, 147 S. Broad St., Waynesboro, Pa.

FOR EXCHANGE—Type E $150 Marconi receiving cabinet complete, also 1 K. W. high voltage transformer for complete or part of radio receiving set or Clapp-Eastham set of equal value or audion amplifier. John B. Hauley, Jr., 912 College Ave., Ft. Worth, Tex.

FOR SALE—200 2-M. F. telephone condensers in tin boxes at 35c. each, also 15 H. P. 220-volt A. C. single-phase Wagner motor. John B. Hauley, 912 College Ave., Ft. Worth, Tex.

FOR EXCHANGE—One 110-volt D. C. motor, one 220 D. C. motor and small receiving transformer. Want 3,000-ohm 'phones, navy type receiving transformer, Ferron and silicon detectors. George Evans, Tippecanoe City, O.

FIRST remittance of $10 takes almost new Colt 22 repeating rifle. 4 magnet generator, exchange for rotary variable or good ½-inch coil. Amco $4 loose coupler $3. Paul Notestein, Wooster, O.

FOR SALE—Small generator, direct connected to water motor. Generates 30 volts. Will swap. What have you? J. Forsht, Box 861, Lock Haven, Pa.

FOR SALE—Complete set of receiving instruments; never been used and not home-made. Sell at half price. For particulars write to Walter Metcalf, Lansing, Iowa.

FOR SALE—Banjo, No. 0 Brownie camera, Morse telegraph outfit, wireless receiving apparatus, motor and a number of story books. Send for list. Leland Epps, Oneonta, N. Y., R. No. 3.

WILL exchange for a large Eastman kodak with supplies, 5x8-inch printing press and type, or blacksmith tools, the following: 1 ½-inch auto coil, $5.50; ½ K. W. oscillation transformer, $6.50; ½ to 5 K. W. E. I. Co. spark gap, $3.60; home-made sending condenser, size 5x7 inch, value $3; one 3,600-meter receiving transformer, factory made, $10; Specialty Co. loading coil, 750 meters, cost $4.50; E. I. Co. circular potentiometer, $2; E. I. Co. peroxide of lead detector, $1.25; E. I. Co. electrolytic detector, $1.25; AMCo. Universal detector with alloy and galena, $2; book on wireless cost, $2.50. All letters answered. Albert L. Hoydar, Fairfield, Neb.

WILL exchange my extra high grade 2-inch spark coil, which cost $11 wholesale, for a 110-volt rotary spark gap of standard make and in fine condition. Will sell 110-volt motor, $3; peroxide of lead detector, $1; telegraph key, 50c.; 9 wet coils, $1; home-made electrolytic rectifier, 3-jar, $1; spark gap, 40c.; Willard hydrometer syringe, 75c.; Little Hustler motor, 50c. All in good condition. I might use a coherer and relay. Duncan Thomson, 318 Miles Ave., Billings, Mont.

PHONOGRAPH in good condition, 40 records, and Premo camera No. 0, will sell to highest bidder or for wireless goods. What have you? Karl Barnlag, 428 E. Leonard St., Grand Rapids, Mich.

MIGNON VARIO selective coupler, $4.25; Murdock 1,000-ohm single headset, $1.75. Francis Pray, 102 Heath St., Somerville, Mass.

FOR SALE OR EXCHANGE—Two E. I. Co. professional type loose couplers, $5 each; pair Brandes superior 'phones, $3.50; American model builder set, $4; one 2½-inch film tank, $2; one 4-volt 10-ampere hour storage battery, $2; one ¼ K. W. Packard transformer, $7; Ferron detector, $4; Murdock silicon detector, with condenser, $4. Want I. C. S. course in electrical engineering, audion detector or audion bulbs (good or broken). Henry W. Campbell, Ironton, O.

FOR SALE—1 K. W. wireless transformer with case, $15; 1 K. W. oil immersed condenser, $4; Impedance coil, $1; 1-inch transmitting set, $3; excellent portable receiving set, $12.50; coherer set, $2.50; Standard resistance set and many other things at bargain prices. Write for particulars and complete list. Allen E. Dudley, Milford, Mass.

BOOKS 3c. each, such as "Telegraph Tom," "King of the Gridiron," etc. For large list write Kenneth Woodward, 24 Lenox St., Uniontown, Pa.

FOR SALE—One complete I. C. S. electric lighting course, four bound volumes, good as new, cost $75; what offers? Address John Stokes, 7305 Denniston Ave., Swissvale, Pa.

WANTED—A second-hand induction motor of about ¼ H. P., 110 volts, 60 cycles, must be in good condition. John A. Irvin, Cannelton, Ind.

WILL sell E. I. transatlantic 'phones, $2.50; Mesco 2,000-ohm 'phones, $3.25; engine coil, $2; "Vesta" 6-80, $10. Carl Barnickol, 2317 Milwaukee Ave., Chicago, Ill.

HAVE 8-volt 80 storage battery, coil condenser gap, key sends 12 miles. Nichols coupler, condensers, galena and Ferron detectors, loading coil, variometer, 2,000-ohm 'phones, tunes 5,000 meters, receives 1,600 miles. 110-volt wireless telephone transmitter, bicycle, skates, skees and pole. Want Crystaloi, large spark coil, 6-volt, 60 storage battery, 3,000-ohm 'phones, or what have you? Ira Wright, Closson St., Methuen, Mass.

HAVE three ½-inch spark coils, loose coupler, variable condenser, loading coil; want Holtzer Cabot 'phones and crystaloi detector, or make offers. Harold Baker, 134 N. Church St., Waynesboro, Pa.

FOR SALE—One K. W. Hightone cabinet type rotary, $13; 1 K. W. Blitzen mounted transformer with protective device, $25; pair of Brandes navy 'phones, $10. Keane, 2936 Main St., Bridgeport, Conn.

FOR SALE OR EXCHANGE—1 pair of skees, No. 2 Brownie camera, $2 tuning coil, ¼-inch coil, ½-inch coil, static machine, boxing gloves, relay, two flashlights, two small motors, master vibrator, $5 worth of 25c. books, other electrical books. Want wireless goods, rotary gap, variable, transformer 'phones, books, 22 repeater rifle, or offers. Write L. H. Sargent, Abrams, Wis.

FOR SALE—1,500-ohm Murdock 'phone and headband, $2. B. Stanley, 405 Jersey St., Buffalo, N. Y.

FOR SALE OR TRADE—800-meter loading coil, galena detector, fixed and plate condensers, lightning switch. Will trade whole for Brandes 'phones, or what have you? B. Stanley, 405 Jersey St., Buffalo, N. Y.

FOR SALE—New 2,500-meter loose coupler, $6; ¼ K. W. transformer, $8 (range 25 to 50 miles); 1 K. W. helix and gap with 7 radiators, $4. Instruments in good condition. Harry McCarthy, Huntingdon, Pa.

FOR SALE—Two 1-inch spark coils, good as new, each $2.50; electro adjustable sending condenser, **$1.75; electro Tesla transformer, $3. Great bargain.** E. C. Braatz, Lowellville, O.

It Pays to Read These Columns

209 N. 3d Street, Charleston, Mo.
Gentlemen:—

It may be of interest to you to know that I am now installing 2½ Kw. station at half price; about $25. This certainly proves the worth of your paper; I would not be without it. Two issues of it have saved me $24.80.

(Signed) Uriel Myers.

INTERFERENCE Preventer by A. L. Patstone. Reliable receiving instrument for aerials of not less than about 100 feet length, thoroughly rubber insulated, to exchange for audion set of no less value than $25, or what have you? Instrument rated to be worth $50 to $60. E. B. Nattenheimer, 555 Lexington Ave., Newport, Ky.

FOR SALE OR EXCHANGE—Electro's No. 9235 Detector, No. 8271 Helix, No. 9260 Condenser, No. 530 Condenser, ½-inch Spark Coil. What have you? Dean Wilson, Alpha, Ill.

FOR SALE OR EXCHANGE—Have full set I. C. S. Complete Electrical Engineering, also Remington 22 ga. 15-shot rifle (cost $10.50). Both like new. Want audion detector or bulbs, variable condensers or 'phones of equal value. F. J. Scupholm, 939 Court St., Pt. Huron, Mich.

EXCHANGE—Books, magazines, Shaw Engine, etc., for most anything; want electric motor, 38 reloading tools, or what have you? Box 322, Glasgow, Mo.

FOR SALE OR EXCHANGE—A I. K. W. transmitting complete, will send over 100 miles. Want $16 for set, which is in excellent condition. Will sell part of set if desired. Cecil Bridges, Louisville, Ill.

HE KNOWS!

Rosser, Man.

Please make 3 more insertions of my ad. as per enclosed clipping. **Results have more than exceeded my expectations.**

(Signed) J. L. GREEN.

THERE'S A REASON.

WILL exchange or sell at a bargain. All articles good as new. Interstate Receiving Outfit, double headset, static machine, X-ray outfit, 1½-inch sending outfit, etc. Write for list. Mark Biser, Middletown, Md.

FOR SALE—Edison Moving Picture Machine, 110 volts, 60 cycle, alternating current, for the home, school or Y. M. C. A. A combined motion picture projecting machine and stereopticon, no toy. The film used is non-inflammable, 80 feet, contains as many pictures as 1,000 feet of the film used in Nickelodeons, size of picture on screen at a distance of 30 feet 54x72 inches. Complete, including transformer and curtain, no films. Guaranteed good as new, used only few times, cost $93.50, will sell for $58. For further description write H. H. Cupp, 511 Anthony St., Carnegie, Pa.

FOR SALE—$15 Murdock loose coupler, primary rewound with 140 turns and tapped to two 10-point switches on hard rubber plate (photo), $20 value, $10. Eastman vest pocket camera with leather case, new, $5. Edwin L. Powell, 1206 E. Capitol St., Washington, D. C.

FOR SALE OR EXCHANGE—One 4x5 folding plate Seneca Camera. Would like to exchange for a good ½ K. W. Transformer Coil of reliable make. Winfred Slauson, Monticello, Ia.

FOR EXCHANGE—1½-inch Spark coil, 20-ohm sounder and key, telephones, polishing head, emery, buffing wheels, etc. Vest pocket Eastman Kodak. Other electrical apparatus. Want receiving instruments, or what have you? E. G. McCown, Spencer, Ia.

FOR SALE, CHEAP—I Omnigraph No. 4, 12 dials, auto spark coil, telegraph instructor. Write for prices. Oscar Eliason, Belmont, Ia.

FOR SALE—$35 Gents' Coaster Brake Bicycle, like new, sacrifice, $15. Alfred Theis, 512 E. 88th St., New York, N. Y.

FOR SALE—Ducks new 1915 Detector with silicon, 1 new rotary spark gap, never been used. All for $5 cash. M. H. Chapman, Baldwinsville, N. Y.

A COMBINATION 4x5 or 5x8 Plate Camera (Tripod), one French and one Morrison wide angle lens (each cost $25), plate holders, carrying cases, etc., a bargain. W. E. Day, Pittsfield, Mass.

A POWERFUL Oxy-Hyd. dissolving view Stereopticon Outfit capable of making a 40-foot picture, complete with lecture sets and large assortment of colored dissolving views. A rare chance to get a LARGE outfit at SMALL price. W. E. Day, Pittsfield, Mass.

FOR SALE OR EXCHANGE—75-Ohm receiver, cord and headband, ¼-inch Rhumkorff coil, new electrolytic detector, galena detector, spark gap and and Tesla shocking machine. All instruments in fine condition. Benj. F. Kinnick, Jr., Greenwood, Ind.

FOR SALE—Experimenter's Electrical Apparatus, books and tools. Want to buy Shaw bicycle motor attachment cheap. Alex. Serna, Lehigh, Okla.

WILL sell for $8 or exchange for ½ K. W. Packard Transformer, a DeDion & Bouton motorcycle engine complete with spark coil, mixing valve, spark plug and timer. Edw. W. McClure, 3325 Hennepin Ave., Minneapolis, Minn.

WOULD like to buy an "Omnigraph and records." Oliver W. Mathewson, care Paine, Webber & Co., Boston, Mass.

AUTOMATIC Telegraph Transmitter, Giant sounder and key, Civil Service Course, History of the Railway Mail Service, Newspaper Correspondence Course, Insect Mount, Dividers. All for $2. Mark S. Kistler, Centerport, Pa.

EXCHANGE—Police .32 cal. Colt's revolver in good condition for a repeating rifle, camera, telescope, blue rock trap, or anything useful. James Gallagher, 1246 Fulton St., Brooklyn, N. Y.

WILL trade stamp collection 1,200 varieties, catalog value $60, for spark coil and other apparatus or cash, amount depending on size and condition of coil. Make offer anyway. Howard Peacock, Barker, N. Y.

DON'T STOP if you want to miss bargains. New wireless set, camera, motion picture films, mandolin, etc. Write for information. Kenneth Woodward, 24 Lenox St., Uniontown, Pa.

FOR SALE—One National Automatic Telegraph Transmitter with key, sounder, 27 records, containing over 10,000 words and Dodge's telegraph instructor. Outfit cost $20. Only 10 of the 27 records have been opened. Guaranteed as good as it was the day it left factory. Will take $10 cash. I. A. Gibson, Jr., 403 Bolton St. E., Savannah, Ga.

8-INCH spark coil, new, $50; 1½-inch coil, new, with spark gap and helix mounted, $5; sending outfit, 1½-inch coil high tension condenser, key, etc., $6; 800 mile receiving set, electrolytic detector, 1,000-ohm head set, fixed condenser, tuner, etc., $3. Brand new 5x7 Premo Camera, tank, chemicals, tripod, plateholders, etc., worth $45, price $30. I will buy or exchange for two to 20 pounds of D. C. C. or D. S. C. 36 copper wire, having fairly good insulation. Write Prof. Harry G. Starnes, Hillsboro, Ind.

WILL sell portable receiving set $5, cost $8; also several different size magnets. Want 1-inch spark coil, will pay cash. E. J. Bachman, 56 Fenwood Road, Roxbury, Mass.

FOR SALE—¼ K. W. $10 Packard transformer in best of condition; one K. W. Helix, value $4; spark gap, $2.50 platinum contact key, two condenser racks with plates and extra tinfoil, all for $11. Also 1,500-mile range receiving set at a reasonable price. Write me. Ellsworth Davis, Morrice, Mich.

FOR EXCHANGE—Bull's-eye kodak, 3½x3½ pictures, tennis racket, motion picture machine, 800 feet film standard size, electric Miroscope, 100 views of Florida, unwritten on. Wireless apparatus wanted. Russell H. Ford, 389 Tremont Ave., Orange, N. J.

I HAVE some electrical and sporting goods for sale or exchange. Write for information. Sherrill Halbert, Terra Bella, Cal.

ONE "Search-Light" bicycle gas lamp and strong two-bar magneto, all in good condition, for 1½ or 2-inch spark coil in good condition. Oliver Black, 19 Charles St., Lawrence, Mass.

WANTED—3,000-Ohm Receiver and Variable Condenser. Must be in good condition. Write Joseph Kapinos, 115 Sweet Ave., Buffalo, N. Y.

ELECTRICAL—35 K.W. Westinghouse Alternator, right for a small town plant, $300 in payments of $20 per month. 18 K.W. 220 volt direct current generator will carry 900 regular 16 candle Tungsten lamps, $200 in payments of $15 per month. 16 cells storage battery in good condition $35. Electric Bath Cabinet $25. Box M, Troy, Ohio.

FOR SALE—Willard storage battery used five months. Perfect Condition. Just the thing for spark coils, motors, lights, etc. Cost $16, will sell for $9. Donald Curran, 66 Thorp St., Binghamton, N. Y.

TWO rotary variable condensers, 33 plates, pair 2,000-ohm 'phones, factory-made loose coupler for camera or offers. H. Butterworth, 15 Kosciusko St., Brooklyn, N. Y.

SALE OR EXCHANGE—Flashlights, three ¼-inch coils, ¼-inch coil, loading coil, two ¼-inch secondaries, ½-inch secondary, primary condenser, 3x10 tube wound 24 wire, 85-ohm telephone receiver, polishing head and treadle, 50 porcelain insulators, two buzzers, heliograph, graphophone, 110-volt motor, bicycle, 15-foot Old Town canoe, three lazy backs, camera, glass tubes, 2-bar telephone magneto. All letters answered. Charles Long, Oakmont, Pa.

EXCHANGE—Small stock mail order goods worth $16 for wireless receiving set. Chas. Schively, 630 Liberty Ave., Brooklyn, N. Y.

FOR SALE—A Baker electric coupe in first-class condition with new batteries; three passenger. On account of illness of owner, will sell at bargain price of $500; cost new, $3,200. S. Gernsback, 817 West End Ave., New York City.

FOR EXCHANGE—One B flat slide trombone, brass, artist's model in good condition, cost $38, for Deforest audion detector set, type RJ4. Frank Russell, Newfane, N. Y.

BARGAIN—Have several commercial transformers. Like new. Transform 110 volts to 55 or 200. Other taps may be easily taken out. Can be used for making wireless transformers. Prices ¼ K. W. $3, ½ K. W. $4. Transformers only. No cases. Robert Enders, 222 Britain Ave., Benton Harbor, Mich.

SALE OR EXCHANGE—136 numbers of "New Tip Top Weekly" in excellent condition. Will sell at 3c. each, or exchange for numbers of "Brave and Bold Library." Samuel Olnhausen, 824 Chester Ave., East Liverpool, O.

FOR SALE—Several numbers "Electrical Experimenter," "World's Advance," "Modern Mechanics," "Popular Electricity and Modern Mechanics," one Morgan's "Wireless Telegraph Construction for Amateurs" and three handbooks, all going cheap. H. Frankland, 517 W. 113th St., New York City.

WILL EXCHANGE—Manhattan No. 3 motor with fan, good condition, for No. 2 Meccano set. John Harnill, Sandwich, Ill.

FOR SALE OR EXCHANGE—One "Electro Junior" 2,000-ohm headset. In good condition. Edmund Blum, 715 Spring St., Elgin, Ill.

EXCHANGE—Six-volt handdrive dynamo, good condition. Want Crystalol, super-sensitive detector type AA. Clarence Vaughan, 175 Wickham Ave., Middletown, N. Y.

EXCHANGE—20-ohm sounder and key. Want 1-inch coil or 2,000-ohm headset. Harry Thomas, Mound City, Mo.

FOR SALE—Northern ¼ H. P. Multipolar motor, D. C. 220 volts, with sliding base, $10. Roberts ½ H. P. motor, direct connected to 18-inch exhaust fan, D. C. 110 volts, starting box for same, $15. D. C. volt meter $4, D. C. Ammeter $4, 4-inch dials, volt meter reads 0 to 150, Ammeter reads 0 to 50. All are nearly new. Wm. L. Leonard, 251 Milwaukee Ave. E., Detroit, Mich.

WANTED—To buy some good second-hand vacuum and Geissler tubes, a small X-ray tube for experimental use. Francis Crump, Jr., Columbus, Ind.

HYTONE ½ K. W. Clapp-Eastham set for sale. Practically new, includes key and hot wire meter. Write for photo and description. Price reasonable. Nelson Dunham, New Brunswick, N. J.

HAVE 1¾ H. P. Thor motorcycle engine, Bb cornet, will trade for complete wireless set or sell separately. Write. Cloyce Rickey, Winfield, Iowa.

WANTED—One type SS dynamo motor, also want 1-inch Bulldog spark coil. Will give cash; must be in A1 condition. Ross Durham, Bountiful, Utah.

Opportunity Exchange

YOU will probably find more opportunities and real bargains in these columns than anywhere else in the country. Most good things in life are hard to find and worth going after—these little ads illustrate that point; you alone will be the real loser if you don't take the time to scan through these columns.

Advertisements in this section 4c. a word for each insertion. Count 7 words per line.

Name and address must be included at the above rate. Cash should accompany all classified advertisements unless placed by an accredited advertising agency.

Ten per cent. discount for 6 issues, 20 per cent. discount for 12 issues from above rate. Objectionable or misleading advertisements not accepted.

Advertisements for the December issue should reach us not later than November 5th.

EXPERIMENTER PUBLISHING CO., INC., 233 Fulton Street, New York, N. Y.

BOOKS

ON APPROVAL

YOU never would have believed, ten years ago, that flying in a sixty mile an hour gale were possible—and yet this problem has been solved. Now, it is the same with many other problems. For instance, there are still millions of people who would not have believed it possible to solve the following questions of ages:

Where does Power and Matter come from? What is Power and Matter? Why did it change into a Universe? Why does the Universe rotate? What am I? Why do I exist? What am I here for? Why must we suffer so much? What becomes of myself after death? Where am I going? What becomes of my good and bad self? and why was every human being born with a tendency to goodness and badness? Is there a self-evident answer to these questions? The answer is: That all these questions and many more problems have been solved by self-evidence after many years of investigation. If you are interested to know the results of thirty years' investigation on the lines of self-evidence by Erardus Sagra, the satisfaction of understanding yourself and your surroundings as well as the harmony between your own universal power and the universe itself, will guide you in conjunction with Your Divine Power within you, through the rest of your life like a true friend in adversity or prosperity. Now the author-investigator, Erardus Sagra, did nothing but unveil, classify and state eternal plain facts (in condensed book-form and in plain, popular language), which so far not even the most learned and matter-of-fact scientists could refute.

An interested progressive reader says: You do not know how much help and satisfaction the results of your investigation gave me.

Another reader said: Your production, "The Might of Truth," is the most beautiful book I ever read.

Retail price, $1.00 net. Introduction, nominal price during this month, 24 cents, postpaid to readers of the Electrical Experimenter.

Money refunded if anyone can prove an untruth in this announcement.

Address M. T. Dept., Box 2034, Middle City Station, Philadelphia, Pa.

360 POPULAR TOASTS—Selections suitable for all occasions; just what you need at an evening supper; 10c. Wedge Manufacturing Co., "KM.," Binghamton, N. Y.

HAVE YOU SEEN A COPY?—Amateur Photographer's Weekly, $1 per year; weekly prize competitions; criticisms; print exchange; illustrated; many features. Three months' subscription 25c. Amateur Photographer's Weekly, 915 Schofield Bldg., Cleveland, Ohio.

MODELS

MODELS, dies and manufacturing for inventors, by builders of "Tools That Work." La Croix Tool Co., 214 N. 21st St., St. Louis, Mo.

GASOLINE and Steam Engines, 1-10 to 10 H. P. engine castings. Dynamos and motors, 1-30 H. P. up. Complete electric light plants, $35. Send stamp for Bulletin 105. Dynamic Manufacturing Co., First National Bank Bldg., Chicago.

DRAWINGS made for inventors. Consulting Engineer, EE-3240 Seminary Ave., Chicago.

MISCELLANEOUS

THERE is but one Telegraph School that places all graduates direct in the Railway Telegraph service. It is Pelnars, Madison, Wis.

$25 new Oxydonor for treating diseases for sale, $9, or will exchange for high grade 3,000-ohm headset. John Mahlmeister, 49 Cedar St., Brooklyn, N. Y.

PHONOGRAPHS, any make, greatly improved in musical tone; voices become humanized when using the "RE-ANIMATER." Agents wanted who can give all or part time. Address Ellis Mfg. Co., 410 Jefferson St., Milwaukee, Wis.

PATENT ATTORNEYS

PATENTS without advance attorney's fees. Not due until patent allowed. Send sketch for free report. Books free. Frank Fuller, Washington, D. C.

DON'T LOSE YOUR RIGHTS to patent protection. Before proceeding further send for our blank form, Evidence of Conception, to be signed and witnessed. Book, suggestions and advice free. Lancaster & Allwine, 242 Curay Bldg., Washington, D. C.

PATENTS SECURED through Credit System. Free Search; Send Sketch. Booklet Free. Waters & Co., 4287 Warder Bldg., Washington, D. C.

PATENTS SECURED OR FEE RETURNED. Send sketch or model for free search and report. Latest complete patent book free. George P. Kimmel, 254 Barrister Bldg., Washington, D. C.

FORMULAS

HOW to Color Electric Lights inexpensively. Instructions Dime. Jos. Diamond, 30 Ash St., Waterbury, Conn.

OPPORTUNITY EXCHANGE—Any formula you want, 20c. Edwin Powell, 1206 E. Capitol St., Washington, D. C.

ELECTROPLATING—Plate your wireless instruments and tools. Make money on silverware and jewelry. Solutions ready for use sufficient for square foot plating. Nickel, 35c. Silver, 50c. Gold, $1. G. Bowles, 1316 Gedden Ave., Ann Arbor, Mich.

STAMPS AND COINS

STAMPS, 100, ALL DIFFERENT, FREE—Postage 2c. Mention paper. Quaker Stamp Co., Toledo, Ohio.

WIRELESS

$10.00 Commercial Keys for $4. Money refunded if not satisfied. Massie Wireless Telegraph Co., 77 Washington St., Providence, R. I.

NAVY type loose coupler, $7.50. 3,000 meters guaranteed with 80 ft. aerial. Also detectors, condensers, loaders. Send stamp for circular. Wm. A. Lohr, 592 Miller Ave., Columbus, O.

2,500-meter Loose Couplers, $5. Other wireless bargains. Send for circulars. Cliff Mfg. Co., Brookfield, Mass.

15 cents postpaid, book explains Arlington Weather Code Letters and figures. Also contains secret amateur codes. John Mahlmeister, 49 Cedar St., Brooklyn, N. Y.

RADIO queries answered fully and promptly, 3 for 10c., 8 for 25c. J. L. Green, Radio Information Bureau, Rosser, Man.

LOOSE-COUPLED receiving set; uses switch-points; wave length 5,000 meters; will receive Arlington 1,000 miles. Price, $5. Information free. E. F. Ball & Co., Buckland, Conn.

SUPERFECT Aerial Masts, $50. Audion, $18. 230 Stuyvesant Ave., Brooklyn, N. Y.

$9 wireless receivers, $4.50 a pair. Rotary variable condensers, the $5 kind, for $2.75. Circulars free. Imperial Electric Co., 89 Wallabout St., Brooklyn, N. Y., Dept. E.

FREE—1916 Wireless Calendar for 2c. stamp. "Arlington" tested Tuning coil, $3.50. Brass sliders, 25c. pair. Guaranteed. Lloyd Gress, Pitman, N. J.

Our New Big 216 PP. Electrical and Wireless CATALOG

IS THE EXPERIMENTER'S REFERENCE BOOK

The Best Bargain in This Magazine is

No. 7729.

The Amco Navy Type Receiving Transformer

Represents the latest advances made towards the ideal tuner and embodies the greatest degree of perfection yet obtained. No greater value can be secured where accurate selectivity, sensitiveness and finish are desirable. The illustration shown herewith cannot possibly do justice to the instrument itself. The primary winding is enclosed in a cabinet, the sides and top of which are polished hard rubber. Two 15-point switches are mounted on the front. One switch controls the primary in groups of several turns and the other controls one turn at a time. The entire variation of the primary is thus secured by the rotary motion of two knurled knobs rather than the movement of a slider, and may be varied from **1 to 225 turns in steps of one turn at a time.** The windings are especially adapted to long wave lengths. The secondary is wound with green silk covered wire. The ends are HARD RUBBER, turned and polished. Secondary variation is secured by a 12-point switch which makes it possible to secure a very fine adjustment. **PRICE, ONLY $15.00.**

SEND 6 CENTS FOR OUR CATALOG—DO IT TODAY—YOU NEED IT

ARE YOU BUILDING SOMETHING?

Our No. 6 CATALOG shows several hundred parts and sets of materials for building your own apparatus at home which have never before been listed. We do all the difficult work in our factory and then you put them together.

WE HAVE JUST WHAT YOU HAVE BEEN LOOKING FOR

Complete description and prices of the Latest Electrical and Experimental Apparatus—Storage Batteries, Rectifiers, Transformers, Induction Coils, Wireless Apparatus, Lamps, Flashlights, Meters, X-Rays, Books, Tools, Electric Railways, Steam Engines, Water Motors, Dynamos, Motors, Telegraphs, Telephones, Electrical Supplies, Model Aeroplanes and Parts for building your own apparatus. A Treatise on Wireless Telegraphy, telling how to put up an aerial, connect apparatus, together with a Call List and Wiring Diagram, FREE with every catalog. 6c. in stamps will bring you this wonderful book. The best catalog of wireless apparatus, etc. published.

ADAMS-MORGAN CO., 13 Alvin Place, UPPER MONTCLAIR, N. J.

ERECTOR

The Toy Like Structural Steel

Here is the Famous Erector Girder

Erector is the *only* construction toy with girders exactly like real structural steel. The patented interlocking edges (an exclusive Erector feature) enable boys to build *big, strong* models of bridges, skyscrapers, inclined railroads, elevators, workshops with machinery of all kinds, battleships, aeroplanes and hundreds of others. The powerful Erector motor, free with most sets, runs many of the models. It's great fun for boys!

LOOK HERE BOYS

FREE!

I want to give every boy, absolutely free, a three-months' subscription to my boys' magazine, *Erector Tips*, including the big holiday issue in two colors, brimful of stories and photographs.

Be sure to get this interesting magazine so your boy can read the absorbing story, "How I Invented Erector," and the special articles telling how I became a world's champion athlete. *Tips* also contains full details of the $3,000 Prize Offer of automobile, motorcycles, bicycles, camping outfits, canoes and other valuable prizes.

Write to-day for the three months' subscription, also a free copy of my new 24-page Book telling all about construction toys. Don't send any money or stamps; ***I want to present all this to you absolutely free.***

Mr. A. C. Gilbert, The Mysto Mfg. Co., 136 Fox St., New Haven, Conn.

Edison and Tesla

IF the recent cabled reports be correct, every American will note with great satisfaction the awarding of this year's Nobel prize in physics to Thomas A. Edison and to Nikola Tesla.

When Alfred Nobel, the multi-millionaire inventor of dynamite and nitroglycerine died in 1896, his will provided for a series of five annual prizes to the most deserving persons in physics, chemistry, medicine, literature and for the best work done in the interest of universal peace.

These prizes have been regularly awarded since 1901, and the learned Academies of Sweden while admittedly well informed and fair as to the award of the prize, have in the past, we believe, overlooked several scientists who by all means were entitled to the prize long ere this.

We are quite convinced, for this reason, that this year's choice of Edison and Tesla will not only be acclaimed in the United States, but in the world over. For, if the world is indebted to two physicists, Edison and Tesla are certainly the biggest single creditors.

The awarding of the Nobel prize in a single year to these two world renowned inventors naturally leads to the question: Who is the greater man, Edison or Tesla? A natural question such as this which surely will arise in the popular mind is manifestly unfair, because the two illustrious scientists have been working in dissimilar fields and their accomplishments are vastly different. Besides, Edison as well as Tesla are hard at work at this minute, and for that reason it is impossible to foretell what they might not still accomplish.

Without wishing to minimize Edison's tremendous amount of work, the fact is well known that he is not so much an original inventor as a genius in perfecting existing inventions.

In this respect Tesla has perhaps been the reverse for he has to his credit a number of brilliant as well as original inventions which, however, have not been sufficiently perfected to permit commercial exploitation.

If the average man were asked what Mr. Edison's greatest gifts to the world are, his choice probably would fall on the Incandescent lamp, the Phonograph and the Cinematograph. Undoubtedly this is a good selection, but it is but a small fraction of the 1,400 inventions which Mr. Edison has patented up to this date. The incandescent lamp would not have been much of avail to humanity had not Edison perfected at the same time the necessary adjuncts to feed the current to the lamp. He had to make dozens of inventions to accomplish this; the lamp itself was the least of his troubles. Exactly so with the phonograph and the cinematograph, several hundred inventions were necessary before either was ready to leave the laboratory. Thus it is a far cry and a weary road from his first tin foil phonograph record to his gold moulded unbreakable Amberol record.

Equally as great as the three above inventions are Edison triumphs in the field of telegraphy, which he revolutionized. His quadruplex telegraph, his telephone transmitter, his alkaline storage battery, his stock printer, his machine for separating magnetic ores, his Portland cement process, his concrete building standardization, are all inventions of the first order.

While Tesla's inventions have not been so numerous as Edison's the world nevertheless owes Tesla a tremendous debt. The modern transmission of power electrically is due entirely to Tesla. Perhaps his greatest invention is the alternating current induction motor, whose wonderful flexibility and vast usefulness have made electrical power what it is to-day. His pioneer work in high frequency currents showed the true genius of the man. This art is as yet but in its infancy and no one can foretell where it will lead us, but it certainly has already opened the way towards the transmission of power without wires. It is not popularly known, but the fact remains that Tesla invented a system of transmitting wireless impulses through the ether in 1893, three years before Marconi began his historical wireless experiments. His wonderful researches on vacuum tubes under the influence of high frequency Tesla currents have practically demonstrated that the day is not far off when the 95 per cent. of electrical energy now wasted in heat in all incandescent lamps will be turned into *cold* light, that is light without heat. In the long list of brilliant inventions of Tesla, we particularly wish to mention the following: His Sun motor for the utilization of solar energy, his new fluid propulsion turbine, the Tesla high-frequency coil, his rotary transformer, etc. Mr. Tesla's patents now number above 100.

H. GERNSBACK.

THE ELECTRICAL EXPERIMENTER is published on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. The subscription price is $1.00 a year in U. S. and possessions. Canada and foreign countries, $1.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 10 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of THE EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. *A green wrapper indicates expiration.*

All communications and contributions to this journal should be addressed to: Editor, THE ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full return postage has been included. ALL accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.

THE ELECTRICAL EXPERIMENTER. Monthly. Entered as second-class matter at the New York Post Office, March 1, 1915, under Act of Congress of March 3, 1879. Title registered U. S. Patent Office. (Illustration shows container with cover off and battery partly inserted)

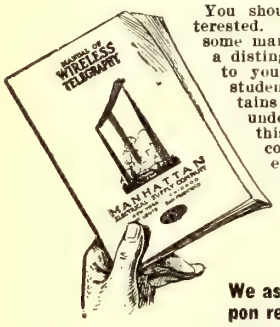
MESCOLITE WILL MAKE YOUR WAY SAFE and BRIGHT

in garage, barn, cellar, closet; in camp; on the motor boat; for the dark country road or any other situation where a lantern, lamp or candle is used, besides many places when an open flame would mean fire, explosion and disaster.

The MESCOLITE consists of a japanned metal container with cover, fibre disc with battery contacts, polished metal reflector, clear glass lens, miniature battery lamp, lens cap or rim with three bayonet catches, a non-detachable bail or handle large enough to allow the arm to go through it, and a RED SEAL Dry Battery. The light is strong, bright and steady and absolutely unaffected by weather conditions. For efficiency, economy and serviceability it is unsurpassed by any other battery lantern. Another good feature is that the battery cannot be inserted in the container in any other way than the RIGHT WAY.



The Red Seal Battery will give about twenty-five hours of continuous service and from forty to fifty hours of intermittent service. Always use the RED SEAL Dry Battery in preference to any other. It does not deteriorate when not in use. If the RED SEAL Dry Battery cannot be had any other standard size dry cell can be used.

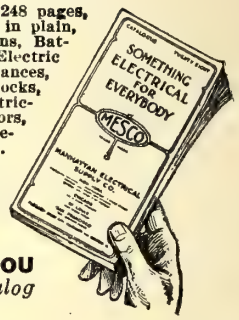
The MESCOLITE can also be supplied with a "Special" two cell dry battery which will give approximately 60 hours of continuous and 120 hours of intermittent service.

No. 5343—MESCOLITE, complete with RED SEAL Dry Battery 1½-volt lamp.....$1.50

No. 5344—MESCOLITE, complete with "Special" two cell dry battery.....$1.75

Send for Our Manual No. 9 on Wireless Telegraphy

You should have it even if only superficially interested. Around about you every day you read of some marvelous occurrence in which wireless played a distinguished part. It may not be entirely clear to you. The Manual will explain it. To the student of Wireless Telegraphy the Manual contains much that is indispensable to a proper understanding of the art. A good portion of this is now published for the first time—and consists of formulas, tables, diagrams, Federal regulations, codes, diagrammatic instruction for installing, maintaining and operating wireless stations, together with a complete list of up-to-date wireless instruments and accessories.



The Manual contains 120 pages, fully illustrated on high-grade paper stock with a two-color cover.

We ask ten cents ($0.10) for it—give you a coupon receipt which can be applied on any order amounting to One Dollar ($1.00) or more.

Do not wait until some other time, but sit down now and send your name and address, and get one of the most complete, comprehensive and reliable wireless pamphlets published.

Send for Our New Catalog W 28

It is pocket size, 8x4½ inches, contains 248 pages, with over 1,100 illustrations, and describes in plain, clear language all about Bells, Push Buttons, Batteries, Telephone and Telegraph Material, Electric Toys, Burglar and Fire Alarm Contrivances, Electric Call Bells, Electric Alarm Clocks, Medical Batteries, Motor Boat Horns, Electrically Heated Apparatus, Battery Connectors, Switches, Battery Gauges, Wireless Telegraph Instruments, Ignition Supplies, etc.

There exist a thousand and one ways where electrical devices may be used, and to know what is best for your purpose you need this catalog.

IT MEANS MONEY SAVED TO YOU
to have our Manual and our Catalog when you want to buy.

THE ELECTRICAL EXPERIMENTER

H. GERNSBACK EDITOR
H. W. SECOR ASSOCIATE EDITOR

Vol. III. Whole No. 32 DECEMBER, 1915 Number 8

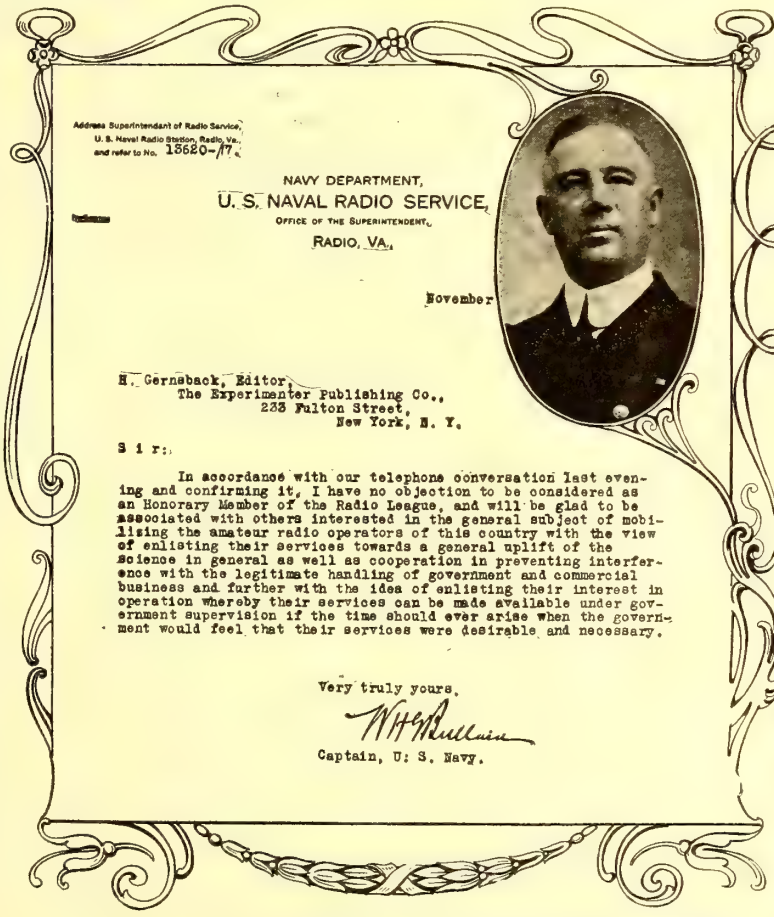
The Radio League of America

HONORARY MEMBERS

Captain W. H. G. Bullard, U. S. N. **Prof. Reginald A. Fessenden.**
Nikola Tesla. **Dr. Lee de Forest.**

Manager, H. Gernsback

A Retrospect.



DURING the past year the need of a national body to champion the cause of the wireless amateurs in the United States has become more and more pressing. There are now over 300,000 radio amateurs and about 350 local clubs in existence in the United States, but there is no national body to safeguard the interests of the amateurs.

When H. Gernsback, in 1909, organized the *Wireless Association of America*, there did not exist at that time a wireless club in the United States. There were then, of course, numerous radio amateurs in this country, but the wireless art—as far as the amateur was concerned—was only in its earliest infancy. Mr. Gernsback, who at that time sensed approaching danger to the wireless amateurs in the form of hostile legislation, succeeded in banding together the majority of wireless enthusiasts, and the membership of the association grew rapidly till at the end of 1912 there had been enrolled no less than 22,300 members.

In those early days the wireless amateurs in this country were a rather reckless sort of element and became more and more disliked on account of their growing mischief. False distress and alarm calls by perverted "humorists" were the usual "smart" acts, and when a coastal station received a C.Q.D. call in those days the thought was always uppermost in the operator's mind that the call was one of the usual amateur hoaxes. Despite Mr. Gernsback's vigorous warnings through his editorials in *Modern Electrics*, of which publication he was editor, the mischief continued, till in 1910 several bills were introduced in Washington which fairly promised to throttle the activities of every wireless enthusiast in the country.

This, of course, brought the amateurs to their senses speedily, but had it not been for the formation of the *Wireless Association of America* a year earlier, all efforts would have been in vain and the amateur would to-day be as dead an issue as he is at present in Europe. Through the Association Mr. Gernsback caused thousands of letters to be written to Washington officials by the wireless amateurs, and he furthermore succeeded in enlisting the press of the country in taking up the cry to save the amateurs from hostile legislation. All this had the desired effect, and when finally in 1913 the Alexander Wireless bill, *amended*, was signed by President Taft, thereby becoming law, it contained almost word for word Mr. Gernsback's historical recommendation of his editorial in the February, 1912, issue of *Modern Electrics*. As is well known, that editorial called the attention to the lawmakers that in case the amateurs were to be restricted the latter should be allowed to operate their stations at a wave length below 200 meters, and they should furthermore be allowed the use of power up to one kilowatt. This suggestion saved the day, and the amateur at last had come into his own.

With the passing of the wireless act in 1913 the usefulness of the *Wireless Association of America* had come to an end, and thus matters rested.

Address Superintendant of Radio Service, U. S. Naval Radio Station, Radio, Va., and refer to No. 13620-/7.

NAVY DEPARTMENT,
U. S. NAVAL RADIO SERVICE,
OFFICE OF THE SUPERINTENDENT,
RADIO, VA.,

November

H. Gernsback, Editor,
The Experimenter Publishing Co.,
233 Fulton Street,
New York, N. Y.

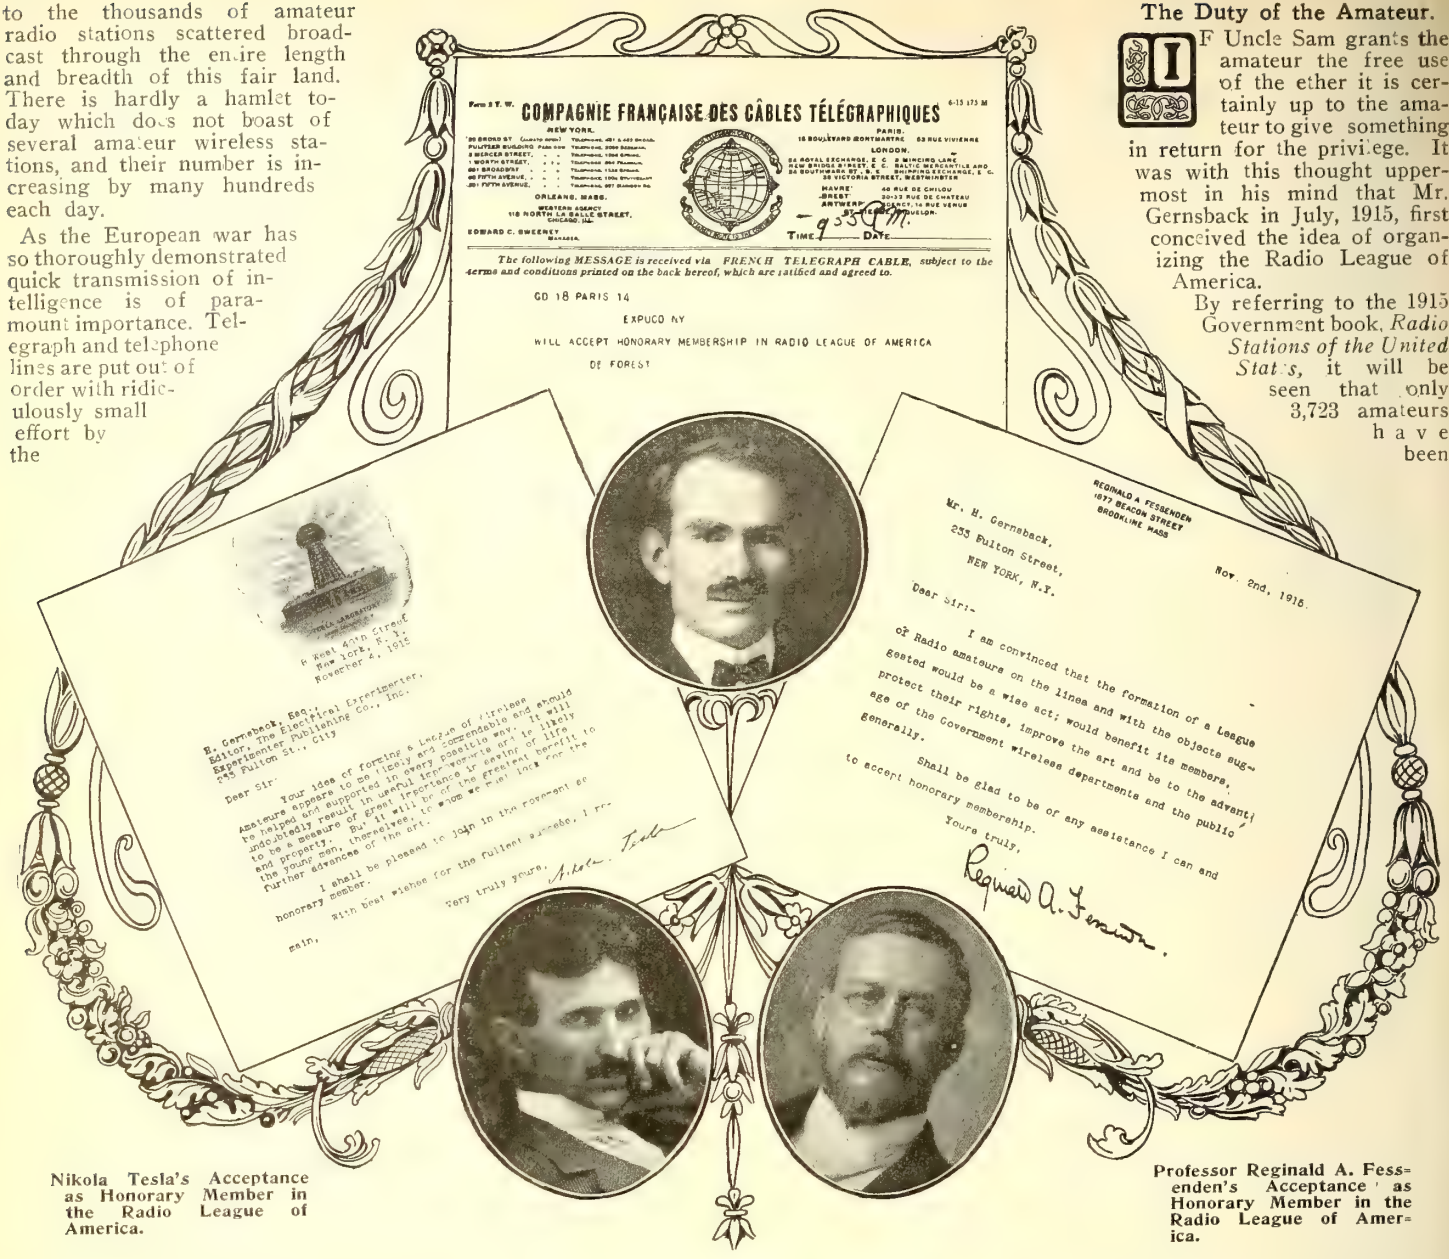
Sir:

In accordance with our telephone conversation last evening and confirming it, I have no objection to be considered as an Honorary Member of the Radio League, and will be glad to be associated with others interested in the general subject of mobilising the amateur radio operators of this country with the view of enlisting their services towards a general uplift of the science in general as well as cooperation in preventing interference with the legitimate handling of government and commercial business and further with the idea of enlisting their interest in operation whereby their services can be made available under government supervision if the time should ever arise when the government would feel that their services were desirable and necessary.

Very truly yours,

Captain, U. S. Navy.

Captain Bullard's Letter of Acceptance as Honorary Member in the Radio League of America.



A Formidable Defense Weapon.

THE advent of the great European war in 1914 found the United States in an unprepared condition as regards its defenses and vigorous steps were promptly taken to wake us up from our lethargy. President Wilson's recommendation to the country for a vast increase of our army and navy has been so much discussed of late that no further reference to his valuable advice is required here. It suffices to say that probably a vast majority of citizens indorse the President's defensive military program.

But there exists to-day a formidable defense weapon, which up to now has not been exploited by Uncle Sam. We refer

to the thousands of amateur radio stations scattered broadcast through the entire length and breadth of this fair land. There is hardly a hamlet today which does not boast of several amateur wireless stations, and their number is increasing by many hundreds each day.

As the European war has so thoroughly demonstrated quick transmission of intelligence is of paramount importance. Telegraph and telephone lines are put out of order with ridiculously small effort by the

enemy and whole sections of country are thereby isolated. Such sections are then helpless and no important messages can be safely transmitted in either direction. All this helps the enemy enormously, and the thus isolated section is then entirely at his mercy. If France or Belgium had possessed an effective amateur wireless scout service there might possibly be a different story to tell to-day. In these days of fast military movements, quick reporting of war intelligence is of incalculable importance, and if this is true of Europe, it is even truer in the United States, the country of such vast and undefended coast lines.

One needs not be a dreamer in order to appreciate how easily a hostile fleet could approach our long, badly patroled coasts and try a landing of an armed force. There might not be a telegraph or telephone line around for miles, or if it did exist, it is certain that spies operating on land would have found little trouble in putting it out of commission beforehand.

But there will be a lone radio amateur on the alert who has seen the approaching fleet and within 30 seconds Washington will have the priceless intelligence. Vice versa, there might be a handful of poorly equipped United States militia holding the enemy at bay temporarily. It is conceivable that this small body of men might have neither sending nor receiving radio apparatus. Somewhere back of the hills the United States regulars are coming to the rescue of the sorely pressed militia men. They want the latter to hold out for a few short hours and want to tell them of their coming. The radio message containing this intelligence is flashed over the hills, but is not received by the exhausted men. However, just as all hope is given up, a lad of 17 years with streaming hair runs up to the major of the small band and breathlessly conveys the cheering news to him. He caught the message over his pitiful 30-foot aerial on top of his barn, but it saved the day. He did not even have a sending station. His outfit comprised only a cheap home-made receiving "set"! But it did the work, just the same.

Such occasions are almost certain to arise in the future, and it is thus of the utmost importance that every patriotic radio amateur should offer his station to his country.

Above: Dr. Lee de Forest's Acceptance as Honorary Member in the Radio League of America.

The Duty of the Amateur.

IF Uncle Sam grants the amateur the free use of the ether it is certainly up to the amateur to give something in return for the privilege. It was with this thought uppermost in his mind that Mr. Gernsback in July, 1915, first conceived the idea of organizing the Radio League of America.

By referring to the 1915 Government book, *Radio Stations of the United States*, it will be seen that only 3,723 amateurs have been licensed since 1913. The reason for this surprisingly small registration is found in the fact that the law does not require receiving stations to be licensed, nor small sending stations located in the interior of large States, where the effect of a weak spark coil would not extend over the State borders. Such stations are exceedingly numerous and have been estimated to run above 300,000. Now, then, there appears no reason for doubt that sooner or later the Government would pass a new law requiring the registration and licensing of such stations in order to have such stations available in case of national stress.

No one can foretell what surprises such a new law will bring the amateurs, and for that reason it cannot be denied that it is far better and more patriotic to give this necessary information voluntarily to the Government, instead of waiting till a new law is passed which might perhaps be detrimental from the viewpoint of the amateur.

The League's Charter.

THE Radio League of America was organized at New York under the laws of the State of New York in October, 1915.

Its charter follows:

CERTIFICATE OF INCORPORATION
OF THE
RADIO LEAGUE OF AMERICA, INC.

State of New York
City of New York } ss.:
County of New York

We, The Undersigned, of full age, citizens of the United States, a majority of whom are citizens of the State of New York and resident therein, being desirous of associating ourselves together for our mutual welfare and advancement, as hereinafter is more particularly described, pursuant to and in conformity with Chapter Forty (40) of the Laws of 1909 and known as the Membership Corporations Law, do hereby certify and declare as follows:

First—That the name by which the said corporation hereby to be formed shall be known and distinguished is and shall be *Radio League of America, Inc.*

Second—That the purposes for which the corporation is to be formed are as follows:

To promote the art of amateur wireless telegraphy and telephony in the United States among the members of the said corporation; to have available for the Government of the United States or any of its officials a complete list of all the amateur radio stations in the country pledged to the service of the Government for use in times of national danger or need; to establish a uniformity in the transmission of wireless messages by amateurs; to uphold the provisions of a law known as the Wireless Act of 1912 and all subsequent laws pertaining to wireless telegraphy; to assist the Government of the United States or any of its officials in apprehending offenders thereof; to prevent the sending of misleading wireless messages; to give information to the members of the said corporation concerning new and useful devices in the operation of wireless telegraphy and telephony and to provide an organization for the interchange of ideas concerning wireless telegraphy and telephony for the benefit of the members and the public at large.

Third—That the number of directors of the said corporation shall be and are five (5) in number; and that the names and residences of such directors who shall manage its concerns until the first annual meeting are as follows: (See below.)

Fourth—That the territory in which the operations of the corporation are to be principally conducted is the entire United States, and that its principal office shall be and is located in the Borough of Manhattan, City, County and State of New York.

Fifth—That the said corporation shall hold its annual meetings on the first Monday in October in each and every year beginning with the year 1916 (October 2, 1916), and annually thereafter.

In Witness Whereof we have made and signed this certificate in duplicate and have hereunto set our hands and seals this 25th day of October, 1915.

Hugo Gernsback, Sidney Gernsback, Milton Hymes, Harry W. Secor, Frederick H. Pruden.

As will be seen, the League is a purely scientific organization. There are no dues, no membership fees to be paid. It has been organized under the auspices of the world's greatest wireless men, who thoroughly indorse its principles. It is not a money making organization, nor is it conducted by a commercial wireless company for its benefit.

The *Electrical Experimenter* has been selected as the league's official organ, as this journal, with the largest circulation of any wireless publication at present, reaches either directly or indirectly almost every wireless amateur in the country to-day. It will publish the league's news from month to month, thereby keeping up the interest of its members.

The League's Rules.

EVERY wireless amateur of good standing, whether he has a sending or a receiving station, is eligible for membership. There are but two conditions:

1. He must be a citizen of the United States.
2. He must own either a sending or receiving station, or both.

Each member will be supplied with an official membership certificate furnished free by the Radio League of America. Our illustration gives a good idea of this beautiful certificate, but it must be seen to be fully appreciated. It is lithographed on a heavy bond paper in green and gold, and its size is 15x11¼ inches. The text follows:

CERTIFICATE OF MEMBERSHIP
TO THE
RADIO LEAGUE OF AMERICA.

A membership organization organized under laws of State of New York.

I, the undersigned, a radio amateur, do hereby apply for membership in the Radio League of America, upon the express condition that by so doing I do not assume or incur any liability either for dues, assessments or any financial obligations whatsoever, and, if accepted, I do agree to follow and abide by the rules and regulations of the league as set forth herein, and all other rules and regulations which may hereafter be adopted.

Rule 1. To observe all rules and regulations of the *Wireless Act* of 1912 (as set forth on the back of this certificate).

Rule 2. That I will at all times have my station in readiness and at the service of the United States Government for use in any defensive or offensive purpose in periods of war, riot or disaster.

Rule 3. That I will at all times allow my station and equipment to be used by the United States Government or any of its officials, and will assist, if possible, in apprehending offenders violating the Wireless Act.

Rule 4. I furthermore solemnly and distinctly pledge myself not to send out at any time whatsoever, a misleading call, particularly a distress call (S. O. S. . . . — — — . . .) nor knowingly allow another to use my station for sending out such a call.

Rule 5. That I will at all times, in case of necessity transmit a distress call to the nearest official, either by wireless, by wire, or in person, and that I will do everything in my power to bring assistance to the party or parties thus in danger.

Rule 6. That I will communicate to the League such information concerning the operation and construction of my radio station as will be helpful or instructive to the other members of the League.

Rule 7. That I will, when requested, furnish information concerning my radio station and observations, which information is to be used by the League in its compilation of wireless statistics.

Rule 8. That I will carefully read and adopt any suggestions published by the League for the benefit of its members, and the transmission of wireless communications.

Rule 9. That in case of my removal to another address, or in case of the permanent discontinuance of my station, I will immediately communicate such facts to the manager of the Radio League of America.

Rule 10. That I will display my membership certificate in the League in a conspicuous place in my radio station.

In witness whereof I have signed my name and address, etc.

Each certificate is numbered and a member is entitled to one membership certificate only. Before the League can furnish a certificate it is necessary that the prospective member shall fill out an *application for membership;* a convenient blank being printed below. (If it is not desirable to cut up the magazine, a blank will be promptly mailed on receipt of a 2c. stamp to cover necessary mail charges.)

No blank is valid nor can it be accepted unless it is filled out properly as prescribed. Two persons must sign as witnesses to the signature and these may be two friends, or your father and your mother, or a sister and a brother, etc.

Upon receipt of the application blank the official membership certificate will be mailed. Ten cents in stamps or in coin should be inclosed to cover mail charges, handling, as well as the heavy cardboard tube to insure safe delivery.

Upon receipt of the membership certificate by the member it must be signed at once in ink in its proper place, and it should then be suitably framed and hung up in the station in a conspicuous place.

It will give your station official recognition, and within the next few months the amateur who cannot produce an official membership certificate *will hardly be looked upon on a par with officially recognized amateurs.* He will have but little standing

Application for Membership in the Radio League of America

I, THE UNDERSIGNED, a Radio Amateur, am the owner of a Wireless Station described in full on the back of this application. My station has been in use since....., and I herewith desire to apply for membership in the RADIO LEAGUE OF AMERICA. I have read all the rules of the LEAGUE, and I hereby give my word of honor to abide by all the rules, and I particularly pledge my station to the United States Government in the event of war, if such occasion should arise.

I understand that this blank with my signature will be sent to the United States Government officials at Washington, who will make a record of my station.

Witnesses to signature: Name.....

..... City..... .....

State.....

..... Date.....191

Describe the apparatus of your station on the back of this application.

In the event of national peril, you will volunteer your services as a radio operator in the interest of the U. S. Government?.....

This last question need not be answered unless you so desire it.

NAVY DEPARTMENT,

U. S. NAVAL RADIO SERVICE.

OFFICE OF THE SUPERINTENDENT,

RADIO, VA.

H. Gernsback, Editor,

SIR:

I beg leave to acknowledge the receipt of your letter of November 8, 1915, submitting information concerning the *Radio League of America,* together with a copy of the Certificate of Membership.

It seems to me that you have undertaken to carry through a very patriotic motive in banding together the great number of amateur wireless operators in the United States, which, as you state, now number probably over 100,000, of which only about 3,000 have been licensed; it being presumed that the remainder operate receiving stations only, and under the law are not required to have licenses. This latter proposition I regard as a very serious detriment to the proper government control of wireless stations, and am of the belief that legislation should provide that all stations, whether for transmitting or receiving, should be licensed by the Federal Government. Although the Radio Act provides penalties for divulging any information received by means of wireless receiving circuits, yet the fact that important government messages might be received by unscrupulous amateurs not friendly to the home government renders some form of protection necessary, and, I might add, will be advocated this coming Congress.

The Naval Radio Service is particularly anxious to increase its operating personnel in time of public peril when many private stations, ship and shore, would probably be taken over by the general government, and the thought has arisen that through co-operation with the *Radio League* many of its members would like to enroll themselves for active service under the Navy Department at such times as their services might be required.

You can readily understand that any information collected by the Radio League will be of the greatest value to this service and this office will be glad to avail itself of your kind offer to furnish such free of all cost, this to contain the names, locations, etc., of all amateurs in the United States.

I should like further to take advantage of this opportunity to ask your co-operation in enrolling members of the *Radio League* for government (Navy Department) operation in time of war, and take this opportunity to enclose a circular prepared in this office which we have sent out to operating wireless companies in the United States, who in turn have distributed them to their operators, with the result that many civilian operators have engaged themselves to enlist in the Navy in time of war. Could we not do something similar to enlist members of your *League,* and would you lend your efforts to co-operate along these lines by giving the matter a little publicity? From the monthly list you propose to furnish we can get the names and addresses of many amateurs, among whom we might find many who would wish to enroll themselves. Of course, the forwarding letter accompanying the circular would have to be modified, but that could easily be done to call the attention of amateurs to how they can really serve their country in time of need.

Please accept my thanks for thus being allowed to bring to your attention certain views in connection with the *Radio League,* an organization which can be made to be of the utmost help to the government, and by focusing the attention on existing laws bring home to every amateur the desirability of co-operation all along the line to correct the great question of interference with proper government, commercial and other legitimate correspondence handled by means of the wireless art.

Very truly yours,

(Signed) *W.H.G. Bullard,*
Captain U. S. Navy,
Supt. Radio Service.

---

as a wireless amateur, for he obviously refused to pledge his station to his Government.

Privileges of the League's Members.

INASMUCH as the League has been organized for the benefit of the wireless amateur, its members are entitled to the following privileges:

Introduction to other members.

All members are registered on cards at the headquarters of the League. The names are filed geographically by State and town. Let us suppose you live in Plattsburg, O., and that you own a wireless receiving outfit. You very much desire to know several radio amateurs in your vicinity, but you have no means of making their acquaintance. As a member of the League you mail a letter to headquarters asking for the names of any wireless amateurs located in your vicinity. Such information will be given free to members, providing a two cent stamp is inclosed with the inquiry to cover postage. As a member of good standing in the League the other members will receive you gladly, and the future relationship between you and these members depends entirely upon yourself. Thus the League will be highly instrumental in bringing together members and cementing their friendship.

The League's Official Button.

Associations and Clubs.

A LOCAL wireless association, or radio club, to be officially recognized by the League must have at least six members. There should be a president, a treasurer and a secretary. The address where such a body meets should be stated. Clubs and associations should meet at least once a month. The above requirements are necessary to secure publication in the *Electrical Experimenter,* as well as recognition in the "Radio League of America's Official Year Book."

In this book, to be issued once a year, will be found all the important League news, a full listing of all the clubs and associations, as well as a complete list of all the members.

The League particularly indorses and encourages the rendering of scientific lectures by their members. The latter should write scientific papers, particularly those that have a wireless subject as its theme. The president of the club should select the best paper in his opinion, and it should be sent then to the editors of the *Electrical Experimenter.* If it has sufficient merit it will be published in due course in the *Electrical Experimenter.* It will show the title of the author as well as a sub-title, giving the name of the club to which the author belongs.

Once a year the best paper from among those that were published in the *Electrical Experimenter* will be selected by the editors and this prize paper will be published in the official year book. This honor will only be accorded to one paper.

Official League Insignia.

AN official button securable only by the League's members is illustrated herewith. This distinctive, as well as striking, design measures ¾ inch in diameter. It is inlaid in real, hard enamel in the three national colors, red, white and blue. The aerial design as well as the mast is in gold on a dark blue background. The button is heavily gold filled and is guaranteed by the makers not to tarnish for two years. It will positively not turn brassy. You will be proud to wear one of these distinctive buttons.

The League furnishes the button at cost; the price, including mailing, being 20c. Both the membership certificate and the button will be sent for 25c. prepaid.

A solid gold button as described above is furnished for $2 prepaid to those not desiring a gold filled one. The solid gold button and the membership certificate will be furnished for $2.05 prepaid, the actual cost of both.

All communications should be addressed to

THE RADIO LEAGUE OF AMERICA,
233 Fulton Street, New York City.

Baron Münchhausen's New Scientific Adventures

By Hugo Gernsback

ONE of the greatest puzzles our astronomers and scientists had to contend with during the last decade is the problem of how water is moved in the Martian "Canals." Nearly all scientists of note who have studied them do not question their existence, but they are all at odds as to what agency moves such enormous quantities of water. It is singular that most of them suggest a form of pump to move the water in the canals, as our present-day knowledge of science and mechanics leaves them no other choice.

But what makes our rivers flow on Earth? What agency condenses billions of tons of ocean water and brings these waters down in form of rains, which keep our rivers from drying up? The Sun, of course. Why can't the Sun move the waters in the Martian Canals also? This instalment contains a new idea, how the Martians might accomplish it.

Münchhausen is Taught "Martian"

PUNCTUALLY, as always, at exactly 11 P. M. the next evening, Münchhausen's dear old voice once more sounded in my receivers. There was the usual preliminary talk, after which the Baron went on:

"I am very much pleased, my dear Alier, that my Radiotomatic relay station on the Moon works so well. Up to last night neither Flitternix nor myself were sure if we could bridge the 60 million miles between Mars and the Moon by wireless, but by means of our wonderful ultra sensitive radio-active detector we were enabled to 'listen in' successfully. When I had finished talking last night, it was about 9 P. M., your terrestrial time. We got our receiving instruments ready at once and promptly at 11 P. M. *I could hear myself talking.* The message which I had sent a few hours before had been faithfully recorded on the telegraphone wire of my Radiotomatic on the Moon, and as soon as the automatic clock released the sending machinery, the vibrations carrying my voice were hurled back to us over a distance of 60 million miles. From this we knew that you must have heard the message too, for you are but 238 000 miles distant from the Moon. While my 'canned' voice undoubtedly must have sounded uncanny to you—excuse the pun—I assure you that it gave me the creeps listening to my own voice, flung 60 million miles through the ether!

"But to come back where I broke off last night: I told you how several Martians had approached us and had placed a soft metallic cap on our heads. I also told you how we then followed the august Martian into the church-like structure.

"While we walked over the hard metallic-appearing walk, which conducted us to the structure, we became conscious of strange flashes in our brains. We also caught distinct, though faint, bars of a soft music, which was followed by weird pictures flashing through our minds. All this took place within our heads, and as I closed my eyes for a few seconds to test myself, the music as well as the picture flashes persisted; I knew then that I did not hear the music with my ears, nor see the pictures with my eyes. I reasoned correctly that both had their origin within my brain.

"Before I had time to puzzle it out, we had entered the structure at the heels of our host. We passed through a magnificent archway, constructed entirely of some transparent material, decorated in superb taste in green, white and gold. One thing struck us immediately; the hallway appeared as light as day, but we could not see where the light originated. Later, though, we were to find out about this.

"As the end of the hallway was a ponderous massive panel with a door-like appearance. It must have been at least 125 feet high and 30 feet wide. It looked very much like cut glass with all its prisms and fancy cuts; we first thought it was glass, but when we came closer to it we changed our minds, for we saw that the huge thing was as flexible as a velvet portière. When our host was but 10 feet away from it, it suddenly blazed forth in a brilliant golden light which seemed to come from nowhere. Simultaneously the huge door, for this is what it was, rose quickly up in the air just like a theater curtain. Our host now entered into a large circular salon-like room, followed reluctantly by us.

"I say reluctant advisedly. I have absolutely no adjectives to do the thing justice. Our state of mind upon entering that room was probably the same as if you had brought back to life Julius Caesar of the year 50 B. C., and had suddenly transplanted him some night on blazing Broadway in New York. His mind would have reeled at the—to him—marvelous sights. It would have taken him days and days of asking questions and explanations of all the impossible things he saw before him.

"Exactly so with us. Only Caesar would have made a jump of but 1,965 years, where we made one of over 200,000 years. We were but uncomprehending children, and our eyes and senses were absolutely inadequate to do justice at once to the higher plane of civilization on which we had been thrown so suddenly. We have been on Mars eight days now and still we know practically nothing of this most miraculous world. Every day brings more tremendous surprises and at night we are usually exhausted from all the excitement of the continuous bombardment of new and wondrous things on our brains.

"But to come back to the wondrous salon of our host, who, as we found out later, was the reigning Ruler of the Planet Mars. The house in which we were was a sort of executive mansion or palace, and the room in which we were standing was what you might call the Ruler's office.

"Here I must stop again to advise you that it is extremely difficult for me to explain in existing terrestrial terms what we see, hear and feel, for everything on Mars is so totally different from what we are accustomed to on Earth, that my best comparisons with terrestrial things must of necessity fall far short of actual conditions on Mars. However, I will do my best to convey a true picture to you.

"The thing that struck us with greatest force at first was that *everything* in this immense room appeared transparent. The room, which is about 150 feet in diameter, is about 60 feet high, with an immense golden transparent cupola forming the ceiling. The tables, the chairs, all the furniture, as well as all the objects for which we had no names, seemed transparent. Even the walls seemed transparent, as well as the soft, rug-like carpets on which we walked. But the wonder was centered not solely in the transparency of the strange material, but in the fact that it gave forth a soft, white light. Imagine a solid chair of glass, glowing in a mellow, white light—not a brilliant light—and you have a good idea what we beheld. It struck us at once that this wonderful material could be handled at will by the Martians; for, the luminous rugs on which we stood were soft as velvet, while a desk-like object nearby seemed hard as steel. The next thing which attracted most of our attention were the luminous walls. They were all paneled in a curious manner, and, of course transparent and luminous. Each panel had a vast amount of small hexagonal plate-like facets arranged somewhat in honeycomb fashion. These hexagonal cells were constantly changing in soft colors, and the most unique, as well as pleasing, geometrical designs in colors were thus unendingly produced. It was a fascinating sight, and we found it hard to take our eyes from these walls.

"At the far end of the room we noticed four Martians whom we recognized at once as females on account of their mass of hair and their more delicate features. Their heads seemed somewhat smaller than those of the males, but they appeared to dress exactly like the men, except that the color of their metallic looking dresses was of a much lighter shade. But it was not the 'girls' that drew our attention as much as what they were doing. We could not rid ourselves of the idea that these females were some sort of secretaries to our host, and it was manifest that they were 'working' at something. And they appeared to be working earnestly and diligently, too, but there were no pencils, no books, no paper, no typewriters; in fact, nothing whatsoever that a terrestrial secretary requires to get up her superior's reports.

"Instead each girl sat motionless in front of a small glass-like table which was entirely bare and flat, except for the center, from which projected two small glass-like rods each about 4 inches high and as thick as a pencil. At the top they bent over and formed a gooseneck pointing in the direction of the girls. The rods were both pointed at their ends, and while one appeared luminous, the other seemed dark.

"The 'operators' were watching the point of the luminous rod intently, and the expression of their faces was as if they were reading something. Every once in a while they seemed to relax and at that moment *a curious white ray seemed to pass from the light point of the rod into the point of the dark one.* That was all we could see.

"While we were still wondering our host motioned us to sit down on the comfort-

Copyright, 1915, by H. Gernsback. All rights reserved.

able looking arm chairs. These chairs, as already mentioned, appeared like transparent glass, but when we put our hands on them they felt like satin and not at all hard or cold. The transparent seats, which had a moment before appeared as glass, were soft and flexible as an air-cushion and extremely comfortable. The only trouble with the chairs was that they were too big for us. Built for large 8-foot Martians, our feet hardly reached the floor, so we sat in the chairs just as children sit in big armchairs, that is with our backs resting against the inside back of the chair and our legs and feet projecting straight out on the seat; and only then were we quite comfortable.

"This position, ridiculous as it doubtless was, evoked a faint smile from our host, who sat down in his own chair in front of a large piece of furniture that was a cross between a rectangular table and a flat top desk, garnished in its center with a huge birthday-cake-like affair with 10 transparent and 10 dark glass-like candles, curved in gooseneck form.

"Our host then turned around to us and looked us over long and earnestly. His large, liquid blue eyes were wonderful in their depth; in them shone a wisdom as, indeed, we had never before beheld. His face had a very benevolent expression, and the features were clear and sharply defined. He appeared tremendously intellectual, yet will power and strength of character radiated from his face in an amazing manner. We thought at last that he was going to speak to us, instead he motioned to us to close our eyes, which, of course, we did. The following then took place, and I will describe it as well as I can. No sooner had I closed my eyes than a clear picture of the Earth with its continents was flashed in my mind, just as if I had tried to think intently of the terrestrial globe, as it stands silhouetted against a dark sky. Then in quick succession followed our 'Interstellar,' the Planet Mars, a picture of our capture by the Martians with their yellow rays and their floating fortresses, then an exact picture of how we appeared at our landing on Mars.

"It then dawned on us that our host was 'talking' to us, not in words and not in a strange language, but motion-picture-wise. *We had experienced the first transference of thoughts,* and had understood everything our host had 'said,' because he thought in pictures which were perfectly familiar to us, not in words which would have had no meaning for us! When there was a lull we opened our eyes in astonishment and blinked bewildered into the smiling eyes of our august host. He seemed highly amused at our amazement and once more he motioned to us to close our eyes.

"For the next hour or more we had our first lesson in 'Martian.' In easy stages our host first flashed simple pictures into our minds, which were then followed by scenes with various actions and explanations just as in a moving picture scene, where the mind must infer what the actors are saying to each other by the expression of their faces and their obvious actions.

"There was a short pause, after which our host launched into the 'Evolution of Mars.' We were first shown how the planet, millions of years ago, was but a nebulae floating in space and how the nebulae slowly became a solid sphere. The early life of Mars was then pictured, which must have been exactly like the evolution of our own Earth. We saw the prehistorical Martians with their clubs and stones, then we saw for a long period the slow evolution of Mars down through the ages till a civilization similar to that of present terrestrial conditions was reached. There were the wars, the barbarism and the thousand other evils exactly as those experienced by man on Earth. Evolution, after all, is the same throughout the Universe, given like conditions.

"As the story of the evolution went on we could see how the Martian's small head and his small chest both kept on increasing with each subsequent generation. We were shown how big oceans and inland seas, as well as vast rivers, dried up gradually, and how the whole population turned into mechanics, electricians and chemists. No true happiness and contentment, however, seemed to exist on Mars until thought transference was established, till gravity was conquered and money was abolished. There had been wars and disorders up to that period, but it seems that these three things, apparently invented and originated at about the same time, finally emancipated the race completely. As we found out later, this period was reached some 14,600 years ago.

"Beginning with that period only did the Martians really become great. We saw how in less than five generations speech had been entirely abolished, it being possible to 'converse' over considerable distances by thought transference. We were shown the evils of too many languages and the race hatreds produced thereby, and how finally one universal language was adopted by all races and nations. We saw the abolition of presidents and rulers over small and big nations, and the inauguration of a Universal Council and a Planet Ruler, both elected by popular votes.

"We witnessed how the once dense a

The above map shows Mars and its canals in Mercator's projection. As objects appear upside down in the telescope, it should be remembered when studying the above map, that the top is South, the bottom North; East is left, West is right. Note how the majority of the canals run North and South (or South and North), toward the poles, which is necessary in order to convey the water from the melting polar snow caps equatorward. The canals can be plainly seen running over the dark areas, which are therefore not seas, but vast stretches of vegetation. Particular attention is called to the numerous circular dark spots, *only* to be found at the intersection of two or more canals. These dark spots, termed *Oases,* are thought to be circular vegetational tracts, containing vast farms, parks, cities, etc.

The above map was made by Professor Lowell at the last opposition of 1896-7 when Mars was but 40 million miles distant from the Earth. The white regions at the top and bottom are the snowcaps of the poles.

became thinner and thinner and how fertile valleys turned into deserts on account of lack of water. We saw the transmutation of the metals, as well as the transmutation of all other matter. Thus we were shown how iron or lead was turned into gold or copper, or into any other metal. Or else new marble or stone was turned into steel or gold or other metals, the same as clay can already be turned into aluminum on Earth to-day.

"Simultaneously with these discoveries, we witnessed the unlocking of atomic forces, which was the last great Martian discovery in the final mastery of the Planet.

"Where extermination had stared the Martians in the face on account of their constantly decreasing water supply, the new atomic engines, combined with the conquering of gravity, dispelled all fears for the future. During the next few generations we were made to see the creation of the monstrous waterways which not alone were to bring water from the two poles, but also were to irrigate existing agricultural districts as well as barren deserts. We saw how the Martians finally harnessed the Sun and how the latter was now moving the waters in the vast waterways, which you know as 'canals.'

"In quick succession we were then shown the past progress and evolution on Mars during the last thousand years. I do not attempt to go into details here, as you would surely not grasp the meaning. Neither do I attempt at this time to explain all the wonders that took place on Mars during the past 10,000 years, because you would not understand most of it, precisely as we did not grasp everything during our first 'lecture.' It therefore becomes necessary to explain the wonders to you by way of examples and comparisons with existing terrestrial terms. This I will do during our stay on this Planet.

"After our host had concluded his first 'lecture' he watched our utter amazement with the benevolent smile a fond mother will bestow on her four-year-old child after she has finished telling him a particularly interesting fairy story.

"After a short time we could understand him fairly well by his motions as well as by more picture talk without our eyes being closed. He then made us understand that he desired us to transfer our thoughts to him. Accordingly we tried the experiment. Flitternix's turn being first. He failed utterly, for our host shook his head smilingly. I then tried my hand, or rather my head at it. But as the metallic-like cap, which one of the Martians had placed on my head, made me too warm, I foolishly proceeded to take it off. Of course our host smilingly made me put it back again, and only then did I remember that he had shown us during our lecture that thought transference was impossible without the medium of the complex 'cap,' which I shall later describe to you.

"I then proceeded to concentrate my mind and began thinking real hard of Flitternix and how he appeared just then. For some seconds I did not seem to be successful, for our host looked blank. Finally, with the perspiration running down my forehead from the unaccustomed effort, the Ruler's face lit up and he pointed similingly at Flitternix! I was much elated over this success, *my first transmission of thoughts*, or rather *one* thought! For a few minutes our host then tried to make us understand that it would take some days of practise before we could hope to even 'talk' by pictures, and perhaps months before we could begin to actually 'talk' in words without using our tongues or ears. He then recommended that Flitternix and myself should practise as much as possible and to forget speech entirely. He also cautioned us that as all thought transmission took place through the medium of electricity, it was necessary that the flexible metallic cord hanging from our metallic-like caps should touch some conductor, preferably the ground. As we could easily guess that this was necessary in order to provide a return circuit for the currents we soon learned how to keep in contact with a conductor, when we wanted to transfer our thoughts from one to the other.

SYNOPSIS

I. M. Alier, an eccentric young scientist of Yankton, Mass., who claims as his own many new as well as startling inventions, far ahead of anything as yet discovered, owns the largest radio-telephone plant in the country. One evening he hears strange noises over his phones and immediately a sepulchral voice is heard. It is Münchhausen, one of the greatest yarn and story tellers of all times. **Münchhausen explains** how it came about that he did not die in 1797, as popularly thought, and he furthermore gives unrefutable proof that his home is on the moon at present.

Alier wants to know why Münchhausen went to the Moon and how. The latter then explains how Prussia persecuted him and how he went over to the Allies and succeeded in capturing Berlin in a wonderful manner. However, it was not a complete success, so the Baron left Europe for America. He immediately constructs a machine which is to take him into space to the moon. Münchhausen has discovered how to neutralize Gravity by means of Electricity, and he applies this invention to his space flyer, the *"Interstellar."* The machine proves a success; it responds and is lifted with tremendous speed towards the moon.

Queer things are discovered on the way to the Moon, among others that bodies lose all their weight inside of the *"Interstellar."* Finally a landing is effected on the Moon in a desert, but great hardship is encountered on account of the Moon's rarified atmosphere. The party then leaves for the nearest mountain range, where they discover a huge subterranean cave and a lake filled with luminous fish. **Bread trees are** also discovered. Münchhausen next gives a vivid description of the Earth, Sun and the firmament as viewed from the Moon; he also explains how the continents and oceans of the Earth appear from the Moon. He then tells of the ponderous meteors which continually crash down on the Moon. Finally one falls down near him and the resulting concussion hurls Münchhausen in a bottomless crater, which goes straight through the Moon. He falls clear through to the other side, but his momentum brings him back to the starting point, where he is saved by his companion. They then decide to depart for the Planet Mars, but they leave behind them an automatic Wireless Plant, the "Radiotomatic," which will relay the messages from Mars to the Moon and thence to Alier. A popular lecture on Mars is also given by Münchhausen.

Within 36 days they arrive at Mars, but when they attempt to land, three floating forts capture the "Interstellar" by means of a yellow ray which benumbs them, and guides the "Interstellar" to the Planet Ruler's revolving mansion where a landing is effected. Flitternix speculates on the probable appearance of the Martians and gives his reasons on which he bases his assumption. Immediately after landing, the Martians place soft metallic caps on the travelers' heads, and they are then conducted to the Ruler's mansion.

This story started in the May, 1915, issue. Back numbers will be supplied at 10c. each postpaid.

"As our host had to go to the other end of the room just then for a few minutes, Flitternix and myself tried thought transmission at once, and we surprised ourselves how well it worked. Not only could we 'talk' in pictures almost at once, but after a while we could tell each other whole sentences. Of course, the unusual strain gave us a headache long before our host returned, which was only to be expected; we had never been used to such hard mental work, and we understood quickly that we must learn the art gradually by constant slow practising and giving the brain a chance to recuperate from the strain.

"As if our august host had divined the strain on our minds during the past hour and one-half since our landing, he immediately began to divert us, and he did this admirably by letting us see for ourselves with our own eyes, instead of making us 'see' with our minds.

"However, we quickly began to understand and appreciate his wisdom in first giving us his historic lecture, because if he had not done this most of the things we saw during the next hour would have been meaningless to us. Thus you will understand that what I am going to tell you now, including the explanations, did not originate entirely in my own mind. Most of my explanations are, naturally, based upon that important lecture.

"We followed our host outdoors, where we boarded his private flyer. This machine was, of course, an anti-gravitational flyer, propelled by atomic engines. It behaved much like our own *'Interstellar'* that is, it had no wings, nor planes, because it is not dependent upon the air. The gravitational attraction of Mars is neutralized by the atomic engine to a certain degree. The more the gravity is neutralized the higher the machine rises. Now, in order to steer the flyer an *Emanation Ray* is used. This ray is the joint product of several elements not known on Earth; the nearest, although a poor analogy, is found in your Radium emanation, but the latter is several million times weaker than the Martian Emanation Ray. This ray is projected into space by means of electricity and another source of energy, which I shall term ION, as yet unknown on Earth, and to be described by me later. The Emanation Ray can be stored just as electricity is stored in a storage battery. When it strikes an immovable object it acts exactly as an oar does when the latter is used in 'pushing off' from a dock, i. e., the boat will move away from land. Precisely so with the Emanation Ray; it is used in controlling the horizontal motion of the gravity-neutralized flyer, and by its means the latter can be guided into any desired direction.

"Our flyer was round in shape, resembling a disc, and measured about 25 feet in diameter. It was almost 6 feet thick, and like most other things we had seen on Mars it was, of course, transparent. In the center was a dome that looked like the conning tower of a submarine, and a slender metallic pole extended from it almost 25 feet into the air. It branched out at the top into three short brackets, at the end of each was a transparent ball about 10 inches in diameter. Between these balls the Emanation Ray played, and the latter could be thrown at will into any direction desired.

"Our flyer was an open one and not covered on top, and there were two 'drivers,' which you probably would call chauffeurs, one forward and one aft. There were no steering wheels and no brakes, nor a horn. The two drivers sat in transparent chairs, not unlike our own, and in front of them was a little round table with small key levers like 'listening in' keys on an American telephone switchboard. That was all.

"As soon as we were seated, our host sitting between us, our 'drivers' pressed a lever or two, and we shot upward with amazing speed. In a few seconds the Emanation Ray went into action, and we began to fly or rather float into an easterly direction. From the position of the Sun, I concluded that it was almost 'Noon,' as the Sun was about overhead; this must

How The "Wireless Wiz" Celebrated Xmas

By Thomas W. Benson

YES; I was burning the midnight oil, or rather *juice,* constructing a high-speed key for the "Wiz." I knew that he wanted this more than anything else and it had to be "some key." Time and money were no consideration, and neither was spared on this work of art. I was buoyed up to my task by the anticipation of the look on the Wizard's face when he would open the box and lift out the shining piece of apparatus on which I was spending so much time in making.

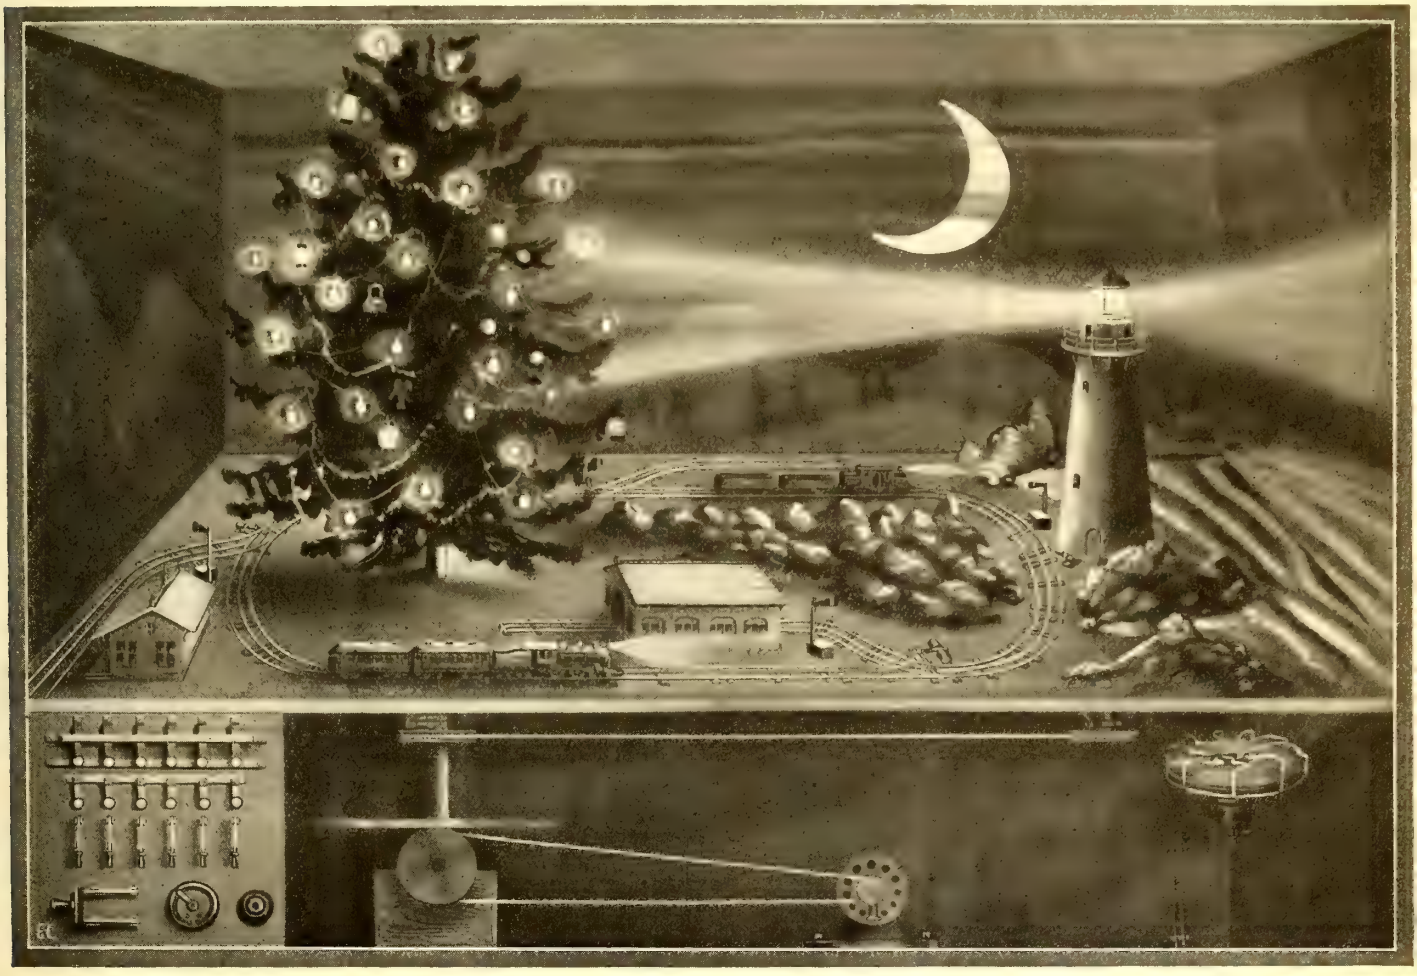
The noise I made in the basement was outdone by that in the ether, for my wrist was nearly gone, returning the good wishes of the season via wireless. In disgust I had shot the closing signal and slid away to the haunts of the rats and cobwebs. The clock in the kitchen had struck one, yet I ceased not.

* * * * * * * *

Time sped on, and that Saturday morning came at last, on which the world does honor to the birth of its Saviour. At six bells I kicked the blankets off and *sat in,* garbed only in my bathrobe and slippers, and nearly had the 'phones burned out by the disturbances in the ether which carried the good wishes that came literally pouring into the set.

I was the first one down that eventful morning and was waiting for the postman as he came whistling up to the door and fairly snatched the box out of his hand. I could not count the time in minutes or seconds that I consumed in opening the box; and, lo! a "wave meter" was revealed nestling in a bed of cotton batting. I reached forward to touch it, and—"ouch!"—I nearly dropped the whole thing. I grinned, for I had detected a soft, buzzing sound issuing from the box that explained everything. Using extreme care, and taking a few more shocks for good measure, I succeeded in getting the wave meter out of the box.

The "Wiz" had included a small but "hefty" medical coil and had arranged two clips that made contact as soon as the lid was removed. A few wires twisted around the box and one to the condenser had served to give me a *shocking surprise.* It was a wave meter that anyone would have been proud to own, and I knew the "Wiz" had spent some time in his "Lab." constructing it.



After I had eaten my breakfast I went out to call on him and, of course, bumped into the usual Christmas morning crowd roaming around half-dressed. They appeared to be waiting for the "Wiz" to start something, and as I came into the room he said, "You're just in time for the ceremony. I'm taking the kids in to meet Kris Kringle."

He stood in front of the door leading to the parlor *and clapped his hands.* The door swung slowly open, and to the strains of a Christmas carol, played on the Victrola, we walked into the land of wonders.

Wonder is a pretty poor word to express my sensation when I beheld the work of art the "Wiz" had wrought over night. The room was darkened, and half of it was taken up with a platform about two feet high and about six feet wide. On one end of the platform was a massive Christmas tree, slowly revolving, and at the other end was mounted a miniature lighthouse on the rocks, against which water appeared to be dashing. The platform was decorated to imitate a mountainous country in the wintertime, and over the whole scene hung a half-moon that vied with the ever-changing beams of light from the lighthouse for superiority.

On the edge of the platform were laid the gifts for the children, and with a shout of joy they dashed for them without waiting to pay any attention to the ever-changing, ever-flashing, vari-colored beams of light that made a charming scene; one indeed never to be forgotten. There was an electric curling-iron for the "Wiz's" sister, Olga. She left immediately with an abashed smile to try it out in the privacy of her own room. There was an electric chafing-dish for mother, and an electric shaving mug for dad, lying beside the usual collection of Teddy Bears and Trumpets that the kids were fighting over. I turned and saw them standing at the door with a smile that would not come off, and dad was feeling his jaw, to see if he was ready to test out the new shaving mug.

I looked for the "Wiz," as I wanted to compliment him on his work of art, but found him bending over a small switchboard, showing Joe how to dispatch the

The "Wiz" Had Quite Outdone Himself. A Miniature Lighthouse Blazed Forth, While Toy Electric Trains Passed Each Other True to Life. The Tree Revolved While the Lamps on it Blinked On and Off Repeatedly.

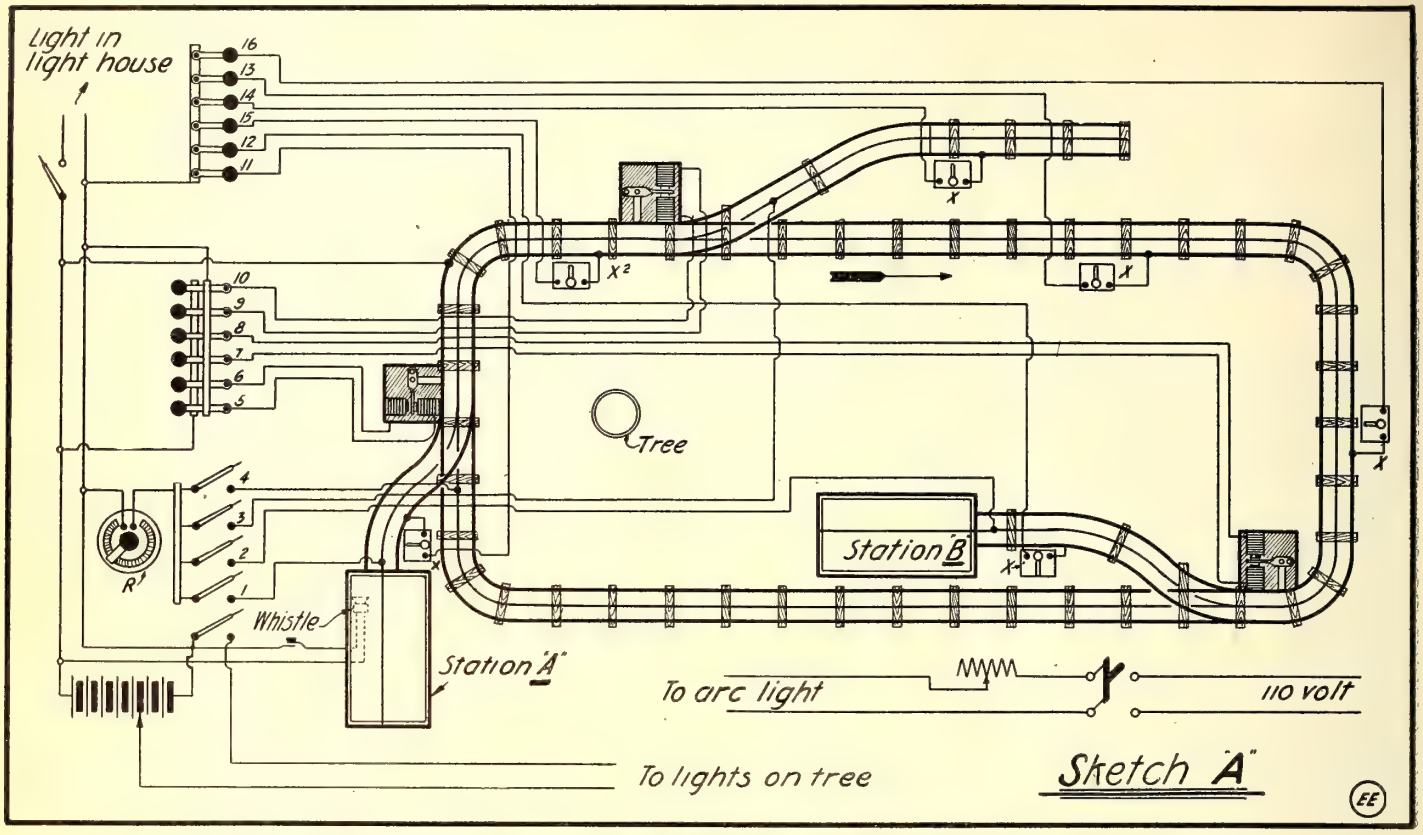
trains on the railroad system. After watching the action for a few minutes, I was practically speechless. He had laid out a railway system which consisted of two stations and a side-track. By closing a switch he would start a freight train from one station and simultaneously start an express train running in the opposite direction around the loop. It looked like a head-on collision, till he pressed a button, and the freight train would shoot on to a side-track and let the express through. After the express had reached the home station, the freight train would be backed off the siding and run to its station. This action could be changed indefinitely and many peculiar and exciting situations came up during the action. He would have the express train about to overtake the freight train when—click—the "freight" would be switched out of the way, with only two inches to spare.

The action was quite natural, for the trains would blow their whistles and emerge from the stations with headlights flashing, glittering on the imitation snow, and with a little stretch of imagination the beholder could readily believe himself on a mountain peak looking down at a scene in one of our many inlets in New England during the winter.

The tiny fir trees on the mountain side, the rising and falling of the semaphores, the whistling of the locomotives, all made such an enchanting scene that it was hard to realize that I was standing in a warm room in the city, and not seated on a mountain top, surveying a picturesque mountainous seashore.

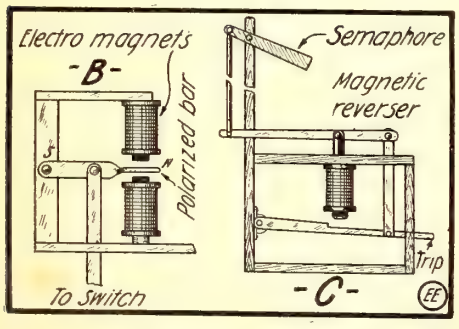
The moon was the final touch to the scene as it shed its pale rays on the landscape, and casting faint shadows just like a real moon. Mountains were painted on the back scene, and the moon appeared to be just rising over the peaks. It was the kind of moon that jewelers and housefurnishing dealers delight in, being an accessory before the fact of many of their sales.

The only object that would spoil this flight of fancy was the Christmas tree slowly turning, while among its branches were flickering numerous tiny lights, and the colored rays from the lighthouse lit up the tinsel and shining fol-de-rols on its branches.



I have seen Christmas trees, many of them, but they all lacked something. Something was always missing, a subtle, but perceptible something that all things should possess when used in the worship of a celestial Deity. They had the gaudy appearance that oftimes means cheapness and lack of refinement.

This tree, however, was decorated very simply, yet did not look bare. It turned slowly on its axis, as though it were showing you, but not without a little hesitation, the wonders attached to its branches, proud of them, but endeavoring to suppress its pride.



My attention was then attracted by the rocks on which the lighthouse was mounted and they appeared to be *glowing* in the semi-darkness. When the lamps in the lighthouse and tree were turned off and the moon had faded away to a faint glimmer, the rocks shone forth in the darkness in resplendent glory and the tree, revolving with its phosphorescent trimmings, put the final touch to the enchanting picture. Again the moon shone forth in all its glory, and the lighthouse once more sent its beams out to sea as I bade the "Wiz" farewell, to go my regular Christmas rounds.

As I left him I promised I would be back for the full details of this wonderful display, and asked him what he had received in the line of presents. With a half-depreciating smile, he replied, "Well, old man, outside of your high-speed key, I got a couple of pairs of slippers and a smoking cap, besides several boxes of those famous or, rather, infamous Christmas cigars. I haven't had time to open all the packages yet, though."

Buying By Mail

By Thomas Reed

I WONDER who the wise man was who first discovered that a boy's trade was worth having. As I look over the experimental supply catalogues of the present time—with everything that a "bug" could want pictured out so exactly, offered in the smallest quantities, and priced so cheaply—I am reminded of the humble figure we "old bugs" used to cut in the "marts of trade."

Those marts certainly bore us in no high esteem. It was a dreaded ordeal for us to meet the lordly hardware clerk and presume upon his august attention for five cents' worth of copper wire, or a quarter of a foot of brass rod. Our reception varied from an amuséd indulgence that made us afraid to come again, lest we wear out so kind a welcome—down through a snappish compliance that usually carried a crushing overcharge—down, down to the icy depths of "we don't deal in such small quantities."

How many times I have timidly inquired the price of some coveted material, such as copper burrs, to receive the answer: "So much a pound." A pound! A vast, uncertain quantity that would make me the envy of my fellow "bugs" in that one particular and bankrupt otherwise! The word "pound" gives me a shiver to this day.

And people never sold finished parts. "Oh, no," they said, "we're too sharp for that. If you could buy that one impossible piece, you would make the whole article, and we should lose a sale." Such was the logic of merchandising then. So the "boughten" commutator that we wanted to put the finishing touch on our home-made dynamo remained unbought. But what booted it?—as Shakespeare was wont to inquire. We found a substitute; and the stingy vendor, instead of selling a thousand commutators, sold no dynamos, or few, and disappeared from the haunts of men.

You lucky "bugs" of later times, take a day off and use it to realize your blessings. You can buy a single milled nut, or an inch of Wollaston wire, or ten cents' worth of galena crystals, and have them delivered at your door, and not grudgingly, but with a hearty "thank you; come again." And parts? "Why, sure; make all of it you can, and buy the rest from us." The best in the house is none too good for the amateur now.

The mail order! There can be great discoveries entirely outside of the physical sciences. The modern mail-order system is as truly an invention as the gas engine and, like it, was formed from several contributory sources. The development of illustration through the photographic half-tone and the machine-line engraving was necessary for the exact description of goods by catalogue. But another factor, intangible though it is, was requisite before the system could be a success—an insistence almost fanatical on the square deal.

It is greatly to the credit of the mail order that it lived down the errors of its youth. 'Way back in the '70s it was in decidedly ill-repute. The picturesque expression "Stung!" had not been added to the language, but the sting was certainly among those present in all advertising columns.

Those were the days of shin-plasters. Do you know what "suspension of specie payment" means? Say no, and say it with gratitude. Uncle Sam was paying his heavy war expenses in paper money, and Unc's gold and silver coinage had fled from the light of day. That's what economists call a necessary consequence, and you have to take their word for it; but I saw its inner workings. Whenever I peeped into the family strong-box I saw there a little roll of silver "quarters," hoarded since the beginning of the war, when the word went round that they would be "worth a premium."

" * * * It was a Dreaded Ordeal for Us to Meet the Lordly Hardware Clerk * * * to Purchase Five Cents Worth of Copper Burrs.

Mother had put them there, and I think her most reasonable hopes of profit took the form of a walnut chamber set. Mother was speculating. Dear old mother, she never speculated on anything else, except on the love and loyalty of her children; and sometimes, I fear, she must have placed those in the same disappointing category as the silver quarters!

So we used "fractional currency"—little young paper bills, about three inches by two, representing 50 cents, 25 cents, even 10 cents; and, believe me, even that humble form of money was hard to get. Boys had no "allowances" in those hard times—except the allowance to have nothing; but deep down in the boy-world there was a system of trade and finance. We collected rusty nails, swapped knives. Instead of stock transactions, we played marbles "for keeps"; though I assure you no dealings were permitted on margin. Well, this boy-wealth, accumulating as slowly and painfully as any other wealth, eventually blossomed into the small copper coin of the upper realm, finally to ripen into the glorified fruit of fractional currency. I have had the pleasure since of gazing upon a rather large banknote (not mine, to be sure—it was for $50,000, or such a matter), but it entirely lacked the haughty impressiveness of my first 25-cent shin-plaster.

And even while I gloated over my magnificent aggregation of capital, frenzied finance got it. I can see that seductive advertisement now, picturing a bewildering medley of articles—a printing press, a Japanese parasol, a trick spider, and a dozen other lures of childhood—all for exactly my fund of 25 cents. Wonderful coincidence, the chance of a lifetime. Really worth $1. Sell them for their real value and grow rich.

The old folks were sceptical—the Pacific Bank, it seems, had spoken in some such strain—but I knew better. Good-night, 25; a fond farewell! To New York it went, and for days I waited, each day a year long. With every rumble of a wagon I was at the window to see the express package trundled in. It was the postman, however, who handed out a box two inches by four—plenty large enough to contain a world of woe. Every article was there, *but in miniature form*—toys for a baby to suck the paint off, not goods commanding traffic in boy-commerce. The advertisement had not mentioned that detail. I was face to face with the dreaded "ketch."

I considered my young life blighted, of course, but it might have given me some comfort had I known that the mail order was blighting itself as well. It took a generation of time, strict laws, and the teaching of experience that honesty is the best policy before the mail order, in partnership with the square deal, came into its own.

You young "bugs" really don't fully appreciate how good the world treats you these days. No more "ketches" in these days of watchful post-office inspectors, no sir-e-e! When you stick your money order with your letter in the envelope, and send it off to that big mail-order house, you know just how long it will take till the postman hands you that pair of long-coveted "classy" 'phones. And, believe me, "bugs," those 'phones will be a whole lot better than the cut showed, or the description read. And on top of this, if you're finnicky and don't happen to like them, why of course you send 'em back. And in due time the mail order returns your money, if you want it.

Take it from an old "bug," you young "buglets" have lots to be thankful for.

The largest electric range in the world has been placed in the Montana State Hospital at Warren Springs, Mont. The range is more than 30 feet long. It is equipped with eight ovens and will prepare meals for more than 1,500 persons daily.

To Foil Submarines With Undersea Searchlights

THE submarine and mine constitute two of the greatest menaces to warships and other vessels under modern war-time conditions and to offset the utility and efficiency of same has interested many inventors both in this country and abroad. Inventors and scientists have advocated from time to time various methods whereby they hoped to render the submarine at least an obsolete engine of destruction.

What bids fair to be a successful combatant of these submerged terrors of the sea is the invention recently brought out by Prof. Herschel C. Parker and Edwin G. Hatch, of New York, mechanical engineer, associated with Prof. Parker in his engineering and research projects.

The accompanying illustration will give an adequate idea as to the method of utilizing this arrangement as perfected by Messrs. Parker and Hatch. Simply explained, it makes use of a powerful searchlight beam which is projected through a suitable focusing tube, fitted with reflecting lenses and mirrors and an instrument termed a *mariscope* (but really the same as the periscope used on all submarines) is used to sight through the water along the light beam, aforementioned, and which is turned about on the axis of the projecting tube until it intersects a hidden mine, the hull of a submarine boat, etc. When the mine, or other engine of destruction, is accurately located by this apparatus, the range of same, as well as the angle at which it lies from the hull of the war vessel, is measured accurately by scientific instruments, such as used on regular cannon. These angle and range figures are communicated to the gunner, who then discharges a special form of projectile resembling a torpedo. This projectile, of course, is so aimed as to strike the mine or other submerged devise, and it is not detonated until it is close to the submerged body proper. It is then exploded by the gunner, who closes an electric switch, causing a current to flow along the attached wires to the projectile, fusing a fine wire detonator inside the missile.

On first sight this invention may seem to be a mere theorist's dream, but from tests that have been made in the taking of pictures under water by means of a powerful searchlight, it is definitely asserted that submerged objects can be seen in this way for distances of from 1,000 to 2,000 feet. These distances, of course, may be greatly increased by using a proportionately greater amount of energy in the searchlight projector. The larger projecting tube, into which is fitted the searchlight lenses, mirrors, etc., is termed a *helioscope*, and the instrument mounted in the smaller sighting tube through which the submerged body is viewed is called a *mariscope* by the inventors. In the illustration herewith given it is, of course, to be taken into consideration that the proportionate distance between the mine and war vessel proper is quite close, but in practise the distance would naturally have to be greater than that shown, for the reason that the explosion from such a device would affect the vessel undoubtedly unless it was more than 300 feet away. If this device is actually tried out and adopted by the navy it would have to be arranged most probably in some such manner as our illustration shows, so that a protection would be afforded the gunner and sighter from ordinary rifle and machine gun fire.

For details regarding this latest scientific invention for the detection of submarines, etc., the following considerations will help to make clear the *modus operandi* of the apparatus in general:

At the top of the tube, the latter being represented by the figure 10 in the diagram, is a powerful electric searchlight 11, of any approved kind, which throws its rays through lenses 12 and 13, arranged to hold the rays in parallel relation. These rays are directed against a mirror 14, which is arranged at an angle at the lower end of the tube, and refracts the rays through the lens at the outlet of the tube. This latter lens can be shaped to throw the rays in parallel relation or to give any amount of divergence desired.

The tube, with the searchlight, lenses and refracting mirror, is attached to the outside of the vessel. Inasmuch as the searchlight is to be used on deck, a light of the highest power can readily be used. The tube can be adjusted so that it may be raised or lowered to bring the light to any desired point. Likewise the mirror can be moved for the same purpose, but the details of this adjustment have not as yet been considered exhaustively, because they do not concern the general scope of the invention. If a light is projected on both sides of the bow, the field which it is possible to light is almost equivalent to the field of human vision.

When the submerged field is lighted, the next step is to observe it properly, and to

Latest Scheme for Locating and Destroying Submarines, Mines, etc., by Means of a Powerful Under-Water Searchlight and Periscope Device. Developed by Prof. Herschel C. Parker and Edward G. Hatch, M. E., of New York.

By Wireless 'Phone from Arlington to Paris

THE spoken word uttered in Arlington, Va., has been heard in Paris, France, on three different occasions recently, and particularly on the evening of Oct. 20 last. On that memorable date the human voice was projected across the Atlantic for the first time in history, and "Hellos" and "Good-byes" spoken in Arlington were heard and understood in the French capital, 3,800 miles from the point of transmission.

Announcement of the epochal achievement was made officially by the American Telephone & Telegraph Co., following cabled confirmation of the success of the wireless telephone experiments received in New York and in Washington from the company's engineers in Paris.

H. E. Shreeve and A. M. Curtis, of the staff of John J. Carty, the chief engineer of the American Telephone & Telegraph Co., went to France to represent the company in the transatlantic experiments.

Owing to the fact that France is at war and that wireless is playing a most important part in the working out of the French military communication system, it was with extreme difficulty that officials were persuaded to permit the use of the 1,000-foot Eiffel Tower station at Paris for the receipt of the radiophone messages from Arlington.

Only a few seconds at a time, in periods far apart, were allowed the American engineers, during which they were permitted to listen for the greeting from far away Arlington. In order that there could be no doubt of the genuineness of the tests, officers of the French Government, two or more of whom represented the army, were with Messrs. Shreeve and Curtis in Paris, while Colonel Samuel Reber, of the United States Army Radio Service; Captain W. H. G. Bullard, head of the United States Naval Radio Service, and other American army and navy officers watched intently the experiments at Arlington.

Mr. Carty, who not only heads the engineering staff of the telephone company but is president of the American Institute of Electrical Engineers, directed the experiments. Following the announcement of the success of the tests, he predicted that wireless telephonic communication between New York or any other American city and all the great cities of the world was but a matter of time.

The announcement given out at the offices of the American Telephone & Telegraph Co. follows:

"Transatlantic wireless telephony is an accomplished fact. Observers listening at the Eiffel Tower in Paris have heard speech sent out by engineers of the American Telephone & Telegraph Co. from apparatus developed by that company and the Western Electric Co. and installed at Arlington, Va. The equipment used was that employed a few weeks ago in talking 4,900 miles by wireless telephony to San Francisco and Honolulu."

That speech has actually been transmitted from Arlington to observers stationed at the Eiffel Tower, Paris, marks the conclusion of another chapter in the experiment undertaken by the American Telephone & Telegraph Co. When Mr. Carty's engineers commenced work on the long-distance wireless telephone experiments observers with receiving apparatus were sent not only to Panama, San Diego, Mare Island and Honolulu, but also two engineers, H. E. Shreeve and A. M. Curtis, were sent to Paris. Through the courtesy of the French Government, limited facilities for listening at the Eiffel Tower station were placed at their disposal.

Graphic Illustration of Arlington to Honolulu and Arlington-Paris Radiophone Tests Recently Conducted; the Distances Covered Being 4,900 and 3,800 Miles Respectively.

Full appreciation of the interest and extreme courtesy of the French Government can be understood when the great value of the Eiffel Tower station for military purposes is remembered. Due to the military necessities, the amount of time available for the wireless telephone experiments was so limited as to constitute a serious handicap to a speedy completion of the work. Added to this was the handicap resulting from the fact that all regular communication between Mr. Shreeve and the engineers in America had to be by cable and was subject to long delays.

Notwithstanding the difficulties of communication, the limited amount of time available for receiving, and despite heavy interference from high-power stations in the neighborhood and from static disturbances, speech was successfully transmitted on several occasions since.

In a cable message received by Mr. Carty concerning the results of the tests, Mr. Shreeve reported speech received by him and the time of its reception at Paris. The matter received at Paris was that sent from Arlington, where R. A. Heising, B. B. Webb and other telephone engineers were manipulating the apparatus at the transmitting station. Mr. Webb did the talking throughout the final experiments.

Simultaneously with the reception at Paris, speech sent out from Arlington was received on the wireless antenna at the Western Electric laboratories in New York and at the temporary station of the American Telephone & Telegraph Co. at the Pearl Harbor Navy Yard, Honolulu. Mr. Espenschied at Honolulu reported that he heard the conversation throughout the entire schedule and that Mr. Webb's voice was easily recognized.

After the announcement was issued Mr. Carty, who was in Chicago, was called up on the long distance telephone and asked to tell the story of the achievement.

"Tell us all about the Paris achievement," said an officer of the company in New York.

"Is anybody 'listening in?'" Mr. Carty asked, quickly guessing that newspapermen also were at the New York end of the line.

Mr. Carty laughed when told he had guessed rightly, and after a little persuasion told the story of the test.

"It was on the night of Oct. 12 when the first signal from Arlington was caught by Shreeve, in Paris. Shreeve heard the 'Hello' of Webb at Arlington several times. Again, the following night, the words were heard, and on Oct. 20 the words were again heard, not only in Paris, but in Honolulu, by Lloyd Espenschied, who cabled to-day that he heard the 'Hello, Shreeve,' and the 'Good-bye, Shreeve,' uttered by Webb in Arlington so plainly that he was able to recognize the voice as that of Webb.

"The announcement of the success of the experiment was deferred through courtesy to the French Government, and it was not until Oct. 22 when further cable confirmation of the success that has attended our efforts made it possible for us to take the public into our confidence and tell what has taken place.

"While Webb was talking to Shreeve he repeated the 'Hello' and 'Good-bye' several times, and they were heard each time in

Audion Bulbs as Producers of Pure Musical Tones

By Dr. Lee de Forest

NOW that the attention of the public has been drawn to the astonishing use of the incandescent vacuum lamp, not only as a receiver in transcontinental wireless telephony, but as a generator of power necessary to transmit the voice in the first place, it may be interesting to know that this incandescent lamp, or "audion," has another entirely different field of utility—that of producing sound or music. Music from light—that, in a word—is the latest magic of this lamp.

Tradition has it that on the plains of Egypt three thousand years ago the giant statue of the Memni emitted weirdly beautiful notes when struck by the first rays of the rising sun. To-day, after three thousand years, it is interesting to know that we have at last reached the point of transmitting light rays directly into sound waves; that which has hitherto been only for the pleasure of the eye can now be made a pleasure also to the ear.

In my laboratory there are a number of small spherical incandescent bulbs, from which I am able to obtain a succession of musical notes, clear and sweet, of surprising volume, the pitch and timber of which can be varied almost at will to imitate any musical tone of an orchestra. Here, then, in the laboratory we have for the first time the music of the lamps.

While working on my experiments in developing the audion as a wireless telephone detector and incidentally as an amplifier to be used on long distance telephone lines I made the discovery years ago that when the circuits of the audion were connected in a certain way a clear, musical note was heard in the telephone receiver, which was connected in one of these circuits. The quality of the note was very beautiful, and I found after a little experimenting that I could change this quality of timber into a great variety of sounds, imitating, for example, the flute, oboe, cornet, stringed instruments and other sounds which, while pleasing to the ear, were quite unlike those emitted from any musical instrument with which we are familiar. The pitch of the notes is very easily regulated by changing the capacity or the inductance in the circuits, which can be very readily effected by a sliding contact or simply by turning the knob of the condenser. In fact, the pitch of the notes can be changed by merely putting the finger on certain parts of the circuit or even by holding the hand close to parts of the circuit. In this way very weird and beautiful effects can be obtained with ease.

At the earlier stage of these investigations I found that the pitch of the note could also be varied by a simple arrangement, such as a graphite pencil mark on a piece of paper or slate, connected across between certain parts of the circuit, and that this afforded the most ready means of altering the pitch and quality of notes.

Acting on these discoveries and suggestions I found it was a comparatively simple matter to arrange a crude scale similar in function to that of an organ, with switches in place of the ordinary keys, so that by pressing certain keys I could cut out, or in, more or less inductance or capacity or resistance, thus changing the notes emitted from the telephone receiver at will.

In order to bring the volume of sound out large and full in the room it was necessary to connect a number of loud speaking horns connected with telephone receivers similar to those which you have sometimes heard in the central railroad stations as train announcers. With these horns distributed in different parts of my laboratory, or grouped together in one place, the sound can be made to emanate from all quarters of the room or from one corner, as I choose.

In producing pure musical tones with an ordinary audion detector bulb, or with the special large size audion oscillator bulbs, the arrangement is shown diagrammatically herewith. At A there are placed in circuit two inductances, inductance No. 1 being of adjustable value, while inductance No. 2 has an iron wire core within it and also has taps taken out at equidistant numbers of turns to E connected to a series of switches or keys (and it is well to use, say, eight keys corresponding to a musical oc-

The Audion Piano May Entertain Us in the Near Future With Music Purer Than That Obtainable With Any Instrument Now Available. Also it Will Imitate Faithfully Any Orchestral Piece.

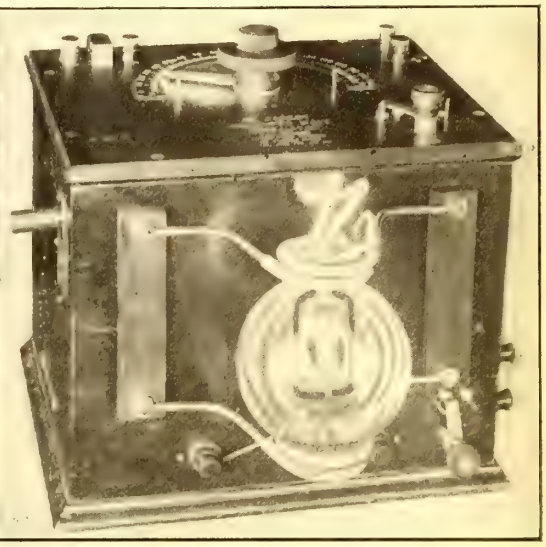
tave, thus giving eight notes). Of course, to produce more tones it is necessary to use more inductance taps, or condenser No. 3 may be of the adjustable type, so as to produce a variation in the musical tones developed in the circuit.

Using an ordinary audion detector bulb, the high voltage battery No. 4 may give 45 to 50 volts, composed of the ordinary 3-cell flashlight batteries. Where the large size oscillation generator bulb is employed 110 volts D. C. is adaptable to this part of the circuit. A D. P. D. T. throw-over switch may be used, as shown in the diagram, to throw the tone-producing audion on to a pair of ordinary radio receivers or on to a loud-talking receiver. The experimenter who wishes to try out this arrangement should try making different adjustments in the circuit, including the filament current applied, until the best results are obtained.

Several years ago, as the public of New York remembers, a very elaborate undertaking was started for producing music by gigantic electric dynamos mixing the tones from 100 or more machines in accordance with the wishes of the skilled performer who in that way produced musical tones of large volume, and which similated almost those of every instrument in an orchestra. This instrument was termed the telharmonium. The idea was to generate this music at a central station, where highly trained organists were constantly at the keyboard, and distribute it through telephone wires throughout the city to hotels, restaurants, lobbies, concert halls and private residences. This was a most meritorious idea and deserved great success. However, the extraordinary heavy cost of the original plant, the maintenance of the wire cables, etc., rendered it commercially a failure.

Now, with the audion or incandescent lamp as a generator of musical tones, we have on a small scale all of the possibilities of the large telharmonium.

Now, this same little bulb which I have just described, in addition to being a receiver of wireless messages and an amplifier for long distance wire telephones (in which use it is now employed on the transcontinental lines of the American Telephone & Telegraph Company), can be made to actually generate alternating current. It receives the energy which is expended in these currents from the dry battery or dynamo. The audion is, in other words, a transformer of energy. The alternating current, if of low frequency, can actuate the telephone diaphragm and make musical notes which the ear can hear, and this is the germ idea involved in the musical instrument which I have just described. The bulbs for musical purposes which I have thus far used are not larger than three inches in diameter.



At the present time I am using one bulb for an octave on the musical scale, with the arrangement of keys and switches such that from this one bulb I can produce the notes of that octave by pressing the appropriate keys. For the next octave another bulb is used, and so on. The output of all these bulbs is made common to one set of telephone receivers or loud speakers, so that the total energy in the form of sound is that of all the bulbs which are operating at any one time.

In the same way when used as a wireless transmitter or generator the high frequency alternating current from the various bulbs is combined on the same transmitting aerial wire or antenna. Thus, if one oscillator is "developing" one-half horsepower 300 of these bulbs connected in parallel and acting on the same antenna will develop 150 horsepower. This is exactly the method which is used at Arlington by the Western Electric Company in generating sufficient energy to send the voice via radio to Honolulu.

In all my work with the audion—and I can imagine no device in the whole realm of practical physics of greater fascination than this little audion principle—I have never found any phase of its unlimited possibilities quite so interesting as this of producing musical notes. Although not a musician myself, I have always been exceedingly fond of music. The idea of producing beautiful musical tones by an entirely new method unknown to all our great composers and perhaps offering to future composers new fields for their genius, has truly captivated me. In the next twelve months I hope to be able to produce an instrument which will be far enough perfected so that I can turn it over to musicians to work out the thousand and one details of musical perfection which such men alone are capable of introducing.

The illustration here presented as worked out by the editor of this journal shows the probable appearance of an "Audion piano" of the not far distant future, utilizing the de Forest musical tube principle, by which means it is possible to produce the purest tones of any value ever obtained by any existing means. The various controlling handles are observed on the front of the piano, and the music is emitted from the large horns on top of same. A storage battery of small size will supply sufficient current for this wonderful instrument, and the feet might be utilized in assisting to effect variations in the audion bulb circuits. Each bulb is capable of producing an octave or eight notes. The large keyboard similar to those used on organs is well suited to this instrument, with which it will become possible to reproduce imitations of any band, orchestral or stringed instrument, etc. Extra oscillator bulbs for emergencies for use in case one should break, are seen lying on the stand at the left. It should be thoroughly understood that music produced by such an instrument as this is much purer in every way than that produced by any other type of musical instrument now known to the art and, moreover, the music is electrically produced in contradistinction to that produced by the usual musical pieces which yield sounds mechanically, so to speak.

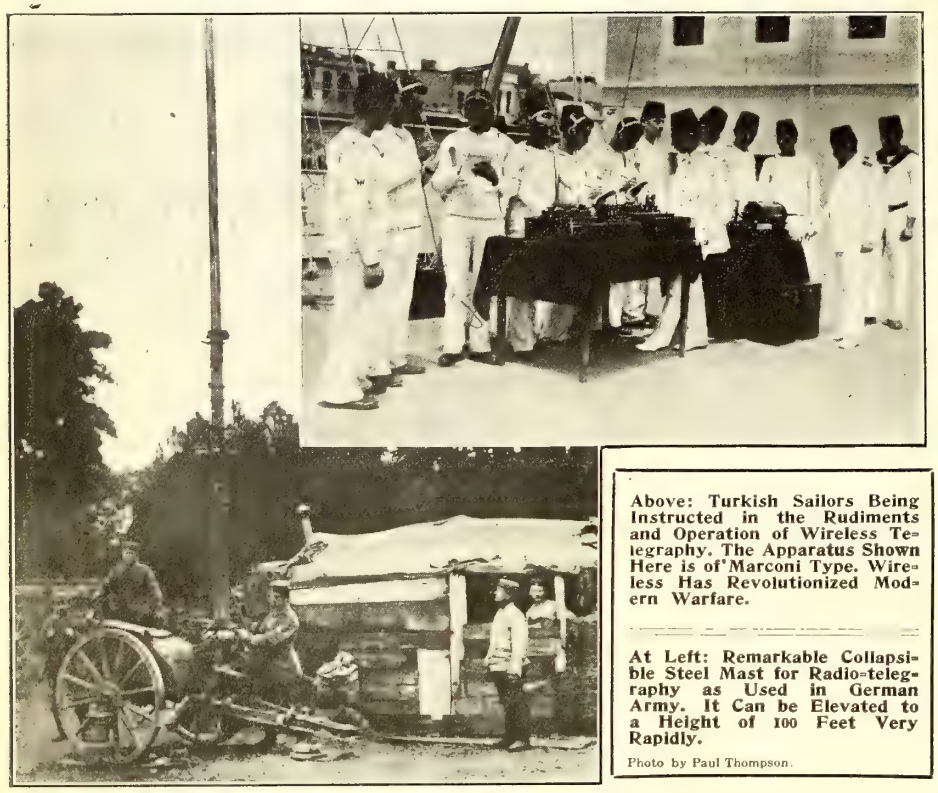
PENETRATIVE POWER OF COLORED LIGHTS.

It may interest those engaged in sign lighting and signaling to know that lights of different colors show varying degrees of ability to penetrate the atmosphere. Some calculations, based on experiments, give the following results for the minimum intensity visible in a clear atmosphere at a range of two miles. (In these calculations light sources of equal area are assumed.):

Red	2.37	candle power
Green	1.96	" "
White	1.71	" "

The range of visibility of any light source depends, of course, upon the intensity of the source. However, it must not be supposed that by doubling the intensity the range will be doubled. The relation between the range and intensity varies for different colors.



The great absorption of light in an atmosphere laden with water vapor is a well-known fact. A few years ago the German Government found that arc lights of 1,000,000 C. P., which were installed in a lighthouse, had less ability to penetrate a fog than a 10,000 candle power oil lamp. This indicates that electric incandescent lamps having more red rays would be superior to arc lamps for use in light-houses.

Dust and smoke unquestionably interfere more with the transmission of blue or green light than with red light. Therefore, when viewed through the atmosphere, all lights should appear redder. On weighing the evidence, it seems that reddish illuminants should have more penetrative power that bluish lights, and where details are to be distinguished at a distance the red light is more readily focused than by any other color. Hence the use of red danger signals on ships and railroads.

Wireless Telegraphy Aids the Teutonic Allies

The photographs presented herewith illustrate some of the up-to-date wireless telegraph equipment in use by the German army and also by the Turks. The smaller photograph shows a complete Marconi radio set as used in teaching the Turkish sailors the rudiments of the art. The outfit as perceived includes a multiple valve tuner of the latest Marconi style, as well as a magnetic detector. The transmitter comprises a 10-inch spark coil, together with storage batteries and other auxiliary apparatus. Regular wireless messages are being received by the students here shown. The Turks have made good use of wireless telegraphy in their numerous brilliant maneuvers on land and sea.

The larger illustration shows a telescopic steel radio mast which can be elevated to a height of 100 feet very rapidly, and the machinery for performing this work is mounted on the truck here depicted. Suitable guy wires are provided for strengthening the mast as it is projected upward, and the total work of raising same to its maximum height, ready for the purpose of transmitting and receiving messages over a fairly large range, can be accomplished in a few minutes by the well trained German radio corps. The wireless apparatus is contained in another cart not shown in the picture. The whole equipment forms a very compact and easily portable outfit.

Above: Turkish Sailors Being Instructed in the Rudiments and Operation of Wireless Telegraphy. The Apparatus Shown Here is of Marconi Type. Wireless Has Revolutionized Modern Warfare.

At Left: Remarkable Collapsible Steel Mast for Radio-telegraphy as Used in German Army. It Can be Elevated to a Height of 100 Feet Very Rapidly.

VINELAND HIGH SCHOOL RADIO ASSOCIATION.

The Vineland High School Radio Association, of Vineland, N. J., was recently organized. Leslie H. Adams was elected president; Firman A. DeMaris, vice-president; Franklin Lamb, secretary, and Frank M. Comfort, treasurer and advisory president.

The association has secured permanent rooms, through the kindness of the Board of Education, in the physical laboratory of the new Vocational High School.

The aerial will have an average height of 100 feet and a length of 250 feet. The set will consist of a ½-k.w. transmitting set and a receiving set of standard make.

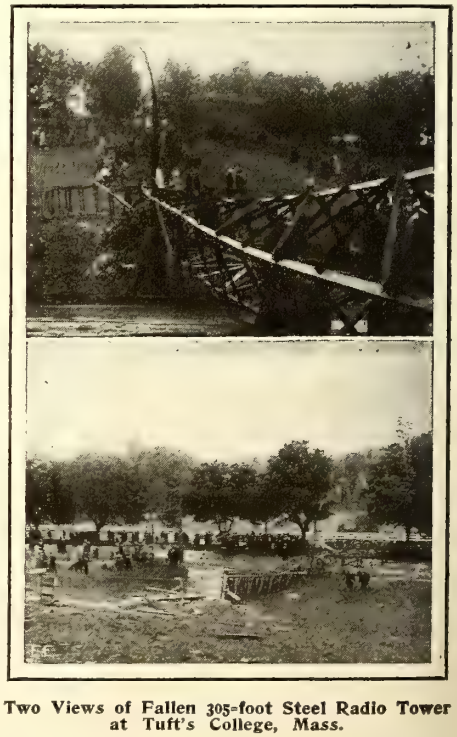
The object of the association is to bring the amateurs of Vineland and vicinity in closer relation and to purchase elaborate equipment which would be impossible otherwise.

The association would like to get into communication with other clubs. All correspondence should be sent to Franklin Lamb, 623 Elmer street, Vineland, N. J.

THE MOST LONESOME RADIO STATION.

On Swan Island, in the Caribbean Sea, is situated what is probably the most isolated wireless station in the world. The station crew is made up of three operators, two engineers, a cook, a machinist and three laborers. No women are permitted to land on the island. Men who express a willingness to go to Swan Island are obliged to sign a contract whereby they agree to remain at least 18 months or waive their right to free return transportation. Those remaining the full period of service are returned to their homes by way of one of the Central American ports and are granted six weeks' vacation with full pay.

Strangely enough, there is no difficulty in obtaining men to man the station. Applicants, indeed, exceed the number of vacancies. Board and lodging, of course, are supplied, a boat bearing all provisions necessary, including fresh meat, and the mail as well, arriving regularly every two weeks. Some men have remained on the island as long as two years and a half and, subsequently, have been glad to return to the station.



305 FOOT RADIO MAST BLOWN DOWN.

On September 26 last the 305-foot steel wireless tower of the American Radio and Research Corporation was blown down at Tufts College, Mass. Through carelessness in erection details the tower fell, it is claimed. The accident was the result of insufficient temporary guying. It had been erected to its full height, but was not entirely completed. It was made up of structural steel with a cross-section of 3 feet 4 inches square, and followed the same dimensions all the way up; the total height was 305 feet. The plans called for three sets of guy ropes at intervals of 100 feet of height. The two lower sets of guys were permanently in place, but some 5-16-inch steel rope was fastened temporarily to the top. As the design called for ¾-inch crucible steel guys for the top, it is evident that the guys used temporarily had an ultimate strength of only 1-12th that called for by the plans. The high wind of September 26 last parted the temporary 5-16-inch steel rope, allowing the top of the tower to sway out, thus bringing into play enormously high stresses at the next lower set of guys. This undue strain snapped first the middle set of guys and then the lower ones.

Some interesting features were noted in the falling of this tower. There were no signs of buckling, the tower falling as a unit indicating great rigidity. It fell across a street railway line, cutting down the trolley wires and feeder cables across the tracks of the Boston & Maine Railway, derailing a locomotive. When the locomotive fender caught the end of the mast it dragged the tower 50 feet down the tracks, twisting the steel somewhat. It was remarkable, however, the way the steel held together, shearing off the bolts rather than pulling out the bolt holes.

The tower was insulated from the ground. Some of the base insulators remained intact, although a few were crushed, due to the side thrust of the falling mast.

The rebuilding of the tower was started immediately. After the new insulators were in place and the cement hardened the steel work was started anew. It is now up 60 feet and should be completed within a short time. All the anchor blocks were perfect, showing no trace of the strain exerted when the tower fell.

Two Views of Fallen 305-foot Steel Radio Tower at Tuft's College, Mass.

Never dust electric globes while unlighted. The static electricity generated will break the filaments.

POWERFUL SEARCHLIGHTS WORK WONDERS IN MODERN WARFARE.

In modern warfare some of the greatest battles are not fought in the daytime, but at night, when darkness provides a mighty impenetrable blanket over land and sea. For that reason the enormous armies now engaged in the titanic struggle in Europe invoke the use of powerful electric searchlights which blaze forth over the battleground at night, so that advances and sorties may be made regardless of nature's handicap. Our illustrations show a clever method for handling, to the best advantage, a powerful electric searchlight projector and, moreover, its mounting is cleverly placed on a specially constructed wagon, as perceived. This vehicle carries at the rear two large reels of flexible cable, which serve to supply the arc lamp with current from a petrol engine and dynamo plant similarly mounted on a wagon, but located in most cases at some distance from the projector.

When the searchlight wagon has reached the point where it is to be used on the field the telescopic, collapsible framework here shown is elevated in a few seconds to any desired height and the searchlight can now be swung to whatever direction desired. A flexible electric cable leads down from the projector case to make connection with the wires leading back to the dynamo truck, as aforementioned.

This outfit is also equipped with a military type telephone instrument, whose circuit runs back to the rear army guard. Note how the truck is partially covered with pine boughs in an effort to conceal the outfit as much as possible from the reconnoitering aeroplanes of the enemy during daytime. Some of these schemes are carried out in such detail that the apparatus cannot be observed at all, even when the scouting aeroplane flies but a short distance above the earth. The particular searchlight here shown has done effective duty in Northern France, and, as may be judged from the pictures, this unit forms a part of the wonderful German signal corps equipment, which is said on good authority, to be second to none in the world to-day. It must be remembered that in most instances, not one or two searchlights are used on the battlefield, but whole batteries of them are brought into play simultaneously, so that the ground is brilliantly illuminated for several miles, thus for all practical purposes they take the place of the sun itself. Occasionally one of these powerful searchlight beams spots an enemy's aeroplane at night, and in several instances it has resulted in the flying scout being brought to earth in short order by the effective use of anti-aircraft guns.

The majority of these devices operate on 80 to 110 volts, direct current, and consume from 5 to 15 kilowatts. Some searchlights require less, where they are used for minor work, and likewise some of them take more energy than above mentioned. The American Army and Navy are equipped with some of the largest projectors extant, several of which measure 60 inches and more in diameter across the reflector. The front opening of the lamp cases are closed with glass, but this is not in one piece. It is divided up into several narrow strips to permit greater facility in replacement, and also to more efficiently take care of the unequal expansion and contraction of the glass, due to the enormous amount of heat developed by the arc, and which is moreover reflected against the glass by the parabolic mirror in the rear of the lamp housing.

HOW THE WIRELESS "WIZ" CELEBRATED XMAS.

(*Continued from page* 390.)

"Well, see you later in the day," I sang out. * * *

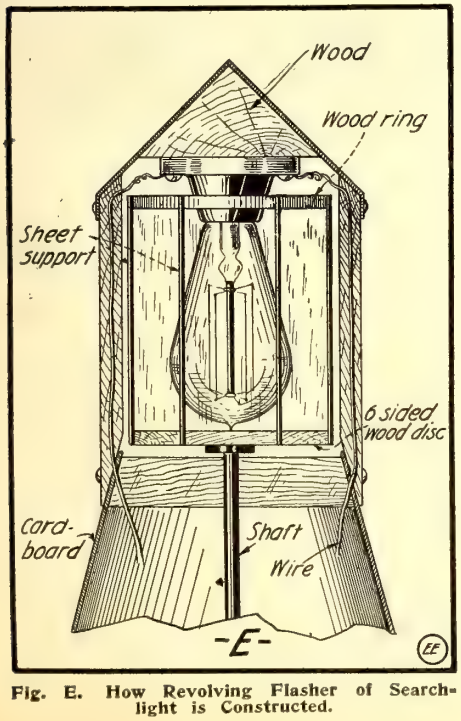

Fig. E. How Revolving Flasher of Searchlight is Constructed.

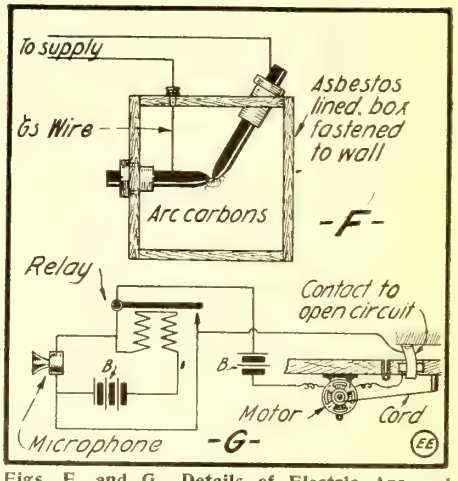

"Are you ready for the dope now?" inquired the "Wiz" that night at 11, as he sank into the chair at his desk and drew forth a few sheets of blank paper, on which he proceeded to make some sketches. "Well, I'll now 'wise you up' on the railroad stunt first. I was certainly stuck for a while on the switches for this system, till I got into communication with a New York electrical firm and managed to get hold of a complete list of miniature railroad supplies to fill my bill. I used two stations—'A' and 'B' (see sketch A)—and one siding made of standard track.

"The three switches were electrically operated from the switchboard and were made similar to this sketch B. Two magnets were mounted with a pivoted magnetized arm to play between them. This pivoted arm was fastened to the bar that swung the switch, and by throwing the current in one direction or the other I was able to open or close the switch.

"The third rail on the side-track and stations was disconnected from the main system, and I had switches 1, 2 and 3 arranged to control them, while switch 4 controlled the current to the main track. The electric switches 5, 6, 7, 8, 9 and 10 controlled the operation of the track switches. I also rigged up magnetically controlled reversing stops at several points, marked X, controlled by keys 11, 12, 13, 14, 15 and 16. These reversers also operate the semaphores by means of the sliding rod, 'R,' pushing the arm into 'Danger' position.

"Now the operation of the system can be briefly outlined as follows: Making the freight train's station, 'A,' and the express train's station, 'B'; then, by closing the switch 1, the freight train is started out on the main track and runs in the direction indicated by the arrow. When it has just passed the express station we may throw the current into that track by closing the switch 2, and the express train will start out in the opposite direction. It will look just like a head-on collision, but by depressing the key 9 the switch is opened that allows the freight train to run onto the side-track; and the button 14, controlling the reverse, is pressed at the same time and the reverse gear will cause it to

The United States Advisory Board and Its Personnel

THE newly-appointed United States Naval Advisory Board of scientists, inventors and engineers, which is the outcome of an excellent idea originated by the Secretary of our Navy, Josephus Daniels, recently held its first meeting and several important matters were taken up at that session. A consulting staff of specialists, such as here brought together, should have been available for the benefit of our Government many years ago, and it is really remarkable that such an idea was not formulated and carried through long before now.

The photograph herewith shows the members of the Advisory Board at their first meeting in Washington, D. C., and below is given a brief outline of the qualifications of the savants and engineers who make up this staff, which is headed by Thomas Alva Edison as Chairman of the Board.

Mr. Edison is probably one of the most widely read and experienced scientific men available in this country to-day, and so we may indeed congratulate ourselves in having such an able electrician and inventor at the head of this illustrious body of well-trained specialists which, in its entirety, covers practically all branches of applied science with which we are familiar to-day—from navigation to wireless.

Thomas Alva Edison was born in 1847 in Milan, O. His early education was entirely self-acquired, and he very early took up the vocation of a railroad telegraph operator. However, his leaning toward scientific and technical matters caused him to invent at an early age an attachment for telegraphic apparatus. He finally disposed of one of his inventions at a goodly sum, which really started him on the road to his present wonderful success as a captain of industry and invention. It would be hard indeed to find a man with a more general and widely extended education than Mr. Edison and, as we know, he has been responsible for many of our greatest mechanical and electrical devices of untold benefit to the human race, such as the electric light, phonograph, motion picture machine and storage batteries, etc. In all, this phenomenal man has taken out over 1,200 patents on various inventions.

Two well-known mathematicians were nominated to the Board by the American Mathematical Society. These were Professor Robert Simpson Woodward, of Washington, D. C. and Professor Arthur Gordon Webster, of Worcester, Mass. The former gentleman is a well-known engineer and an expert in astronomical matters. He was born in Rochester, Mich., in 1849 and graduated with the degrees of Civil Engineer and Doctor of Philosophy. He has also received honorary degrees from the Universities of Wisconsin, Columbia and Pennsylvania. Part of his experiences covered positions as assistant engineer in the United States Lake Survey, assistant astronomer in the United States Transit of Venus Commission, etc. He was at one time Professor of Mechanics, Physics and Mathematics at Columbia University and also served in the capacity of president of Carnegie Institution and has besides served in various capacities in numerous scientific societies. Professor Webster is Professor of Physics at Clark University, Worcester. He was born at Brookline, Mass., in 1863 and graduated from Harvard University. He has spent much time abroad at scientific schools in Berlin, Paris and Stockholm, and is considered an authority on physics.

The two members nominated by the American Society of Civil Engineers were Alfred Craven and Andrew Murray Hunt. The former gentleman has been for many years connected with the various branches of the municipal engineering department of New York City. He is a son of Rear Admiral Thomas C. Craven and a nephew of Alfred W. Craven, for many years Chief Engineer of the old Croton Aqueduct. He was born in Bound Brook, N. J., in 1846 and graduated from the United States Naval Academy. In 1910 he became Chief Engineer of the Rapid Transit Commission of New York. His experiences have been varied and most thorough, and his opinion on engineering and technical matters is taken as final. Mr. Hunt comes from San Francisco and occupies a prominent position as an engineer in that city. He also graduated from the United States Naval Academy in 1879. He is a specialist in steam and gas engine plant design, as well as hydro-electric developments of large extent.

The Inventors' Guild selected two members for the Board, namely, Peter Cooper Hewitt, of New York, and Thomas Robins. Mr. Hewitt is a New Yorker born and bred, and first saw the light of day in 1861. He graduated from Stevens Institute with the degrees of mechanical and electrical engineer. He was also honored with a degree of Doctor of Science from Columbia University. He has performed very extensive research work in the direction of mercury vapor and mercury arc devices, such as rectifiers, illuminating devices, etc., and latterly has taken up the work of developing special generating and amplifying mercury vapor apparatus for use in radio-teleg-

In the above illustration looking from left to right, the following members of the new Naval Advisory Board appear as indicated: 1. Josephus Daniels, Secretary of the Navy; 2. Thomas A. Edison, Chairman of the Board; 3. Elmer Ambrose Sperry; 4. Arthur Gordon Webster; 5. Hudson Maxim; 6. Lawrence Saunders; 7. Benjamin G. Lamme; 8. Frank Julian Sprague; 9. Henry Alexander Wise Wood; 10. Lawrence Addicks; 11. Howard E. Coffin; 12. Spencer Miller; 13. Thomas Robins; 14. Wm. L. Emmett; 15. L. H. Baekeland; 16. Benj. B. Thayer; 17. W. R. Whitney; 18. Peter Cooper Hewitt; 19. Joseph W. Richards; 20. Alfred Craven; 21. Andrew Murray Hunt; 22. Andrew L. Riker; 23. Robert Simpson Woodward; 24. Matthew B. Sellers.

ETHEREAL ELASTICITY.

The Danish physicist Oersted, in 1819, discovered the magnetic effect of electric currents upon needles. It created a great deal of excitement at the time because it was the first clew which had been found that a relationship existed between electricity and magnetism. The idea that a third electricity existed was never advanced until my "Electrical Theory of the Universe" was published, says Prof. G W. Cooper, suggesting that an electron of electricity was composed of positive, negative and magnetic electricity, magnetic occupying the center of an oblong electron. The ether of space has been referred to by many scientists as the elasticity that holds our earth to the sun, or bodies of the universe in their respective places, but no scientist has ever attempted to explain what that elasticity is. If we accept the theory of three kinds of electricity and allow each electron in nature to set universally north and south, unless otherwise deflected, and that like electrically repels and unlike attracts (meaning positive and negative electricity); also that magnetic electricity attracts positive, negative and magnetic. The drawing will illustrate this arrangement of electrons, showing lines of attraction and repulsion. If we pull the electrons apart endwise and let go they will instantly fly back to place; if we pull them apart or push them together sidewise and let go they will return to their former position.

If we accept this theory we have the only explanation of the elasticity of the ether of space, and if the earth was pulled out a million miles farther into space and released, it would go back into position so gently that we would never know it happened. Now, if we change Newton's famous law of gravitation and use electrons instead of bodies, here is the result: Any two masses of electrons (meaning any magnets) in the universe attract each other

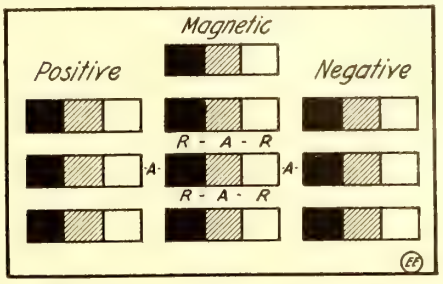

Diagram Showing Arrangement of Positive, Negative and Magnetic Electrons. Attraction at A; Repulsion at R.

with a force which is directly proportionate to the product of the masses and inversely proportional to the square of the distance between them; also, every electron in the universe attracts every other electron with a force which varies inversely as the square of the distance between the two electrons.

HUMANE USES OF WIRELESS 'PHONE.

Since the recent wonderful achievement of successful wireless telephony from the Atlantic coast to Honolulu suggestions are forthcoming of possible life-saving uses at sea for this latest scientific miracle. If the device had been perfected a few years earlier the Titanic disaster might have been averted, for President Vail, of the American Telephone & Telegraph Co., predicts the employment of the apparatus as a protection to liners against icebergs. The idea is to equip a lifeboat with a wireless telephone, and when a ship gets into a fog where ice may be met, to send the boat ahead as a scout to give warning of danger. This use would also guard against collisions between vessels in fog, which have cost so many thousands of lives in maritime history.

Again, when a man has fallen overboard, it often happens that rescuers sent out in a small boat cannot see him, although he may be plainly visible from the ship's crow's nest. It is pointed out that the lookout could direct the rescue if the lifeboat were fitted with a wireless telephone. Then, too, there would be the value of wireless telephony to castaways from shipwrecks. Communication between their boats and passing ships would be comparatively easy. The wireless "telephone" has an immense advantage over the wireless "telegraph" in that it does not call for the presence of a skilled operator, and the mechanism is much simpler. Thus the newest marvel of modern science bids fair to rob sea travel of much of its danger and suffering.

---

raphy and telephony. Thomas Robins is a resident of Stamford, Conn. He was born at West Point, N. Y., in 1868 and graduated from Princeton University. He is in business in his home city, holding the position of president of the Robins Belt Conveyor Co. He also serves as secretary of the Inventors' Guild and is a member of a number of technical societies.

The American Society of Automobile Engineers is represented by Andrew L. Riker and Howard E. Coffin, both of Detroit. The former was born in New York City in 1868 and is a graduate of the Columbia Law School. He later became greatly interested in the problem of mechanical propulsion of vehicles. One of his early inventions was that of the first electrically propelled vehicle in this country. His experience with gasoline engines and vehicles adapted to propulsion by this means has been vast and varied. Probably one of the best-known men in the automobile line is Howard E. Coffin. He was born at West Milton, O., in 1873 and studied at the University of Michigan, where he received the degrees of B.S. and M.E. He was for several years in the United States Civil Service, along the line of internal combustion engineering and was for some time in charge of the Olds Motor Works' experimental department, at which plant he later served as chief engineer. Since 1910 he has held the office of vice-president and consulting engineer of the Hudson Motor Car Co.

From the flying world two well-known inventors were selected through the courtesy of the American Society of Aeronautic Engineers. These representatives are Henry A. Wise Wood and Elmer A. Sperry. Mr. Wood hails from New York. He has perfected and developed many appliances in the realm of printing machinery and for which he was awarded a gold medal by the Franklin Institute. Among his societies is the Society of Naval Architects and Marine Engineers. For some time he has been an enthusiastic student of, and a writer on, aeronautical subjects. He was born in New York City in 1865 and received his early education in the Media Academy at Media, Pa. The latter gentleman—Mr. Sperry—is well known to-day for his inventions pertaining to the automatic stabilizing of aeroplanes. He also is an electrical engineer of ability, besides having had wide experience in many other lines of engineering and industry. He was born at Cortland, N. Y., in 1860 and received his degree from Cornell University. He is a member of many scientific and technical societies and should prove indeed a very able and valuable member of the Naval Advisory Board.

From the American Society of Mechanical Engineers there were nominated William LeRoy Emmett, of Schenectady, and Spencer Miller, of South Orange, N. J. Mr. Emmett was born at Pelham, N. Y., in 1859 and graduated from the United States Naval Academy and has also received the honorary degree of Doctor of Science from Union College. He has specialized in electrical engineering. At present he is connected with the illuminating engineering department of the General Electric Co. Mr. Miller serves as chief engineer in the cableway department of the Lidgerwood Manufacturing Co. He was born in Waukegon, Ill., and graduated from Worcester Polytechnic with the degree of B.S. He has made a number of inventions relating to apparatus for saving life at sea and cableways for coaling vessels at sea, which devices are used by the Navy Department of the United States Government.

In electrical science two brilliant men were selected by the American Institute of Electrical Engineers; namely, Frank Julian Sprague, of New York City, and Benjamin G. Lamme, of Pittsburgh, Pa. As a pioneer in the development of electric railways and devices for the control and operation of same, Mr. Sprague is well known and he has served in many important capacities with various corporations. He was born in Milford, Conn., in 1857 and graduated from the United States Naval Academy. He was at one time assistant to Thomas A. Edison and has acted as consulting engineer to the Edison General Electric Co., the General Electric Co., and as a member of the Terminal Commission for the Electrification of the New York Central Railway. Mr. Lamme was born on a farm near Springfield, O., and graduated as a mechanical engineer from the Ohio State University. He has had a large amount of designing and other experience with the Westinghouse Electric Manufacturing Co. at Pittsburgh, and at present holds the position of chief engineer with that corporation. He is one of the best-known men to-day in the field of large size alternating current electrical machinery design, and the mighty generators at the Niagara Falls power plant are constructed after his designs. He holds many patents on electrical machinery. One of his particular pleasures is in discovering and assisting young men of ability along the lines of his chosen profession.

In the field of aeronautics two well-known men have been appointed by the Aeronautical Society of America in the persons of Hudson Maxim, of Brooklyn, N. Y., and Howard Bacon Sellers, of Baltimore, Md. The former is well known throughout the world for his original and important research work on high explosives and his activities have covered many other fields of sociology, philosophy and science. He was born in Orneville, Me., and at an early age he engaged in the publishing business. Later he took up the work of inventor and experimenter, developing the first smokeless powder ever used by the United States Government. This invention he later disposed of to the Du Pont de Nemours Powder Co., of which he became the consulting engineer and expert in research work. In later years he has evinced great interest in aeronautical science and has made many valuable suggestions along this direction. Mr. Sellers was born in Baltimore and there he received his early education. He studied in the Law School of Harvard University, from which he later graduated, and then followed up this work with courses in the Laurence Scientific School and the Drexel Institute in Philadelphia. He was the first editor of *Aeronautics* and is also a member and past chairman of the technical board of the Aero

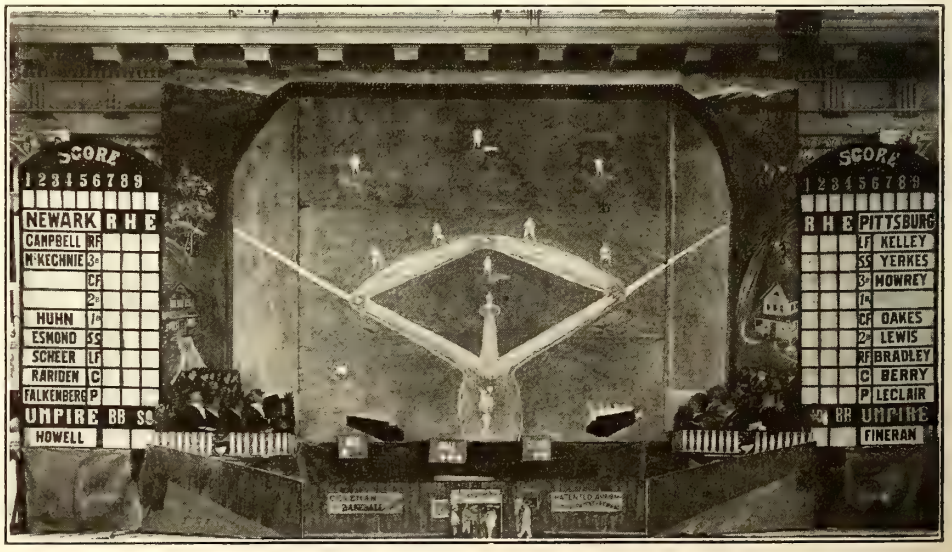
The Electrical Burglar of the 20th Century

IT is, indeed, surprising what ingenuitp and ability are shown among the criminal classes in quickly adapting the latest advances in the electrical and mechanical sciences to their art—if we may so call it—of breaking into safes, vaults and buildings. The up-to-date burglar has many marvelous scientific devices at his beck and call, and most of them require but little knowledge of science or the trades in order to operate them very effectively.

The Modern Burglar Utilizes Electricity to Find the Combination of a Safe and for Numerous Other Purposes.

Our illustration herewith depicts a 20th century burglar in the act of blindly checking up the combination lock on a steel safe by means of a very sensitive telephone outfit, known as a "Detectaphone." The microphone transmitter of this supersensitive telephone set is held, by means of a rubber suction cup, against the front of the safe door in proximity to the combination lock mechanism. When the knob carrying the numbered dial of such a lock is rotated, the movement of the bolts on the inside of the door can be heard, and in some cases the interlocking of the various parts of the lock mechanism proper can be perceived by this arrangement. It thus becomes an easy matter for a clever safebreaker, with a little patience, to readily open any ordinary safe or vault door fitted with this type of lock, without knowing the actual combination numbers by which it was locked in the first place. The telephone set is completed by a pair of sensitive telephone receivers placed over the ears as our illustration indicates, and the battery for this set may be carried in the pocket as depicted at B.

A second detectaphone set is often utilized by a confederate, for the purpose of indicating the approach of the police, etc., on the outside of the building. The accomplice is stationed at the door in the illustration thus pictured, in the act of detecting the approach of any persons outside of the building or also within same. In this case the supersensitive microphone transmitter of the detectaphone is placed outside the front door of the building or down the length of the hall, as the case may necessitate.



While on the subject it may be of interest to state that the yeggmen and second-story "artists" of our day use nothing but electric flashlights or battery lamps, and one is here shown illuminating the combination lock dial of the safe.

A cable is perceived dropping down from a convenient electrolier and terminating in a large disc fitted with a carbon electrode and insulated handle, which lies in front of the burglar who is attempting to open the safe. A pair of smoked goggles are necessary in conjunction with the use of this electric *arc burning* apparatus. Whenever the safe lock refuses to yield to the treatment aforementioned, it is a matter of but a few moments, relatively speaking, to ground one side of the electric circuit to the safe and by means of the shielded electrode just mentioned, an arc is readily established between it and the surface of the safe door. This "arc" is one of the hottest fusing agencies known to modern science. It has a temperature of from 6,000 to 7,000 degrees Fahrenheit, and it is needless to say that the hardest nickel steel, even though Harveyized or chilled, will soon be melted by the intense heat of the incandescent electric arc gaseous stream thus produced. As may be readily imagined, it would take but a short time to literally "bite" the lock mechanism right out of the safe door. When this work has been performed it is a simple matter to throw the bolts and open the door in most cases.

However, in this instance as well as in most others, and in accordance with the old proverb, "There never was a smart man but that there was a smarter one," it is safe to say that sooner or later the most clever and cunning tricks of the best yeggmen are ferreted out or compensated for by equally clever counteracting ideas as promulgated and devised by our modern detective and police experts. The selenium cell is probably one of the best devices with which to foil the would-be safebreaker, for the minute he flashes a light on the spot where the selenium cell is concealed, an electric bell will ring in any part of the building desired or at police headquarters, notifying the proper parties instantly as to where the alarm originated. Thus it is that the march of science is constantly toward a higher plane, endeavoring to eliminate any weak spots in diversified applications to the needs of society and the fine arts.

SEEING A BASEBALL GAME BY WIRE.

One of the most novel and entertaining inventions of the 20th century is that enabling one to *see a baseball game by wire.* This is illustrated in the accompanying photograph which depicts an exact reproduction of a baseball field, but on a miniature scale. The action of the complete device is very human; that is to say, each performance of the player is so naturally

This Electrically Operated Baseball Diamond in Miniature Duplicates Every "Play" Made.

ELECTRICAL PROSPERITY WEEK.

By John A. Randolph.

(The Society for Electrical Development.)

OPTIMISM, enduring, persevering, finally triumphant, made the biblical legend of "Job" a classic. Job looked on the sunny side, kept plugging, and achieved prosperity in the end. The moral is obvious.

With the same faith in destiny, hope for the future and confidence in truth, the united electrical interests of the country have planned a big sales campaign for the week of Nov. 29 to Dec. 4.

They have called it ELECTRICAL PROSPERITY WEEK, a fitting name, fraught with wholesomeness and characterized by the spirit electrical.

It is to be an event, a six-day celebration, in which the people throughout the United States from the Canadian frontier to the borders of Mexico, from ocean to ocean, will be shown the wonders of electricity as never before—will be taught how inseparably linked with modern progress this all pervading force has come to be. In short, the purpose is to advocate, demonstrate, promulgate, electricity.

The Goddess Electra.—The emblem of the celebration is a design beautifully symbolical of the broadness in scope, the cleanliness, convenience, economy of electricity. The central figure is the "Goddess Electra" in the act of closing an electric switch. A look of confidence and satisfaction illumines her countenance, as our illustration portrays. Electricity is her servant. The attractive background shows a residence section on one side and a city street on the other, with electric light and power everywhere. The home scene is peaceful. It suggests things as they ought to be—where drudgery has passed, to give way to cleanliness and purity, the light of truth.

The city street is suggestive, at once, of efficiency, system, speed—tasks done automatically, everything moving at the push of a button.

The design was as carefully chosen as the other features of the campaign. It was selected only after weeks of careful consideration, during which a large number of other designs produced by many of the foremost artists of the country, were submitted for approval.

Official Design for Electrical Prosperity Week.

The story of the choosing of the model for the "goddess" was published in the newspapers throughout the country. She was chosen by contest, the final selection being made by a jury of well-known artists. The winner was Miss Florence Cassasa, of Brooklyn.

The spirit of the celebration will be education. The public will be shown as never before that electricity is a necessity, not a luxury; is economical, not expensive; is simple, not complex; is broad in scope, not limited; is safe, not dangerous; is, in short, the most willing, reliable, able servant mankind has ever known.

Displays, exhibitions, lectures, parades, shows will be held everywhere—presenting, demonstrating, explaining things electrical as never before. A blaze of illumination from coast to coast will come at night as a climax to the activities of the day. Myriads of electric lamps of all types, shapes and sizes will take up the light where the sun leaves off. The coolness of the year will make people actively receptive. Meetings in full sway everywhere will offer unbounded facilities for lectures.

The schools will be in session, and will provide a means of setting forth the advantages of electricity to the coming generations by prize essay contests upon electrical subjects, "Electurettes," recitations, readings, addresses embodying the electrical spirit.

UP-TO-DATE SHOPPING BY TELEPHONE.

Newark, N. J., has a new shopping idea. Usually there are two ways of shopping—either by telephone or going personally into the store. This shopper goes to the window of the store, which in this case is the Western Electric Co.'s supply depot at 64 Park place, picks up one of the several Inter-phones extending through to the street side of the window, and talks to the clerk inside, as perceived from the photo.

Electrical Supply Store Uses Telephone Outside of Show Window to Attract Customers.

Experts in selling goods to the public often say that if a dealer can only get people inside his store he will sell goods. That's why so many bargain days are conducted. People come for the bargains, but also buy other goods. Just to try out the psychology of this claim the local manager of this store decided to find a way to sell goods and take orders without his customers coming inside at all. An increase in sales has resulted.

Here's the way the new electrical seller is worked out: A desk equipped with order books, Inter-phones and electrical devices has been placed just inside the show window. One of the office force sits at the desk in plain view of the passing thousands. He is a very busy young man. His desk 'phones are connected up to lines which reach to the outside. A customer comes along, sees some electrical appliance that he needs, picks up the outside Inter-phone, speaks quickly to the clerk in the window, who is there to take down orders, and asks the clerk for further details about cost, etc., of devices in the window. Usually a crowd stands about waiting for a chance to ask questions. Addresses are obtained and the mailing list improved by the arrangement, besides giving to the public an excellent idea of how an up-to-date concern handles its office work.

ELECTRIC SHOWER FOR A BRIDE TO BE.

It is the custom among young people to give a "shower" to a bride to be and bestow upon her gifts that she is likely to need in her future home. There are linen showers and handkerchief showers, tinware and woodenware showers, but the very latest is the "electric" shower!

Miss Irene Brothers, of Nela Park, Cleveland, was the fortunate recipient of such a shower recently when her engagement was announced. The event took place in a beautiful ravine in Nela Park. Electric Japanese lanterns were strung among the trees. An electrically cooked supper was served. Among the electrical devices presented to Miss Brothers were an electric coffee percolator, toaster, grill, electric iron, hair drier, tea urn and table lamp, all of which can be utilized to best advantage in the modern home.

Man to man—can you afford to miss a single issue of this magazine?

SUBWAY IMPROVEMENTS CAUSE GREAT CHANGE IN ELECTRIC WIRES.

Owing to the vast amount of underground excavations now having to be made in New York City in building the new subway lines, which extend for many miles, the electrical engineers of the telephone and power companies have had their hands full in taking care of the continual shifting and rearrangement of the hundreds of underground cables and wires used for telephone, light and power service.

The illustration we present herewith shows a section of Dey street where it intersects with Church street, in New York City. In the foreground may be seen one of the telephone cable manholes, in the process of reconstruction. At the left of the picture may be observed a myriad of electric power and other cables. It is astonishing to the uninitiated who, for the first time, happens to behold one of these exposed sections of a New York thoroughfare, when he observes the tremendous amount of underground wires, cables and pipes which seem to intertwine and pass each other like so many huge snakes. The magnitude of this task becomes more apparent when it is considered that there are often a dozen different voltages, both high and low, being carried by these various cables and wires, and, also, the pipe lines which pass and repass these electric lines contain gas, live steam and water. Besides this, there are the huge sewer lines. All of these various transmission cables and conduits have to be invariably rearranged and shifted about in the construction of the subway, even to different levels, or from one side of the street to the other.

Showing Vast Net Work of Electric Gas, Water and Steam Conductors in a New York City Street Exposed During Building of New Subway.

DR. DE FOREST TO HELP DETECT ZEPPELINS.

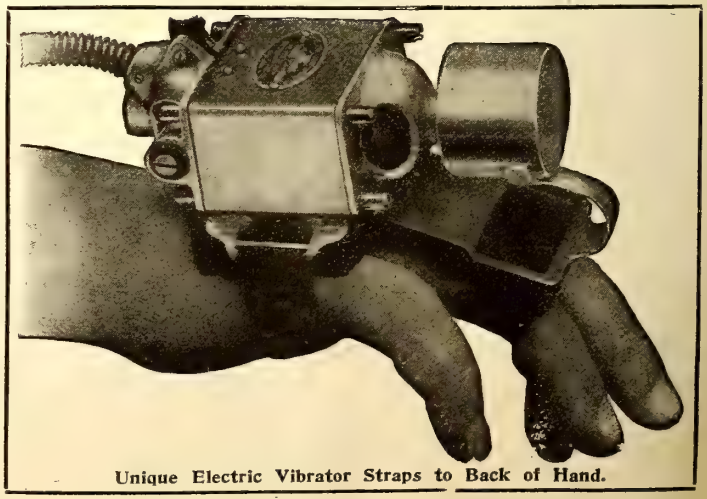
A middle-aged American inventor with an electric bulb arrived in London recently on a hurry-up call from the British Government to show Sir Percy Scott how the British capital may avert danger from Zeppelins. And when the American inventor has done his work in London he will cross the Channel to devise a system of protection from air attack for the treasures and the lives of Paris. The inventor is Dr. Lee de Forest, of New York City.

As our readers are well aware, Dr. de Forest is the inventor of the Audion amplifier, an adaptation of the incandescent electric light, by which feeble electric impulses can be magnified to a point at which they can be registered with considerable force.

For several months England has used for coast defense a system of microphone detection against submarines by means of which the vibration of the propellers of German submersibles was picked up by microphones at sea and transmitted to a base, so that the approaching submarine could be located. This defense has been credited by London with being responsible for the destruction of many submarines. In this plan an instrument fashioned on the principle of the Audion was used to magnify the impluses recorded by the microphones at sea, but that form of Audion was not perfected to the stage of Dr. de Forest's recent inventions.

The effectiveness of the coast defense system suggested to the English authorities a similar plan for defense against invading airships. But conditions were different from that of dealing with submarines, because microphones could not be placed high enough in the air to record the vibrations of the propellers of approaching Zeppelins. The success of the de Forest Audion was brought to the attention of the British authorities, and they sent for the man who had invented it to come over and make their protective system work so that London could sleep in peace.

The detection system which Dr. de Forest proposes to work out is as follows: Several delicate microphones are placed on a geometrical figure, probably each on a mast. These microphones are equipped with Audions so that any vibration reaching them is magnified several hundred times, each of the Audions being of the same recording power. The microphone on that point of the geometrical figure nearest the approaching airship will record vibrations of a greater strength than the microphone on the most distant point of the figure. The effect of the vibrations upon the intermediary microphones will, of course, be of varying force, according to the relative distance of the microphone from the source of the vibrations, the approaching airship. From the varying effects of these vibrations on individual microphones is calculated the line of direction of the approach of the vibrations on each microphone. These lines of direction when extended form the outline of an imaginary cone, at the apex of which will be found the approaching airship.



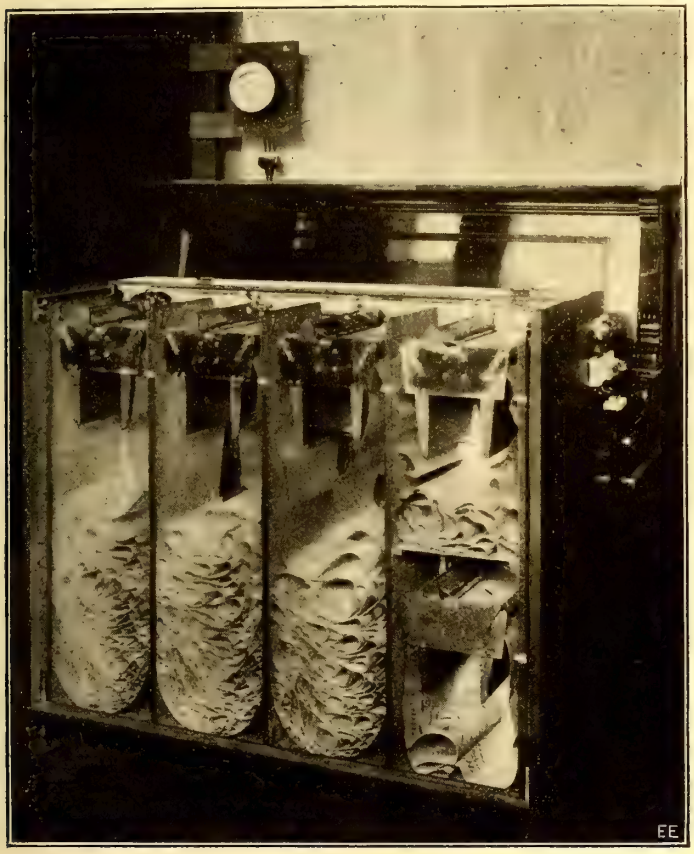
When the location of the airship has been determined, Dr. de Forest's task ends, and that of the aeroplanes and airship guns begin. It is planned to send aeroplanes out above the dirigibles after the location has been determined.

GIRL RADIO OPERATORS.

No girls have as yet qualified as licensed radio operators in this country, although it is stated unofficially that hundreds of girls are transmitting messages in amateur stations controlled by their licensed brothers. Many French girls have qualified as wireless operators, and are now in active service in the war zone.

NOVEL ELECTRIC VIBRATOR STRAPS ON HAND.

A very neat and efficient type of electric massage vibrator is shown in the illustration and, as perceived, it can be strapped to the back of the hand. The vibrations from the device may thus be transmitted through the hand to the face of the patient, etc. It is of great use to barbers and facial specialists. It is supplied for 110-volt direct-current or alternating-current circuits, and comes complete with flexible cord and attachment plug, which may be inserted in the regular lamp socket. Undoubtedly this is one of the smallest practical massage vibrators of the electric type ever devised and one that will appeal to everyone interested in any way in this art.



Unique Electric Vibrator Straps to Back of Hand.

A REMARKABLE ELECTRIC PIANO PLAYER FOR THE "MOVIES."

By Frank C. Perkins.

The accompanying illustration shows the mechanism of a wonderful electric piano player, controlled from the film booth by a series of buttons. By the use of sets of endless perforated rolls the movie operator is enabled to instantly change the type and tempo of music from the rear of the house without any other attention to the piano. Bellows are eliminated by a series of electrical contact points which actuate hammers that play on the keys.

New Electric Piano Player, Designed to Replace Orchestras and Capable of Accurate Control by "Movie" Operator.

This electric piano player makes possible the instantaneous change from one piece of music to another at any moment and is particularly adapted for playing pianos in moving picture theaters, eliminating the services of the pianist and the disadvantages and annoyances incident thereto.

It will be seen that the player is placed before the piano, the latter remaining in its usual position before the picture screen, and is controlled by the moving picture operator from his booth by means of a simple electrical controller. The musical program embraces crescendo and thunderous music for battle scenes and the like, allegretto or fast, lively music of various character to correspond with animated scenes such as horse or automobile racing, moderato for social or dramatic scenes, diminuendo, or slow music to coincide with pathetic or sentimental pictures, Indian music to make American Indian action more realistic, staccato chords for highwaymen or burglar action, the music produced having automatic expression.

It is stated that in addition to the above musical effects the more expensive machines are equipped with elementary apparatus controlled by the picture operator for producing battle chaos, shooting, thunder, lightning and wind. Instantaneous changes from one selection of music to another with change in tempo, at the instant the scenes are shifted on the screen, is a most important factor for the successful display of a film.

It is pointed out that in this the ordinary piano player is deficient and the effects desired are oftentimes spoiled. The common automatic piano is almost worse than useless for the picture theater on account of lack of music control, for it may play "Onward, Christian Soldiers" while burglars operate, tango music for a battle scene or a waltz for a funeral.

It is, of course, apparent that the right music at the right time and in the right time, is most vital for the success of the motion picture house; for without it the proper effect of the pictures is nullified which means eventually the loss of patronage.

It is held that with the new player installed to operate the piano, the musical program is directly under the control of the picture operator as it should be and at his will *the music changes instantaneously* on pushing a button, even to the breaking off of playing one selection at any note, and the beginning of another of different tempo the next second—so flexible is the electric current in connection with this mechanism. It is thus possible at all times to have melody to correspond and be consistent with each picture shown.

DAILY NEWS RADIO NOW GOES TO NAVY IN DISTANT WATERS.

Even the oldest inhabitant of Port-au-Prince, Hayti, cannot remember the time before now when the tropics received the baseball scores every evening.

Somehow one doesn't associate the thought of the blue Caribbean and scorching semi-equatorial sunshine with the thought of "New York, 4; Pittsburgh, 6." But it's an actual fact, just the same.

Secretary Daniels has been bitterly assailed as the man who took the Demon Rum out of the navy. But the officers and men in Southern waters bless his name as the man who gave them baseball scores every night.

Not only baseball scores, but the latest word about the Kaiser and the war and William Jennings Bryan's latest opinion penetrate the tropical evenings. The officers and men of Uncle Sam's warships in West Indian waters are now able to learn of the things going on at home and abroad.

Every night the day's news is boiled down to 200 words—just as it should be, someone says—and is telegraphed to the naval wireless station at Key West, Fla. Then the wireless sparks begin to sputter and out over the Gulf, the Caribbean and the South Atlantic flashes the news "from home."

Capt. W. H. Bullard, Superintendent of the Naval Radio Service, is the man who conceived the idea, and through his suggestion Secretary Daniels obtained the co-operation of the news agency and the telegraph company. Only officers and sailors who are thousands of miles from home, in strange waters, by strange shores, can fully appreciate the value of a service of this kind.

Not long ago some 300 jewelers informed Secretary Daniels that they had equipped themselves with radio apparatus just to catch this twice daily time flash from Washington. Time signals are said to be of immense benefit to vessels on the high seas, which now possess for the first time an accurate means of checking their chronometers, which is of the greatest help in fixing longitude.

As soon as the new wireless section in the Philippines is completed it is believed that an interchange of messages between the Philippines and the United States can be made in 30 minutes.

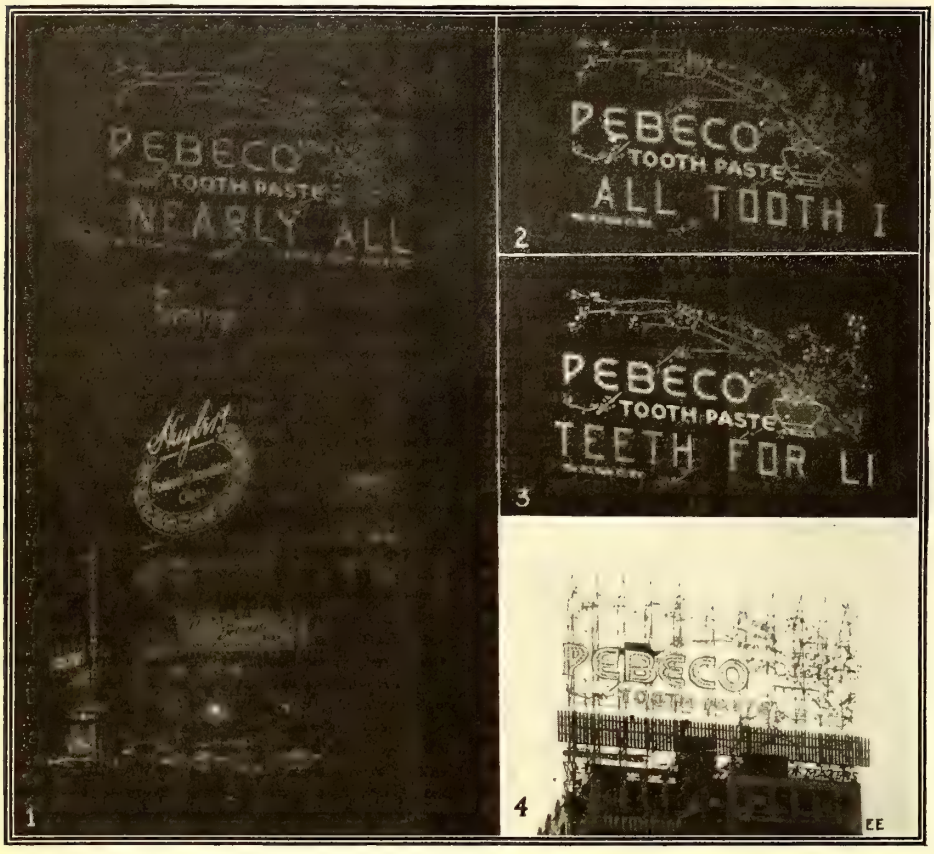
WOMAN MAKES TELEPHONIC INVENTION.

Knowing nothing of the workings of electricity or the telephone, but living daily with a paralyzed husband and mother, who in her absence could not lift the receiver to answer the 'phone, a Memphis, Tenn., woman has invented and patented an appliance to the telephone which enables one to talk and hear without using the hands at all.

The appliance is on the order of a phonograph horn and the connection is made by pushing a little button which is mounted on the stem of the 'phone. This can be done with a pencil held in the teeth if necessary, and the connection once open, the sound may easily be received and sent 15 feet away from the device by talking in a moderate tone of voice.

This combination 'phone will be especially desirable in hospitals or with invalids who have no use of their hands, as they may talk and hear with the greatest ease.

This appliance also enables one to cut out the branch 'phone in the house, as the instrument placed on the landing or stairway with string attached to button enables one to answer calls and hear perfectly without going upstairs or down.



Telephonic Loud Speaking Device Invented by a Woman.

The newest patent for the "Hatch Combination 'Phone" is the collapsible horn and the sound intensifier; by the use of the former the 'phone has the appearance of an ordinary instrument, and by putting it over the lips and using the intensifier properly one may carry on conversation as privately as if he were in a sound-proof booth.

Marvelous Electric Sign that Actually Spells

A RECENT innovation in the multitudinous array of electric signs appearing along the "Great White Way," otherwise known as Broadway, New York City, is that advertising "Pebeco" tooth paste. The illustrations herewith show four distinct views of this extremely novel advertising attraction which, of course, is only to be seen at its best at night time.

Changing Night Effect and Daytime Appearance of New Electric Sign in New York City that Spells Out Successively Continuous Sentences.

The sign is a large affair, measuring about 100 feet long by 50 feet high, and it is supported on a steel framework mounted on top of the Hotel Hermitage near Forty-first street and Broadway in the metropolis. The upper part of the sign does not possess any remarkable features, as may be seen by carefully looking over the illustrations herewith. At the bottom of the sign, however, as becomes noticeable in Fig. 4, is a band about 12 feet high and which extends clear across the face of the sign. This band (which is stationary) is made up of a series of narrow strips, on which are mounted vertical lines of electric bulbs. By a very ingenious flasher arrangement, due to the engineers of the O. J. Gude Co. and on which it is understood patents have been issued, it is made possible to cause a letter, a word or a sentence to flash across this normally black band from right to left, i. e., it is spelled out in front of the spectator's very eyes, the letters apparently forming at the right and slowly traveling across the face of the sign, each letter being followed by its complement in forming a word, etc.

This sign has attracted greater crowds than probably any other like advertisement ever erected on Broadway for many a day. It is so unique that it is bound to catch the eye of nearly every passerby, no matter how much in a hurry he is or how intent on his business.

Complete sentences are spelled out in this way, but of course only a section of the sentence, as two or three words appear in the course of a couple of minutes, while the letters form at the right and move across the sign, so to speak.

To more clearly illustrate the action of this highly ingenious sign we may glance at Fig. 1. Here we see the words "nearly all," which form part of a Pebeco advertisement sentence. To start with, only the "N" is observed, and this is formed at the right and gradually slides over toward the left, the E—A—R, etc., following each other consecutively and in their proper sequence with respect to one another.

One of the best effects obtained with this sign is at the close of a certain sentence when the active part of the display becomes totally dark, when the letters forming the end of the sentence appear to literally slide off into the darkness of the night.

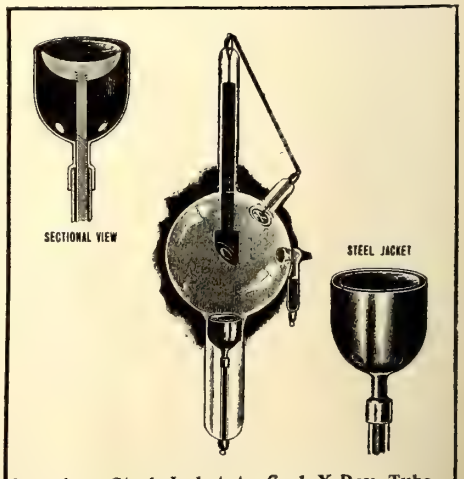
It is understood that the switching control of this spectacular display is arranged somewhat on the order of a player-piano, with perforated paper roll, which passes through a special switch arrangement in a manner which becomes apparent to any electrician. A vast amount of work is necessitated in designing, installing and operating such a display, and this is more clearly emphasized when we consider that practically every lamp in the active (spelling) part of the layout has to have a wire brought from it to the switch-control booth on the roof of the hotel. Most of these elaborate sign effects require a staff of several electrical experts to operate and care for the complicated and intricate switch gear utilized in cutting in and out the proper lights.

The sign is in the theatrical section and, therefore, commands nightly a vast audience.

HEARS JAPAN WIRELESS MESSAGE AT GREAT LAKES, ILL.

Sitting at the desk in the new wireless station at Great Lakes, Ill., at 4.10 o'clock on the morning of Oct. 1 last, G. F. Reiling, one of the wireless operators, heard one of the new stations in Japan, about 5,000 miles distant, talking to Kokoa Head station in the Hawaiian Islands. He also declares he heard a wireless telephonic message from Mare Island, Cal.

That there is no doubt about the efficiency of the new wireless station at Great Lakes is seen by the fact that Reiling gives word for word the message which he heard flashing from the Japanese station, as follows:



"Hello! Hello! How do you hear me? How are you? What do you want? Please copy: 543210. Do you get this? Please copy (repeats figures) that's all; that's all. Good-bye."

Reiling worked the same morning at 4 o'clock with the San Diego, Cal., station and the operator there told him that the message sent out from Great Lakes station was heard very distinctly. He in turn, at Great Lakes, could hear the California message very plainly.

The Great Lakes station is in daily schedule with San Diego and Arlington, Va., and the clearness of the messages sent so far has caused officials at the station to feel that the local plant is about as efficient as any in operation at any place in the country.

STEEL JACKET CATHODE HELPS COOL X-RAY TUBE.

One of the principal troubles encountered in modern X-ray work and particularly where medium or small sized tubes are utilized, lies in the large amount of heat generated within the tube, and especially at the cathode electrode. In some cases water cooling is resorted to, in an effort to help cool the tube, and electric fans are also employed in a similar effort. It has remained for a western X-ray concern to bring out a very simple device which seems to possess considerable prom-

Ingenious Steel Jacket to Cool X-Ray Tube Cathode.

ise in an effort to reduce the heating in such tubes.

This device, the new Kesselring tube, comprises simply a steel jacket, as illustration shows, which surrounds the cathode electrode proper. The heat produced by the cathode is conducted through the steel jacket and thence along the electrode rod and so out of the tube. This device is of low initial cost and much simpler than many other schemes advocated and employed for this purpose.

High Frequency Currents and Apparata

(Concluded)

AT Fig. 7 is shown how a 16-cp. 110-volt incandescent lamp may be lighted through the body by a high frequency coil. A piece of copper wire is firmly held in the mouth for this somewhat startling experiment and it is also joined to one terminal of the incandescent lamp. A second wire is connected from the other terminal of the lamp to the high frequency transformer. When the proper adjustments have been made on the high frequency set it will be found possible to bring the lamp up to full brilliancy. The Oudin connections are invariably employed for this class of experiments where lamps are lighted, sparks allowed to jump to the hand, etc. A word of caution should be mentioned here, as these high frequency sparks will burn considerably when allowed to jump directly to the skin. In any case, a piece of metal should be held in the hand. No severe shock is experienced in the passage of such high frequency currents through the body as long as they are properly handled by allowing the spark to enter the body through a metal electrode, as stated, and providing the frequency is high enough. Experiments have been conducted where half a million volts were passed through a man's body with several amperes of current. Even with a small high frequency set, lighting a 32-cp., 110-volt lamp, then one ampere of current is passing through the body. With this current, as indicated on a hot-wire ammeter (and which also has the effective current value of one ampere), it is quite possible that it may have an instantaneous maximum value of as much as 160 to 170 amperes. This is due to the very rapid discharge of the condensers in the circuit, and if large enough electrodes are used on the skin no burning effect will be felt.

Fig. 7. Lighting 110 Vt. 16 C.P. Lamp Thru the Body by High Frequency Current.

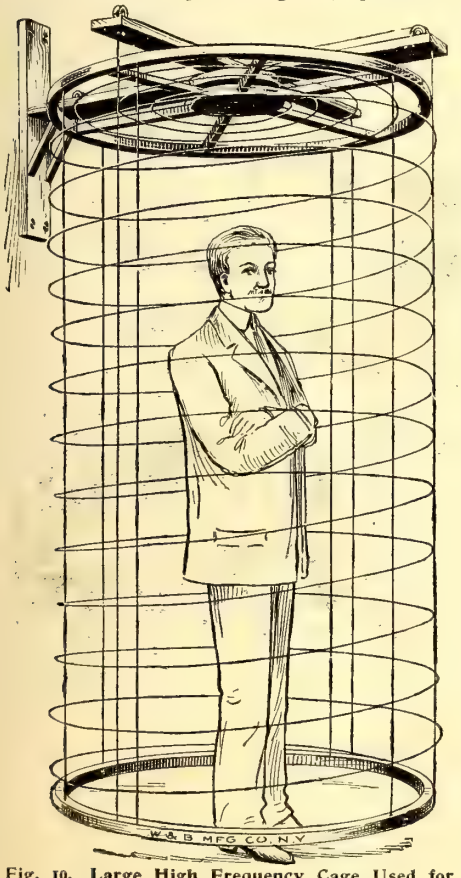


Fig. 10. Large High Frequency Cage Used for Electro-Therapeutical Treatment.

Rather spectacular high frequency discharge effects are portrayed at 8 and 9. These are usually produced by using an Oudin transformer giving a powerful unipolar discharge at high frequency and ultra-high potential. In the experiment at Fig. 9 a metal piece is held in the hand and a flame discharge from same leaps forth into space. The body of the man is here charged at very high voltage by connecting the high frequency terminal of the Oudin transformer to his ankles through a couple of metal ankle straps. He is best seated on a glass platform for this experiment, and all of the adjustments in the high frequency transformer circuit must be very carefully made in order to produce these fine effects, and the inductance of the primary exciting transformer is very important. It is quite advisable, and in fact imperative in some experiments of this nature, to use an adjustable impedance coil in the primary of the exciting step-up transformer, so as to be able to tune it properly with respect to the high frequency circuit. The wonderful effect produced at Fig. 8 is also an Oudin coil phenomenon, and a very fine spray is seen to branch out all around the top of the high frequency coil. This effect is truly marvelous and can only be fully appreciated when observed at first hand. No photograph, and especially a half-tone as here printed, can do justice to the weird and awe-inspiring effect produced in this way. In this experiment a person can approach carefully the highly charged Oudin coil and part of the spray will discharge through the head without any appreciable shock as long as the person does not come too close.

In the electro-therapeutical application of high frequency currents by the medical profession there is often employed a large wire cage of sufficient size to enclose the subject's body as Fig. 10 shows. The high frequency current from an Oudin or Tesla machine is passed through this large helix and powerful currents are induced in the subject's body, and in this way are produced valuable results of an electro-therapeutical nature for various kinds of ailments and diseases. This method is one of the best known to medical science for the treatment of arteriosclerosis, or as it is commonly termed, "hardening of the arteries." Dr. D'Arsonval, the noted French scientist, has made numerous measurements in this direction and has proved by tests on different male and female patients that, after a few treatments of this kind, the blood pressure can be reduced quite markedly, and in most cases permanent lowering of arterial blood pressure is effected.

This large solenoid arrangement can be used to produce spectacular high frequency stunts and experiments, a common one being to let the person inside of the wire cage hold a Geissler tube in his hands so that the current produced in the body will pass through the tube from one hand to the other, lighting up same in a spectacular manner. If the cage is made sufficiently large, two or more persons may stand within same and Geissler tubes placed in their hands so as to complete the circuit from one body, through a Geissler tube, to the next body, etc., giving a very interesting effect for stage and lecture purposes.

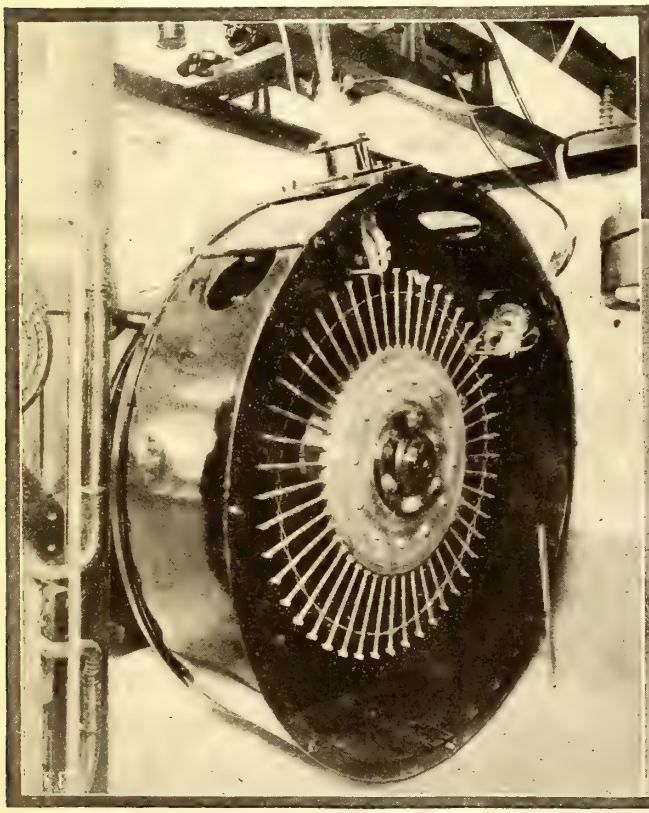
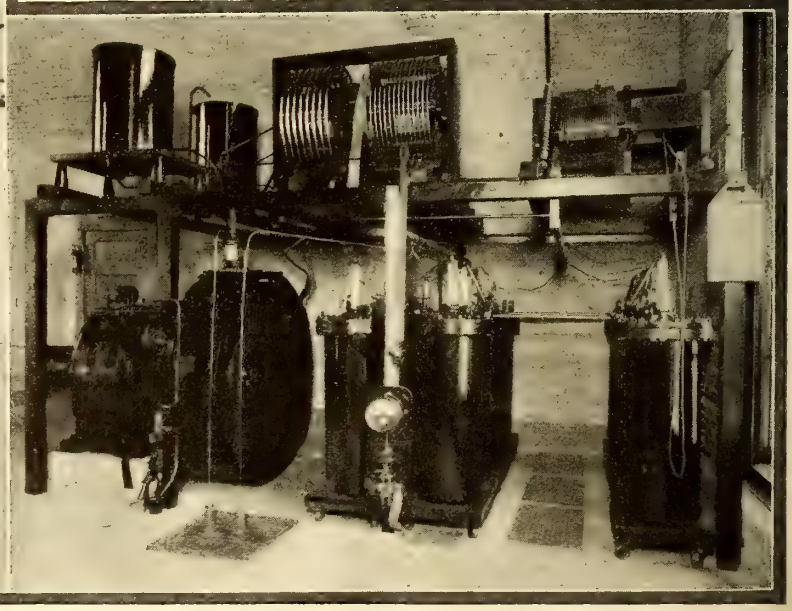
RADIO DEPARTMENT





The Radio Transmitting Set at Arlington, Va.

THE powerful Government wireless telegraph station operating at Arlington, Va., and rated at approximately 100 kw., utilizes a synchronous rotary spark gap and a number of other unique apparatus especially designed to handle such a large amount of power in the most efficient manner possible. This installation was supplied by the National Electric Signaling Co., exploiting the patents of Prof. Fessenden. One of the basic patents embodies a synchronous rotary spark gap mounted on the end of the generator shaft or similarly disposed so as to cause the spark to occur in an exact relation at all periods with respect to the reversal of current in the alternating current transformer (primary) circuit. This has been found essential for the best result in any case and is always superior to any non-synchronous rotary spark gap. The two illustrations herewith depict the extra large synchronous spark gap used at Arlington in transmitting time signals, and the other view shows the spark gap itself mounted on the shaft of the 500-cycle alternator, together with the large-size oscillation transformer and aerial loading inductance, as well as the compressed air condensers of the Fessenden type, which resemble steel boilers or tanks, as perceived. The radiation hot-wire ammeter is mounted on the wood post shown in the foreground of the general view of the transmitting set. The tuning oscillation transformer and the loading inductance are very large and are composed of hollow copper tubing. In shifting or adjusting these large tuning inductances, recourse is had to a rope or a belt and countershaft which rotates the drums on which the coils are wound. Electrical contact can be made with any part of a turn as desired by means of a rolling wheel or trolley. This is noticeable, particularly on the aerial loading inductance observed at the extreme right of the photograph.

The rotary spark gap of heroic size rotates at 1,200 R.P.M. and contains two stationary spark electrodes which are fitted with two insulated water cooling systems to help extinguish the spark abruptly, which, of course, is conducive to the most efficient operation of any wireless transmitting set. This rotary gap is enclosed within a guard ring of large size and in which the stationary electrodes of the gap are mounted in extra large insulated bushings. This form of construction has many advantages, and one in particular is that allowing the stationary electrodes to be moved through several degrees with respect to the rotating spark wheel, and in this way the sparks proper can be made to occur at practically any point desired in the alternating current cycle passing through the step-up transformer which charges the condensers and, likewise, this spark gap circuit.

The condensers used with this set, which are, as aforementioned, of the compressed air type, have many advantages over other types employing glass as the dielectric. When a break-down occurs in such condensers as these they possess a self-healing or self-restoring dielectric characteristic, and in operation it is merely necessary to keep the compressed air at so many pounds' pressure within the tanks. The metal tanks are of very rugged construction and the condenser plates within them are suspended from the covers, which are bolted to the tank proper. One set of plates is grounded to the shell, while the alternating plates are connected through a heavily insulated terminal, as perceived from the illustration. This plant is probably one of the most powerful and efficient extant today and the wireless time signals sent out at noon and 10 P. M., Eastern time, daily are now received by thousands of experimental and commercial radio stations throughout the United States, and also by ships at sea in all parts of the Atlantic Ocean. Signals from this station have been received under good conditions at the Eiffel Tower radio plant at Paris, France. It has been stated a number of times that the time signals and weather reports as picked up from the Arlington station are much clearer and more easily read over long distances than those transmitted by the Eiffel Tower station at Paris, or from any other high-power radio station now in operation. This service is of inestimable value to the merchant marine and also to the naval service, enabling the chronometers on board ship to be correctly checked twice each day.

U. S. Army Field Radio Set

THE photographs and diagram herewith show the general appearance and also the connections of the various parts making up the portable radio pack set as used by the U. S. Signal Corps.

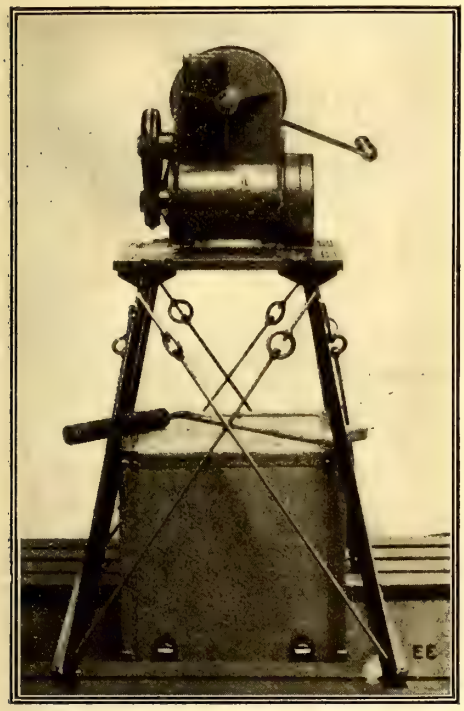

Fig. 1. Compact 250 Watt Hand-driven 500 Cycle A. C. Generator Used to Supply Power for U. S. Signal Corps Radio Pack Set.

The photograph Fig. 1 illustrates the hand-driven dynamo, rated at 250 watts, which can be disassembled in a few minutes so as to be readily packed on a mule's back. Photograph Fig. 2 shows the very compact arrangement of the transmitting and receiving apparatus, including the quenched spark gap, oscillation transformer and loading inductance, the latter being of the flatwise wound ribbon type. These pancake coils forming the oscillation transformer can be swung toward or away from one another, as they are mounted on hinges. On the shelf in the cabinet containing this apparatus is mounted the spark gap, as well as the radiation hot-wire ammeter and the transmitting key. Under the shelf there is mounted the receiving apparatus inductance, and also the step-up transformer of the sending set, as well as the high tension condensers, etc.

Switching means are provided on this set for quickly throwing the aerial and ground terminals onto the receiving or transmitting apparatus. All of the instruments used in the make-up of this outfit are first-class in every particular, the best possible being purchased, as becomes requisite for military requirements.

The small-size hand-driven dynamo utilized in this set can be operated by two men nicely, and is especially geared up with enclosed gears as perceived, so as to give the proper speed when the crank handles are turned at a fair velocity. This style of radio pack set can transmit 20 to 30 miles under average conditions, and can receive over distances of a couple of hundred miles or more in connection with the collapsible mast and antenna wires used in conjunction with it. The whole outfit, including the mast, can be erected in a few minutes' time, ready for service.

Referring to the diagram of connections Fig. 3 as used with this set, they in general follow regular radio engineering practise. As will be evident, there is employed for receiving a switch type loose coupler with primary and secondary windings, and several unique features not commonly found, on experimental radio sets at least, are herewith to be noted.

Among these features is the inductive coupling of the *buzzer test* with the primary coil of the loose coupler. This is arranged on any receiving set very easily by simply winding a few turns of wire around the primary coil or by placing these few turns of wire at the end of the primary, so as to react on same by induction. Another feature which works very nicely, and also one that is invariably used on all commercial radio sets nowadays, is the *safety spark gap* placed across the aerial and ground connections of the receiving apparatus proper. Any heavy static or lightning discharges will jump this gap in preference to passing through the high resistance and reactance of the coupler windings. This indirectly protects the sensitive and expensive head 'phones, as well as the mineral detector. Also in some cases where such protective spark gap were not used it has happened that the coupler was burned out by an extra heavy static surge through the circuit, occasioned by the close proximity of an electric storm while operating the set.

A simple aerial switch effects the change-over from transmitting to receiving set. The transmitting apparatus is very simple and will be readily understood from the diagram. It comprises a primary coil in the oscillation transformer, and this reacts by induction on three secondary spirals, any one or all of which may be joined in the circuit as different wave lengths are required. The quenched gap, condenser and hot-wire ammeter connections are indicated clearly, and the step-up transformer of the *resonance type*, especially designed for this work, is air insulated. Alternating current of the proper voltage and 500 cycles frequency is supplied by the hand-driven self-exciting generator previously described. This machine is fitted with an automatic centrifugal cut-out switch which does not permit operating the set until the proper speed is reached, and consequently the critical frequency produced by the dynamo. This is necessary for several reasons when maximum efficiency is to be attained by such a set, and particularly due to the utilization of the resonance type of transformer incorporated in this design.

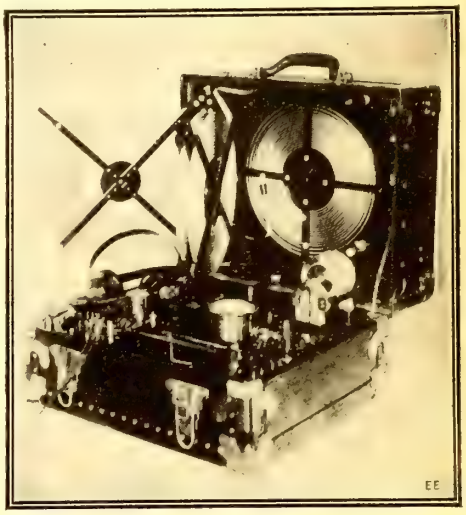

Fig. 2. Showing Neat Arrangement of Complete Portable Radio Transmitting and Receiving Apparatus in Army Pack Set. Note Use of Several "Pancake" Style Helices.

Marconi Company Develops New 2-KW. Radio Panel Set

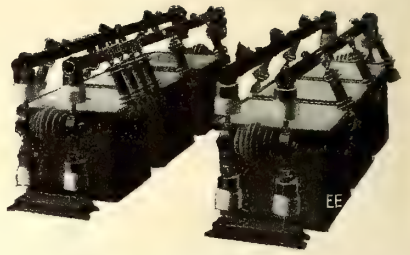
The accompanying illustrations show, respectively, the front and rear views of a newly developed 2-kw. radio transmitting set of the quenched-spark type as brought out by the Marconi Wireless Telegraph Co. This set marks the latest advance in wireless outfits of this type. As will be observed, all of the apparatus for both the primary and secondary transmitting circuits are mounted behind the switchboard panel. This conduces to the interchangeability of the outfits for installation on shipboard, and also it permits of using short leads for connecting up the apparatus, and in this way undue losses are obviated.

Front and Rear Views of New Marconi 2-KW. Radio Transmitting Panel Set.

This is a very important consideration in the high-potential, high-frequency circuits.

The motor-generator set is seen at the bottom of the photograph in its cylindrical casing. Above it are mounted, in a special rack, the Leyden jar condensers. Back of the motor-generator set is placed the step-up, high-potential alternating-current transformer, which is provided with a protective spark gap fitted with ball terminals. On the upper rear section of the panel is mounted the oscillation transformer, made up of a spiral copper strip moulded in a special insulating disc, and also a large loading inductance for the aerial circuit used in transmitting long waves is incorporated in this part of the apparatus. The wave lengths are controlled by suitable handles on the front of the switchboard panel, as the illustrations indicate, and these handles are fitted with indicating needles, which move over calibrated scales marked off in wave lengths.

Variation in the coupling between the primary and secondary coils of the oscillation transformer is effected by the control handle and needle, which are mounted directly above the quenched-spark gap.



On the lower front of the panel are mounted the necessary motor-generator switches and starting solenoid, as well as overload relay. The usual ammeter and voltmeter for the primary circuit of the alternating-current transmitter are mounted on the front of the panel, as well as slider type rheostats for the field circuits of the motor and generator. This, as will be seen, forms a very desirable and compact set, readily adaptable to ship and other requirements which in most cases permit of very little space for the installation of the radio apparatus.

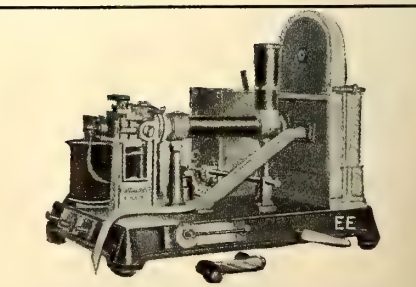
FESSENDEN INVENTS SUBMARINE RADIO.

Professor Fessenden, of Boston, claims to have invented a contrivance for sending wireless messages from battleships to submarines at a distance of 32 miles under water. By experiments he hopes to increase the distance very considerably. He states that the appliance can also detect the sound of submarine propellers at a distance of two miles, which can be increased to five miles by means of a sound-amplifying contrivance. This, he says, would be useful in detecting enemy submarines.

A HUGE OIL TYPE RADIO CONDENSER.

The large oil insulated condenser herewith presented is of the non-variable type and consists of a large number of zinc plates separated by glass plates. The conducting plates are bolted together in the usual manner. The condenser is placed

Large Size German Make Oil Type Radio Condenser.



in a container in which oil is used as a dielectric. Each condenser acts as a single unit and any number of them can be shunted across the two metal conducting tubes, as shown above the containers. Each one is properly insulated, as can be observed.

These condensers are now extensively used in the German wireless stations, as they are very reliable. Note that hollow tubes are used to give low resistance for the high frequency currents, which, as we know, only travel on the surface of a conductor.

PHOTOGRAPHING RADIO WAVES.

Various methods have been suggested and some actually developed for recording incoming wireless waves. These were generally unsuccessful, due to the fact that the messages had to be transmitted at a slow speed. Finally a photographic recording scheme has been developed whereby the waves are photographed upon a moving strip of film. This apparatus here shown consists of a camera, a string galvanometer, mechanically-driven photographic film strip and a beam of light from an incandescent electric lamp.

The operation of this instrument is as follows: The galvanometer is connected to the receiving instruments in place of the regular receivers and a beam of light is set upon the mirror of the galvanometer. Now the film is passed before the reflected light of the mirror by starting the mechanical motor. If there are messages in the ether, the galvanometer string will oscillate in accordance with the incoming waves and in turn deflect the reflected light on the film. After the message is finished the film is developed and fixed as in the ordinary photographic process. It will be found that the dots and dashes

Radio Signal Photographic Apparatus, Uses Film.

are all connected in one continuous wavy line.

This method of recording wireless signals is very accurate, durable, and high speed signals can be successfully copied. It was found that 150 words per minute can be readily recorded in this way.

A New Vibrating Reed Radio Amplifier

By Homer Vanderbilt

The greatest desire of the present wireless "bug" is to have some means of amplifying the incoming radio signals to such an intensity that he may remove his head 'phones and still be able to hear; also

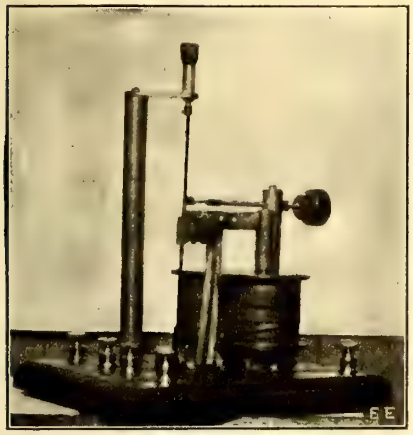


Fig. 1. Photo of Vibrating Reed Amplifier.

thereby making it possible for any interested friends to "listen in" at the same time. Many such devices have recently been developed, but most of them have proven failures, while the cost of others is far beyond the means of the average experimenter.

The amplifier herewith described was developed after some research work, and below is explained briefly the building of the complete apparatus, the photo at Fig. 1 being the completed instrument and Figs. 2, 3, 4 and 5 depicting the construction in detail.

By referring to B in figures it will be noted that two electro-magnets B B are made up from a couple of soft iron cores ⅝ inch in diameter and 8 inches long. A pound of No. 24 B. & S. insulated copper wire is wound on each. The bobbins measure 3½ inches between end cheeks. On one end of each core there are two strips of soft iron L L for supporting the coils C. These coils and their soft iron cores are obtained from a wireless receiver (having 3,000 ohms resistance), and are held in place by means of two No. 8-32 machine screws as shown. The two large electro-magnets are supported on a soft iron yoke P (see Fig. 2).

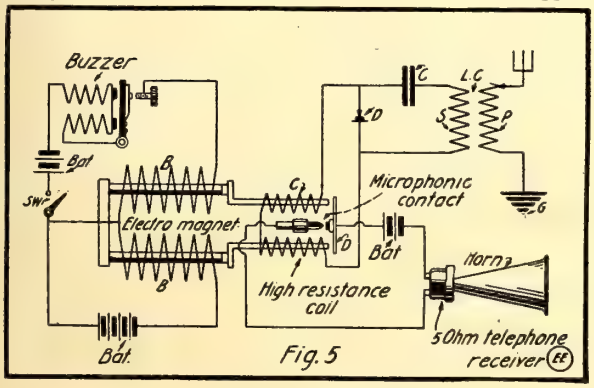

Fig. 5. Diagram for Amplifier.

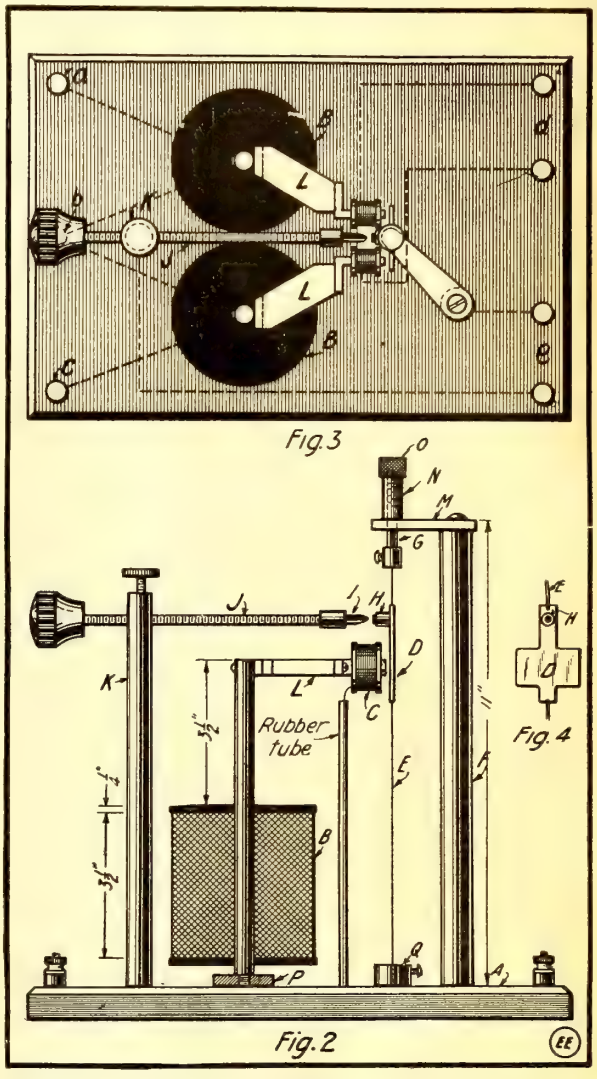
The armature D, as we see from Fig. 4, consists of a thin strip of soft iron (about No. 34 gauge), cut as may be perceived. A small cup H, made from brass, is now fastened to the armature. This is done, first, by thoroughly cleaning the upper portion of the armature and then copper-plating it, after which the cup is soldered fast and a small polished carbon button is fitted snugly into it.

The armature is supported by two No. 40, or better, No. 45 B. & S. copper wires E E, which are soldered to each end of it. The free ends are fastened to an adjusting attachment G, which consists of an 8-32 threaded brass rod having on one end a small hole for inserting the copper wire E, and the rod G slides through a small tube N. This tube is soldered to the bar M and standard F. The rod F is supported by a square base of wood A, having also a small wire support Q and set screw.



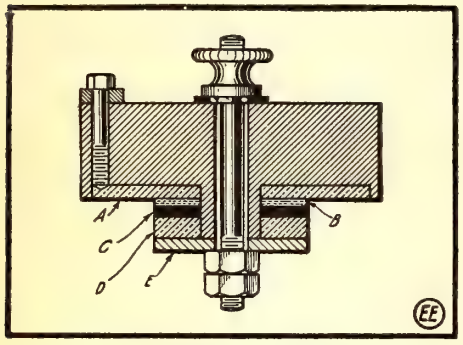
The other standard K supports the second carbon point I by means of an 8-32 threaded brass rod, which is used to regulate the pressure between the carbon electrodes.

As will be noted, seven binding posts are employed, three of which are connected from the electro-magnets, two from the high-resistance coils, while the other two lead from the microphonic points I and H.

Fig. 5 explains the connections of each part and, as is seen, one coil of the electro-magnet is connected in series with a buzzer and battery and the other is hooked up directly across a set of storage batteries giving about 8 to 10 volts. The sensitive high-resistance coils are connected to the regular receiving apparatus in place of the head receivers, while the microphonic electrodes are wired in series with a 5-ohm telephone receiver (having its permanent magnet removed) and a small horn attached to its cap.

The operation is as follows: When the current is sent through one coil the iron armature is twisted and attracted at that point. As soon as the buzzer is operated (which produces an alternating current in the opposite coil) it starts the other end of the armature vibrating. Now adjust the carbon point I by screwing the knob on threaded rod J until a slight click is heard in the receiver. At this point, without touching any part of the amplifier, connect the 3,000-ohm coils to the wireless set. If there are signals in the ether, and picked up by the apparatus, they will be transmitted to the coils C, which will cause a break in the vibration of the armature, due to the alternating current produced in the electro-magnet, which consequently shortens the contact between the carbon electrodes and thereby making the "telephone circuit" complete. This will produce a loud sound in the receiver. By very carefully adjusting the carbon contacts the signals can be readily amplified without any trouble. A good point about this amplifier is that it will not jar or break its adjustment if once set.

It is hoped that this may lead to further research on the part of other radio "bugs" along this line, as the writer's experiments with a rather crudely made model, constructed as here outlined, seemed to possess considerable promise.



Side and Top Views of Amplifier, Showing Suspension of Reed.

INSTITUTE OF RADIO ENGINEERS PACIFIC COAST MEETING.

On Thursday and Friday afternoons, Sept. 16 and 17 last, joint meetings of the Institute of Radio Engineers and the American Institute of Electrical Engineers were held at the Native Sons of the Golden West Hall, Panama-Pacific Exposition grounds, San Francisco. Two papers for the radio engineers were presented, one on each day. Thursday afternoon Prof. Harris J. Ryan read the results of investigations on the "Sustained Radio Frequency High Voltage Discharge," by Roland G. Marx and himself, taking up the flame and brush types of discharge obtained from conductors when a powerful arc generator is used to apply voltages up to 50,000 at frequencies as high as 200,000 cycles per second. On Friday Robert H. Marrjott, of the United States Naval Radio Service, read a paper on "Radio Development in the United States," giving special attention to Pacific Coast conditions.

THE TELEFUNKEN PERMANENT CRYSTAL DETECTOR.

A form of crystal detector which has been used for some time in the Telefunken radio receiving sets as supplied to various army and navy signal corps, and also in use in the United States Signal Corps radio

Make-up of Telefunken "Permanent" Mineral Detector.

pack sets, has interested undoubtedly more than one experimenter who has seen one of them. The particular reason why this detector is very little known is due to the fact that once it is adjusted and made up in the laboratory it is sealed and is not supposed to be opened by anyone, even the Government operators. We present herewith a diagram showing how this crystal detector is made up, and besides being robust in construction it is also extremely sensitive and compares well with the audion.

Referring to the sectional view of this detector shown herewith, A is a washer serving as one terminal of the device, while B is a plate of sensitive mineral material, such as galena. At C is placed a thin perforated mica disc, while D is a brass, graphite or other washer whose surface next the mica is corrugated and silvered. When sufficient pressure is applied to this device the corrugated surface of D comes in contact with the mineral B, thus providing several rectifying parts for the received oscillations of the radio receptor circuit. The washer E allows the whole to be screwed up tightly, as perceived. No auxiliary battery is necessary for this detector and it is connected into circuit in the same way as the galena detectors, with which practically all experimenters are familiar. Two of these detectors are usually provided in the Telefunken sets and they are connected with a throw-over switch, so that if one should fail for some reason, the second detector may be immediately switched into circuit.

NAVAL RADIO STATIONS.

The opening of the new naval radio station at Darien, Isthmian Canal Zone, adds to the facilities for the transmission of Government messages, but does not extend the commercial service. The Navy Department, in advising the Department of Commerce of the opening of the station, offers to transmit free all official messages to or from points in the Canal Zone from or to points in the United States.

Out of a total of 47 naval radio stations which are now in use in various parts of the United States or possessions 21 are open to commercial messages, while the others are reserved for official business. In the Canal Zone there are two stations—at Balboa and Colon—which receive commercial messages, so that the new station need not enter that field in order to accommodate the public as the facilities are already adequate.

A list of the United States naval radio stations, with their classes of service, is here presented:

Location.	Service.
Annapolis, Md.	Official
Arlington, Va.*	Official
Balboa, Canal Zone	Commercial
Beaufort, N. C.	Official
Boston, Mass.	Official
Cape Blanco, Ore.	Commercial
Cape Cod, Mass.	Official
Cavite, Philippine Islands	Official
Charleston, S. C.	Commercial
Colon, Canal Zone	Commercial
Cordova, Alaska	Commercial
Darien, Panama	Official
Dutch Harbor, Alaska	Commercial
Eureka, Cal.*	Commercial
Farallons, Colo.	Official
Fire Island, N. Y.	Official
Guam, Marianne Islands	Commercial
Guantanamo Bay, Cuba	Commercial
Honolulu, Hawaii	Official
Jupiter, Fla.	Official
Key West, Fla.	Commercial
Kodiak, Alaska	Commercial
Mare Island, Cal.*	Official

Tutuila, Samoa	Commercial
Washington, D. C.	Official
Yerba Buena, Cal.	Official

* Station transmits time signals and weather reports daily.

Besides these the army of the United States, through its Signal Corps, has stations that are open to commercial business at Fairbanks, Alaska; Fort Mills, Philippine Islands; Fort St. Michael, Alaska; Kotlik, Alaska; Nome, Alaska; Petersburg, Alaska, and Wrangell, Alaska.

Plans have been made for radio communication between San Francisco and Manila by way of Honolulu, but work on that project will not be commenced until fall, and the section to Honolulu will not be in operation until a year from this time.

A naval station at Point Isabel, Tex., and Great Lakes Training School Station are under construction.

SPIRAL ANTENNAE FOR RADIO PURPOSES.

M. Bethenod, in *La Revue Electrique*, proposes the antenna arrangement shown

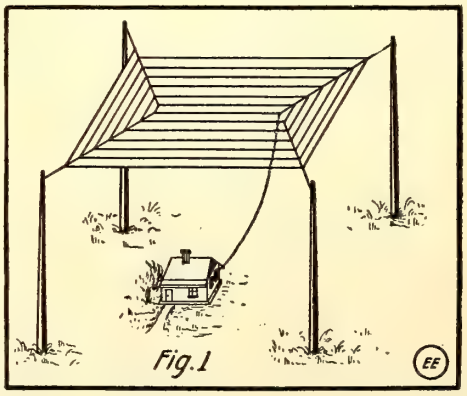

Fig. 1. Proposed Spiral Antennae for Radio-Telegraphy.

in Fig. 1, in which the antenna starts from the station building in the form of a single wire and is then arranged in the form of a spiral, in a nearly horizontal plane, by means of supporting cables as shown in the illustration. Fig. 2 shows an ordinary antenna consisting of 11 wires, the wave length being 3,500 meters, in comparison with an antenna in which the spiral arrangement is employed, the wave length here being 5,500 meters. As will be seen, the construction is much simpler and requires considerably less space. The only inconvenience seems to be that a spiral antenna cannot be used with damped waves on account of the high tension which would be developed between the horizontal conductors.

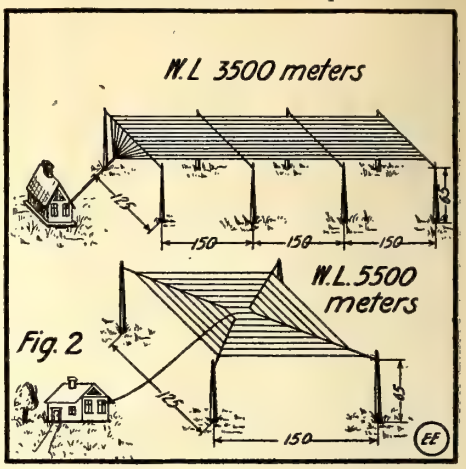

Fig. 2. Comparative Sizes of Spiral and Straight Types of Antennae.

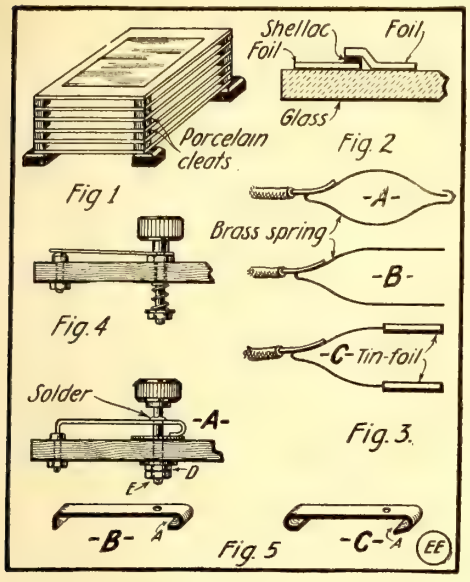
THE RESISTANCE OF WIRELESS ANTENNAS.

A suggested explanation of increase of resistance of radiotelegraphic antennas which has been observed under certain conditions where the wave length is increased has been offered by L. W. Austin in a paper on the subject issued by the Bureau of Standards.

The resistance of radiotelegraphic antennas may be divided into three parts—first, the ohmic resistance of the wires; second, the so-called radiation resistance, and third, the so-called earth resistance.



Up to the present no satisfactory theory of ground resistance has been developed. The experimental curves of antenna resistance, on account of the decreasing radiation resistance, fall rapidly at first, as the wave length is increased, and then, as the wave length is further increased, remain nearly constant, if the ground conditions are good, as in the case of a ship's antenna, or again rise nearly in a straight line, if the ground conditions are poor. This rise may be very rapid in the case of peculiarly poor grounds. For instance, the resistance of the Bureau of Standard antenna rises from 13 ohms at 800 meters wave length to 38 ohms at 2,000 meters.

Great difficulty has been found in explaining this increase of resistance with increasing wave length, but it is believed that the antenna system must be looked upon as a condenser, the antenna itself being the upper plate and the ground water the lower plate. Between the ground water and the surface there is usually a layer of semi-conducting material, which would correspond to a poor dielectric in the case of an ordinary condenser. It is well known that the dielectric losses in imperfect condensers generally increase in proportion to the wave length of the current employed in the measurement. It is found that by covering the surface of the ground under and around the antenna with a wire net, thus making the lower plate of the condenser, ground losses nearly disappear.

Don't nickelplate your instruments. It increases the high frequency resistance and lowers the tuning efficiency.

SOME WIRELESS KNICK-KNACKS.

Very few amateurs care to invest in the hard-rubber support necessary when building efficient high-tension condensers. A good method is to build them as in Fig. 1. The plates are simply stacked one on

Useful Wrinkles for the Wireless Man.

top of the other, using porcelain cleats for separators.

I have visited quite a few amateur radio stations and it is surprising to learn how many experimenters tolerate brush discharges in their condensers. Some of them paint the edge of the foil with shellac, but this soon breaks down, due possibly to the shellac cracking when drying out.

The best plan is to dip the edges of the glass plates in hot paraffine until a quarter of an inch of the edge of the foil is coated; when dry and hard, dip again quickly (to make a thicker coat) and you will have no brush discharge. Your hot wire meter should now show a higher reading. It is well to construct a pan for coating these plates. The size of the pan will vary with the requirements of each amateur—a good size measures 18 inches long, 2 inches wide and 3 inches deep. A piece of "tin" for the purpose may be obtained from a clean five-gallon gasoline or kerosene can, which, when opened at the seams and bent to shape, will prove big enough for a large-sized pan.

When pasting the foil on the glass it i best to coat the glass with shellac, b oil or other binder and then paste th on the glass, for if the foil is first and pasted the shellac forms an insulato between the foil sheets where they overlap (exaggerated in Fig. 2 to make Of course, the foil might touch in more places, but this is insufficient for a quick discharge—a positively necessa tion, since the law requires "sharp"

Sometimes you will find that the of the contacts touching the foil is quate, and quite often it would arc at the contacts, burning holes which quickly enlarge and necessitate entire rebuilding.

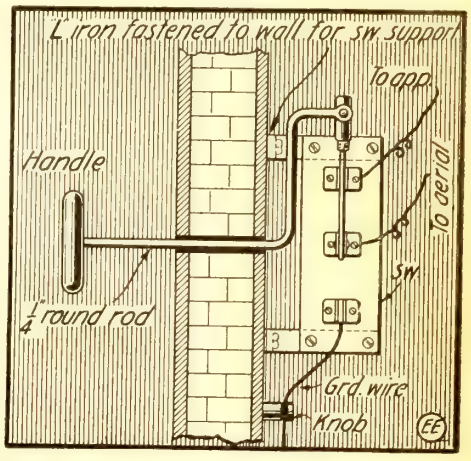
These condenser contacts should made of ⅜ or ½-inch wide spring brass or copper ribbon 1/32 inch thick and bent to shape as in Fig. 3, A or B. At least they should be made of some flat metal and even then it is an excellent plan to wrap some scrap tin-foil about the where it comes in actual contact w condenser foil; Fig. 3-C will ma clear.

Very often a "sputter spark," pro in the gap when seemingly a sharp spark should be the result, is due to these faults in construction as explained above, and a change in such a small matter may make the set highly efficient. Like all other things, a wireless set is "no better than its weakest spot."

I was called on one time to look over a wireless receiving set which from all appearances should have given excellent results, but which was very unsatisfactory. After testing aerial, ground circuits and insulation, I found that the trouble was in the tuning coil. With unthinking zeal and haste, characteristic of the average amateur, he had painted the coil with some black enamel rich in carbon. I am not sure as to whether the turns were actually shorted, or if the trouble was due to the inductive effect. At any rate, when the coil was rewound with new wire, the set "got" long distance.

Another time I "shot trouble" for an hour before the trouble narrowed down to the detector. The crystal itself was good before and after mounting, for it has been tried in the test clamps.

The detector itself was a beautifully polished brass and marble affair and truly was a thing of beauty. We hooked up the detector in series with the battery and 'phones, and on withdrawing the point from the crystal the 'phones still showed a *short*. On dismantling the detector we found—with battery and 'phones—that there was an invisible vein of mineral from one post to another, running through the marble. All the holes in this detector were rebored a little larger, bushed with hard rubber, and it has given no trouble since.



It is a good plan to bush all holes in marble bases, especially in high-tension switches. This course is usually unnecessary with manufactured apparatus for the imperfect ones are discarded, though I know of two instances where the purchased detector "leaked," and was repaired by the above method successfully.

In making radial arm switches for tuning coils, detectors, etc., it is a common practise to use simply a straight strip of brass or copper for the arm, with the necessary tension obtained by the use of some form of spring, usually a spiral spring inside of the case or switch, as in Fig. 4. The arm with this form of construction is never level and seldom looks well. A far better-looking, better-acting and much simpler plan is shown in Fig. 5. Bend the spring brass arm to the shape as in the figure at B or C. The end A will be [illegible] below by the nut D, Fig. 5. The lock nut E will hold things permanently.

A CONVENIENT LIGHTNING GROUND SWITCH.

"In cases where the aerial is—permanently and effectively grounded at all times when the station is not in operation, by a conductor not smaller than No. 4 B. & S. gauge copper wire, run in a direct line as possible to water pipe at a point on the street side of all connections to said water

Controlling Out-Door Lightning Switch From Inside of Building.

pipe within the premises, or to some other satisfactory earth connection—the switch to join the aerial to the ground connection shall not be smaller than a standard 100-ampere knife switch."—From sections a and d of Rule 86 of "Rules and Requirements" of the National Board of Fire Underwriters."

Some radio amateurs are not aware of the above fact and others are sadly so because the location of the ground switch often indirectly locates the apparatus in a place which is not as well suited for it as some other. To move the apparatus away from the lightning switch often increases the wave length, so that to keep within 200 meters the amateur must shorten his aerial or use the ineffective series condenser.

The only things required besides the switch are two iron angles, about two feet of one-quarter inch round iron rod, a round wood radiator valve handle and a few screws and bolts. Nearly all of these can be obtained from any hardware store.

A hole large enough to allow the iron shaft to freely turn is drilled in the side of the house and the shaft put through the hole and bent so that the end can be screwed to the switch handle. The location of these screw holes is then found by ing the switch upon the angles with the ge screw in front of the hole in the

fter drilling the holes and fastening the rod to the switch handle the shaft is then put through the hole and the switch screwed fast, as shown. The control handle is then fastened to the inside end of the shaft with a screw or pin and a small indicator put on. It may be necessary to loosen the hinge screw to have freer mo- [illegible] housed from

FRANK H. BROOME.

Laboratory Equipment for Illustrating the Principles of Electro-Magnetic, Magnetic, and Electro-Dynamic Phenomena

By Harlan A. Eveleth

THE amateur radio-telegraph operator and electrical experimenter enthusiast does not usually obtain satisfaction by the mere operating of finished apparatus which has come direct to his hands from the display windows of the warehouse; he is—to be successful—of an inquisitive temperament and is forever delving into the mysteries of the unknown in the fervent hope of discovering, by the "cut and try" method, some idea which may have escaped the observation of his contemporary "scientists." Following is a description of apparatus which, because of their simplicity and wide range of adaptability, will enable its possessor to investi-

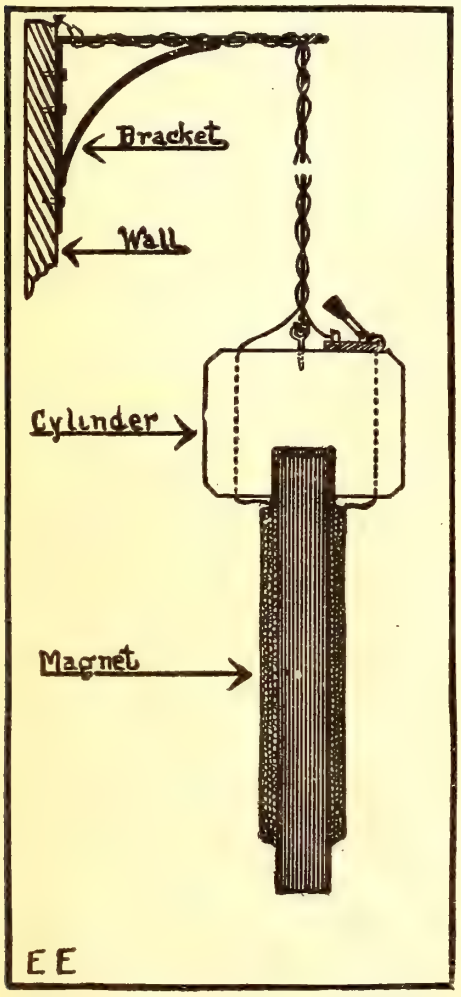

Fig. 1. Showing Suspension of Experimental Alternating Current Electro-Magnet.

gate, to a marked extent, the principles of electro-magnetic, magnetic and electro-dynamic phenomena. Several of the experiments described are exceedingly simple as viewed by the initiated, but all are guaranteed to hold the attention of the uninitiated—the casual visitor to the "laboratory."

core, one inch in diameter by nine inches in length, is composed of a bundle of annealed, soft-iron wires. It is taped for insulation and then, beginning at a distance of one inch from one of the ends, is wound with six layers, 150 turns to a layer, of No. 20 S.C.C. copper wire. The magnet is to be operated direct from the 110-volt, A.C. 60-cycle mains. It is suggested that empire cloth or other insulating fabric be interposed between the various layers, and that the final layer be taped to prevent abrasion of the insulation.

The magnet should be suspended vertically from a bracket fastened to the wall of the room, and a means must be devised for attaching the cord, by which it hangs, to the upper end of the core. A simple way of doing this is to turn a cylinder of wood to a diameter of about four inches and a length of three inches. Bore a hole at the center of one end of the cylinder to a depth of one inch, and of a diameter which is slightly greater than that of the taped end of the core. Spread glue over the taped core and then force it into the hole in the cylinder and secure it by wooden wedges driven in about its circumference; when the glue has set the cylinder will be securely fastened to the magnet. The whole can now be suspended from the bracket by a stout cord tied to a screw-eye set in the upper part of the cylinder. A switch of some sort should be inserted in the circuit, and it may well be placed on the top of the cylinder near the screw-eye. The feed wires may be entwined about the cord and bracket and then led to the power mains. The consumption of current will vary according to the load placed upon the magnet, but the greater part of the experiments will require but a fraction of a kilowatt.

EXPERIMENT No. 1.—To illustrate electro-magnetic repulsion of an A.C. magnet pole.

If possible obtain a solid copper ring of two inches internal diameter and three-quarters to one square inch sectional diameter; see Fig. 2. A satisfactory ring can be constructed by forming a coil of bare copper wire; wind the coil to the dimensions specified and bind by winding the last few feet radially. A ring formed in this manner by the writer was wound with No. 14 bare copper wire and weighed 1½ pounds.

Steady the magnet with one hand and with the other grasp the copper ring and raise it vertically over the magnet. The electro-magnetic repulsion is so great that

EXPERIMENT No. 2.—To illustrate the heating effect of Foucault or "eddy" currents.

Grasp the ring with a pair of tongs and hold forcibly at a point of maximum repulsion. The ring, notwithstanding its large cross-sectional area, will heat rapidly

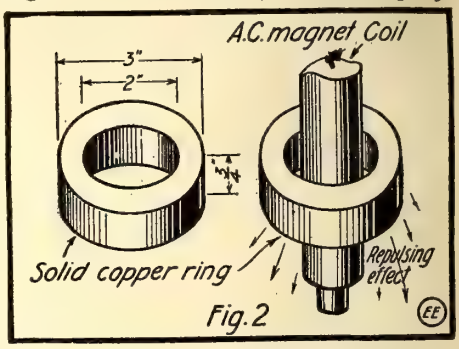

Fig. 2. Demonstrating Repulsion of Solid Copper Ring from A. C. Magnet Pole.

and if left long enough will become red-hot. Care should be exercised so as not to char the insulation of the magnet winding. Lumps of solid iron attracted to the core will heat perceptibly, thus showing the necessity of employing laminated cores in alternating current machinery.

EXPERIMENT No. 3.—To illustrate continuous rotation from electro-magnetic repulsion, or electro-magnetic attraction.

Wind a coil of wire on a form, or "pie," having an internal diameter of 2¼ inches, an external diameter of 5¼ inches and a width of ⅞ inch; the rectangular cross-section of the coil will thus measure ⅞ inch by 1½ inches. About two pounds of No. 26 S.C.C. copper wire will be required. Tape or bind with cord to preserve its form.

Procure two aluminum discs, 6 inches in diameter and of $\frac{1}{16}$ inch gauge. Drill a small hole in the center of each and pivot so they will revolve in a horizontal plane with little friction.

Energize the magnet; then hold the discs,

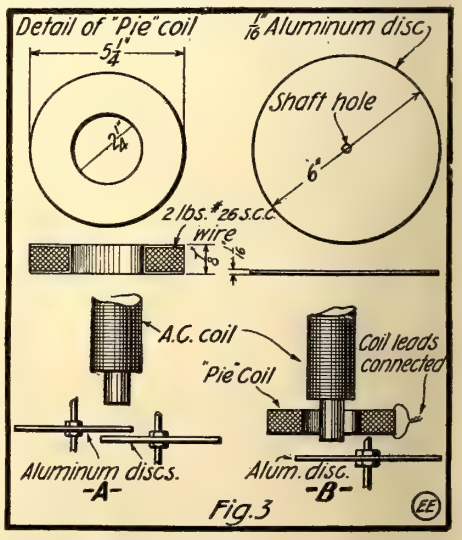

Fig. 3. Apparatus Used in A. C. Rotating Disc Experiment.

partially over-lapping, one about half an inch below the other, Fig. 3 A, beneath the magnet in such a position that the end of the core is above a point on the upper disc, which is about 1½ inches back of one of the two intersections of the peripheries of the discs. The discs will rotate in oppo-

site directions. If one disc is held the other will rotate with greater torque.

The rotation of one of the discs can be shown more lucidly by employing the coil of wire, see Fig. 3 B. Slip the coil over the core (it being understood that the magnet is hanging vertically in this experiment) until the bottom of the coil and end of the core are in the same plane, then hold the disc so that about three-quarters of its surface is beneath that of the coil. The disc will rotate in an opposite direction—if held in the same relative position to the magnet—to that of the first case, and will attain a speed of approximately 300 r.p.m. The terminals of the coil should be short-circuited.

EXPERIMENT No. 4.—To show the shape and intensity of the magnetic field around an A.C. bar magnet.

Form a coil of 50 turns of No. 20 S.C.C. copper wire and connect terminals to a discarded telephone receiver, as in Fig. 4. Do not use radio-telegraph receivers which are valued as such, for a strong alternating current is to be induced in the coil, which tends to weaken the permanent mag-

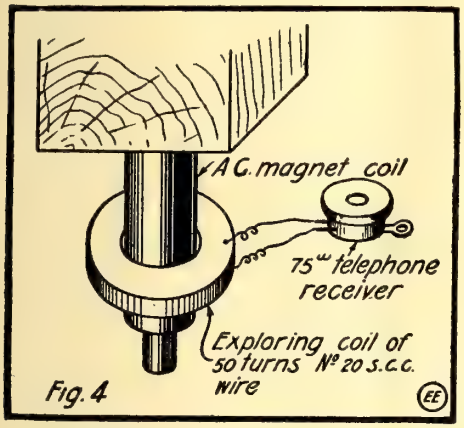

Fig. 4. Exploring Coil and Telephone Receiver for Ascertaining Shape of A. C. Magnetic Field.

net. The magnetic field surrounding the alternating current magnet can be explored and its shape and intensity roughly determined by noting the strength of sound which comes from the receiver as the coil is moved about the magnet. The coil should be kept in a horizontal plane throughout the experiment.

Another method is to employ the coil used in Experiment No. 3, with its terminals connected to a 110-volt lamp. Care should be taken not to burn the lamp out. The induced current from this coil can also be taken through the body without discomfort.

EXPERIMENT No. 5.—To illustrate the principles of the transformer.

Two coils should be wound which will slip easily over the magnet; the first of 10 turns of No. 4 bare, copper wire, and the second of a great many turns of fine, insulated, copper wire. The current induced in the first coil will be in the order of several hundred amperes and the carrying capacity of different sizes of wire can be shown by bringing them across its terminals. Relatively high voltages can be obtained with the second coil; in fact, the whole will act as a fairly efficient transformer.

EXPERIMENT No. 6.—To illustrate the magnetic effects of an A.C. magnet pole upon different metals.

Obtain strips of iron, lead, copper and aluminum and place each in turn beneath the pole of the magnet. The iron will be attracted while the other metals will be slightly repelled. Substances which are attracted to the poles of magnets are termed *paramagnetic*, while those which are repelled are termed *diamagnetic*.

Place the pole of the magnet within a box of iron brads, then remove the box from its contents. The brads will tend to align themselves in the direction of the magnetic lines of force. Iron filings may be used if desired, but brads are much easier to pick out of the carpet. Take several of the brads and place them end on end at different points on the magnet. They will form magnetic chains and will tend to assume the direction of the lines of force.

Interpose sheets of glass, aluminum, copper and iron between the pole of the magnet and a *paramagnetic* metal held within the influence of the field. The sheet of iron will shield the object from the effect of the magnet while the sheets of *diamagnetic* substances will not affect the transmission of force from one point to another, any more than an equivalent thickness of air.

Magnetization may be destroyed or weakened by an excessive rise of temperature. If an iron wire be heated to redness and held beneath the pole of the magnet there will be no attraction between the two. At a temperature of 750 degs. C., known as the critical temperature, iron becomes non-magnetic, but upon cooling it becomes magnetic although completely demagnetised at this stage.

Ingenious Instruments for Testing Electrical Machinery

A new *field tester*, shown in the illustration, Fig. 1, has been perfected for the special purpose of testing the field coils and armatures of the electric railway type of motors. It is a quick and certain detector of weak fields and faults in armatures. It tests the fields when in the motors or out, as the presence of iron makes no difference. It is not even necessary to disconnect the fields. Armatures are tested for shorts, opens and grounds without raising the leads or disturbing the hoods. This new field tester is very simple and easy to operate. It is operated by direct current from the lighting circuits by simply attaching same to a lamp socket in the car or shop.

When testing fields the readings are obtained by sliding the pointer knob along the scale to the point where two distinctly separate sounds become as one, or continuous. The armature test is a bar-to-bar receiver test with the telephone receiver and contact fork.

Experience shows that weak fields are the cause of roasted armature coils, blistered commutators, flash-overs, sparking brushes, arcing controllers, overloaded power circuits and generators. Hence the value of a good field tester, and especially one such as this, which is capable of accurately testing the field coils when in position on the pole pieces.

Another *field and armature tester*, as seen at Fig. 2, is about to be put on the market by the same company. This instrument was developed to supply the demand for testing apparatus that could be operated by current from alternating circuits and which could be used in noisy places, where too much noise might interfere with the use of a telephone receiver. It does the same work as the field tester above described, but instead of the telephone receiver for obtaining the readings meters with pointer and dial are used. When testing field coils the readings are obtained by sliding the pointer along the scale until both meters read the same. The armature test is a bar-to-bar meter test. The meter is mounted in a convenient position right on the testing fork.

The same concern also supplies an *armature tester*, as shown in the accompanying cut, which was developed to supply the demand for a very simple little device intended for testing armatures only. It is operated in connection with either alternating current or direct current lighting circuits. A hard rubber knob with knurled edge permits changing over from one kind of current to the other. As is the case with the two instruments above described, no batteries are used. It quickly detects and exactly locates shorts, opens and grounds without disconnecting the leads or tearing off the hoods. It exactly locates a grounded bar or coil in less time than it takes to tell about it. It will make a complete test of any ordinary armature in less than two

Fig. 1. Instrument for Rapid Testing of Motor and Dynamo Field and Armature Coils.

minutes. This device is regularly furnished with either the alternating current or direct current adjustable contact fork, or both, as desired. It is a handy and indispensable device for power plants and

Fig. 2. Similar Device to That Shown at Fig. 1, but Utilizes Meters Instead of Telephone Receivers.

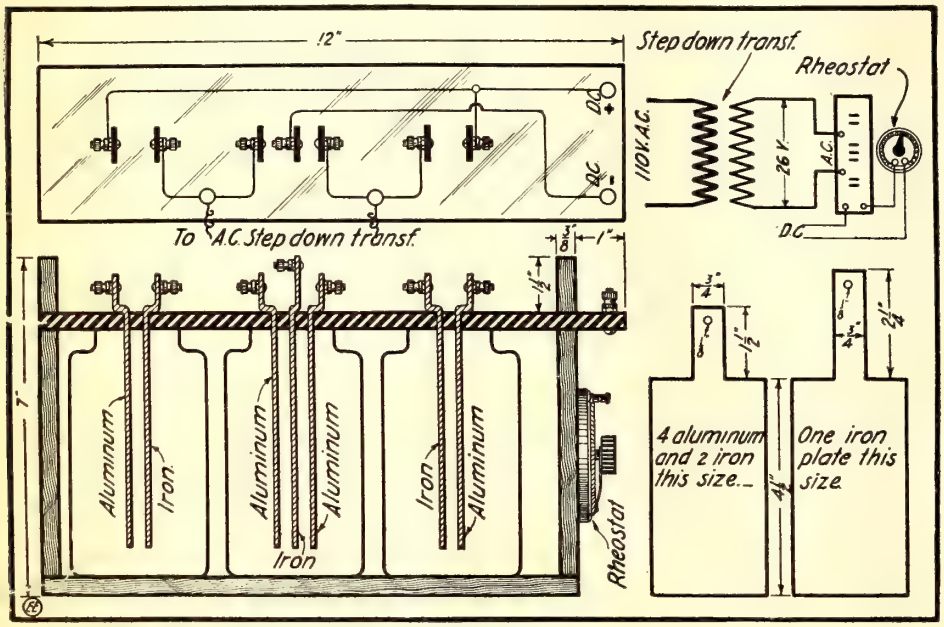
electrical repair shops of every description. It will test any type of motor or dynamo armature.

THE CONSTRUCTOR

How to Make an Electrolytic Rectifier

By C. R. Barmckol

The following are the details for the construction of an electrolytic rectifier for the experimenter who does not want the trouble of dragging numerous large jars about and who does not care to spend much money. If you have a few things around the house the cost is insignificant as compared with the larger rectifiers.



With an alternating current pressure of 26 volts from the secondary of a step-down transformer the rectifier has given as high as 6½ amperes. Of course, it cannot be used for any great length of time owing to its size, but I have recharged storage batteries very successfully by charging at intervals.

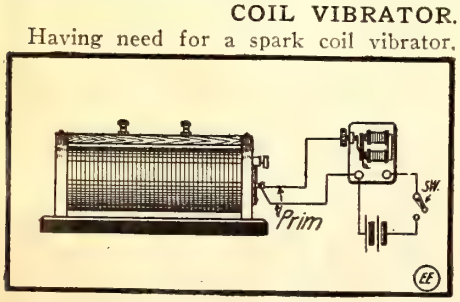
The first thing to build is the containing box. The wood should be about ⅜ inch thick, with the following dimensions: 11x7x4¼ inches. A Mellin's Food box will be found very satisfactory. The ends of the box, at the top, are cut down 1½ inches, making U-shaped ends for the top of box. In these slots, where the box has been cut out, the board holding the plates rests. Its dimensions are 12x3½ inches. The containing jars are three ordinary one-pint fruit jars. The next part is the plates. Aluminum and iron are used. The necessary plates are drilled and cut as follows:

Four aluminum plates 4½x2 inches, with lugs 1½x¾, drilled for ⅛ hole, ½ inch from top.

Two iron plates 4½x2 inches, with lugs 1½x¾, drilled for ⅛ hole, ½ inch from top.

One iron plate 4½x2 inches, with lugs 2¼x¾ inches, drilled for ⅛ hole, ½ inch from top.

Parts for Making an Electrolytic Rectifier.



Having procured the plates, they must next be put in place. Their position may be seen in the drawing, the large iron plate being the central plate of the middle jar. The top board is measured off as shown in drawing, the first slot (all slots ⅛x¾ inch) being placed 1¾ inches from edge. One-quarter inch separates this from the next slot, and the drawings give dimensions for the remainder.

Having slotted the board, the plates are then fitted in their position as shown. After fitting them up as tight to the supporting board as is possible, bend the plates over as indicated. This serves to hold them in place. Binding posts from ordinary dry cells can be used, and are placed in the holes drilled in the plates. Having finished this part, mount other binding posts, two for alternating current side and two for direct current side on the board, and connect as shown in drawing. Next mount the rheostat on the end of the box where the cover extends over. It will be seen that by cutting down into the box the lugs of the plates are protected. Next paraffine the inside of the box. The fruit jars are placed in it as shown. The solution is to be made as follows: Fill jars within ¾ inch of top with water. (Warm water is better, but not necessary); then dissolve a heaping teaspoonful of ordinary baking soda into each jar of water. Then to each jar very slowly add about three or four teaspoonfuls of sulphuric acid. Although this solution can be used immediately, it is better to allow it to cool for some time.

The rectifier will be found quite efficient, and its small size makes it very desirable. An ammeter may also be mounted on the side of the box in the case of charging storage batteries. Also another improvement may be added. You may cut a rectangular hole in one side of the box, thus making it an open window rectifier, allowing inspection of the jars without removal. To take out plates and to renew solution only the wire to the rheostat needs to be disconnected. This rectifier utilizes both halves of the cycle.

EMERGENCY SPARK COIL VIBRATOR.

Having need for a spark coil vibrator,

Using Ordinary Buzzer as Spark Coil Interrupter.

and no time to construct one, I hit upon the following idea: Taking an ordinary door-bell and connecting one primary wire to the post grounded to the bell frame and the other to the adjusting screw on the make and break contact, I secured excellent results. The batteries are connected to the bell as usual. Contributed by

JEAN J. EILER.

MAKING A LOW VOLTAGE LAMP.

Procure an ordinary mazda lamp (110, 115 or 120 volt), the vacuum of which has not been impaired. This lamp may have been broken by rough handling or burned out normally. Then connect a socket (which can be placed in any position) to the current supply and screw in the lamp. Tap the lamp so that all or part of the filament comes loose from the wire support. Now shake the lamp around, so that the filament falls across the two lead-in wires. The lamp will light up as soon as contact is made within the lamp.

If the lead-in wires are far apart, the lamp will burn best on 6 volts or more; but if the lead-in wires are very near or the filament extra thick, the lamp will light best on a lower voltage, as 2, 3, 4 or 5 volts.

The writer has had success with about 95 per cent. of all the lamps thus tried. These lamps burn up to 800 hours when filament is new, and from 25 to 200 hours when filament has already been used.

A PERMANENT MAGNET TYPE VOLTMETER.

Herewith I suggest how to construct a permanent magnet type voltmeter, which I have made myself and found to work very satisfactorily.

The case (at Fig. 1) is made of any suitable wood that is not too thick. The base of the meter is 5x7½x¼ inches, while the front part of the case is 5x7x⅛ inches, with an egg-shaped hole 3½x2¼ inches

Details and Make-up of Permanent Magnet Style Voltmeter.

cut into it for the glass. The sides of the case are 1½x6x¼ inches. Two holes 2½ inches from the bottom are drilled for binding posts, and a piece of glass is cut and fastened on inside of the case, as shown in Fig. 3, by four tacks. The scale is of cardboard glued to the horseshoe magnet, which is in this case taken from a telephone magneto.

The steel magnet is supported at the top by a strap as shown. This strap is either screwed or glued fast to the base. The side supports are two blocks, with strips of wood tacked or glued on so that they overlap (see Fig. 4). The side supports are fastened to the base in the same manner as the upper block. A wooden block turned into a cylinder, with a groove sawed on each side lengthwise for winding the wire in, constitutes the armature. A portion of a sewing needle is forced into each end, leaving the points projecting to form the shaft of the armature. A hole 3/16 inch in diameter is bored into the bottom of the block, into which a small lead weight A is placed for the purpose of bringing back the armature to normal position after it has swung over, due to an electric charge. Into the top of the armature a straight-pointed aluminum or brass wire 3½ inches long is forced. This serves as the indicating needle.

The front bearing is a piece of strip brass 2¼ inches long, bent as shown in Fig. 6. First ¾ inch is measured off and bent; then it is bent again 1 inch from the first angle, leaving ½ inch for screwing on to the base. A deep center-punch mark is made in the vertical leg of the strip 3/16 inch from the top, which forms the front bearing. The rear bearing, as shown in Fig. 7, is built from a flat piece of a brass door-catch with two perforations bored through it for screws, with a punch mark at the center for the needle point of the armature.

No. 36 wire is wound around the armature, through the slots, after first soldering one end to a needle point. About 150 turns are taken, after which the other end is soldered to the remaining needle. Wires are attached to the screws that hold the bearings and then to the binding posts on the case, after which the case is screwed on by two round-head wood screws. The scale is of pasteboard, glued on to the magnet as shown. If the needle does not move correctly after connecting the instrument to a battery, remove the wires and thus reverse the polarity of the circuit.

To calibrate the instrument, connect it up to one dry cell and indicate where the needle comes to rest by a pencil mark. Then connect it up to two cells; then three, and so on until the needle is at the end of the scale. The first mark signifies 1½ volts; the second 3 volts, and the third 4½ volts, etc. After the marks are numbered the scale can be divided off into fractions of a volt fairly accurately.

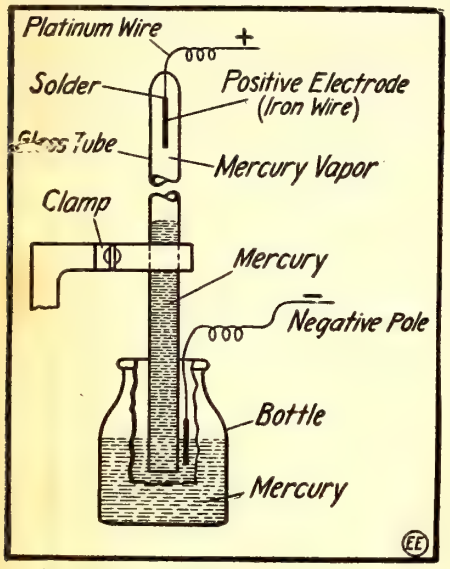
EARLE BELSINGER.

A SIMPLE, YET EFFICIENT ELECTROPLATING APPARATUS.

A novel, interesting, yet inexpensive electroplating outfit may be readily constructed from odd parts, usually to be found in an experimenter's laboratory.

A wide-mouthed jar, of about one (1) quart capacity, will serve for the cell. In this cell is placed a porous cup, which may be taken from an old battery. A rod or strip of zinc is now to be placed in the porous cup and the zinc must be amalgamated by rubbing its surface, previously polished, with dilute sulphuric acid and then with mercury. The mercury will spread over the zinc and give it the aspect of a looking-glass. A piece of wire may be soldered to the zinc (before amalgamating it) in order to attach the mold thereto. In the porous cup is to be placed a solution of dilute sulphuric-acid, made by stirring one (1) part of sulphuric acid in ten (10) of water. The water must not be added to the acid, or the violent reaction might cause an accident with serious result. A saturated solution of copper sulphate, or blue vitrol, is to be placed in the vessel containing the porous cup. The solution must be kept saturated with the copper-salts. This can be done by placing a small basket made of wire screen in the solution and keeping it partly filled with the copper sulphate. The basket must be hung near the top of the vessel in order that the solution may be diffused equally through the water.

The mold is then to be made. Anything that will take the fine lines of an engraving can be used. Gutta-percha and wax are the commonest materials now in use for this purpose. The wax must be warmed and worked into a ball and then pressed over the coin. Gutta-percha must be scalded. The coin should be slightly oiled *before* pressing on the wax, so as to prevent sticking. A small wire must be pressed in on one side of the wax (near the face of the coin) as in top sketch. The mold should be brushed over with powdered black lead (graphite) and polished. Some of the lead must be placed on the wire so as to conduct the electric current. When all is ready fasten the mold to the zinc-rod and place it so it is in the copper-sulphate solution. After leaving it about 12 hours the exact reproduction, or rather impression of the mold will be reproduced in the copper. This can be pried off the wax and the mold used again. The impression may be coated with a thin film of solder on the back by rubbing it over with the soldering fluid, and then by placing a few small pieces of solder on it. A soldering iron should be utilized to melt the solder. In the drawing the various parts of the outfit, designated by letters, are thus explained: A is the mold, B is the containing vessel, C is the porous pot, D is the zinc, and, finally, E is the little wire basket, suspended on wire from the top of the vessel, as clearly shown. When not in use the outfit may be used as an ordinary battery for ringing door-bells, etc. by placing a piece of copper bent in a circle around the porous pot.



Home-made Electroplating Set.

The most pleasing and satisfactory results and experiments can be carried out if the directions are carefully and exactly followed. Contributed by

WM. WARNECKE, JR.

A HOME-MADE MERCURY VAPOR LAMP.

A mercury vapor lamp may be easily constructed by any experimenter with the aid of a very simple apparatus, by making use of the principle of a Torricellian, or barometer vacuum. The above vacuum is produced when a long tube is closed at one end, completely filled with a liquid and then inverted with its open end under the surface of more of the same liquid, as the illustration shows. Under these conditions the liquid, if the tube be long enough, will fall to a certain height above the lower liquid level. The space above the liquid is left empty, except for the small amount of liquid which evaporates into it, existing as vapor.

Home-made Mercury Vapor Lamp.

Mercury vapor lamps consist essentially of a positive electrode of iron and a negative electrode of mercury, projecting into a vacuum saturated with mercury vapor. Minor details as to the means of starting may be omitted here for the sake of brevity. This vapor, under certain conditions, is capable of carrying a current of electricity, at the same time becoming heated and producing a dazzling, bluish-white light.

The mercury vapor lamp is made as follows:

Procure a glass tube about 40 inches long, of about ¼-inch bore, with medium thick walls and open at both ends. By heating very carefully and gradually, first in the smoky flame and then in the bluish flame of a gas or alcohol torch, the walls become softened, so that they will close together around a piece of platinum wire twisted to a piece of No. 12 iron wire, thus sealing it into the tube.

Fill the tube thus prepared with some pure mercury, which has been boiled to remove all of the inclosed and dissolved air. This boiling should take place in a glass or porcelain vessel. The resulting fumes, which are *very* poisonous, should not be inhaled.

The glass tube must be wholly and completely filled with mercury. Not even a bubble of air should be left behind, sticking to the walls; otherwise the operation will be a decided failure. When absolutely sure that all the air has been removed, close the open end of the tube with the thumb, and by inverting it place this end under the surface of some mercury in an open vessel. Then, *while still under the surface,* remove the thumb.

This done, the column of mercury will not completely fill the tube, but will fall to a height of about 29 inches. In falling from the top of the tube, since there was no air present, it might be supposed that there would be a space quite empty left above the mercury. This is very nearly, but not exactly, true, as the mercury, like water, only to a much smaller extent, will evaporate, thus filling the space above it with attenuated mercury vapor.

Clamp the tube in a vertical position and attach one terminal to the mercury in the dish by merely inserting a wire in it and the other to the iron wire electrode terminal projecting from the top. The current used may be 110 volts direct current, taken from the street mains, or from any other convenient source.

When the power is first thrown on, no current will flow because of the very high resistance of the space between the electrodes. If a spark from an inch or even ½-inch spark coil be sent across the terminals, it will break down this high resistance and pass. In doing so it will cause the formation of much more mercury vapor than before, on account of the resulting heat. The path of this spark will then have much less resistance than the space had before, on account of the greatly increased amount of vapor present. Because of this lowered resistance the main current is now able to pass, and in doing so will heat the vapor in its path to a bluish-white, dazzling light, with which the reader is familiar. ALFRED MORGENBOLD.

HOW TO BUILD AN OZONE GENERATOR.

The peculiar properties of ozone as a purifier and sterilizer have made it very serviceable for use in libraries, homes, factories, etc. An apparatus to produce ozone, termed Ozonator, can be readily made and advantageously employed.

This generator should be made up of three distinct parts—the high-tension induction coil, such as a two-inch spark coil; the discharging device and the circulating fan. These are treated in the following paragraphs.

An ordinary spark coil, having heavy contact points, in order to stand continuous work, and better still, if used on 110-volt alternating current, with its vibrator closed and in series with a suitable resistance, should be employed. If direct current is available an electrolytic interrupter should be placed in a vessel containing some water, or, still better, circulating water, so as to cool the solution of the interrupter. This latter method of running the coil will be found very satisfactory. It should be connected in the usual way.

The discharging device is next to be considered. To ozonize air it is essential that a visible electrical corona or brush discharge be produced. This takes the form of a violet glow and is always the index of an extremely high potential or voltage.

Details of Ozone Generator.

There have been many forms of dischargers developed, among which the one herein treated is quite efficient and, moreover, simple in construction.

Two pieces of heavy sheet brass, measuring 3x4 inches, are placed in a horizontal position, one-eighth inch apart, in grooves in a fiber base. Rubber should not be used, as it carbonizes quickly under such electric stresses as it would be subjected to, and wood has too low a dielectric strength. Between the brass pieces in another groove, at least one-quarter of an inch deep, should be fitted a one-eighth-inch sheet of plate glass, measuring 4x5 inches. The difference in potential of the two electrodes, which are connected to the secondary terminals of the coil, is sufficient to cause a violet "brush" or corona discharge to form in the spaces between them and the dielectric. In these spaces enough ozonized air is produced in a short while to purify and freshen the air in a comparatively large room or hall.

The function of renewing the air between the electrodes and forcing the ozonized product out into the room is performed by a small electric fan, operated either by storage batteries or on a lighting circuit. It should be placed several inches behind the discharger, so that the air flows through the electrodes and out into the room.

The complete ozone generator may be mounted or cased, as the builder desires. The different parts are connected in the manner shown in diagram.

WILLIAM AMPERE.

[Ed.—It is usual to employ a small 75 to 100 watt alternating current step-up closed core transformer for this purpose. One giving about 7,000 volts at the secondary is used in several commercial ozonators of small type.]

AUTOMATIC LIGHTING SWITCH.

How many times have you entered a dark room with your hands full and found to your great perturbance that to turn the light on you would have to drop everything, thus losing time and also patience? To alleviate this, the following may aid you to lose less of your patience and also to retain your good nature:

Remove the switch and place it in such a position that it will be behind the door when opened. Then procure a piece of wood (use your own judgment in selecting); also another piece about 4 inches by ¾ inch, and join these pieces as shown in diagram, nailing crosspiece to door. Now bore a hole through the handle of the switch and also in the stick nailed to the crosspiece. Put an axel from an old skate wheel through the holes and fasten them by an ordinary machine pin. Now the opening and closing of the door will turn the switch automatically on and off.

Switch Fastened to Door by Rod "C" Cuts Off Lights Automatically.

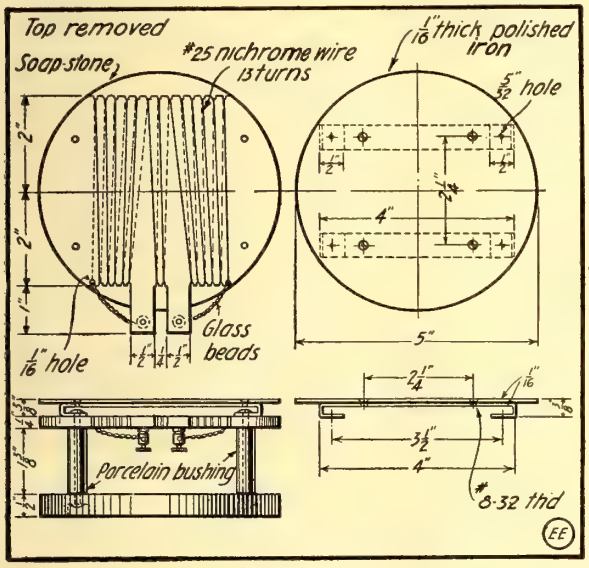
HOW TO MAKE IT



This department will award the following monthly prizes: FIRST PRIZE, $3.00; SECOND PRIZE, $2.00; THIRD PRIZE, $1.00.
The idea of this department is to accomplish new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best ideas submitted a prize of $3.00 will be given; for the second best idea a $2.00 prize, and for the third best a prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings.

FIRST PRIZE $3.00.

A USEFUL 495 WATT ELECTRIC STOVE.

The enclosed drawing shows a simple way of making an excellent electric stove for use on a circuit of 110 volts at 4.5 amperes. This stove will be interesting for those who like simple designs.

Practical and Useful Home-made Electric Stove.

The heating element is made from asbestos or soapstone; either one will do, as it is easily cut with a hack saw. Then it is wound with No. 25 Nichrome wire (9½ feet in all). After it is wound a few beads are slipped on the ends, so as to insulate them from outside objects, and fastened by means of binding posts.

The unit is supported by four screws running through porcelain bushings and fastened to a slate base. When this is done a cover is cut from 1/16-inch thick iron and fastened to the screws. This will be useful for heating the coffee pot, etc.

Contributed by FRANK HARAZIM.

AN ACID-PROOF CEMENT.

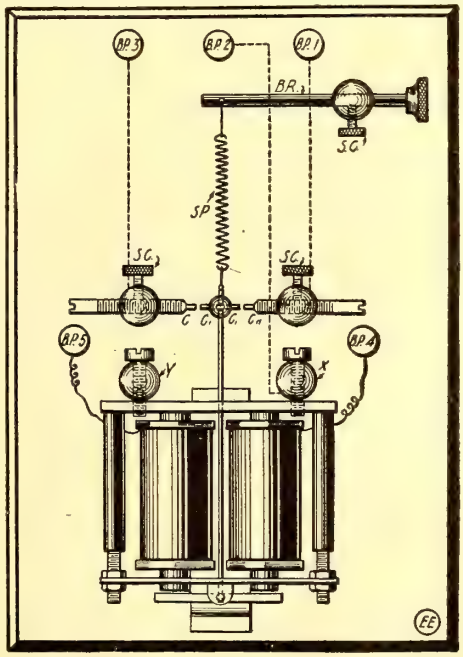
A very good acid-proof cement for cementing articles exposed to acids may be made up of a mixture of litharge (yellow lead) and glycerine. Mix to a stiff paste and use quickly, as this cement sets quite rapidly.

A Good Varnish for Electrical Apparatus.

A very good insulating varnish for metal work on electrical instruments is black asphaltum varnish. It has a finish like black enamel and good insulating qualities.

If this finish to too glossy a varnish made from orange shellac and lampblack should be satisfactory.

This latter is better for woodwork, while the first is better for metal work. Contributed by WALTER FRANSEEN.



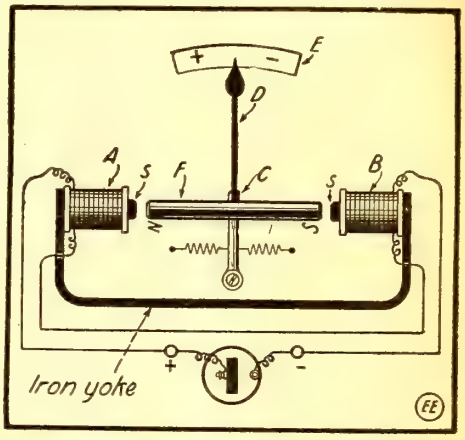
SECOND PRIZE $2.00.

A SIMPLY CONSTRUCTED POLARIZED RELAY.

Many experimenters have found it impossible to use a polarized relay owing to the prohibitive price which is usually charged for this instrument. The following description, together with the accompanying drawing, will enable one to make a simple yet efficient instrument of this character with little trouble:

An alternating current or magneto bell ringer (polarized type) is mounted on a wooden base about 4x8 inches. A hole is drilled through the clapper ball to accommodate a pair of silver or platinum contacts C′ and C′ as shown. Adjustable contact screws C and C″ are mounted so as to be engaged by the contacts in the clapper. A spring SP connects the clapper with a rotatable and slidable rod BR, which serves to hold the contacts C′ and C′ in a neutral position between the contacts C and C″.

Connections are made as shown by heavy dotted line. Upon the reception of a direct current either one or the other of the circuits will be closed, depending upon the direction of the current. By the use of this instrument either of two circuits may be closed at will over a two-wire line by means of a key and a simple pole-changing switch. Contributed by HENRY B. GRAVES, JR.

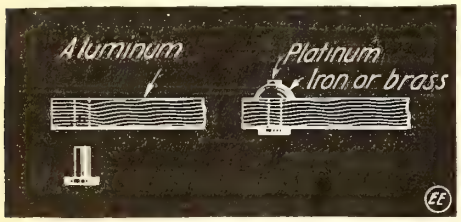


Polarized Relay Constructed from A. C. Telephone Bell.

THIRD PRIZE $1.00.

A MAGNETIC POLARITY INDICATOR.

Magnetic polarity indicators are not very well known to the average experimenter, and the sketch herewith shows a plan for making up one from a pair of 20-ohm electro-magnets and a small permanent steel magnet, properly mounted. While one electro-magnet can be used in making up this device as at A, it is best to use two of them as sketch shows. The small permanent magnet, which can be made of a piece of magnetized tool steel about 1 inch long by ¼ by 1/16 inch, is mounted on a pivoted arm C carrying an indicating needle D. A paper scale is mounted suitably on the device, as at E, with a zero center mark. Care must be taken in hooking up the electro-magnets, so that when the positive pole of the circuit is joined to the binding post marked "plus" the proper magnetic poles will be produced in the electro-magnets to give the maximum effect or reaction on the permanent magnet F. This can easily be ascertained by making a couple of tests with different connections from the magnet coils. When two magnet coils are used, mounted on a soft iron yoke (made of ½x⅛-inch stock) the two core ends facing each other will have to produce the same magnetic poles, so that in one air gap the magnetic action between the permanent magnet and the coil A will be "attractive," while in the opposite air gap, at magnet B, the magnetic effect will be "repulsive." This acts on the principle that like poles *repel*, while unlike poles *attract* each other. Contributed by G. BARENBLATT.



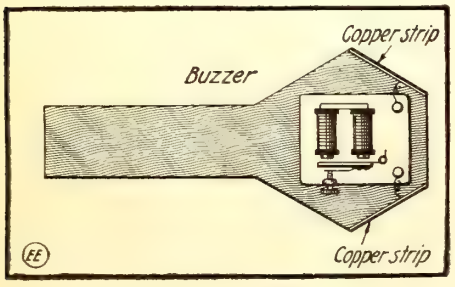
Magnetic Type Polarity Indicator.

A dime in time may save nine. A single idea gleaned from these columns may save you money and time going over ground already covered.

FASTENING CONTACT POINTS ONTO ALUMINUM.

Sometimes it is convenient to use aluminum as the moving element on an instrument such as a moving coil relay, or in wireless telegraphy when the element must necessarily have a small time period to prevent lag. These moving elements must have contact points on them, and as it is difficult to solder them onto aluminum I hereby propose a plan which has proven successful.

Method of Securing Platinum Point to Aluminum Parts.



A small rivet, made necessarily of light material, such as from lath or shingle nails, can be riveted to the aluminum. Sheet platinum can then be soldered to the nail head, which first must be well cleaned and scraped. This will present a comparatively large and non-oxidizing surface to the spark. By referring to the illustration this will be made very clear. Contributed by R. E. RYBERG.

A HANDY DRY CELL TESTER.

Practically the simplest and most commonly used method in vogue for testing the electrical activity of dry cells is that involving the use of an ordinary buzzer or bell. If any number of cells worth mentioning are to be tested it is rather a tedious job to try out each with two wire terminals from a buzzer. Therefore I provide in this suggestion a very quick and efficient method of testing such batteries, and the sketch makes this idea quite clear.

It consists simply of a piece of wood cut to the shape indicated; on the lower part of it is mounted a small buzzer. The two terminals of the buzzer connect by pieces of copper wire to two copper strips, as shown. All that is necessary is to place the lower part of this wood support between the binding post of the dry cell so that the two copper shoes on same make contact with the zinc and carbon binding posts.

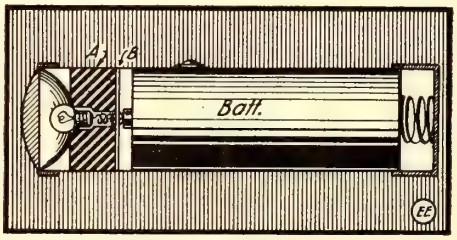
Testing Device for Battery Cells.

A GOOD READING LIGHT.

Have you a good reading light? If this very important question was put to a mass of people 99 per cent. of that mass would be compelled to answer in the negative. Why?

The reason that good lights are so uncommon is not so easy to discover. Perhaps the best explanation may be found in the well-known proclivity of the human mind to accept without question the things it is most familiar with, and to turn to the unfamiliar and remote in its efforts at improvement. It is only within recent periods that it has been made possible for most every individual to be provided with an artificial light that is practically as good as daylight.

If electric light is used in a dome over the library table the dome should be arranged to take a single Mazda or tungsten lamp, which should be fitted with a prismatic or opal glass reflector, and the lamp itself should be what is called "bowl-frosted," i. e., have the lower part of the lamp frosted. A 60-watt tungsten lamp will give ample light under all ordinary conditions and will use very little more current than a single 16 C. P. carbon filament bulb, which consumes about 54 watts. Desk lights should be fitted with a reflecting, or rather deflecting, shade, to prevent the direct or



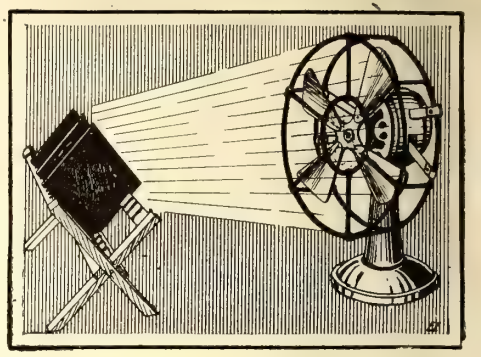
Efficient Desk Lighting Scheme.

even strongly reflected light rays from striking the eye. A sufficient, yet soft, light is that which proves the least trying to the eye. Indirect lighting is widely employed, but is not universally adaptable to all requirements.

A FLASHLIGHT "BULB" PROTECTOR.

Those who are troubled with the cracking or breaking of flashlight bulbs and filaments will find the following device an antidote for these unpleasant mishaps:

Lamp Protection for Flash-Lights.



All that is necessary is a block of either fiber, hard rubber or wood, backed by a copper disc. Through the center of this block is bored a hole, large enough at one end to allow the base of the lamp to fit in with ease. Just below the disc of copper the hole is made smaller, with a small spring attached.

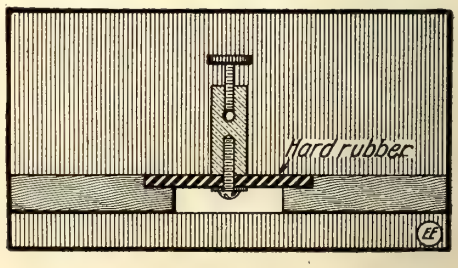
The object is to take the weight of the battery off the lamp bulb and put it on the case instead.

Contributed by WATSON McALEXANDER.

ELECTRIC FAN HELPS DRY PHOTO NEGATIVES.

Those engaged in developing and drying photographic negatives will find an ordinary electric desk fan of great value in quickly drying such negatives as they rest in their drying rack. The fan is placed a few feet

Electric Fan Quickly Dries Photo Negatives.



away from the negatives, and it is best that this arrangement is so located that a good draught of fresh air can be drawn in through the fan from an open window. The negatives will be dried very quickly in this way, and it is considered by many photographers as much superior to the use of artificial cooling baths.

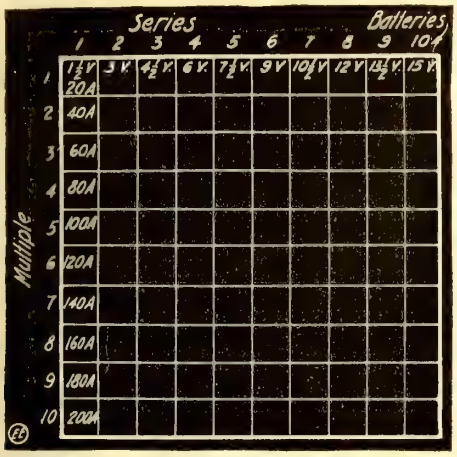
ETCHING ON STEEL.

Cover the article with a film of paraffin wax (or candle grease) and with a scriber write or mark on the surface whatever is required, making sure to cut clean through the wax. Sprinkle some salt over this and then cover with strong nitric acid. The etching should be continued for an hour or so, depending upon the depth of the etched part. Then clean off with hot water and grease the article to prevent any rusting.

Rust Preventive.—The following is a good rust preventive for steel: 16 parts *Turpentine* and 1 part *Caoutchouc* dissolved by a gentle heat. To this add 8 parts *Boiled Oil,* stir and at the same time bring to the boiling point. Apply with a brush after the manner of varnishing. This coating can be removed by the use of *Turpentine* if desired.

IMPROVED BINDING POST MOUNTING.

Improved Insulation for Binding Posts.



The sketch herewith shows a method of using ⅛ inch hard rubber (or other thickness) as an insert in table or cabinet tops to support binding posts, spark-gaps, helix stands or other connections which carry high potential or high frequency currents.

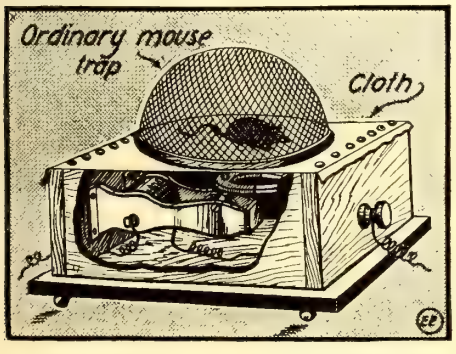
This results in better insulation and greater efficiency without the excessive cost of using hard rubber for the entire surface. It is recommended for wireless receiving sets also if maximum efficiency is to be realized from such sets.

Contributed by I. L. JONES.

A BATTERY COMPUTING TABLE.

A convenient table to have at hand for quickly calculating the power of dry cells connected up in various ways is shown in the accompanying illustration. This table

Direct Reading Battery Chart.



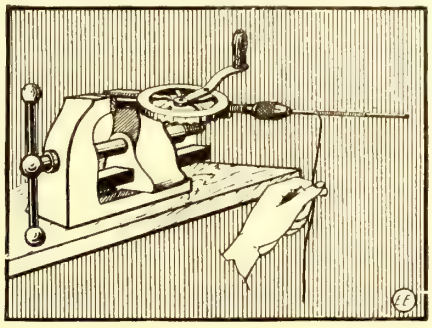
is worked out for "new" dry cells only. Each square represents a single dry cell. Should a battery with an output of, say, 6 volts, 60 amperes be desired, then 6 volts are depicted on the top line under the (cell) number 4, signifying that it takes four cells in series to produce 6 volts. Sixty amperes will be found on the side row opposite the figure 3, indicating that three cells in multiple make 60 amperes. Now four cells in series and three rows in multiple ($4 \times 3 = 12$) give 12 cells necessary for the desired output. Also, as each of the 12 squares represents 12 cells, the arrangement can be readily understood.

Any combination up to 15 volts, 200 amperes may be obtained. Contributed by

ARTHUR R. DARLING.

A MYSTERIOUS MOUSE WINDOW ATTRACTION.

On the end of the motor shaft, as depicted, a horse-shoe magnet of tungsten steel is attached. This, of course, must be well magnetized. An old, weak one, will not do. Now, on top of the wood box, where the cover was removed, a cloth is fastened, by small tacks, as shown in sketch. Two binding posts may be placed on the side of box, as will be noted. Next a mouse-trap (of circular shape, preferably) is obtained and the entire base thereof removed so as to leave the hollow, wire net only. A little gray mouse (costing but a few cents) of plaster-paris is needed,



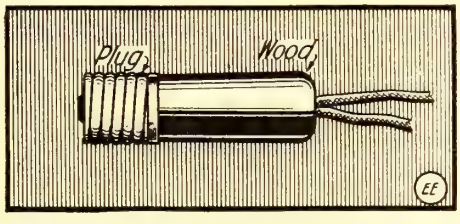
Magnetic Revolving Mouse Window Display.

such as are usually sold in stationery stores, also a piece of iron ½ inch thick is tacked to the bottom of the mouse. The base, however, so as not to be noticed, must be neatly trimmed off so as to fit the lines of the little creature. When all is ready the mouse is placed on the cloth, the wire net placed over the mouse, and the motor set rotating. As the motor turns around the mouse will also hurry around, being attracted by the magnetism of the horse-shoe magnet on the revolving shaft of the motor. It is desirable that the motor should not run too fast. Contributed by

WM. WOODHOUSE, JR.

WINDING RESISTANCE COILS.

Many an experimenter has wanted to make a resistance or perhaps an electric toaster or heater but was at a loss as to



Hand-Drill Used for Rapid Winding of Resistance Coils.

winding the coils of the resistance wire. While making a resistance I hit upon the following method of winding the coils: The handle was removed from a hand drill and the drill fastened in a vise so that the crank could revolve freely. A ⅜-inch rod, 5 inches long and with a ⅛-inch hole in one end, was fastened in the chuck. The wire for winding the coils was No. 22 iron (German silver would do), having been obtained from a basket factory. The wire was cut into as many 9 foot lengths as coils were needed. The end of the wire was put through the hole in the end of the rod and the wire wound on the rod in one closely formed layer. The end of the wire is pulled out of the hole and the coil slipped off the rod. This gives a coil about 4 inches long, but when stretched to about 6 inches in length the adjacent turns do not touch. I wound 120 of these coils in one afternoon, using this method. Contributed by

ALBERT P. VANSELOW.

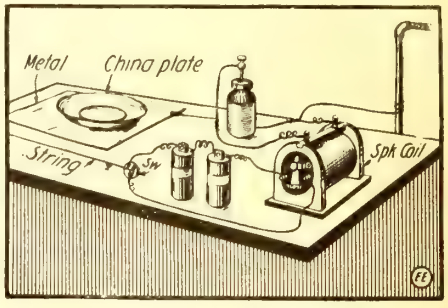
A CHEAP ATTACHMENT PLUG.

Herewith I suggest a method for utilizing

Attachment Plug Made From Wooden Rod and Lamp Base.

to good advantage an old incandescent lamp base and a piece of broomstick.

Empty the lamp base of everything except two wires, which should be threaded through a hole bored in the center of a short stick cut from an old broom handle. The wires are then soldered firmly to a couple of flexible leads. The wooden plug may be cut down until it just fits into the brass cup and with a little glue it can be made to hold fast.



This completes a neat, yet very cheap and effective attachment plug for laboratory requirements. Contributed by

LAWRENCE MICHELS.

AN ELECTRIC "HOUND" CHASER.

For those who are troubled with neighboring dogs (hounds and such), the following scheme will be found efficacious in getting rid of them thoroughly and finally.

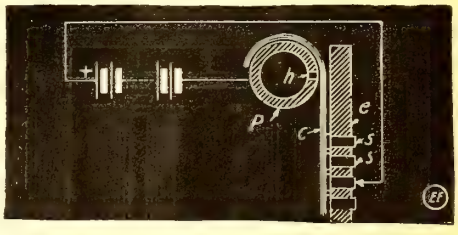
All that is required is a small spark coil which most experimenters have about their laboratory, together with a Leyden jar, a

Electric Shocker for Dogs.

china plate and a piece of string with batteries and a switch for same.

The piece of string is arranged near the china plate containing milk or meat, so that when his "Riverence the Pup" strides toward the plate his foot engages the string which closes the battery switch and a metal plate or sheet under the china plate is then charged with high voltage from the spark coil.

Needless to say, this makes the most *highly seasoned* dish that friend "Pup" ever dined on. Contributed by



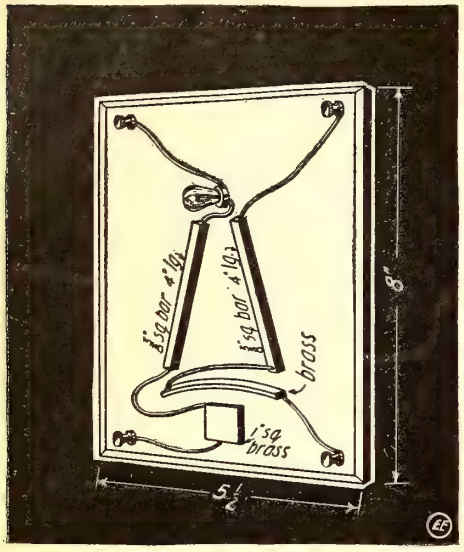
C. L. ROBINSON.

A VISUAL PHOTOTELEGRAPHIC RECEIVER.

A visual receiver for phototelegraphy and telectroscopy, employing a special electrolyte, has been recently invented, says L. H. Walter, in the *Proceedings of the Royal Society*. The schematic sketch is herewith shown.

It consists of luminous elements, 5,500 in number, with independent electrical connections placed in a frame, which is hardly larger than that of an ordinary camera. The anodes *s* are embedded in an ebonite plate *e*, their backs being wetted by an electrolyte which escapes from the holes *h* of the pipe *p* and flows over the crape *c*. A voltage of 130 to 140 volts is used. The negative pole of the circuit is connected to the pipe *p*, while the anodes *s*, which are to be rendered luminous, are connected to the positive pole.

This arrangement can be used for various applications, as it combines in a lim-



Visual Phototelegraphic Receiver.

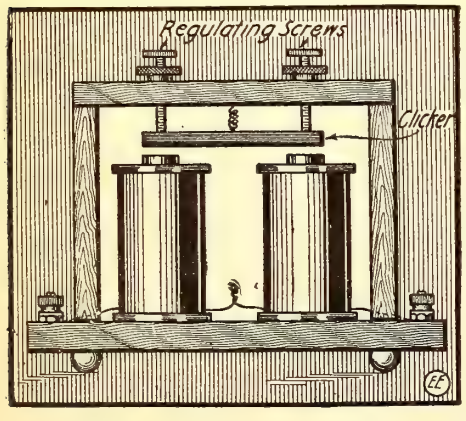
ited space almost an unlimited number of elements, the surface of which can be illumined or darkened hundreds of times a second at will. The degree of luminosity can be adjusted by the voltage applied.

Wireless communication between Scandinavia and America, with an intermediate station in southern Greenland, has been proposed.

A HANDY FUSE TESTER.

Many electrical experimenters have cartridge fuses on most of their instruments. The following diagram will show a good

Quick Test Board for Fuses and Lamps.



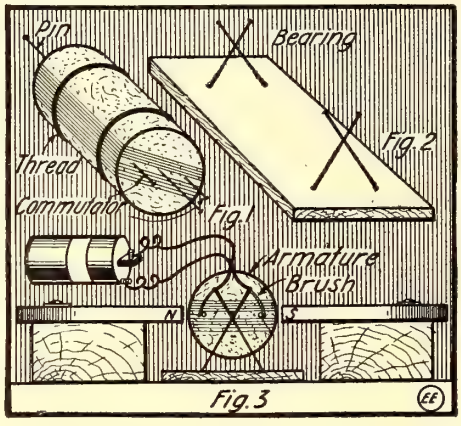
way to test them. This apparatus can be used to test fuses of any kind by making the block of wood to fit the length of the fuse. Contributed by

CARL MENKE.

A NOVELTY AMONG TELEGRAPH SOUNDERS.

A novel telegraph sounder of quite odd proportions is described and depicted in the following contribution:

First two wood posts are mounted in an upright position on a base of wood, neatly varnished. Then another wood rod is fastened on the upright ones at each end, as will be seen in the sketch. In other words, it is bridged across, from one to the other, as drawing depicts. A pair of electro-magnets are mounted on the bottom of the wood base, as perceived. Two binding posts are fastened to the base of the apparatus, and, of course, put in circuit with the magnets. For clicker an iron shaft, such as door-knobs are fastened on, offers itself well for this purpose. A small spring to make tension is soldered to the steel shaft, and the other end (of spring) is tacked to the top wood piece, which is shown in sketch clearer than words can



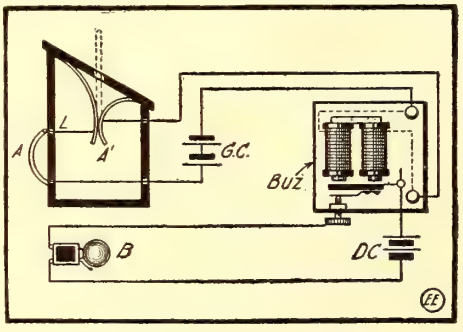
Unique Style of Telegraph Sounder.

describe it. After the regulation-screws (at the top) are properly adjusted, the instrument is ready for use. It may be put in circuit with a telegraph key, as usual.

Contributed by WM. WARNECKE, JR.

MAKING A MOTOR IN 10 MINUTES.

Anyone having some wire, a few pins and a cork can construct this motor in less than 10 minutes. The armature consists of a cork having a pin stuck in each end. See that the pins are exactly in the center or the armature will wobble. Wind the armature with No. 30 enameled wire, as shown in Fig. 1. Stick four pins in a piece of wood as at Fig. 2. Arrange the armature, bearings, brushes and magnets, as in Fig. 3. The brushes are of No. 26 wire, bent as per sketch. Although simple, this motor will run very swiftly with one



Simple Motor Made From Cork and a Few Pins.

dry cell. It also demonstrates the principle of large motors very clearly and at the lowest possible expense. Contributed by

MATT JAROSZ.

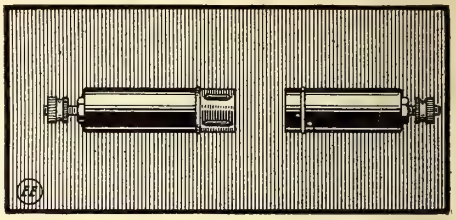
CLOSED CIRCUIT MAIL BOX ALARM.

Herewith is presented a very serviceable mail box alarm of the closed circuit type.

Closed Circuit Alarm for Mail Boxes.

A′ is made of two light pieces of some flexible metal, and is bent, as shown, to separate when a letter is dropped in the box. A is of the same material, but much heavier, and is so constructed that when a parcel or letter is placed in contact A′ is opened from L. The springs should be connected in series with each other, and a pair of "crowfoot" gravity cells is then connected to a buzzer with the windings arranged as illustrated. A bell and two dry cells are connected to the vibrator contact and to the iron armature bar of the buzzer.

When the closed circuit is broken the armature of the buzzer rebounds and closes the local bell circuit, thereby sounding the alarm and signifying that a letter or parcel is in the box. Contributed by



S. F. CSOHAR.

A SIMPLE CONNECTOR FROM PENHOLDERS.

One glance at this neat little device is sufficient to disclose its simplicity, usefulness and niftiness. It is constructed from a simple metal penpoint case (for holding penpoints, and which usually come with Eberhard Faber's pencil sets). Two holes are drilled in on both ends of the case and posts from old batteries are fastened therein.

This is all that is necessary, and the sketch plainly shows how the device is operated to make a connection.

It is invaluable for running small motors,

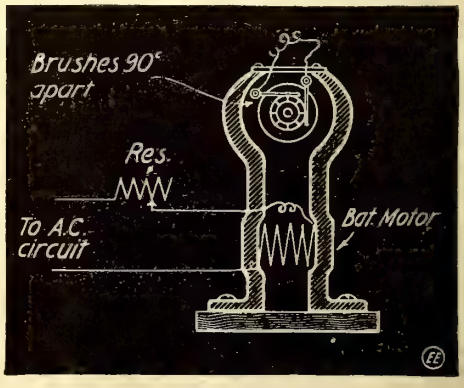
Electric Connector Utilizing Pencil Tips.

lighting automobile lamps and miniature lighting systems, etc. It is merely clipped together, the action being the same as if a penpoint were taken out and the case closed again. Contributed by

ALGERNON W. WRANDON.

SOLDERING IRREGULAR PIECES.

To solder accurately irregular pieces of metal or the parts of a broken piece, press the parts into a lump of putty, placed on a piece of tinplate. Having thus formed a mould, remove and dry the putty with a gas jet. This burns the oil in the putty. When the mould is ready replace the pieces and also some solder in small pieces. Use a gas jet or blow-torch to heat same and do not remove the parts until quite cool.



BATTERY MOTOR ON ALTERNATING CURRENT.

Many experimenters have some small battery motors which they wish to run on alternating current. For this purpose the following directions will be found efficacious:

The field windings should be connected in series with a suitable high resistance. The brushes are short-circuited and then adjusted to give the greatest speed and power. It has been found that a 6-volt, 4-ampere "Knapp" motor will operate best when the lower brush is at right angles with the upper one. No connection whatever is made between the field and armature. Contributed by

PERCY M. ROOPE.

[Ed.—*This is the "repulsion type" of alternating current motor principle. For best results the iron frame should be laminated or made up of many soft iron sheets, firmly bolted or clamped together.*]

Operating Battery Motor on A. C. Circuit.

A year's subscription would make an appropriate Xmas gift to your friend.

Under this heading we will publish every month useful information in Mechanics, Electricity and Chemistry. We shall be pleased, of course, to have our readers send us any recipes, formulas, wrinkles, new ideas, etc., useful to the experimenter, which will be duly paid for, upon publication, if acceptable.

FORMULA No. 16.
Soaps.

Transparent Soap.—Slice 6 lbs. nice *Yellow Bar Soap* into shavings; put into a brass, tin or copper kettle, with *Alcohol*, ½ gal., heating gradually over a slow fire, stirring till all is dissolved; then add 1 oz. *Sassafras Essence* and stir until all is mixed; now pour into pans about 1½ inches deep, and when cold cut into square bars the length or width of the pan, as desired.

English Bar Soap.—Six gal. *Soft Water*, 6 lb. good *Stone Lime*, 20 lb. *Sal-Soda*, 4 oz. *Borax*, 15 lb *Fat* (*Tallow* is best), 10 lb. *Pulverized Resin* and 4 oz. *Beeswax;* put the water in a kettle on the fire, and when nearly boiling add the lime and soda; when these are dissolved, add the borax. Boil gently and stir until all is dissolved; then add the fat, resin and beeswax.

Best Soft Soap.—Mix 10 lb. *Potash* in 10 gal. *Warm Soft Water* over night; in the morning boil it, adding 6 lb. *Grease;* then put all in a barrel, adding 15 gal. *Soft Water.*

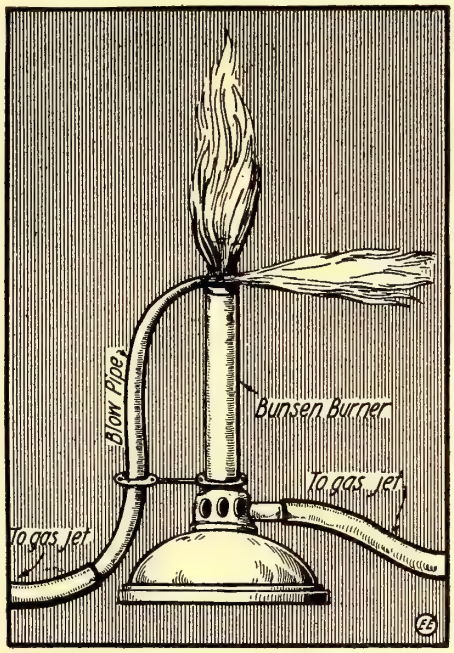
German Yellow Soap.—Tallow and *Sal-Soda*, of each 112 lb.; *Resin*, 56 lb.; *Stone Lime*, 28 lb.; *Palm Oil*, 8 oz.; *Soft Water*, 28 gal. Put soda, lime and water into a kettle and boil, stirring well; then let it settle, and pour off the lye. In another kettle melt the tallow, resin and palm oil; having it hot, the lye being also boiling hot, mix all together, stirring well, and the work is done. *For small quantities—Tallow* and *Sal-Soda*, each 1 lb.; *Resin*, 7 oz.; *Stone Lime*, 4 oz.; *Palm Oil*, 1 oz.; *Soft Water*, 1 qt.

Hard Soap with Lard.—Sal-Soda and *Lard*, each 6 lb.; *Stone Lime*, 3 lb.; *Soft Water*, 4 gal.; dissolve the lime and soda in the water by boiling, stirring, settling and pouring off; then return to the kettle (brass or copper) and add the lard, and boil it till it becomes soap; then pour into a dish or moulds; and, when cold, cut into bars and dry it.

Camphor Soap.—Curd Soap, 28 lb.; *Otto of Rosemary*, 1¼ lb. Reduce the *Camphor* to powder, add 1 oz. *Almond Oil*, then sift it; when the soap is melted and ready to turn out, add the camphor and rosemary.

Sand Soap.—Curd Soap, 7 lb.; *Marine Soap*, 7 lb.; *Sifted Silver Sand*, 28 lb.; *Oils Thyme, Cassia, Caraway* and *French Lavender*, of each 2 oz.

Shaving Paste.—4 oz. of *Naples Soap*, 2 oz. of *Powdered Castile Soap*, 1 oz. of *Honey*, 5 drops each of *Essencce of Ambergris, Oil of Cassia, Oil of Nutmegs.* Melt the soap in water bath, add honey and when nearly cool add the oils and essence.



"SOLDER" FOR METAL, GLASS AND PORCELAIN.

A soft alloy which adheres to metal, glass and porcelain and can be used in the same manner as soft solder is prepared from powdered copper (copper dust) which may be obtained by stirring a solution of blue vitriol with granulated tin. The solution becomes considerably heated and a fine brown powder is precipitated. Of this copper dust, 20 or 36 parts by weight, according to the desired hardness of the solder, are mixed in a cast-iron or a porcelain mortar with sulphuric acid of 1.85 specific gravity to the consistency of paste, and 70 parts of mercury added with constant stirring.

When the amalgam is thoroughly mixed it is carefully washed with water to remove all traces of acid, and then cooled off. In 10 or 12 hours the mass becomes very hard. When the solder is to be used it should be heated to about 400 degrees Fahrenheit, in which condition it can be kneaded like wax in an iron mortar. In this plastic state it is applied to the broken surfaces, which are then pressed together, and when cooled the amalgam adheres very firmly. Contributed by DAVID KARRON.

A DOUBLE FLAME LABORATORY BLOW TORCH.

While working in a laboratory last winter I frequently needed a blow torch for welding purposes, but as there was none in the laboratory equipment I struck upon a novel means of making the desired heat. I attached a mouth blow pipe to a gas jet

A Double Flame Laboratory Blow Torch.

by means of a rubber tube and, turning on the gas, held the blow pipe in the flame of a Bunsen burner. The gas coming through the blow pipe had the desired effect upon the Bunsen flame, producing as great or greater heat than the average blow torch.

Contributed by HARRY R. FEES.

Shabby leather can be much improved by either *Linseed Oil* or the well-beaten *Whites of Eggs* mixed with suitable coloring matter. The surface can be brought to a gloss by the use of a soft duster.

To Clean Brass.—Rub it with a mixture of *Vinegar* and *Salt*, or *Oxalic Acid*, then wash with *Water* and polish with *Tripoli* and *Sweet Oil.*

SOME USEFUL WRINKLES FOR THE EXPERIMENTER.

Turpentine makes a very good lubricant for a drill when boring thin glass.

A liberal coating of parrafine on the outside of battery jars keeps the acid from climbing.

It is hopeless to try to restore dry cells to their former strength, but after they have lost most of their voltage they can be partially restored by soaking them in a solution of salt water and drilling a number of holes around the base of the battery to let the solution soak in.

A very good way to intensify weak radio or telephone signals when using only a single pole watch case receiver is to procure a large magnet from some electrical supply store. Bind one of the poles on the back of the receiver where the screw that holds the bobbin protrudes (some little experimentation will have to be done to determine the right pole), and the signals will be found to have been increased to three and four times their previous strength.

Never try to tap your local telephone line. The company dislikes it; in fact, so violently that they may have you arrested on a serious charge. Many an innocent experimenter has gotten himself into a lot of trouble doing this.

Never try to make hydrogen gas without some knowledge of safety appliances to be used on the apparatus. It is about as quick a way to put your eyes out as there is.

If you are using storage batteries in your wireless set, and they fail to give proper voltage, or get too hot, don't try to fix them yourself, as they can be very easily ruined. A garage man can't fix in a day what you can "unfix" in 10 minutes.

Don't light matches around storage batteries to see if they are working properly. When operating they liberate a gas which is at times very explosive. Use a pocket flashlight.

If you are disturbed by alternating currents interfering with your wireless receiving set turn your aerial in another direction. It may help.

If you can get your wireless instruments silver plated, do so by all means, as silver is a much better conductor than nickel, and high frequency currents such as are used in wireless work travel almost entirely on the surface of switches.

If you are intending to buy any instrument and don't know the size, range, adaptability to your requirements, etc., don't be afraid to ask the manufacturer about the instrument. Even if he does have a catalogue, he will be glad to give you any additional information you desire.

When experimenting with 110-volt current always have a pair of 10 amp. fuses in circuit. It will stop a lot of pyrotechnics if something goes wrong.

Don't paint the stand that you intend to mount your instruments on. Paraffine is better; it don't allow so much current to leak through.

Contributed by WARD B. BABCOCK.

Rust spots on nickel can be treated with *Grease*, and after several days rubbed with a rag saturated with a few drops of *Hydrochloric Acid* in *Ammonia.* Parts should be thoroughly rinsed, dried and polished.

Aluminum Polish.—An emulsion of equal parts of *Rum* and *Olive Oil* can be used for cleaning aluminum. *Potash Lye*, not too strong is also effective in brightening aluminum; *Benzol* is also used.

A good polish for aluminum consists of a paste formed of *Emery* and *Tallow*, the finish luster being obtained by the use of *Rouge Powder* with *Oil of Turpentine.*

WITH THE AMATEURS

Our Amateur Radio Station Contest is open to all readers, whether subscribers or not. The photos are judged for best arrangement and efficiency of the apparatus. To increase the interest of this department we make it a rule not to publish photos of stations unaccompanied by that of the owner. Dark photos preferred to light toned ones. We pay each month $3.00 prize for the best photo. Make your description brief. Address the Editor.

AMATEUR RADIO STATION CONTEST.

Monthly Prize, $3.00.

This month's prize winner.

WIRELESS STATION AND ELECTRICAL LABORATORY OF FRANK H. BROOME.

The accompanying photo shows the sending and receiving outfits, also the main switchboard controlling the other laboratory and experimental apparatus, most of which is on a slate table not shown in the photo.

The wireless receiving outfit is of the semi-cabinet type, most of the instruments of which have been described by the owner in *The Electrical Experimenter* during the past year. All of the instruments are of the owner's design and make, and have proved of exceptional worth. They consist of a loading coil, loose coupler, variable and adjustable condensers, crystal detector and 'phones. The horn was used in connection with a receiver in receiving from WHB, NAH and other near-by stations.

Mr. Frank Broome is an Ardent Radio and Electrical Student. Here We See Him Surveying a Mast Site.

Below: The Radio Laboratory of Mr. Broome is Up-to-date and Contains Transmitting and Receiving Apparatus with Amplifier.

The present sending set consists of a 1-inch coil, operated in connection with an electrolytic interrupter on 110 volts alternating current; Leyden jar condenser, helix, hot-wire ammeter and key. Aerial is "T" type, 40 feet high and 100 feet long.

The aerial and lightning ground switch are both conveniently located, and can be operated from the switchboard panel.

The laboratory apparatus consists of step-down transformers, rectifiers, arc lamps, electric furnaces, storage batteries, etc., all of which are home-made. Tools and raw material are conveniently kept under the wireless table.

The station is over five years old, and during that time *The Electrical Experimenter* or its predecessor, *Modern Electrics*, was always to be found in its library.

FRANK H. BROOME.

Roselle Park, N. J.

RADIO OUTFIT OF JACOB WEISS.

I take this occasion to enter my station in your monthly contest. My station consists of a 1-kw. closed-core transformer (made by Queen & Co.), pancake oscillation transformer, rotary gap, consisting of motor-driven disc containing 13 studs (r.p.m. 6,000), and three Murdock condenser units. I use a break-in system, eliminating the aerial switch, and a magnetic key. The key operates the magnetic relay, which in turn operates the break-in relay. My transmitter is in the basement of my home and my receiving set is in the dining room on the first floor. I use a small Pittsburgh step-down transformer on 110 volts to operate a relay type motor starter. The relay for the motor is energized by a small foot-plate push mounted on the floor under the table.

My receiver consists of a loose coupler, primary and secondary rotary condensers and Audion amplifier, with 2,000-ohm 'phones. There are of course the necessary batteries and resistances to go with the audions. I use the series-shunt system for condenser on the primary coil.

I have no trouble in getting the distant stations very well. On Oct. 18 last I heard N.A.W. very plainly. I have held communication with Western stations regularly at such times as I have happened to be at home. During the winter months I worked 8 P.P., 8 A.M., 9 K.U., and was received at a station in Chicago, Ill., and at Winnetka, Ill. Also I have worked stations in Wheeling, W. Va.; Cleveland, O.; Little Valley, N. Y., and 8 O.Z., Pennsylvania.

I hold a certificate of the American Radio League as an official relay station; also first-grade commercial license. I am a regular subscriber to *The Electrical Experimenter* and find it excellent in its contents and suggestions.

Mr. Weiss Gets Excellent Results With His Radio Receiving Set.

JACOB WEISS, Asso. M. I. R. E.

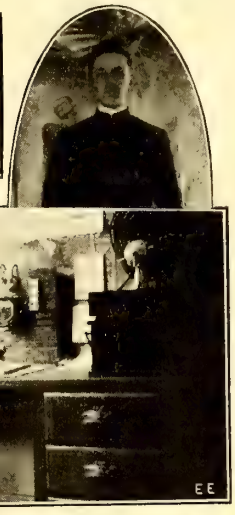
Port Washington, L. I.

G. L. LA PLANT'S RADIO STATION.

I give here a brief description and photograph of my station, and would be pleased to have you publish them in your journal. The receiving apparatus consists of an R. J. 5 Audion detector, Blitzen receiving transformer and rotary variable condenser; also three pairs of 2,000-ohm 'phones. The transmitting set is composed of a Blitzen 1-kw. transformer, rack type condenser, oscillation transformer and Marconi type discharger. As the discharger is extra large I will give the dimensions for those who wish to build one. It is made of a hard rubber disc 10 inches in diameter, ¼ inch thick, with 13 studs on the side of the disc placed ¾ inch from the outer edge. The motor is a Robbins & Meyers 1/10-hp. style, running at 2,400 r.p.m. The aerial consists of four No. 14 H. D. W. P. copper wires spaced 2½ feet apart and is 80 feet high and 150 feet long. It is insulated with Electrose 4-inch insulators.

1 KW. Transmitting Set and Also Receiving Apparatus of G. L. La Plant's Radio Station.

I am a member of the Central Association, American Relay League and also corresponding secretary of the Hawkeye Radio Association. My call is 9.K.T.



St. Anthony, Ia. G. L. LA PLANT.

CHARLESTOWN NAVY YARD RADIO CLOSED.

While the divisional radio is being secured the wireless station at the Charlestown, Mass., Navy Yard will be closed and all messages will be received at the Chelsea station. This will be for several months. The station at the navy yard has been dismantled and the apparatus has been set up at the Chelsea station. Messages received at Chelsea will be sent by "wire" to the Charlestown station.

J. W. ALLEN AND HIS WIRELESS "LAB."

The illustration herewith depicts my wireless station. At the left is the receiving set, consisting of a loose coupler, two specially designed silicon detectors, a double slide tuner, a large variable condenser and fixed condenser. I have two aerials,

Mr. J. Wyman Allen, owner of the Experimental Radio Station Shown Below.

Below: Well Arranged Radio Set Mounted on Desk.

one six-wire aerial 90 feet long and 60 feet high, for sending, and one two-wire aerial 200 feet long and 60 feet high, for receiving. Either or both of these aerials may be switched on for receiving by means of the two two-point switches seen on the front of the receiving set. The set is wired up so that by manipulating the switches on the front of the cabinet the hook-up may be changed from a loose coupler to a double slide tuner set, and the variable condenser may be shunted between the aerial and ground or may be switched in series with aerial. I have a 2,000 ohm double head set and a 1,000 ohm single head set. My sending outfit is a ¼ k.w. set with a Clapp-Eastham rotary gap. I have no aerial switch as I use a break-in system. My receiving apparatus has a range of 100 to 3,000 meters wave length.

J. WYMAN ALLEN.

Beverly, Mass.

HAMMOND PROFFERS INVENTION TO NAVY.

John Hays Hammond, Jr., recently laid before Secretary Daniels and ordnance experts of the navy the wireless device which he has perfected to direct torpedoes discharged from submarines.

Secretary Daniels declined to give the mechanical make-up of the device. He said, however, it may be of incalculable advantage to the navy.

H. LIGHTNER'S REMARKABLE POCKET RADIO SET.

After seeing the wireless sets pictured in your Prize Contest Department I decided to submit a snapshot of a pocket wireless designed and constructed by myself.

The outside dimensions of this set are 8x4x2 inches, while the weight is only two pounds without the receivers. I use one of the E. I. Co. dime galena detectors and find it extremely sensitive. My headset consists of two 2,000-ohm Brandes' Superior type receivers, which are very good. My condenser and coils are of my own make and have sufficient inductance to bring in high wave-length stations.

This set is able to receive NAA, WSL, WCX; several lake boats, including the C. & B. boats, and numerous unidentified stations. NAA comes in loud enough to be heard 26 inches away from the 'phones. By using a bed spring as an aerial I have picked up the first three stations above mentioned.

Mr. Lightner Has Perfected an Efficient Pocket Radio Receiving Set.

HERBERT LIGHTNER.

Alliance, O.

Amateur News

The Institute of Radio Engineers' October Meeting.

At the regular monthly meeting, held on Oct. 6, at Columbia University, New York City, The Institute of Radio Engineers had the pleasure of hearing a timely paper on the subject of "The Training of the Radio Operator," by Mr. M. E. Packman, professor of Radio Telegraphy at Dodge's Telegraph, Railway and Wireless Institute, Valparaiso, Ind. Mr. Packman's discourse covered the method found best for instructing embryo radio operators, and covers such matters as the type of apparatus best suited to transmit code practise signals, number of subjects to be taught, length of time required to thoroughly teach the operator the necessary rudiments of electricity and radio operation, etc.

The point was brought out that in most cases, and taking for granted that each applicant to the school has a fairly good general education, such as given in grammar schools, that a finished radio operator could be turned out in about six months. About 600 students have been enrolled annually at this school and one-third of them are radio students.

The pupil is taught typewriting and penmanship as well as all necessary wireless instruction for the reason that most telegraphic and radio messages today are copied direct on the typewriter and, of course, in any event the wireless man in charge of a station should be a first-class penman. Geography and other practical branches of study are also gone into at this school with good results. The practical side of the radio operating profession is also covered, so far as becomes possible in the short length of time the student has at his disposal. This covers such matters as the routing of messages, repetition of messages, the various codes and modifications as well as abbreviations in use internationally, etc. The fact was brought out that most of the radio operators graduated are in the Marconi service, as this company controls the major portion of the radio business to-day. The short-comings of young radio operators were brought out and the speaker offered several suggestions tending to offset these, if proper training was given in the school.

Boston Radio Amateurs, Attention

Radio amateurs located in or near Boston interested in forming a wireless association with headquarters and a central station will do well to inquire for particulars at The Young Men's Christian Union, 48 Boylston St., Boston, Mass.

Maple City Radio Club of Hornell, N. Y.

The "Maple City Radio Club" was organized on Oct. 2, 1915, with the following officers: Guy Loper, president; James Stephens, vice-president; Robert Shults, secretary; Benedict French, chief operator, and the following as members: Raymond Wright, Carl Mead, Sidney Emerson, Carl Chapman, Walter Howard.

All correspondence should be addressed to the secretary at 179 Main Street, Hornell, N. Y.

Bronx Radio Club.

At the last October weekly meeting of the Bronx Radio Club of New York, the election of new officers was held, the result of which was as follows: M. Haber, president; J. Smith, vice-president; A. Schoy, business manager; H. Berlin, secretary; A. Richter, treasurer.

A lecture was delivered by one of the members on "The Theory of Wireless Transmission."

Lectures are given at every meeting by the more advanced members of the club, dealing with timely topics of wireless or electrical interest.

The club will be glad to communicate with other societies and individuals desirous of having information or particulars of the proceedings of this organization.

All communications should be addressed to the secretary, 705 Home St., Bronx, New York. Those wishing to call on the president may do so at his home, 670 E. 170th St., Bronx, New York.

Ames, Iowa, Has Radio Society.

The second annual convention of the Hawkeye Radio Association was held at Ames, Iowa, on Sept. 1 and 2. It was well attended and proved a success in every way. The meeting on Sept. 1 was attended by wireless amateurs from all over the State. The following officers were elected: President, Ralph Batcher, 131 Hyland Ave., Ames, Iowa; Vice-President, W. P. Rathert, Cresco, Iowa; Secretary, A. B. Church, Lamoni, Iowa; Treasurer, Hollis Sels, 131 Hyland Ave., Ames; Corresponding Secretary, G. L. La Plante, St. Anthony, Iowa.

The association has had published a monthly bulletin containing from one to three pages filled with articles of interest to the members. This will be continued and enlarged during the next year. Information will be given applicants by the officers, regarding membership. We are trying to get a complete directory of the amateurs residing in Iowa, and the president would be glad to obtain any information relating to such a directory.

Much interest was afforded the members by a large display of the most modern types of radio apparatus, which was kindly loaned for the occasion by some of the well-known wireless manufacturers.

RADIO CLUBS ATTENTION!

We are always pleased to hear from young Edisons and Radio Clubs. Send a write-up of your Club with photos of members and apparatus to-day to: Editor "Amateur Gossip" Section, The Electrical Experimenter, 233 Fulton St., New York City.

Savannah, Ga., School Wireless Licensed.

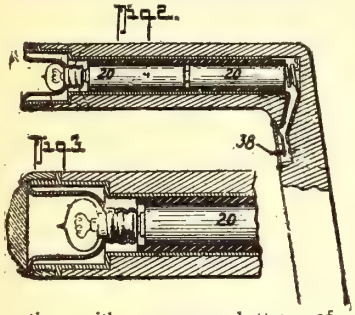
Arthur Funk, amateur radio operator, who has for the last two years been perfecting the station he has now installed on top of the High School at Savannah, Ga., recently received his operator's license from the Government.

It is a license for "Commercial, experimental and instruction purposes," and was obtained primarily to enable him to pursue research work in connection with the problems of the station. His call letters are 4AH.

Mr. Funk is also endeavoring to install a wireless 'phone, working along a theory of his own, and has already begun work on the instruments. He is working independent of the lines followed by experimenters in the recent Government successful wireless 'phone tests.

The station, which was constructed entirely at the High School, has a sending radius of 100 miles and the operator has picked up messages from Colon, Panama and the naval stations at Guantanamo, Cuba. Among other devices that have been recently installed is a marble switchboard, and the lightning switch has been placed outside the school to minimize the danger from that source.

Middletown Scientific Association Holds 410th Meeting.

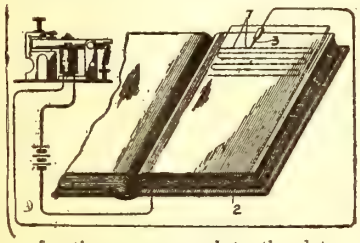


The 410th meeting of the Middletown Scientific Association was held in the Scott Laboratory of Physics at Wesleyan University, on the evening of Oct. 13 last. The address was by Professor Walter Guyton Cady, Ph.D., professor of physics in Wesleyan University, on the subject, "Wireless Telegraphy." The lecture was illustrated with experiments and lantern slides.

LATEST PATENTS

Flashlight for Canes and Umbrellas.

(No. 1,151,114; issued to Gustav Matthies and August Rehberg, Jr.)

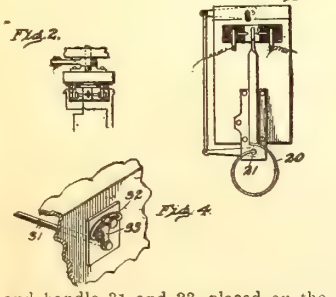


This patent covers a neat arrangement for a small flashlight bulb, together with necessary battery of miniature dry cells and switch for controlling the lamp circuit in a cane. The drawing clearly shows how these parts are arranged and the lens of the flashlight is indicated while the push button appears at 38. The miniature dry cells are shown at 20.

Electric Apparatus Enabling the Blind to Read.

(No. 1,149,547; issued to Henry Tideman.)

Intended to aid the blind to read, makes use in general of special books containing a perforated page, which

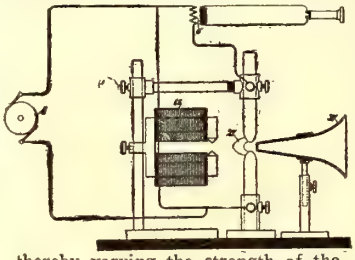


perforations correspond to the dots and dashes of the Morse telegraph code. A regular sounder (or a telephone receiver type sounder) may be used, together with battery, as shown in diagram, and this circuit is opened and closed by means of a metal stylus 3, which is moved over the perforations 7, on the page. Under the page lies a metal plate, which is connected with the opposite side of the circuit. Several other unique schemes are covered in this interesting patent.

Thermostatic Circuit-Closer for Incubators.

(No. 1,151,142; issued to Louis L. White.)

A modified form of thermostatic circuit closer for incubators and the like, the closing and opening "valves" of which are easily adjusted for, as by means of a dial

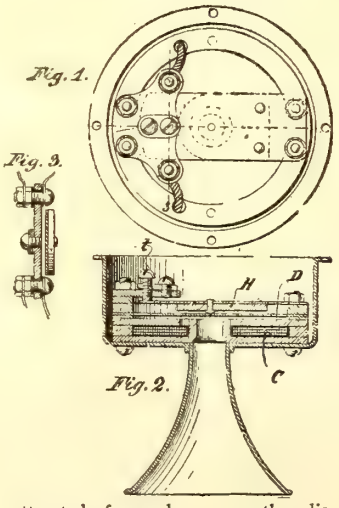


and handle 31 and 33, placed on the exterior of the incubator. The handle 33 is secured to a shaft 31, which in turn connects by means of levers to the pivot 21. A thermo-electric element 20, which is of circular form as perceived, is composed of strips of brass and steel soldered together. This thermostat is used to regulate a motor or other electrical attachments for opening and closing dampers or doors, so as to keep the incubator at a practically constant temperature.

Arc Type Telephone Transmitter.

(No. 1,150,266; issued to Walton Harrison.)

A telephone transmitter intended to be used with heavy currents, such as for loud-talking telephone circuits, wireless telephony, etc. The air waves set up by speaking into the horn 37 are caused to impinge against the arc at 27. Controlling electro-magnets, which aid in the operation of this arrangement, it is said, are shown at 15. It acts on the principle that the variable air currents, corresponding to the voice waves, will cause the arc 27 to change in its length and resistance,

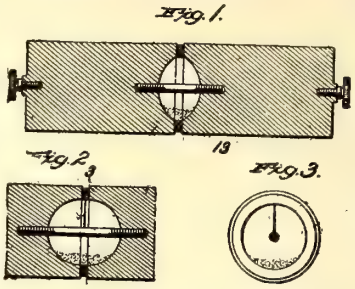


thereby varying the strength of the current through an induction coil 6, which is joined to a loud-speaking telephone, etc.

Electro-Magnetic Sound Producer.

(No. 1,147,016; issued to Leo Grubman, assignor to Electric Spark Appliance Co., Inc.)

A novel form of electro-magnetic sound producer, intended for use particularly on Ford automobiles, whose magnetos yield alternating current. This horn has an electro-magnet coil C, mounted in a magnetic or iron frame with pole pieces, as drawing shows. The flux from the pole pieces reacts on to a distinct magnetic armature H. This, when

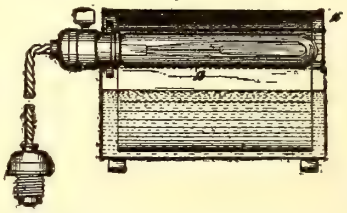


attracted forward, moves the diaphragm proper "D" naturally, and also in its return movement, the diaphragm "D" acts resilliently on the armature H. By this action the inventor claims to attain the best results for this form of construction. A tuning screw *t* is provided for properly adjusting the armature vibration period. No interrupter is used.

Radio Telegraphic Coherer.

(No. 1,150,111; issued to Edwin R. Gill.)

Another advance in the design of coherers for radio telegraphic or other requirements. The inventor lays great stress on the proper formation of the spherical chamber 13, in which metallic or other filings are contained. Also he mentions that if

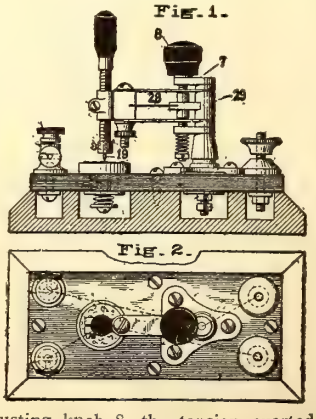


these filings are of the proper size, and also by utilizing a periodically changing sweeper, or mixer, that it is possible to obtain very regular and reliable results with a coherer so constructed. Again he mentions the use of a number of such coherers on a common circuit and each one of these coherers to be successively but independently switched into circuit by proper means, and thus while one is decohering another one will be in circuit to perform the regular function of such a device.

Electric Humidor.

(No. 1,145,218; issued to Walter E. Schimmel.)

This type of humidor, used to produce a damp vapor from water or other liquid, utilizes an electric lamp



13, placed in the upper part of a chamber 9. In order to improve the operation of this device blotting paper or some other good absorbent is supported in the vaporizing chamber from rods 16, and this causes the water to be drawn up near the lamp and thus the vaporization is greatly enhanced. The moist vapor produced in this way can then escape through perforations in the top of the containing vessel.

Radio Detector Stand.

(No. 1,152,444; issued to Augustus K. Sloan, Jr.)

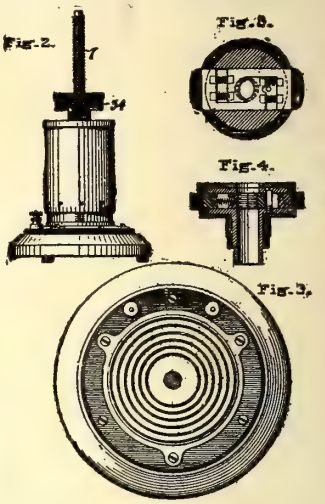
Another radio detector stand which embodies several good features, it seems, with respect to the spring tension adjustment for the "cat-whisker" electrode. By means of an ad-

justing knob 8, the tension exerted by the metal point electrode 19 is very accurately adjustable owing to the unique construction, which employs a flat tension spring 28, secured to a movable block 29. This block 29 can be raised or lowered independently by turning knob 8. Also the electrode 19 may be moved over the face of the crystal rapidly owing to the novel construction of pillar 7, which permits the whole spring arm arrangement to be swung from side to side.

Wireless Condenser.

(No. 1,150,895; issued to Augustus Kellogg Sloan.)

A newly devised variable condenser suitable for radio or other circuits and comprising a number of concentrical metal tubes nested together as



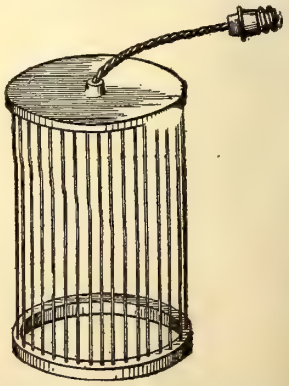


illustration shows. Every other tube connects to one pole of the condenser and one set of tubes may be moved up and down to vary the capacity by means of a special insulated handle 34. This handle is threaded and the nut within same is made in two halves; thus it is possible to compress the nut sections so that the moving element can be slid up and down the threaded vertical rod rapidly. For the fine adjustment the handle 34 is released and the split threaded nut engages the screw 7, so that the plates can be accurately and closely varied in their relative position.

Electric Insect Trap.

(No. 1,150,835; issued to Joseph Satinover.)

It is proposed with this device to

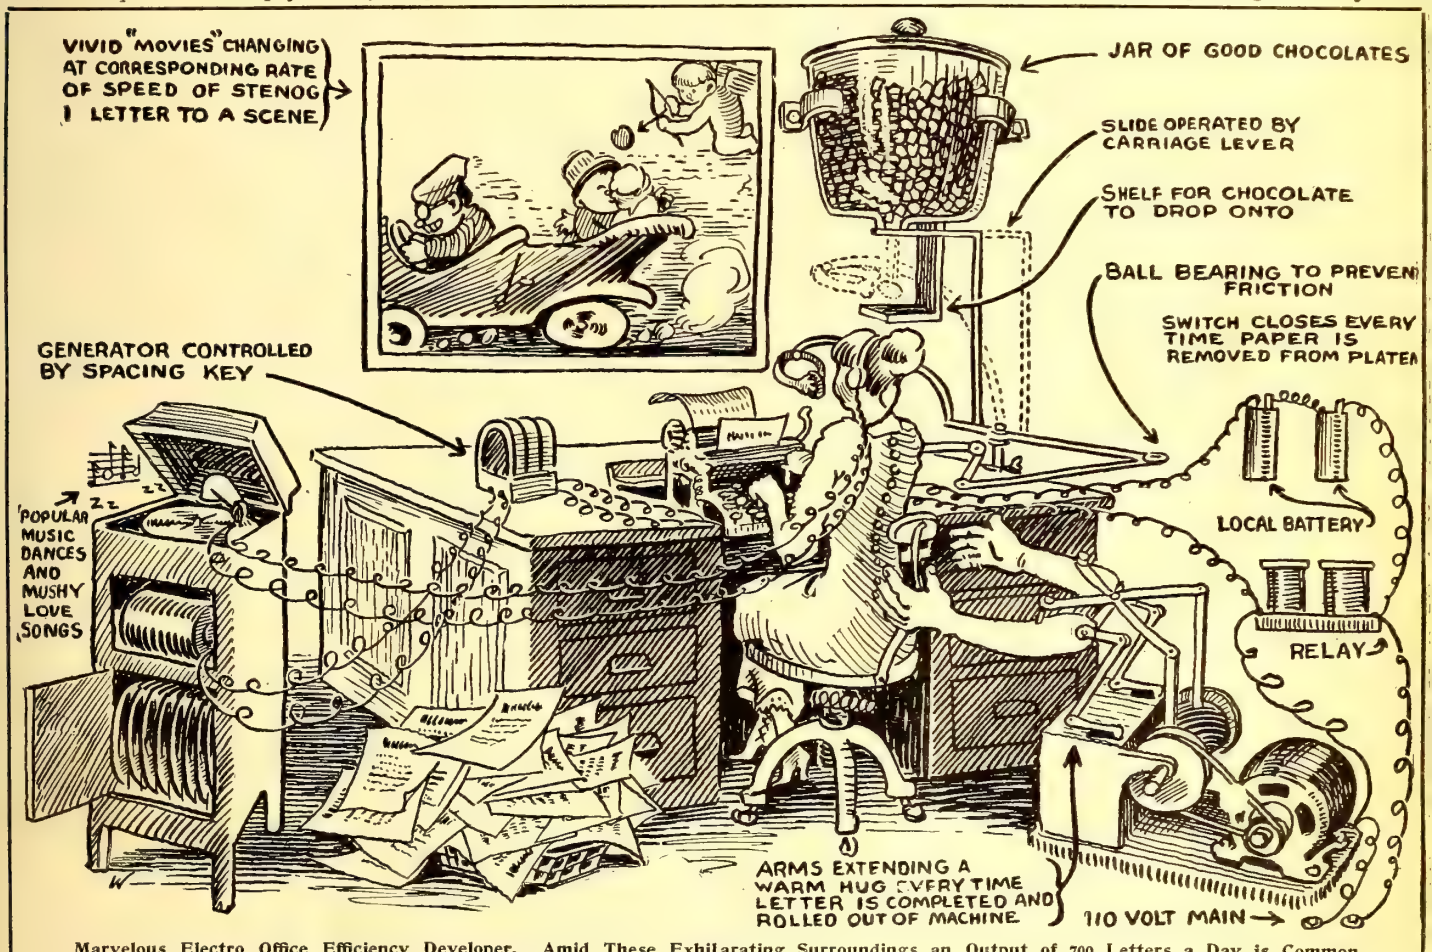
electrocute insects of all kinds by arranging two sets of oppositely charged wires or metallic rods to form a cage, as perceived in the illustration. These oppositely charged wires are bare, of course, and spaced a short distance apart. They will work on a 110 volts and alternating current or direct current, the same as that supplied for lighting.

COPIES OF ANY OF THE ABOVE PATENTS SUPPLIED AT 10c. EACH.

Phoney Patents

Under this heading are published electrical or mechanical ideas which our clever inventors, for reasons best known to themselves, have as yet not patented. We furthermore call attention to our celebrated Phoney Patent Offizz for the relief of all suffering daffy inventors in this country as well as for the entire universe.

We are revolutionizing the Patent business and OFFER YOU THREE DOLLARS ($3.00) FOR THE BEST PATENT. If you take your Phoney Patent to Washington, they charge you $20.00 for the initial fee and then you haven't a smell of the Patent yet. After they have allowed the Patent, you must pay another $20.00 as a final fee. That's $40.00 ! ! WE PAY YOU $3.00 and grant you a Phoney Patent in the bargain, so you save $43.00 ! ! When sending in your Phoney Patent application, be sure that it is as daffy as a lovesick bat. The daffier, the better. Simple sketches and a short description will help our staff of Phoney Patent examiners to issue a Phoney Patent on your invention in a jiffy.



PHONEY PATENT OFFIZZ

PHONEY PATENT PERPETRATED BY WATT A. LUNKHED

No. Px6 $\sqrt{Lx4}$ **ELECTRO OFFICE EFFICIENCY DEVELOPER** **Pat. Applied Externally**

To all who should worry:

Be it known that I, Watt A. Lunkhed, of the City of Oful State of Affairs, have deliberately sacrificed my fortune and last ray of sanity in devising, developing and perfecting this apparatus for alleviating the troubles of all poor stenographers who are troubled with a lack of ambition. It has worked perfectly under all conditions. Many girls preferring it to the effeminate attentions of mushy office managers, the latter are not required on the payroll any longer.

Marvelous Electro Office Efficiency Developer. Amid These Exhilarating Surroundings an Output of 700 Letters a Day is Common.

The results are based upon the formula $E. = \frac{P.}{W.}$ where E. = efficiency P. = pleasure and W. = work. By increasing both factors of the fraction it is apparent that the results will not be changed, thus doubling the work can be offset by increasing the pleasure an equal amount, thereby retaining the same efficiency, and vice versa.

The apparatus is arranged as per attached drawing and its operation is as follows:

After the stenographer has taken all the letters (700 a day is common when this machine is installed), she sits down, inserts the letter-head and starts typing. As she presses the keys real movies appear on the screen in front of her. The scenes appear in perfect synchronism with the striking of the keys, therefore fast work is necessary so she can find out quickly how it all ends.

A touch on the spacing bar automatically turns lose the Victrola with a lot of love melodies and mushy ballads, in perfect keeping with the movies.

When the carriage is pushed back after each line, a system of levers (not lovers) delivers a luscious chocolate to her rosy lips. The supply of delicacies is contained in the large glass jar at the right, and if the boss is of a sporting disposition he can offer prizes to the stenog emptying the jar first.

The master stroke of my invention is found in the hugging attachment operated each time a letter is removed from the machine. The motor operated arms clasp her firmly but tenderly around the waist and hug her as good as any mere man without the attendant smell of cheap tobacco, which latter ofttimes accompany this blissful pastime. For best results this motor should be at least two horse-power —this is a small detail that should be carefully attended to.

For best results with this recipe for efficiency it is absolutely necessary that only pure ingredients be used—thus purely emotional motion pictures—pure high grade chocolates, and purely sentimental music should only be employed.

This machine has been tested by all the crowned heads and blockheads of Europe and New Zealand, proving in every case that woman, with the aid of this machine, is complete in herself, does not require the association of males and therefore should rule herself.

In testimony thereof I therefore bury here my tame seal on this day of devotion and supplication to Woman Beautiful in this City of Oful State of Affairs.

WATT A. LUNKHED.

By his Attorney:

S. A. TROMBLY,
Worcester, Mass.

Witnesses:

G. WATASINCH,

LILL Q. PIDT,

ROMEO CHEESIT.

INTERNATIONAL RADIOTELEGRAPHIC CONVENTION

LIST OF ABBREVIATIONS TO BE USED IN RADIO COMMUNICATION

ABBREVIATION.	QUESTION.	ANSWER OR NOTICE.
PRB	Do you wish to communicate by means of the International Signal Code?	I wish to communicate by means of the International Signal Code.
QRA	What ship or coast station is that?	This is . . . . .
QRB	What is your distance?	My distance is . . . . .
QRC	What is your true bearing?	My true bearing is . . . . degrees.
QRD	Where are you bound for?	I am bound for . . . . .
QRF	Where are you bound from?	I am bound from . . . . .
QRG	What line do you belong to?	I belong to the . . . . . Line.
QRH	What is your wave length in meters?	My wave length is . . . . . meters.
QRJ	How many words have you to send?	I have . . . . . words to send.
QRK	How do you receive me?	I am receiving well.
QRL	Are you receiving badly? Shall I send 20 • • • — • for adjustment?	I am receiving badly. Please send 20. • • • — • for adjustment.
QRM	Are you being interfered with?	I am being interfered with.
QRN	Are the atmospherics strong?	Atmospherics are very strong.
QRO	Shall I increase power?	Increase power.
QRP	Shall I decrease power?	Decrease power.
QRQ	Shall I send faster?	Send faster.
QRS	Shall I send slower?	Send slower.
QRT	Shall I stop sending?	Stop sending.
QRU	Have you anything for me?	I have nothing for you.
QRV	Are you ready?	I am ready. All right now.
QRW	Are you busy?	I am busy (or: I am busy with . . . .). Please do not interfere.
QRX	Shall I stand by?	Stand by. I will call you when required.
QRY	When will be my turn?	Your turn will be No. . . . .
QRZ	Are my signals weak?	Your signals are weak.
QSA	Are my signals strong?	Your signals are strong.
QSB	Is my tone bad? Is my spark bad?	The tone is bad. The spark is bad.
QSC	Is my spacing bad?	Your spacing is bad.
QSD	What is your time?	My time is . . . . .
QSF	Is transmission to be in alternate order or in series?	Transmission will be in alternate order.
QSG	. . . . .	Transmission will be in series of 5 messages.
QSH	. . . . .	Transmission will be in series of 10 messages.
QSJ	What rate shall I collect for . . . . . ?	Collect . . . . .
QSK	Is the last radiogram canceled?	The last radiogram is canceled.
QSL	Did you get my receipt?	Please acknowledge.
QSM	What is your true course?	My true course is . . . . . degrees.
QSN	Are you in communication with land?	I am not in communication with land.
QSO	Are you in communication with any ship or station (or: with . . . . .)?	I am in communication with . . . . (through . . . . .).
QSP	Shall I inform . . . . . that you are calling him?	Inform . . . . . that I am calling him.
QSQ	Is . . . . . calling me?	You are being called by . . .
QSR	Will you forward the radiogram?	I will forward the radiogram.
QST	Have you received the general call?	General call to all stations.
QSU	Please call me when you have finished (or: at . . . . o'clock)?	Will call when I have finished.
QSV	Is public correspondence being handled?	Public correspondence is being handled. Please do not interfere.
QSW	Shall I increase my spark frequency?	Increase your spark frequency.
QSX	Shall I decrease my spark frequency?	Decrease your spark frequency.
QSY	Shall I send on a wave length of . . . . . meters?	Let us change to the wave length of . . . . . meters.
QSZ	. . . . .	Send each word twice. I have difficulty in receiving you.
QTA	. . . . .	Repeat the last radiogram.

*Public correspondence is any radio work, official or private, handled on commercial wave lengths.

When an abbreviation is followed by a mark of interrogation, it refers to the question indicated for that abbreviation.

These Code charts are supplied by the Department of Commerce, Washington, D. C. The new edition of "Radio Stations of the United States" can be obtained from the Superintendent of Documents, Washington, D. C.

QUESTION BOX

This department is for the sole benefit of the electrical experimenter. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be published. Rules under which questions will be answered:

1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered.
3. Sketches, diagrams, etc., must be on separate sheets. Questions addressed to this department cannot be answered by mail.

MAKE AND BREAK COIL OPERATION.

(368.) Montgomery Joseph, Cove, Tex., wants information regarding: (1) The operation of "make and break" coils for

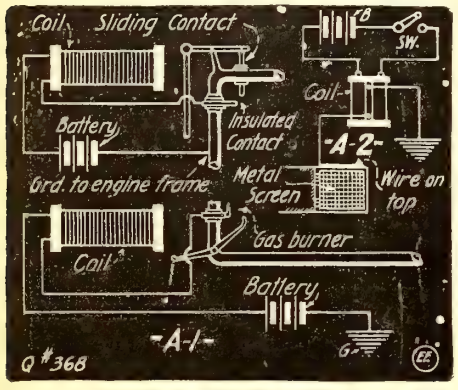

Fig. A-1. Hook-ups for "Wipe" Spark Gas Ignition Coils. Fig. A-2. Connection of "Jump" Spark Coil to Fence Gate.

ignition purposes, and (2) a method of protecting a gate or other entrance by using high-tension induction coils.

A. 1. The diagram given herewith shows how a "make and break" spark coil is used on gasoline engines or igniting gas burners, etc. It works on the principle of self-induced currents, which increases the battery potential at break of the circuit.

A. 2. You can protect a gate, as you mention, with a spark coil by simply hooking up proper switching arrangements operated in the house or by action of the gate itself, and this switch should be placed in the primary circuit of the coil as the diagram indicates. A pair of copper wires secured to the gate might carry the current from the secondary of the spark coil to give the shock, or one secondary lead may be grounded.

SODIUM VAPOR AND SPARK GAPS.

(369.) Francis Feig, Jr., New York City, asks: (1) How to obtain sodium vapor, and (2) the effect of lengthening the spark on the primary input to a spark coil.

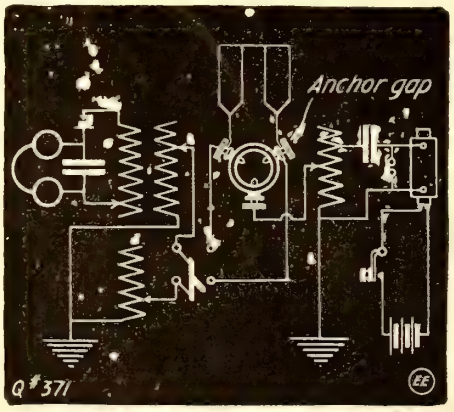
A. 1. Sodium vapor is obtained from "Na" or sodium proper. The sodium is usually heated, and by proper appliances the vapor is gathered from same. The vaporizing point of sodium is about 95 deg. C. We have been unable to locate any definite data on the resistance of sodium vapor, and in this direction wish to suggest that you might communicate with Dr. A. N. Goldsmith, care of College of the City of New York, New York, who undoubtedly can supply data on this point.

A. 2. As the spark gap is reduced in length the primary will tend to draw more current. This is not so noticeable with an ordinary spark coil excited with dry batteries as becomes the case when a regular alternating current transformer is used, owing to the peculiar action resultant from the spring vibrator.

WAVE LENGTH AND ¼-KW. TRANSFORMER QUERIES.

(370.) Roy Trome, Norfolk, Va., desires to know: (1) Wave length of his aerial. (2) The dimensions and winding of ¼-kw. transformer.

A. 1. The wave length of your antenna, which is 50 feet long with a 49-foot lead-in, is approximately 175 meters. Should you use six wires on 18-foot spreaders your wave length will be increased to about 190 meters.



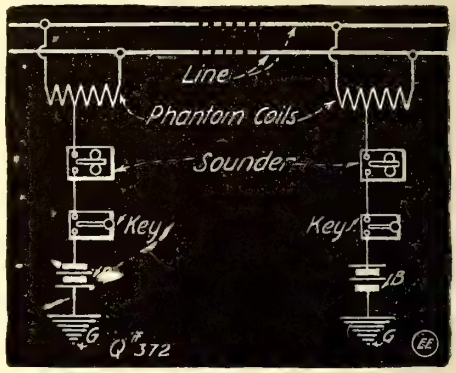
A. 2. The dimensions of the sheet-iron core for a ¼-kw. radio transformer are 10½ inches long and 6½ inches wide, outside measurements. The core should be 1.4 inches square. The primary should consist of six layers of No. 15 D. C. C. copper wire, and the secondary should comprise 3.7 pounds of D. C. C. copper wire wound into 17 pies, each ¼ inch thick. The secondary is wound with No. 34 wire and has 35,000 turns. Regular transformer practise should be followed in building this transformer, paying particular attention to the insulation of the different windings.

ANCHOR GAP HOOK-UP.

(371.) Carl Menzer, Lone Tree, Ia., wants information regarding the anchor gap in connection with a looped aerial.

A. 1. The anchor gap is practically not used any longer in modern wireless stations, as it entails too much loss in the transmitting set.

Diagram is given showing how the anchor gap is used with looped aerial, and in this way, as you will perceive, the spark can jump the gaps in transmitting, while in receiving this anchor gap reduces the complexity of the switching scheme necessary



Arrangement of Anchor Spark Gap and Looped Aerial in Radio Transmitting and Receiving Set.

in throwing on and off transmitting and receiving set to the aerial.

PHANTOM CIRCUITS.

(372.) W. S. Clampitt, New Providence, Ia., inquires for a method by which he can transmit telegraph signals over a telephone circuit without interfering with the telephone transmission.

A. 1. We give herewith a sketch showing the method of accomplishing this by means of a "phantom circuit." It is necessary to construct two coils having a comparatively high impedance. These coils may be wound on a core of soft iron wire 6 inches long and ¾ inch in diameter, and

Use of Phantom Coils in Sending Telegraph Signals Over a Telephone Circuit.

consist of six layers of No. 26 S. C. C. wire. A tap should be taken from the third layer. The coils are then connected across the telephone circuit and the wire run from the taps on the third layer to the telegraph instruments; the other wire from the telegraph set is run to the ground in the usual manner, as shown.

AERIAL CONSTRUCTION.

(373.) Harry Slater, Brooklyn, N. Y., requires information on the usual method of erecting an aerial, particularly the manner in which the wires and spreaders are fastened together before hoisting to the tops of the poles.

A. 1. The usual way is to lay out the aerial wherever possible at full length on the roof or on the ground, and the two outside wires are the first ones to be secured to the insulators on the spreaders.

It is then an easy matter to connect up the other wires between the two outer ones, so that they will all be of approximately equal length and at equal tension when hoisted into position.

STATIC ELIMINATION.

(374.) Glenn Decker, Ligonier, Ind., asks us: (1) For a method of eliminating static in his wirelss receiving station. (2) Why the strength of the wireless signals from N.A.A. (Arlington) change.

A. 1. We do not have anything particular to suggest regarding the elimination of static in your wireless receiving station, excepting you try one of the static preventers, such as that devised by Professor Fessenden, and you will find complete hook-up for this arrangement given in our 25-cent book entitled "Wireless Hook-ups."

A. 2. The change in strength of the wireless signals from N.A.A. is, of course, experienced regularly, and this is due to the change in temperature, or from winter to summer; the winter range of radio stations is about two to three times that obtainable in summer. From some very

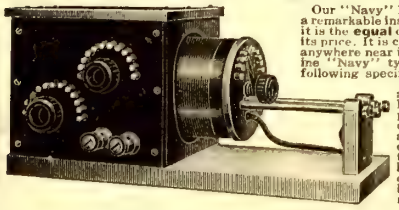
(*Continued on page* 432.)

EXPERIMENTERS READ EVERY LINE OF THIS INTERESTING AD-

We've prepared it with care and it's written for *YOU*. We want you to *know* the Electro-Set Co. We are anxious to have you *realize* what we are doing to make experimenting financially possible for every live American Boy. We haven't space to tell you all—you'll have to send for our catalogues to see this. We are taking this opportunity to introduce only seven of our regular specialties and 14 wonderful bargains in odd parts such as every experimenter needs and can use. One order will convince you what the Electro-Set Co. is offering. Get in touch with us *to-day*.

HERE IT IS AT LAST!

This 1-6 K. W. Closed Core Wireless Transformer.... $6.95

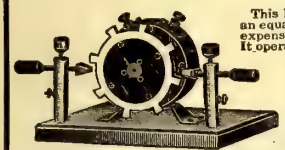


After months of experimenting and after making dozens of designs and models, we have finally produced a thoroughly practical closed core transformer to retail at $6.95, the price you formerly had to pay for spark coils and batteries.

Thousands of amateurs will welcome the advent of this instrument who either did not require ¼ K.W. power or who did not care to spend the money for it. The transformer will send messages for twenty miles not a wild figure, but an actual fact—if a good aerial is used. **Under extraordinary circumstances it will send** one hundred miles. No trouble with vibrators and adjustments, reactances or resistances. **Just connect the primary terminals to 110 volt, 60 cycle A.C. mains and press key.** Best silicon transformer iron is used in its construction.

It will throw a heavy crashing spark that, with proper condenser, will fill a gap with a ball of white flame ¼ inch in diameter. This comparatively small but powerful spark will send **six times as far as a 1 inch spark coil.** The 1-6 K. W. Transformer is another **ELECTRO-SET triumph.** It was thoroughly tested in one of the most complete electrical laboratories in the country by competent engineers, who pronounced it perfect, for its size, in all particulars. You will be delighted with it.

No. 1000 1-6 K. W. CLOSED CORE TRANSFORMER, without case, shipping weight 10 lbs. . . **$6.95**
No. 1001 1-6 K. W. CLOSED CORE TRANSFORMER, in a beautifully finished mahogany case; impregnated with insulating compound and fitted with four posts; shipping weight 15 lbs. . **9.00**



Electro-Set "Navy" Loose Coupler

Our "Navy" Loose Coupler or Receiving Transformer is a remarkable instrument. In price it is **lower** and in quality it is the **equal** of almost any loose coupler, no matter what its price. It is certainly far superior to any we have seen at anywhere near its price. Think of being able to buy a genuine "Navy" type loose coupler at a low price with the following specifications usually only found in prohibitively priced transformers: Hard rubber secondary end with large turned brass contacts; hard rubber switch panel on the front of the primary coil with twenty large, turned brass contacts; primary enclose i in a dark mahogany finished covering on all sides; every contact soldered, assuring perfect connection; handsome mahogany finished base; lacquered brass posts and trimmings. The equal of this receiving transformer can not be found. It is the acme of efficiency at moderate price.

NO. 1698 "NAVY" RECEIVING LOOSE COUPLER; shipping weight 10 lbs. **$10.00**
NO. 1698 "NAVY" RECEIVING COUPLER; all wood construction..... **9.00**

Type "A"

This Rotary Spark Gap is without an equal. Made like any of the more expensive gaps, but smaller in size. It operates in series with a 16 C. P. lamp on 110 volt alternating or direct current or from batteries. The Rotary Electrode is of cast aluminum alloy and is perfectly accurate. The wheel is mounted with genuine hard rubber on a heavy brass bushing which fastens to the motor shaft. The motor is a K. & D. series wound A. C. or D. C. Machine, small but **powerful.**

This Type "A" Gap, although especially designed for our extraordinary 1-6 K. W. transformer will readily stand any good ¼ K. W. instrument.

NO. 476 TYPE "A" ROTARY GAP, shipping weight 4 lbs. . . **$5.50**
NO. 477 TYPE "A" ROTARY GAP, wound to operate on 3 dry cells. **5.00**
NO. 478 THREE INCH ROTARY DISC ONLY, mounted on hard rubber, with brass bushing, ½ in. hole, shipping weight 4 oz. **1.50**

MARCONI USED APPARATUS

Send 5c. in stamps for new, interesting catalogue of used Marconi Wireless Instruments at ridiculously low prices. We are agents for this line and can ship promptly anything from a Type "D" Tuner to a Motor Generator.

No. 611 Aerial Switch

This instrument is novel in design and convenient in operation. The base is dark mahogany finished. The copper bars are 8 inches long and are sawed, not drawn. Posts are provided on all contact jaws for connections. Three posts and bars are provided on one side for the purpose either of shunting the detectors when sending or cutting off the transmitting power when receiving.

This instrument is handsome in appearance and efficient in use. Suitable for powers up to 1 K.W.

NO. 611 AERIAL SWITCH, Shipping weight 5 lbs. **$2.50.**

Electro-Set "Arlington-Tested" Crystals

When testing out a wireless receiving installation for the first time you want to know that your mineral crystal is sensitive. Then, too, why buy minerals on a gamble. **Be sure of results—good results.** Buy our **"Arlington Tested"** Crystals. Every one is tested for Arlington time signals. Each crystal comes sealed in an air-tight glass phial and is carefully tested before leaving our factory. **Only one crystal in 20 passes our examination.** Arlington Tested Crystals are the most sensitive you can procure. They are worth the price. Each one is individually examined and packed.

NO. 303 ARLINGTON TESTED BORNITE-ZINCITE COUPLE. . . . . **.40**

Electro-Set "Famous" Mineral Sets

One of the most interesting fields in wireless telegraphy is the experimenting with various combinations and methods of contact in detectors. We offer the following outfit especially designed for this purpose and packed in a neat box. Countless hours of interesting experimenting is offered to the amateur with this set. It includes five different minerals (galena, silicon, carborundum, bornite and molybdenum), each packed in a neat glass bottle; one universal detector cup; three pieces phospor-bronze "cat whisker" wire; one polished wood detector base; one large binding post; one hard rubber knob; one brass rod with holder for wire. With this outfit it is possible to make many different kinds of detectors. It is ideal for the experimenter.

NO. 2100 DETECTOR MINERAL SET, as described, complete, postage paid. . . **$1.25**
NO. 2150 MINERALS ONLY, as above, five kinds, in bottles, postage paid. . . . . **.50**

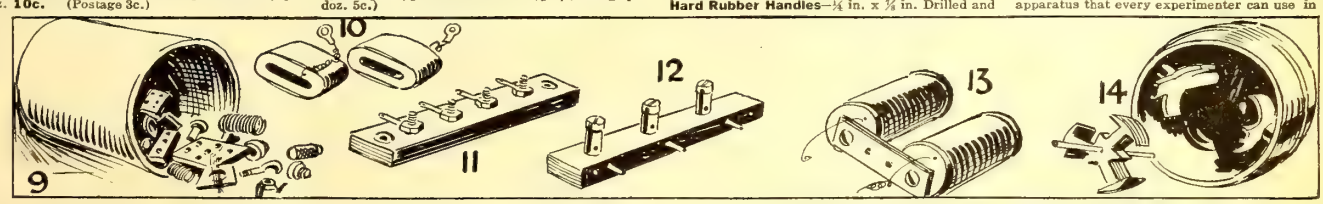
14 EXTRA-ORDINARY BARGAINS

Polarized Ringers—New, never used. Complete with 2 high resistance magnet coils wound with silk wire and a strong permanent magnet with ringer. Worth 60c. ea. Any experimenter can use one. Special price, ea. **15c.** (Postage 6c.)

Hard Rubber Knobs—Size 19-16 in. x ½ in. Drilled and Tapped 1 for 6-32 screw. Handy for making apparatus. Worth 8c. ea., new. Special Price, per doz. **10c.** (Postage 3c.)

Telephone Induction Coils—Never used. Wound to 100 Ohms with primary and secondary coils, silk covered wire. Excellent shocking coil can be made with one. Worth 50c. ea. Special price ea. **09c.** (Postage 4c.)

Binding Posts—Handsomely nickeled, 5 16 in. x 1 in. over all. Complete with nut. Worth 6c. ea. Special price, per doz. **25c.** ea. **2½c.,** (Postage per doz. 5c.)



Telephone Relay Coils—Wound to 100 Ohms with size 36 silk covered wire. Complete with soft iron core. Wire alone worth 20c. Special price, ea. **09c.** (Postage 4c.)

Connecting Blocks—Hard rubber, size ¾ in. x 1 in. x 3-16 in. Have 6 holes for 6-32 mach. screws. Complete with 6 screws. Worth 12c. ea. Special price **04c.** (Postage 1c.)

Hard Rubber Handles—¼ in. x ¾ in. Drilled and Tapped for 8-32 screw. Worth 4c. ea., new. Special price, per doz. **15c.** (Postage 3c.)

Horse Shoe Magnet—3 in. long, very powerful—useful for many experiments and for making instruments. Worth 15c. each. Special price **05c.** (Postage 3c.)

Here's A Dandy Chance—We have made up a number of boxes of small odd parts of electrical apparatus that every experimenter can use in his shop. These boxes each contain from 40 to 60 pieces of odds and ends, such as rubber knobs, brass standards, hooks, binding posts, screws, units, thumb nuts, coils and miscellaneous parts. Some are new—some used, but all of them are useful to have around when you are making apparatus. They are just the kind of convenient parts to be able to choose from for your experiments. We've sold hundreds of them in our retail department. Experimenters all want them. You can make dozens of things with them.

No. 121—Handy Assortment. Prepaid **20c.**

75 Ohm Receiver Coils—Never used. Ready to put into any phone or to make receivers with. Wound to 75 ohms with silk wire. Worth 20c. pair. Special price, per pair, with connectors **06c.** (Postage 1c.)

Connecting Blocks—Made of genuine hard rubber, with 4 nuts and screws with connectors. Worth 15c. ea. Special price, ea. **05c.** (Postage 2c.)

Connecting Blocks—made of genuine hard rubber with 3 handsome nickeled binding posts. Useful for dozens of things about the experimenter's shop. Worth 25c. They have never been used. Special price, ea. **09c.** (Postage 2c.)

Relay or Telegraph Magnets—In fair condition. Have been used but are in perfect shape. Wound to 80 ohms resistance. Make relay or telegraph with them. Worth 50c. pair. Special price with yoke, per pair **09c.** (Postage 5c.)

Toy Motor Parts—Consisting of one iron case with pole pieces; 2 covers for same and one 3-pole laminated armature with shaft. All you need is a commutator, bearings, and wire to complete motor. Above parts worth 40c. set. Special price, **15c.** (Postage 6c.)

Note:—Commutator wire for above motor, extra **40c.** (Prepaid.)

BOSTON — CHICAGO

UNMOUNTED TRANSFORMER

You Can Get Results

with a small condenser and this transformer

It is a 1-2 K. W. size and is built on the same specifications as to material and workmanship, etc., as our big central station transformers.

Hundreds of stations are now using these transformers. This transformer gives you 13,200 volts.

Let us tell you how you can do part of the work yourself and get this transformer at a remarkably low cost.

QUESTION BOX.

(*Continued from page 430.*)

exhaustive tests extending over a period of a year and more and presented in the Institute of Radio Engineers' "Proceedings" of a recent date, this summer range has been found for ordinary ship radio stations of the spark type to quite regularly be only equivalent to one-tenth the winter range.

REGARDING QUENCHED SPARK GAPS.

(375.) Frank Zacharia, Jr., N. S., Pittsburgh, Pa., desires to know how many pairs of gap plates are required for a ½-kw. and a 1-kw. wireless transformer.

A. 1. The number of pairs of plates required for the Telefunken gap depends upon the discharge voltage of your condensers. The general practise is to allow 1,000 volts to each gap. Thus, knowing the voltage of the transformer secondary or the discharge voltage of the condensers, it is very easy to calculate the number of gaps required. You understand that the more power there is used the larger the gap surface must be to prevent overheating of the gap.

ELECTRO-MAGNET DESIGN.

(376.) Charles Malcolm, Jr., Philadelphia, Pa., requires information: (1) As to relation between the size of a wire on a magnet and its lifting power. (2) Data for the construction of an electro-magnet to exert a force of one pound at a distance of 6 inches.

A. 1. It makes practically no difference what size of wire is found on an electro-magnet if the proper voltage is used in conjunction with same. That is to say, the same number of ampere turns will go in a given space, roughly speaking, if the voltage and current are properly balanced out, so that the coil will not overload. This, as you will perceive, is merely a matter of electrical design and calculation.

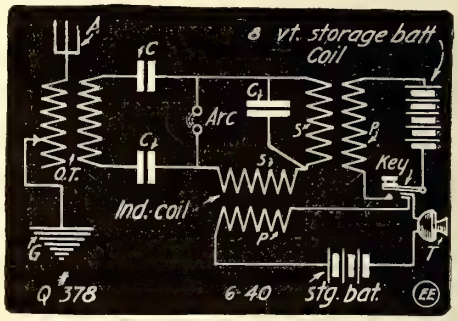
A. 2. Your problem for designing an electro-magnet to exert a force of one pound at a distance of 6 inches is rather out of the ordinary, and it would require a very powerful magnet coil to do this work. Possibly, however, your problem can be solved efficiently by the use of a properly designed solenoid or suction type electro-magnet. However, it does not seem practical to build a regular type electro-magnet to exert any such pull as you mention over the range of action specified.

INSULATION AND DETECTORS.

(377.) C. Russell, London, England, asks: (1) The best dielectric or insulator for high-frequency apparatus. (2) Several questions regarding the de Forest Audion and Fleming valve detectors.

A. 1. The best substance now available is that known as Bakelite Di-Electo. This is used by the Marconi Wireless Telegraph Co. for its panels on wireless receiving cabinets, and therefore can be considered as probably one of the best substances available at this time for the purpose in question.

A. 2. The Audion detector is supplied in America by the de Forest Radio Telephone & Telegraph Co., which manages practically all sales for this detector in this country, and it is, of course, supplied by various dealers. However, no independent companies make a detector similar to the Audion insofar as we are aware.



The Marconi Co. supplies the Fleming valve, but this is said on pretty good authority to be inferior to the Audion.

WIRELESS TELEPHONE QUESTIONS.

(378.) M. A. Norgren, Springfield, Mass., sends us a sketch of a wireless telephone transmitter and wishes to know: (1) If this set would work. (2) If not, why not? (3) Will the 6-volt 40-A.H. and 8-volt 80-A.H. storage cells be powerful enough, and how far will it work?

A. 1 and 2. To all appearances your apparatus will not work because you have the secondary of the 1-inch spark coil inserted in the high-frequency circuit, and the high impedance of this coil will prevent pure oscillations taking place.

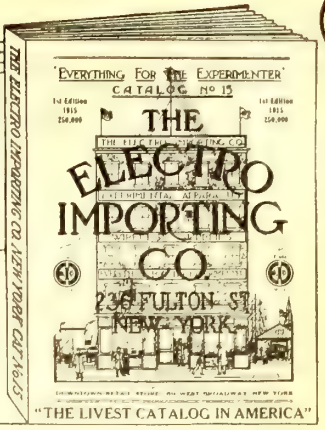
A. 3. We cannot say whether the storage batteries you are using would be powerful enough for a wireless telephone, but an ideal set of this type should operate on such small storage batteries. We would like to say here that for a satisfactory wireless telephone it is necessary to obtain undamped oscillations in the closed oscillatory circuit having a frequency value of at least 30,000 per second, which is above audibility. It is impossible to obtain this frequency with an ordinary vibrator, and

Proposed, But Impractical, Radiophone Hook-Up.

for this reason spark coil sets have never worked satisfactorily over very long ranges and the enunciation in every case is very poor.

THE AURORA BOREALIS.

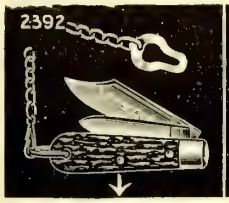
(379.) Lawrence Madison, Kingman, Me., writes us stating that he has personally seen the Aurora Borealis from his home in Maine and that a distinct hissing sound was noticeable. This is contrary to the statements in the article entitled "The Aurora Borealis, or Northern Lights," which appeared in the October issue of *The Electrical Experimenter*, and he wishes an explanation.



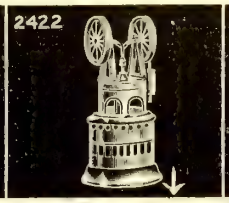
A. 1. It seems reasonable to suppose, and especially if we consider the Aurora Borealis an electrical phenomenon, that there may be a noise or sound produced by such a display. We have, however, checked up this matter quite carefully in preparing the article, and in all cases which came to our attention and wherever this sound theory or statement was made, it was invariably refuted by different authors and authorities on the Aurora Borealis. One of the best works on the subject is that by Alfred Angot, and while many statements are quoted therein from various people to the effect that they had distinctly heard sounds when the Aurora Borealis effect took place, the authorities on this matter give an explanation about in line with that mentioned in the article referred to.

This same idea, advocating the "no sound" theory with regard to the Aurora Borealis, is concurred in by Henri Arctowsky, a well-known authority on this phenomenon and a scientist who has passed many years exploring the Northern and Southern Polar regions. This does not, however, purport to infer that your ideas or statements are not correct, and, as yet, we can truthfully say that the Aurora

(*Continued on page 434.*)

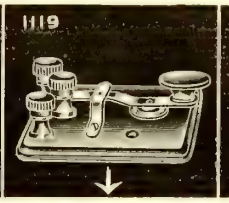


"EVERYTHING FOR THE EXPERIMENTER" IN THIS "THE LIVEST CATALOG IN AMERICA"

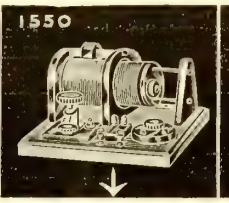


"THE LIVEST CATALOG IN AMERICA"

THE ELECTRO IMPORTING COMPANY CARRIES THE LARGEST STOCK OF EXPERIMENTAL, ELECTRICAL AND WIRELESS GOODS IN THE WORLD. *We are the originators of the Wireless Experimental business in the U. S.*, selling the first wireless outfit in 1904. Our wonderful facilities enable us to give you *delivery in 24 hours.* WHEN ORDERING GOODS FROM THIS PAGE ENCLOSE POSTAGE ELSE GOODS MUST BE SHIPPED BY EXPRESS COLLECT. The goods shown here are only a small part of our entire line which is fully described in our 275-page Cyclopedia Catalog, which weighs ½ lb., is 6¾x5¼ inches in size and contains 2,000 articles, 658 illustrations, 30 diagrams and tables, full Morse Continental and Navy Code Charts, besides "Treatise on Wireless Telegraphy," list of call letters of all U. S. Gov't and Commercial ship and shore stations. This wonderful Cyclopedia sent free if you send us 4c. in stamps or coin *to cover postage only.* WE SELL MERCHANDISE, NOT CATALOGS. *"Why buy Catalogs when the best is free?"* Use coupon below to send for Catalog, enclosing 4c. for postage only.

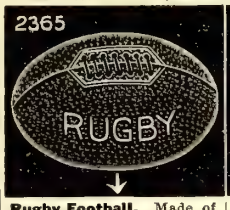


Boy Scout Knife. Has 2 excellent quality steel blades, stag handle and a chain to guard against loss. Chain is detachable at will. Length 3¾ in. Sh. wt. 4 ounces. Price ..... **$.50**

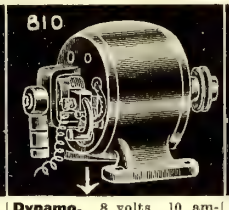


Upright Caloric Engine. Runs by hot air. Simplest model engine possible to construct. Is very durable. No steam or water used. Size 9½x4½. All cylinders of brass. Sh. wt. 2 lbs. Price ..... **$.95**

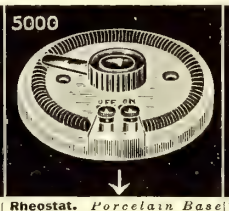
Smallest Flashlight Made. Nickel case, tungsten lamp, long life battery. Gives a very powerful light, is very handy and fits in vest pocket. Size 2⅝x1¼x11-16. Sh. wt. 4 ounces. Price ..... **$.50**



Telegraph Key. Double circuit. Rubber comp. base and knob. Has three rubber comp. binding posts. Metal parts nickeled. Size 2¼x3½. A wonderful value. Sh. wt. 1 pound. Price ..... **$.35**



Inter-Ocean Wireless Receiving Outfit. Has loose coupler, galena detector, Jr. fixed condenser and 7000 meter loading coil all mounted and connected on polished oak base. Size 10x12x6½. Sh. wt 10 lbs. Price **$8.00**

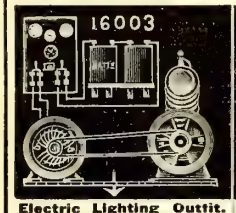


Wireless Detector. *Guaranteed to receive long distance messages or money back.* Base hard rubber comp. Metal parts nickeled, galena crystal supplied. Size 2x1½x1¼. *Our cyclopedia sent free with it.* Price prepaid ..... **$.10**

Rugby Football. Made of Pebble grain leather, lined with duck. *Bladder guaranteed against accident, wear or abuse for one year.* Most wonderful value ever offered. Standard size. Sh. wt. 2 lbs. **$.90**

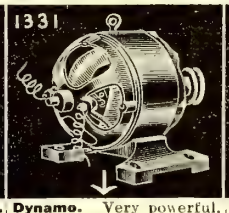
Dynamo. 8 volts, 10 amperes. Very heavily built for auto. ltg., charging batteries, electroplating, etc. Excellent power motor on 8 volts, made to last. Size 8x5½x5¼. Sh. wt. 20 lbs. Price **$9.00**

Rheostat. *Porcelain Base* (Pat'd). Resistance 10 ohms, maximum capacity 3 amps. continually. Invaluable for dimming lamps, regulating small motors, etc. Diameter 4 inches. Controlled by 1" knob. Disconnects on off side. Binding posts rubber comp. Sh. wt. 2 lbs. Price ..... **$.60**

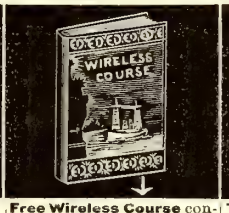


X-mas Tree Lighting Outfit. For 110 volt house current. Has 16 colored lamps, red, blue, white and green, arranged in two festoons. Absolutely safe and complete with cord and plug. Sh. wt. 3 lbs. Price **$4.05**

Hustler Motor. Runs wonderfully on one dry cell. Will operate small toys, beautifully finished and very strong. A wonder for the price. Size 3x3x4. Sh. wt. 1 pound. Price ..... **$.85**



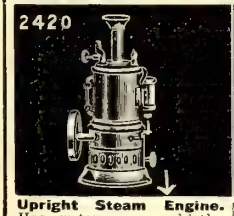
Revolver Flashlight. Exact model of automatic revolver, shoots brilliant light when trigger is pressed. Contains tungsten lamp and battery in handle. Surprise your friends. Size 4x2¾ ins. Sh. wt. 1 lb. Price **$.95**



Electric Lighting Outfit. 8 volt 150 watt capacity. Includes generator, switch board with meters, etc., ¾ H. P. gasoline engine, storage battery, fuses, wire, belt, hydrometer and plans. Capacity 19 lights. Sh. wt. 185 lbs. Price **$74.00**

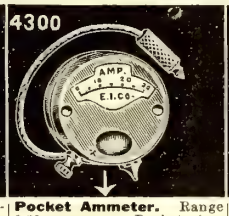
Radio Nitrogen Battery. *Gives 3 volts* and is same size as standard No. 6 dry cell. Wonderfully efficient. Made of extra high grade materials. Used for lanterns and experimental work. Size 6x 2½. Sh. wt. 3 lbs. Price **$.35**

Dynamo. Very powerful, gives 6 volts 6 amperes, lights, 12 tungsten lamps, charges storage cells, runs as a power motor, etc. *Not a toy.* Size 6x6x6 inches. Sh. wt. 7 pounds. Price **$3.70**



Free Wireless Course consisting of 20 lessons, total 160 page, cloth binder size 7x10¾ in. with 350 illus. 30 tables. *Coupons for this Free Wireless Course in our Cyclopedia Catalog.*

Telephone Receiver. 75 ohms. Hard rubber comp. powerful magnet. With two receivers and no battery, you can talk 500 feet. Size 2¼ x 1⅛ inches. Shipping weight 1 pound. Price ..... **$.40**



"Presto" Hand Lamp. Fits on any dry cell and will burn for 50-75 hours. No danger and always ready. Supplied complete without battery. Reflector is adjustable. Size 6x3. Sh. wt. 7 lbs. Price **$.75**

Upright Steam Engine. Has water gauge, whistle, large balance wheel and will operate on kerosene and petroleum. Tested before shipment. Directions included. 11 in. High. Sh. wt. 3 lbs. Price ..... **$.95**

Trolley Car Outfit. Wonderful value, will run on dry cells. Outfit consists of trolley car, controller, electric headlight and 15½ feet of straight and curved track. Car size 12x6x4. Sh. wt. 10 lbs. Price **$5.65**

Pocket Ammeter. Range 0-30 amperes. Pocket size. Finely nickel plated, accurate, dependable and handy. Invaluable for testing dry cells. Diameter 2¼ inches. Net weight 4½ oz. Sh. wt. 1 lb. Price ..... **$.80**

"Presto" Bicycle Lamp (electric). Operates almost *50 hours on one dry cell.* 2 inch reflector is fully adjustable. Fastens on handle bars. Battery container included but no battery. Perfectly safe. Sh. wt. 2 lbs. Price **$1.15**

Spark Coil. Gives 1 inch flaming spark on 6 volts. "Bull Dog" style that's copied but never equalled. Oak frame, platinum points. Rubber comp. binding posts. Size 7¾x5¾x6¼. Sh. wt. 6 lbs. Price **$4.00**

Printing Press (Self Inking). Will print a form of 2⅜x3¾ in. Includes 5a font, of 175 characters, type case, gold and silver bronze, ink, cotton, cards, etc., with instructions. Not a toy. Size 14x7¾x5½. Sh. wt. 25 lbs. Price **$3.00**

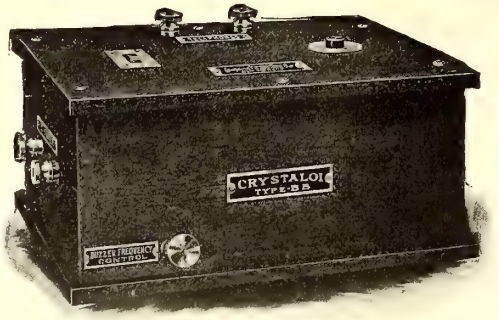
"EVERYTHING FOR THE EXPERIMENTER"

236 FULTON STREET, NEW YORK

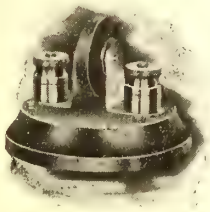


Write your name and address in the Margin below

CRYSTALOI
THE NEW–BB–

The New Type -BB- CRYSTALOI is a SUPERSENSITIVE Detector comprising every accessory and refinement in A SINGLE UNIT

It consists of a highly finished African mahogany case in which is located a super sensitive Crystaloi cylinder of which the periphery protrudes through the top making it accessible for rotating to secure finest adjustment. A cohering inductance especially calculated and calibrated to the supersensitive cylinder. A fixed condenser with the exact capacity for this particular cylinder. A specially wound Buzzer of which the frequency is controlled by a knurled screw head mounted on the front of the case to produce a note that is best suited to assist in cohering the alloy in the cylinder. Two of the highest grade dry batteries to operate the Buzzer and a Buzzer control button which protrudes through the top of the case for accessibility.



With this carefully designed and calibrated instrument you have but to set it on the table, connect your phones and leads from your tuning coil and you are permanently and thoroughly equipped to engage in the most serious wireless work of the present day. Of course Variable Condensers can be added if desired.

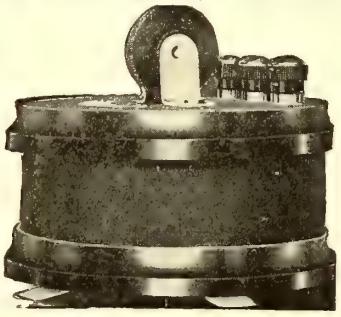
Dimensions 7½ x 5½ x 3½ high
Mailing Weight 3 Pounds. Price **$12.00**

— Other Types of the Crystaloi —

CRYSTALOI TYPE O
Very Sensitive

Dimensions 2¼ x 1⅞ in.
Mailing Weight 1 Pound.
PRICE, $3.50.

TWENTY-ONE HUNDRED MILES IS THE LATEST CRYSTALOI RECORD

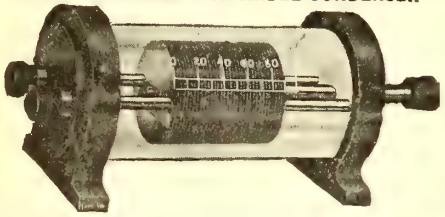


CRYSTALOI

A PERMANENT WIRELESS DETECTOR THAT HAS MADE A WONDERFUL RECORD

You will find wireless men on land and sea using Crystaloi Detectors in preference to any other detector made. They will not burn out or go dead and are ever ready to pick up the minutest currents that are in the air. They are sold under the Turney guarantee and are making their wonderful reputation on real merit. Send today for full description.

ORDER A CRYSTALOI TODAY AND STOP YOUR DETECTOR TROUBLES

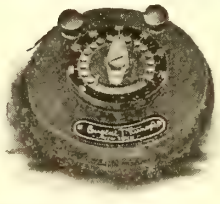


CRYSTALOI TYPE AA, Super Sensitive

Dimensions 4 x 3½ in.
Weight 2 Pounds. PRICE, $6.00.

OUR WIRELESS ACCESSORIES

THE NEW TURNEY VARIABLE CONDENSER



Dimensions: 5¼ x 2½ in. Made in two capacities.
Type X—35 Plates. Price $3.50.
Type XX—50 Plates. Price, $5.00.
ORDER ONE NOW
and see what you have been missing.

The New Turney Variable Condenser meets all the requirements of the most exacting wireless man inasmuch as it has more capacity for its size than any condenser ever made. The great advantage lies in the fact that it is provided with round plates of a special alloy 1½ in. in diameter, of which the entire area is available for condensing purposes. This you will find in no other variable condenser.

The New Turney Variable Condenser possesses an absolute zero. This you will find in no other type of condenser. The plates are inclosed in a flint glass tube on which the scale is engraved. It is air and dust-proof and can not get out of order. The dielectric is air, therefore the efficiency is the greatest possible. The ends are of hard rubber composition and are highly finished. A handsomer and more valuable wireless instrument you never saw.

SEND FIVE CENTS IN STAMPS FOR COMPLETE CATALOG

THE TURNEY ROTARY LOADING-COIL

Dimensions 3½ in. x 1 in.
Price $3.50.
Mailing Weight One Pound.

This is a radical departure from the accepted form of loading-coil for the reason that the entire coil with its switch points revolves while the switch blade remains stationary. This new form of construction makes a much neater and more compact instrument, and the rotating of the coil is a much more natural movement than turning the switch blade. It has a capacity of 4,000 meters divided into sixteen divisions of 250 meters each. When used with the ordinary loose-coupler will give a total capacity of about 4,600 meters. The entire instrument is of hard-rubber composition. The blade is of a silver alloy, which insures the maximum efficiency. The rotary coil has a knurled edge and is provided with a scale divided into sixteen equal divisions.

CONSTANT AMPLITUDE TEST BUZZER

CONSTANT AMPLITUDE TEST BUZZER
Dimensions 2¼ x 2½ ins.

Our special Constant Amplitude Test Buzzer contains some entirely new features and gives a smooth, even tone at all times. This is due to the arrangement of the contact which is provided with a lenient backcheck. The contact points are of pure silver, which prevents burning, and the entire mechanism is enclosed in a non-resonant dielectric case. PRICE, 75 CENTS

Include 10 Cents extra for postage. Remit in form of P. O. or Express Money Order.

Eugene T. Turney Company, Inc., 2595 Third Avenue NEW YORK CITY

QUESTION BOX.

(*Continued from page* 432.)

Borealis effect is really but very little understood, even by our foremost men of science.

DIMENSIONS OF ½-KW. STEP-DOWN TRANSFORMER.

(380.) John Burkitt, Madoc, Ont., Canada, asks us for the dimensions of a ½-kw. transformer to change 220 volts to 110 volts alternating current.

A. 1. The dimensions of the ½-kw. transformer for changing 220 volts to 110 volts are as follows: Core, outside dimensions, 14x7 inches and 1.4 inches square. Primary windings consist of 625 turns of No. 16 D. C. C. or enameled wire, and the secondary requires 312 turns of No. 13 wire. Three pounds of the No. 16 and 2½ pounds of the No. 13 will be sufficient for you to wind the transformer. It can be constructed in the usual manner and connected direct to the 220-volt mains. It will consume 2.5 amperes and will deliver 5 amperes at the secondary terminals. The iron core should be made of transformer iron and particular attention should be paid to the insulation.

OPERATION OF ROTARY GAPS.

(381.) Walter Franseen, Woodhull, Ill., desires to know: (1) If the "Multi-Audi-Fone" and the "Multum in Parvo" instruments are fully up to the claims made by the manufacturers. (2) Several points regarding the operation of a rotary spark gap.

A. 1. The "Multi-Audi-Fone" and the "Multum in Parvo" instruments are fully up to the advertiser's claims. *The Electrical Experimenter* does not carry any questionable advertisements in any sense of the word. We do not know the patent number on these instruments. However, you could, no doubt, find this out by communicating directly with the United States Patent Office, Washington, D. C., or with the manufacturers themselves.

A. 2. Your question regarding the rotary spark gap is not entirely clear, as most of the rotary gaps, to our knowledge, are of the one type. Perhaps you refer to a gap with two breaks; the number of breaks has little or no bearing on the matter, and the only effect obtained is an increase in the quenching effect. It is, of course, necessary to run the rotary gap so it sparks at the peak of each cycle of the A. C. for synchronism. This would give you 120 sparks per second on 60-cycle current. Non-synchronous gaps have been used with more or less success, particularly the Marconi type, which gives 240 sparks per second. To increase the tone of a spark gap, that is, to operate the disc at a higher speed, it is necessary to change the capacity of the condenser in the closed oscillating circuit for highest efficiency, the capacity being smaller the higher the spark frequency.

DOES A TUNER "KILL" SIGNALS?

(382.) "Experimenter," Georgetown, Tex., writes us inquiring how wireless signals pass through a tuner when the "curls" of the wire used in some electric connections have the effect of choking the signals, as we well know.

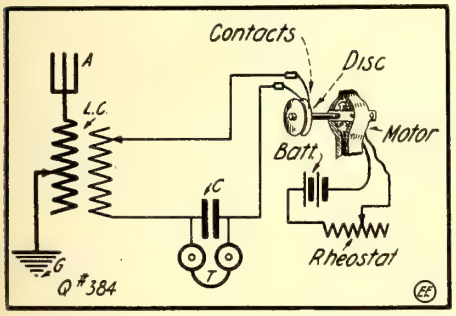
A. 1. A high frequency current flowing in a circuit similar to a circuit used in radio work requires that a certain amount of the inductance capacity should be in that circuit to prolong the oscillations, the turns of wire in the tuner acting as the inductance and the elevated aerial as the capacity. When these are properly adjusted the circuit is in tune and the incoming wave currents flowing in the circuit will be at their

maximum. Should any small coils be inserted in the connections it adds that much unnecessary inductance, which is of no use usually and the added impedance causes the current to be reduced in value, owing to the circuit being thrown out of tune, or to the increase in resistance (damping).

HYSTERESIS IN CONDENSER.

(383.) Jeter Pinkston, Valdosta, Ga., asks: (1) What is the standard formula for the solution in storage cells? (2) Is a high potential current a high voltage current? (3) What does hysteresis mean when used in the description of a variable condenser that is losing energy due to hysteresis? Also which is better to use in a variable condenser, oil or air?

A. 1. The standard solution used in storage cells is a mixture of 1 part of sulphuric acid to 5 parts of water. This should be mixed in an earthenware container and constantly stirred. Don't fill cells until solution has cooled.



A. 2. A high potential current is one having a high voltage.

A. 3. Hysteresis loss here is the loss in the dielectric of the condenser. The plates of the condenser are constantly charging and discharging; thus the stress between them is constantly changing its direction. This change of stress has the effect of heating the dielectric and a small amount of the current is lost in this manner.

For high efficiency a variable condenser should use air as a dielectric, but oil increases the capacity and also the hysteresis loss somewhat, as mentioned in your question.

RADIO RECEIVING TIKKERS.

(384.) H. P. Keiffer, Lebanon, Pa.,

Undamped Wave "Tikker" Hook-Up.

asks: (1) Is it possible to receive stations using undamped waves with a Radioson, electrolytic, or mineral detector? (2) Can a copper disc be used in constructing a tikker and what is the location of the contact springs? (3) The hook-up for the tikker, using a loading inductance and tuning coil or loose coupler?

A. 1. It is only possible to receive undamped wave stations with an ordinary detector when the sending apparatus gets slightly out of tune, resulting in slightly damped waves. The tikker is necessary for all around work in the reception of undamped waves.

A. 2. Any metal can be used for constructing the disc of the tikker and the two springs can lay in the groove about one-half inch apart. The disc may be 2 inches in diameter, and a rheostat should be used to control the speed of the motor. The faster the motor is driven the higher pitched note will be as heard in the 'phones.

A. 3. Hook-up is given herewith for a tikker, and no detector is used in the circuit with this instrument ordinarily.

IS MÜNCHHAUSEN AT IT AGAIN?

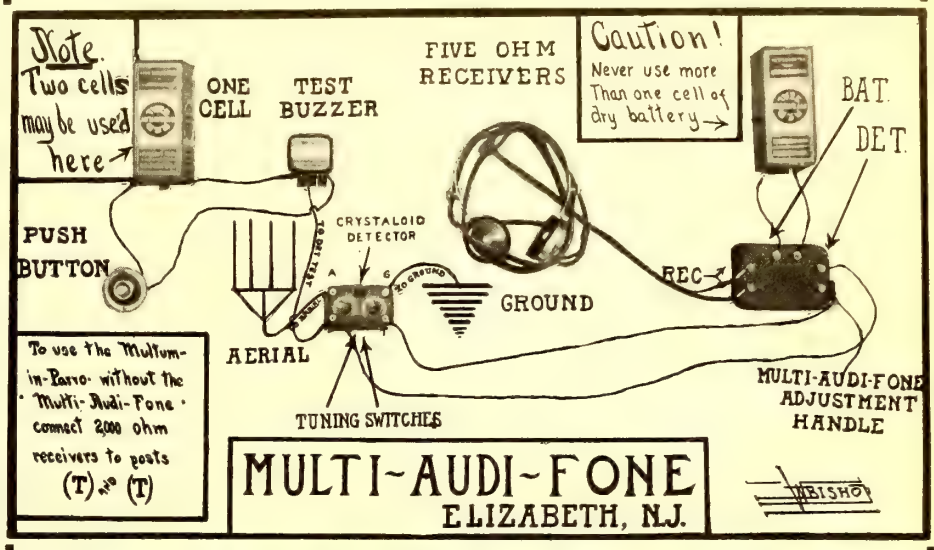
(385.) R. E. Breunig, Chicago, Ill., asks several questions regarding a peculiar phenomenon that occurred in the neighborhood

(*Continued on page* 437.)

Multi-Audi-Fone

The new wonder in the wireless world. It increases the Audibility 1,500 Times

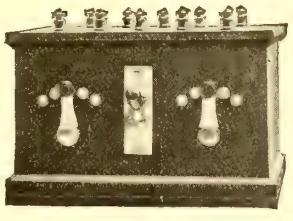
Read What Others Say



Messrs. Stickel & Stickel, of Connellsville, Pa., say: "We have given your apparatus a thorough test and find that they are all that you claim them to be."

Mr. D. L. Irvin, of Curwensville, Pa., says: "I was surprised with the results from it. Arlington and several other stations came in so loud that I could read them with the 'phones ten feet from my head."

Mr. Ralph Batcher, of Toledo, Iowa, says: "The results were even more than were expected, both at the convention and by other amateurs in Des Moines, who tested the apparatus, and other places."

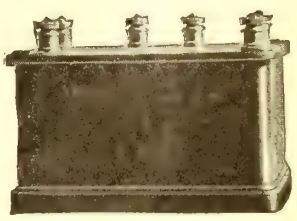


Mr. John Tucker, Jr., of Elizabeth, N. J., says: "After a thorough trial, am astonished at the results obtained . . . Combining, as these instruments do, the greatest degree of efficiency coupled with extreme compactness, they are, without doubt, the finest instruments offered to the amateur and professional wireless field at large."

W. O. Horner, of Cleveland, Tennessee, says: "I have been trying your Multi-Audi-Fone out as an Amplifier . . . I was more than surprised at its sensitiveness. It is certainly wonderful. . . . I stood at the rear of my store, one hundred and twenty-five feet from 'phones, and copied Arlington and Key West, also Tampa, Florida. I consider that some amplifying for way down here on Inland."

Multum in Parvo Receiver, including Crystaloi Detector and Buzzer - $20.00
Multi-Audi Fone, including our Specially Wound Head Set - - - - - $30.00
The Matchless Christmas Present. Our Complete Wireless Set, Only - - - $50.00

Talking Multi-Audi-Fone



Size, 4½" x 5" x 7".

The amplification is so great with the Talking Multi-Audi-Fone that the signals can be read all over the five-story building from our laboratories, which are located on the third floor. If the windows are opened, the signals can be heard across the street, even when the trolley is passing.

Price, including horn - - $100

Telephone Voice Multiplier

Size, 2¼" x 3¼" x 4½".

The Telephone Voice Multiplier has been made possible by applying the principle employed in our Multi-Audi-Fone to the telephone receiver. The voice can be distinctly heard coming over 1,000 or even 2,000 miles of wire that would be indistinct coming over 100 miles of wire. Buy a Multiplier and stop straining to get something you can't hear. **Price $15.00**

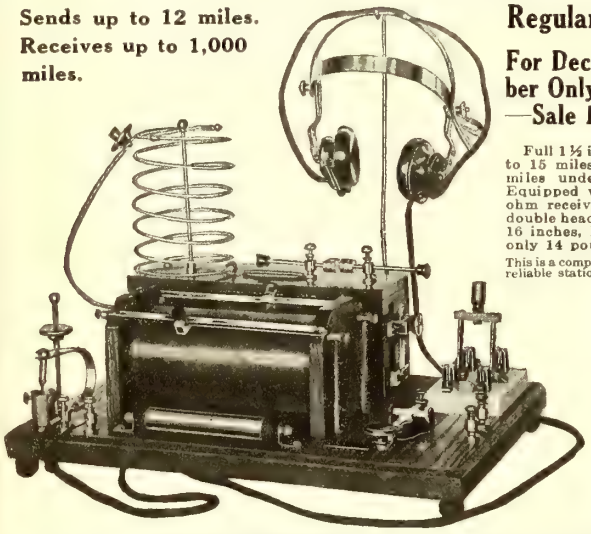
Save 25% If You Act Now



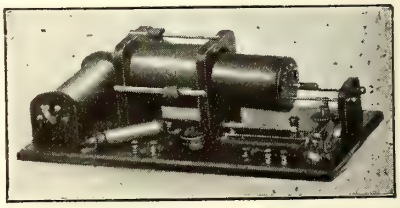
Here is Your Opportunity to Secure the Best Navy Type Loose Coupler on the Market. Regular Price - - - - - - $15.00
For December Only—Reduced Sale Price - - - $10.00

A brass lacquered 6,000 meter inductance tuner, perfect in every detail. Equipped with four point loading inductance which increases the wave length 4,000 meters over the average Navy Type Transformers. The primary winding has 24 taps—one switch controls the primary in groups of tens, the other controls one turn at a time—and is equipped with a dead end switch. Enclosed in a cabinet, the front of which is polished hard rubber. The secondary coil is wound with double silk covered wire and the inductance is varied by a ten point switch. With this coupler the very finest and most accurate tuning is easily and quickly secured. With a good sized aerial the reception of wave lengths up to 6,000 meters is possible.

All Finished Parts Ready For Assembling With Full Instructions - - - $6.50

Our No. 810 Complete Sending and Receiving Station

Sends up to 12 miles. Receives up to 1,000 miles.



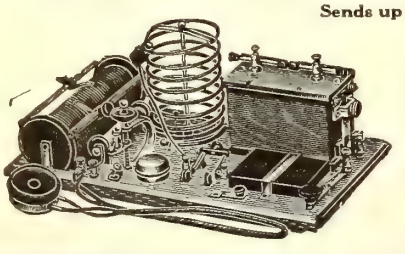
Regular Price $20.00
For December Only —Sale Price $14.00

Full 1½ inch coil type. Sends up to 15 miles. Receives up to 1,000 miles under favorable conditions. Equipped with 2 double pole 1,000 ohm receivers, 6 feet silk cord and double headband. Size of base 12 x 16 inches, height 13 inches, weight only 14 pounds.

This is a completely equipped and thoroughly reliable station, mechanically and electrically perfect and ready for instant service. Nothing better in the class was ever constructed. The new improved tuning coil enables you to tune in or tune out any party you might desire, thus eliminating any interference. The set consists of a 1½ in. Spark Coil, 12 Flat Plate Condensers, our "Don't Jar Out" Detector, Buzzer and Switch to tell if your detector is working, Double Slide Silk Wire Wound Tuner for long wave station capacity, Fixed Condenser, Helix, Key, DPDT Switch and complete 2,000 Ohm Headset.

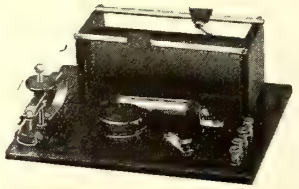
Receive The Time From Arlington

AND ALL NEWSPAPER AND SHIP REPORTS
OUR SPECIAL TIME SIGNAL RECEIVING OUTFIT REGULAR PRICE $10.85—SALE PRICE $8.10



This is our new 1915 model made of the highest grade material obtainable. Double slide coupler for close tuning is wound with No. 24 green silk covered wire on the primary — the secondary with No. 28. There are 8 points to divide its capacity. A 3,000-metre loading coil placed between the coupler and the aerial by a switch that throws it in or out of the circuit enables you to receive amateurs with the coupler alone and long wave stations by the addition of the loading coil. One fixed condenser of proper capacity, improved universal detector, one buzzer test to test your mineral and potentiometer. This instrument is assembled on a highly finished oak base. All metal parts are heavy nickel-plated.

This station, with our Navy Type Loose Coupler, as illustrated above, ... **$15.00**



OUR No. 401 SENDING AND RECEIVING STATION

Regular Price $5.95
For December Only—Sale Price - - $4.95

Sends up to 3 miles. Receives up to 300 miles.

Consists of ¼-inch coil, fluted end spark gaps, four plate secondary, one collapsible helix, one key, a two-slide tuner, fixed condenser, detector and buzzer test to test your mineral. This set is mounted on a highly finished oak base with all metal parts heavy nickel-plated. With a good-sized aerial, under favorable conditions, will send up to 3 miles and receive up to 300 miles.

FREE!

Complete Gem Station

Receives up to 300 miles. We will give absolutely free a Gem Outfit to every one who sends us the cost of the necessary equipment for it. This equipment consists of:

2000 Ohm Headset	$3.95
16 Insulators	.48
1 Ground Clamp	.10
500 Ft. of A-1 Wire	1.20
20 Ft. of Rubber Cable for lead in	.90
TOTAL	$6.63

Send $6.63 at once and we will include the Gem Receiving Station Free. A splendid outfit for beginners.

QUESTION BOX.

(*Continued from page 435.*)

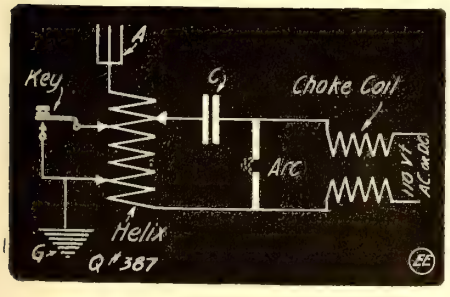
of Chicago from the 14th to the 18th of September last, when the wireless detector would go "dead" and no amount of adjusting would bring in any signals. He writes, however, that by reversing the connections to his detector it would be put into operation again. (2) When a rheostat or potentiometer is used to regulate the brightness of a lamp does the same amount of current flow from the battery whether the lamp burns bright or dim? (3) How does a Radioson work?

A. 1. We cannot think of any reason for the peculiar action of your detector, except that strong static currents may have been the cause; to the best of our knowledge *Baron Münchhausen* had nothing to do with it!

A. 2. As the resistance in the circuit determines the amount of current flowing through the circuit, increasing the resistance will decrease the current drawn from the battery.

A. 3. The Radioson detector is constructed on the principle of the sealed-point electrolytic device of this class. This detector at one time was thought to act on the drop of resistance principle, but later researches prove it to be a pure rectifier. See "Principles of Wireless Telegraphy," by Prof. George W. Pierce, where this matter is exhaustively treated upon, accompanied by actual rectifying oscillograms.

OPEN CORE TRANSFORMER ON D. C.



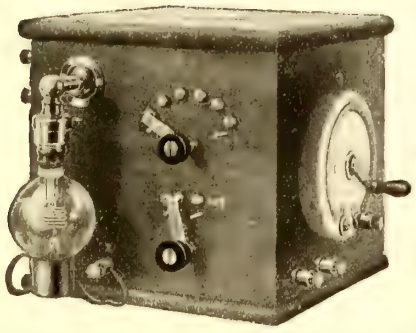
(386.) B. Tilden, Brookfield, Ill., writes us asking: (1) How an open core transformer can operate on D. C., having seen one working under these conditions. (2) Instructions for making a closed core transformer from a 2-inch coil.

A. 1. The fact that the transformer operated on a D. C. generator indicates that the commutator on the dynamo was in very poor condition, creating distinct breaks or bumps in the current. This would cause the transformer to operate the same as a spark coil on an interrupted primary current, but the efficiency is very low.

A. 2. A closed core transformer can be made from a 2-inch coil by constructing a rectangular frame of thin transformer iron and winding on one leg three layers of No. 16 D. C. C. copper wire and mounting the secondary of the 2-inch coil on the other leg. The input will be about 250 watts, and you should place a choke coil in series with the primary to control the current.

ARC TRANSMITTER FOR RADIO.

(387.) Edward D. Fitzpatrick, Wilson Park, Tarrytown, N. Y., requires (1) a



Are Used for Radiophony.

hook-up for transmitting set using an arc. (2) Why does the note of a sending station become louder when the rotary gap has stopped and while the last few letters are being sent?

A. 1. The sketch herewith shows the

The Famous
DE FOREST AUDION

Type R. J5 De Forest Audion Detector

The Bulletin of the U. S. Bureau of Standards, Vol. 6, No. 4, Page 540, states that the DE FOREST AUDION DETECTOR is fully 50 per cent. MORE SENSITIVE than ANY other known form of detector.

NO HIGHER AUTHORITY could be quoted.

Further than this—ASK ANY USER.

The cut illustrates the popular and efficient Type RJ5 De Forest Audion Detector. It remains in adjustment ALWAYS, and is guaranteed to be MORE EFFICIENT, and MORE RELIABLE than ANY OTHER detector ever offered for private use. **Price, $25.**

THE DE FOREST AUDION AMPLIFIER is used in connection with any detector, preferably a De Forest Audion Detector, to increase the intensity of received signals from 5 to 10 times (actual, not theoretical) per step. Constant and reliable, as all other De Forest Audion Apparatus. Brings in stations otherwise inaudible, ALWAYS. **Price, $65,** and worth it.

Type PJ1 De Forest Audion Amplifier

WARNING

Vacuum Bulbs, having a filament and two electrodes, as well as a number of other types, are protected under a large number of BASIC PATENTS, issued to Dr. Lee de Forest, and owned or controlled by this company.

All infringers will be prosecuted to the full extent of the law.

DE FOREST AUDION APPARATUS is sold by all the large reliable wireless supply houses and is carried in stock by most of them.

ORDER FROM YOUR REGULAR DEALER, or from us if you prefer.

method of wiring an arc for radio transmitting purposes. With this apparatus you will be able to cover quite a long distance, but it will be necessary to use a tikker or audion "beat" circuit at the receiving station.

A. 2. The only reason we can give to explain why the note from a transmitting station increases in intensity when the rotary gap stops is as follows: The diaphragm in the receiver has a certain natural period of vibration, and this may be approximately tuned to the low frequency of the note when the rotary gap is stopped. Your receiver diaphragm does not vibrate fast enough to be in synchronism with the group frequency of the transmitting set when the gap is running, therefore it does not give the loud note noticed when the two are nearly at the same pitch.

MAGNETIZING COILS.

(388.) Young Experimenter, Buffalo, N. Y., wishes to know: (1) Where he can obtain a battery type magnetizer of the Swedish-American type? (2) If distilled water can be used instead of rain water in mixing solution for silver plating, and if rain water is a chemical or naturally pure solution?

A. 1. You can no doubt purchase a battery type magnetizer of the Swedish-American type from the Swedish-American Telephone Co., located in Chicago, Ill.

A. 2. Rain water is condensed moisture from the atmosphere and contains no alkali, but has several impurities in it, such as dust and traces of various acids found in the air. Distilled water can be used in mixing plating solutions instead of rain water, as they are both practically pure, but not chemically pure.

PERPETUAL MOTION.

(389.) George Haller, St. Louis, Mo., asks us: (1) Has any perpetual motion machine ever been invented that will deliver power? (2) How do aeroplanes obtain a "ground" for wireless work?

A. 1. No one has succeeded in inventing a practical perpetual motion machine as yet, and such an invention would entirely upset all our present basic laws of physics and energy.

A. 2. Aeroplanes obtain a ground by dropping a wire 100 or 200 feet long from a reel, and they use wires strung from the tail to the wing-tips for an aerial.

WAVE LENGTH OF COUPLER.

(390.) Nels Erlandson, Chicago, Ill., desires: (1) A formula to calculate the wave length of loose coupler. (2) A tuning coil. (3) Whether a carborundum detector requires a battery potentiometer.

A. 1 and 2. A rough method of determining the wave length of coupler or tuning coil is to calculate the length of the wire on the coil, primary only, in the case of the coupler, and multiply the length of this wire in feet by 1.5, which will give approximately the wave length in meters. For further data on this we refer you to the September, 1914, issue of *The Electrical Experimenter*, in which appeared an article entitled "Loose Couplers and Their Wave Lengths"; also to the numerous publications procurable at small cost from the Bureau of Standards, Washington, D. C., which give exact mathematical formulas for calculating self and mutual inductances of coils of various sizes and diameters of wire used in radio practise.

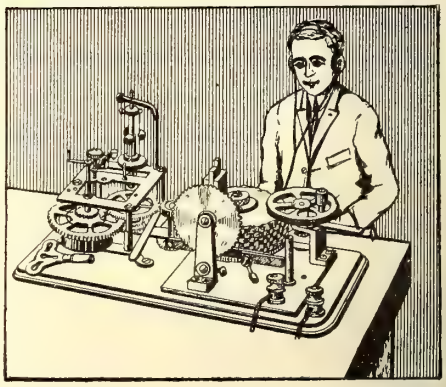
A. 3. For the best results with carborundum detectors a critical adjustment of the voltage applied to it is required and it will be necessary to use a potentiometer with battery for this purpose.

FRANCO

FRANCO FLASHLIGHTS

are ideal for use by electrical experimenters. The Fibre case lights have a patented wireless feature which absolutely prevents their short-circuiting under any conditions whatsoever. The nickel plated lights won't short-circuit, either, and are not affected by oil or moisture.

"Franco" flashlights are quality flashlights; equipped with our Radio Battery they give more light than any flashlight on the market. They are definitely guaranteed to give you real satisfaction and service. Among the many different styles you are sure to see the one you want. Prices are very reasonable.



See your dealer's assortment, or if he hasn't got the genuine "Franco" flashlights, write us for an interesting catalog, No. 9.

Special Dynamos for Arc Lamp in Moving Picture Shows. Special Dynamos for Charging Storage Batteries. Special Dynamos for Incandescent Lighting. We sell upon payments of $5 and $10 per month.

Hobart Bros. Co., Troy, O.

MAGNETIC PULL.

(391.) Verne Bonnett, Birmingham, Iowa, desires a formula for calculating the pull of a magnet at various distances from its poles.

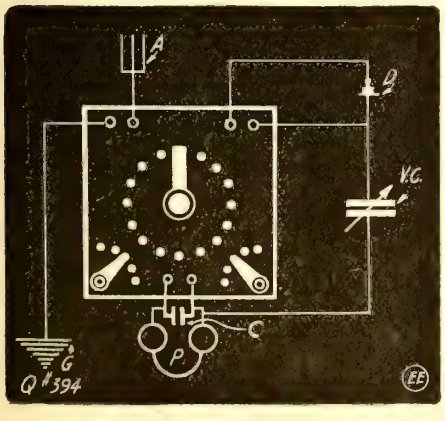
A. The pull of a magnet varies inversely as the distance of the armature from the poles; thus, if a certain magnet will lift 20 pounds 1 inch from the pole-pieces, then 2 inches from the pole-pieces it will lift one-quarter of this amount, or 5 pounds, and if 3 inches, one-ninth of this amount or about 2.2 pounds. This law is known as the rule of inverse squares and is also applicable to lighting problems as well.

ELECTRIC WIRING QUESTIONS.

(392.) John Odill, Norway, Mich., asks several questions regarding the wiring of a house: (1) Is a person allowed to do additional wiring on his premises without permission from the authorities? (2) Where can he obtain this permission, if necessary? (3) Must the work be inspected before connecting to the service line?

A. 1 and 2. It is unnecessary to obtain permission to install additional wiring in the house and barn, but proper precautions must be taken in this work, so it will comply with the Fire Underwriters' rules.

A. 3. It is necessary that the wiring should be inspected by the Fire Underwriters' before connecting to the supply mains, or the fire insurance policy on the building will be void should it burn down from any cause.



MOTOR TROUBLES.

(393.) R. O. Shadd, Williamstown, Pa., writes regarding his 1-6 H. P. motor which sparks on the positive brush when the current is turned on, but ceases to spark when the motor reaches its maximum speed.

A. The above mentioned action may possibly be explained by the fact that the positive brush is not at the right angle of commutation and the armature, drawing more current when accelerating, will make the sparking more noticeable than when running under normal speed conditions, with the armature current somewhat lower. Another cause for this may be that one of the wires in the armature is grounded, causing an excess flow of current. When the motor reaches full speed centrifugal force might throw the wire away from the armature, thereby destroying the ground.

RADIO CONNECTIONS.

(394.) Henry E. Davies, Jr., Vineyard Haven, Mass., writes us asking for a hook-up for the Mignon cabinet style radio receiving coupler, together with variable condenser.

Hook-Up for Mignon Radio Cabinet Receptor.

A. We show in the diagram connections for the Mignon cabinet style radio receiving coupler, together with variable condenser, fixed condenser, detector and 'phones.

Here's the Most Sensitive Head-set for Wireless Work

On 10 Day Free Trial

Stromberg-Carlson Radio Head-Set

THIS set is guaranteed to increase the receiving efficiency of any radio station with which it is used, regardless of the type of head-set used heretofore.

This claim is based on comparative operating tests conducted at many stations. If you are skeptical, convince yourself by ordering a set for 10 days' free trial against all other makes. The price is $8.25, and your money will be given back at once without the slightest obligation if you are not satisfied.

Dealers sell this head-set. If you cannot get it from your dealer, write us. Write today for free bulletin No. 1006.

Mr. King rose from Newsboy to Meter Engineer

YOU are needed NOW AS METER ENGINEER

Get the big job. Earn the big salary. Get into the new profession where high salaried positions are seeking the men. Train yourself to fill one of these big jobs. There is one or more in every Electric Light Plant. The demand is growing daily for Meter Engineers. We have trained hundreds of others and placed them in big jobs. We can do the same for you.

Earn $1,200 to $3,000 a Year

Just a few short months at home during spare time. You learn while you earn. Course is interesting, concise, thorough. You learn all about meters and instruments. No problem will stump you. Step into an Electric Light Plant as Meter Engineer at a salary of $1,200 to $3,000 a year. Our course prepares you for every emergency.

Mr. King's Rise to Meter Engineer

His experience is no different from hundreds of our students. He wanted the big job and trained for it. He has a fine position—at a big salary. His training makes him indispensable to his employer. His job is sure the year round.

Our Money-Back Guarantee

We guarantee to furnish you with our complete course of instruction in Electrical Meter Engineering and train you without charge, other than tuition as specified in our Enrollment Blank, until you are qualified to accept a position paying from $75 to $300 a month. Furthermore, we guarantee to assist you in securing a high grade posit on after you receive your Diploma. If after receiving all supplies and instructions to which you are entitled, and after fulfilling all of your agreements, you are not perfectly satisfied, we are to refund the full amount of your tuition.

FREE—Full Information—Use Coupon. Get the School Literature story of Mr. King's rise, terms, testimony from students and graduates, outline of course, duties of Meter Engineer—all absolutely free. Write to-day, "NOW." Use coupon.

KNAPP ELECTRIC & NOVELTY CO.

523 West 51st St. N. Y. CITY

THE RADIO PIONEERS.

In a recent communication to the *New York Times* Dr. Alfred N. Goldsmith, director of the radio laboratory at the College of the City of New York, said:

"I have read the highly interesting reports which have appeared in the *Times* describing the radio (wireless) telephonic experiments carried on over great distances by the American Telephone & Telegraph Co., using for the transmitting station one belonging to the United States navy (Arlington, Va.). Without desiring to disparage in the least the undoubtedly earnest and intelligent engineering work which has resulted in the accomplishment of this particular achievement, I feel strongly that less than due credit has been given to the many and eminent radio engineers who have done previous research work in this field, and without whose work the results just obtained would have been completely unattainable.

"I have been creditably informed that what are known as oscillating gas valves have been used for generating and controlling the power used in this work. While I cannot hope to gauge the relative importance of the contributions of all the previous inventors, I certainly believe that the following gentlemen are entitled to much more than a curt dismissal of their claims, and ignoring of all they have contributed to our knowledge of the oscillating gas valves. I refer to Edwin Armstrong, of Columbia University; Dr. Lee De Forest (under some of whose patents the American Telephone & Telegraph Co. is already licensed); Professor Fleming, of London University (one of the early workers in this field); Peter Cooper Hewitt, Dr. Irving Langmuir, of the General Electric Co.; Dr. Meissner, of the Telefunken Co.; Professor George Pierce, of Harvard University; H. J. Round, of the English Marconi Co.; Dr. Reisz and his associate, von Lieben, of the Telefunken Co., and Mr. Weagant, of the American Marconi Co. Three of these gentlemen, Messrs. De Forest, Armstrong and Langmuir, have in the order named made the results of their researches public in the 'Proceedings of the Institute of Radio Engineers,' and the interesting and important information which they gave has thus become available.

"It is impossible for me to apportion credit for the present achievement suitably among all the gentlemen mentioned, but it is quite certain that their united contributions to radio telephony have made the Arlington-Hawaii transmission possible. It is their due to receive credit for what they have done. It is not just that the commercial organizations involved should receive full public credit and the originating engineers be hidden by enforced anonymity. It is certainly to be hoped and expected that they will receive at least the mention which they have earned."

Electric Light for Your Home

Uni-Lectric lighting plant generates standard 110-volt direct current; operates from one to 50 lights, electric motor, electric iron, vacuum cleaner, electric toaster, force pump, churn, washing machine, etc.

No Batteries—No Switch-Board

and a **better** machine for **less** money. High speed gasoline motor, generator and automatic governor, all complete in one small, compact unit. Uses standard lamps and fixtures. Simple, easily installed, dependable, economical. Costs less than other systems to buy and to operate

Auto Throttle Governed Engine for Every Work

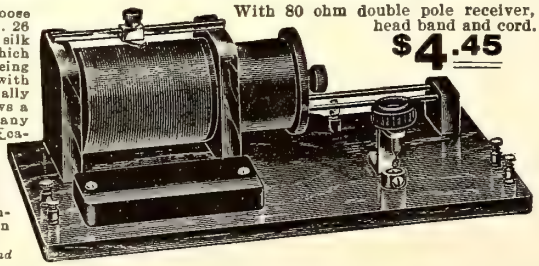
There is no other four-cycle engine with automatic auto type of throttle governor on the market near the price. Unlike ordinary low priced engines it is not hit-once-in-a-while governed with irregular speed and wasted gasoline.

It fires every shot with speed regulated by exclusive auto-throttle govenor which means even, economical power.

It will operate electric light plant, pump water, run separator, churn or freezer, chop feed, operate machinery, in fact, it is "the engine for every work."

Hopper cooled complete ready to run, 2 H. P., for only $35. Direct to you from the factory. Write for catalog.

C. Benninghofen & Sons Dept. 110, Hamilton, O.



This Complete, *Efficient* Wireless Receiving Set

RECEIVES 1500 MILES

This station is equipped with a two-slide loose coupler. The primary is wound with No. 26 bare wire, secondary wound with No. 30 silk covered wire and is divided off into 10 taps which are brought out on the end piece, contact being made by a phosphor bronze rotary switch with hard rubber knurled knob. Our new, specially designed detector will not jar out and allows a much finer adjustment than possible with any other detector. A fixed condenser of exact capacity, specially constructed for this loose coupler, affords extra efficiency. An extra pair of binding posts is provided to which a variable condenser may be connected.

All parts are of solid oak and mounted on a solid oak base. The set is beautifully finished throughout and is fully guaranteed in every particular.

Send stamp for our big Wireless Catalog "E" and free code chart made of unbreakable fibre.

PATENT ADVICE

Edited by H. GERNSBACK

In this Department we will publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Questions addressed to "Patent Advice" cannot be answered by mail. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

FOOLPROOF ELECTRIC SWITCH.

(33.) Wilmer J. Slifer, Quakertown, Pa., submits a sketch of a novel electric switch which he terms "foolproof" for the reason that it is necessary to use a key in connection with it. He wants to know if this switch can be patented, and if such an article is in demand.

A. After looking over the drawing and the description, we have come to the conclusion that a patent could not be obtained on this device, at least, we have our doubts about it. In case a patent was actually obtained, we do not think it would be of very much value as switches of this kind are not very well liked by the trade.

ELECTRIC RAIN AND WIND SIGNAL.

(34.) Martin Hoeft, Minonk, Ill., claims to have a new device for electric rain and wind signals, but fails to submit drawings to explain the idea. In the absence of these we cannot give any advice on the merit of the invention.

INSULATOR AND AERIAL CONNECTOR.

(35.) Bernard Russell, Colorado Springs, Colo., has sent in a drawing of a new insulator on which he desires to have some advice. He also submits an aerial connector and wants to know if the latter is patentable. He inquires further if there is a market for these two articles. He furthermore wishes to know if an article can be patented by using Electrose instead of porcelain for insulation without the consent of the company.

A. The insulator presents no novel ideas and we do not think it is practical; we doubt whether a patent could be obtained on it.

The connector, however, has some very novel features, and this is an article that probably will be welcomed by many wireless people. You should by all means try to obtain a patent on this connector, and we think this can be done without much trouble.

Concerning the last inquiry, you cannot obtain a patent by simply changing one material to another. In other words, if you constructed (let us assume) a screwdriver made of aluminum, you could not obtain a patent on this screw-driver simply because it was made of aluminum. The mere substitution of materials does not entitle anyone to a patent.

TEMPORARY WIRING INSULATOR.

(36.) Walter Franseen, Woodhull, Ill., has submitted to us a new idea showing how to run temporary wiring on walls which have been papered, by using a special appliance. He wishes to know if the idea is good enough to warrant obtaining a patent on it, and whether the idea has any merit.

A. Inasmuch as no sample had been submitted to this department, we are not quite sure that the device will do everything which our correspondent claims for it. As far as we can see, the idea is novel and we think a patent might be obtained upon it, but we would advise our correspondent to be cautious and he should try to have a search made in the Patent Office before going ahead with the patent. This is the best we can suggest in the absence of the actual model.

SELENIUM WIRELESS RELAY—ELECTRIC REGISTERING THERMOMETER.

(37.) Isaiah Rosin, Cincinnati, Ohio, submits to us a drawing of a selenium wireless relay which is supposed to work by means of a selenium cell and a telephone receiver and by its vibrating diaphragm and amplifying relaying arrangement. He wishes to know if a patent can be obtained upon this device. He also has bruitted an idea on a registering thermometer which is intended to be used in registering temperatures at a distance. He wishes to know if this device is novel and whether it can be patented.

A. We find that the first idea is entirely impractical and it will not work the way it has been submitted to us. A relay does not work on alternating current and the idea of lighting a lamp as outlined in the drawing to operate a second selenium cell is not practical and will not work.

As to the electric registering thermometer, this is quite a clever idea and deserves being looked into. We think that if this device were to be worked out carefully from its present crude state a valuable patent might be obtained upon it. We would advise our correspondent to get in touch with a patent attorney.

ROTARY SPARK GAP.

(38.) William Boyle, Brooklyn, N. Y., submits a drawing of a new rotary spark gap in which two separate motors are used and the spark points being arranged in a novel manner.

A. While the idea of using two motors on a rotary spark gap is not novel, the arrangement of the spark points seems to have some merit, at least we have never seen anything quite like it.

We think the best way is to get in touch with some of the patent attorneys and have a search made in the Patent Office to find out what has been done before in this line. If you find that nothing similar exists so far, you stand a good chance of obtaining a patent.

ELECTRICAL WAY TO FATTEN SHEEP.

Electric lighting of pens at night causes sheep to eat frequently and accordingly grow fat for the markets in record time. The tour made through the ranch section of Oregon by Samuel Galland, a Spokane financier, resulted in the discovery that the Oregon sheep growers are using electricity extensively for both light and power.

Besides being applied for pumping in irrigation districts and for doing nearly all the ranch work, electricity has been wired into the sheep pens. The light is turned on at 4 o'clock in the afternoon in winter and burns until 9 o'clock. The ranchers find that sheep will eat during off periods when the light is turned on. At 4 o'clock in the morning lights are switched on again and the sheep again begin to feed. Frequent feedings encourage the animals to eat so much that they are quickly fattened for the market.

BARON MÜNCHHAUSEN'S NEW SCIENTIFIC ADVENTURES.

(*Continued from page* 388.)

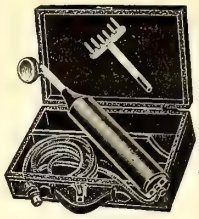
have been in Flitternix's mind too, for presently he set his chronometer to noon, which, of course, was a ridiculous thing to do, for we did not know if the Martians divided their day into 24 hours or into 100 hours.

"We were now floating some 1,500 feet up over what we afterward knew to be the Martian National Capital, the 'city' of the Ruler. It is located in the elliptical spot which terrestrial astronomers have marked as *'Solis Lacus'* on their Martian maps.*

"As if our host had divined our innermost wishes, we soon passed over the capital and approached the waterway which you will find in your Martian map under the name of *'Nectar.'*

"The Martian Canals! At last we beheld one of them at a distance of less than 2,000 feet! The riddle of terrestrial astronomers for over a century! The cause of one of the most heated controversies on Earth! And now we saw them close by with our own eyes!

"The 'Canal' proper, which is termed 'Nectar' by astronomers on Earth, is about 6 miles wide. It runs in a perfectly straight line for over 500 miles and is about 20 feet deep. Like all other Martian waterways, it is lined with the Universal Martian material termed TOS, which looks like glass, yet is not glass. The Tos in this instance is waterproof, is an electrical conductor on one side and an insulator on the other. Yet it is a solid body and much harder and tougher than steel. The conducting side is turned toward the water, and when a certain current of ION is sent through the Tos, the water near it loses all weight because the gravitational attraction of Mars is neutralized thereby. It becomes now an easy matter to move the tremendous masses of water, a problem which your earthly scientists could never solve.



"At each bank of the vast waterway we saw immense towers about 2,000 feet high. These towers are spaced about 5 miles apart and follow the entire course of every canal. Their purpose is as follows:

"At the top of each tower is an immense 'pyramid,' made of a certain variety of Tos. The sides of these pyramids are formed of thousands of small black cells, which, when exposed to the Sun's rays,

* See accompanying map of Mars. Solis Lacus is located at about 30° latitude and 90° longitude. Nectar runs from the eastern (left) edge of Solis Lacus, due east.

absorb the heat of the latter. As the surface of these pyramids is very large, a proportionally large amount of heat is received. This heat is directly transformed into ION and stored within the pyramid. The latter turns on its axis, so as to present the largest possible surface to the Sun from sunrise until sunset; also as more power is generated than needed during the daytime the excess is used during the night.

"Now, then, from the top of the pyramid a gigantic Emanation Ray bursts forth, fed from the stored ION, originally secured from the Sun's heat.

"This ray is made to fall over the entire width of the waterway, and it is directed on the latter at an angle. The ray striking the water, which does not resist, as it has no weight, as explained to you, must naturally move away from the direction of the ray. This it does, the Emanation Ray 'pushing' the water at a rate of about 2¼ miles an hour. If it was not for the ray the water would, of course, be entirely motionless, for the Martian waterways are exactly level, there being no 'fall' to them.

"As each tower assists in moving the water over a certain distance the water gradually acquires momentum and flows slowly but steadily. Before the momentum has been expended, the next tower is reached, which pushes the water on to the next one, and so on through the entire length of the Canal. You will naturally understand that these towers must work nights as well as during the day, else the water would not flow during the night. The stored surplus power during the day, of course, makes this possible. Furthermore, the towers work to their full efficiency and uninterruptedly year in and year out, for there are no clouds to hide the Sun on Mars, as it is well known; consequently, the pyramids are never without power, except nights.

"You realize that all the towers must throw their rays in the same direction, which, of course, they do; thus, if the water is to be moved in one season from North to South, the rays face the South. During the next season when the flow of the water must needs be reversed, as explained to you yesterday, the Emanation Rays will all point northward. Thus one of the great problems on Mars has been solved. But who does the work? The all dominating Sun.

"And who moves the waters on Earth? Who condenses the waters from the oceans and lifts up myriads of tons of water year in and year out, to form clouds, which latter produce the rains, without which your rivers would run dry within four weeks? The

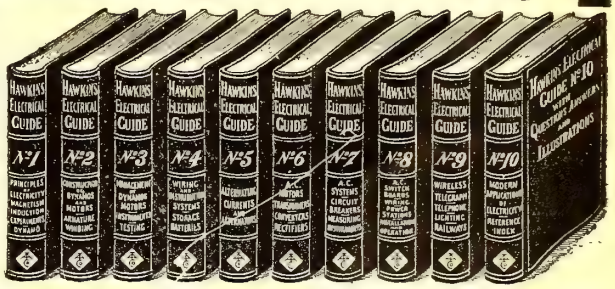
Do It Electrically



The applications of electricity are increasing every day. The man who has an exact knowledge of electrical science has ever growing opportunity for profit. Ten years ago practically all machines in use were run by steam engine and countershaft. Statistics now show that most of the machines used are now operated by the electric drive. A generation ago gas was the only known means for lighting and cooking. Now almost every modern house is lighted by electricity, and electric cooking utensils are coming more and more in use. Even the steam locomotive, that great achievement of the twentieth century, is being gradually replaced by electric power. Whether it be for driving machines, for railway transportation, for lighting, for heating, for cooking, for a thousand daily necessities, the watchword of the age is "Do It Electrically."

Hawkins Electrical Guides Will Show You How

Electrical knowledge means money to you and these books will show you how to get it. Hawkins Electrical Guides are the standard works on Electricity. They cover every single phase of the subject and they are written in a way you can understand. The text matter is arranged in questions and answers, and contains several thousand illustrations. No more groping for a solution of your electrical problem. You find the answer at once, clearly and concisely.

A Most Complete Library of Electricity at the Lowest Cost

Look at the titles and convince yourself that Hawkins Electrical Guides tell you everything you want to know in Electricity. They are a complete course in Electrical engineering, written especially for the ambitious man who is training himself for advancement, for the wide awake man who is likely to be called in for work outside of his regular line, for the man who needs at his elbow, for ready reference, an accurate up-to-date work on electricity. An examination of these books will convince you of their value instantly. They cost $1 per volume. They are a wonderful buy at this price, and they are the best electrical books at any price. Don't take our word for their merits. Fill out the coupon today and the books will be sent you absolutely **FREE** for your own examination. You have seven days full use before you pay a cent.

In Handy Separate Volumes The binding is in flexible black leather with gold edges—very durable and attractive. The books are easy to handle and easy to read. They fit your pocket and your pocket-book as well.

Shipped to You FREE

Send no money. Examine the books first. Decide for yourself that they are the most complete library of electricity ever published, and that you cannot afford to be without them. Every book is complete in itself. The price is only $1 per copy, but the complete set is the best bargain. Settlement can be made at only $1 per month. EIGHT NUMBERS ARE READY.

A FEW OF THE SUBJECTS

Magnetism—Induction—Experiments—Dynamos—Electric Machinery—Motors—Armatures—Armature Windings—Installing of Dynamos—Electrical Instrument Testing—Practical Management of Dynamos and Motors—Distribution Systems—Wiring—Wiring Diagrams—Sign Flashers—Storage Batteries—Principles of Alternating Currents and Alternators—Alternating Current Motors—Transformers—Converters—Rectifiers—Alternating Current Systems—Circuit Breakers—Measuring Instruments—Switch Boards—Wiring—Power Stations—Installing—Telephone—Telegraph—Wireless—Bells—Lighting—Railways. Also many Modern Practical Applications of Electricity and Ready Reference Index of the 10 numbers.

Easy Payments

Accept this great offer now—today. Each page—every illustration will convince you of the big value we are offering. See the books first, then decide. If you decide to keep them you can make settlement at only $1 monthly until paid for.

Sun, of course!

"Only on Earth the Sun does it in a natural manner; here on Mars, the Sun works just the same, but without the intermediary of the clouds."

* * * * *

There was the familiar snapping sound in my receivers, a low click and everything was quiet. I knew that the telegraphone wire on the Moon must have been filled to capacity, and that I would not hear again from Münchhausen till the next evening.

(To be continued.)

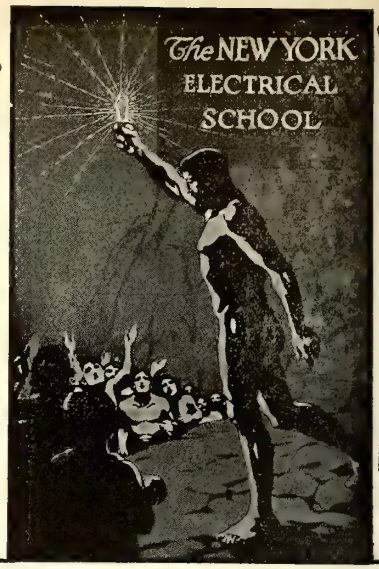
SUBMARINE F-BOATS ALL UNSAFE, NAVAL BOARD FINDS

The preliminary investigation into the cause of the sinking of the submarine F-4 on March 25 last at the entrance of Honolulu Harbor has resulted in a report to the Navy Department, which asserts that all four of the submarines of the F class, including the F-4, had inherent faults, and were difficult to keep in repair and that serious trouble was experienced with their propelling engines, electric motors and storage batteries; in short, that they were in a dangerous condition for use on long dives like the one on which the F-4 met with the accident which wiped out the lives of her officers and crew.

The Board of Inquiry found that the storage batteries of the F-4 were always in a state of being more or less electrically "grounded," due to leakage of electrolyte, and that these "grounds" have been of sufficient intensity to cause flame and the fusing of electrical connections, also that these faults obtained in all four of the boats of the F class, of which there are three remaining, the F-1, F-2 and F-3. The F-4's storage batteries evolved excessive quantities of hydrogen gas. The fumes of hydrogen and acid were noticeable inside the F-4 on long dives and on March 6 last, some days before the F-4 was lost, there was a hydrogen explosion in that submarine which damaged the battery deck and broke several separators of the cells. The report just received by the Navy Department asserts that the "conditions under which an explosion of hydrogen is always possible obtain in all the boats of the F class."

RADIO LINKS TWO PRESIDENTS.

It was announced at the Navy Department recently that congratulatory messages were exchanged between the President of the United States and the President of Guatemala in celebration of the opening of a new high-power radio station erected in Guatemala City, Guatemala.



The naval station at Arlington, Va., handled the American messages.

NEW ELECTRIC AIR WARMERS.

The approach of cool weather is directing attention to the subject of convenient electrical means for warming rooms. To the variety of these equipments now available there has been added recently a new line of electric portable and fireplace heaters, which is made by a Western manufacturer.

A complete assortment of these is on display in the Manufacturers' Building at the Panama-Pacific International Exposition.

These heaters are all of unique construction, with one or more heating units. The one shown in Fig. 1 resembles an enlarged desk telephone stand, and has one heating unit consuming 615 watts. It is made of brass, highly nickeled. The height of the outfit is 16 inches, and the base is 6.5 inches in diameter. The weight is about five

THE N. Y. ELECTRICAL SCHOOL is the pioneer and premier school of the "Learn by Doing" method. When you have completed this Course you shall be fully qualified to handle ALL branches of Electrical industry.

The equipment of this School is unequalled and up-to-the-minute. No preparation needed to become a "learner" in this school. You can start to learn on any day of any week throughout the whole year. Send for catalogue.

America's Scientific Railway Training School

pounds, making this a very handy device that can be readily placed where desired. The reflector behind the heating unit directs the heat to the point where it is needed.

The heater, or rather stove, shown at Fig. 2, will take the place of a small coal or oil stove, and it stands 28 inches in height. It weighs 13 pounds and has two heating units which consume 960 watts.

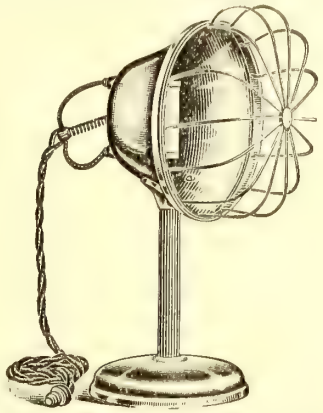

Fig. 1. Small Size Electric Heater of New Type.

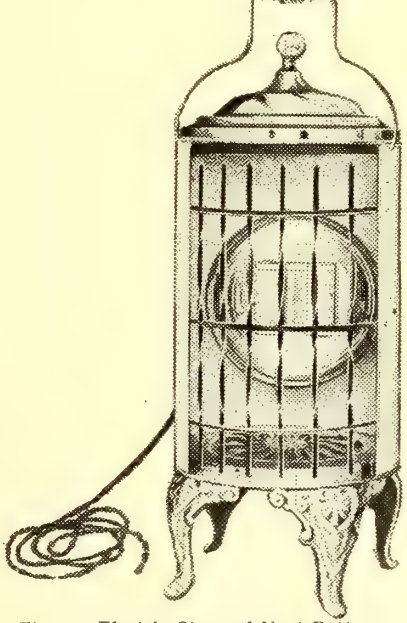
Body and guard are finished in white or black enamel, the balance of the heater being highly nickeled.

This form of heater will give a great deal more satisfaction to the user than any electric heater yet placed on the market, say the builders. High efficiency is obtained by operating the heating units at a high temperature, thus increasing the resistance and decreasing the operating cost. They can produce heat comparing with other radiators at approximately 20 per cent. lower amperage.

They do not depend solely on the wire temperature for radiation, and the high temperature surrounding the unit is not affected by outside atmospheric conditions as readily as the comparative low temperature produced by other heaters; in other words, it is a more permanent heat.



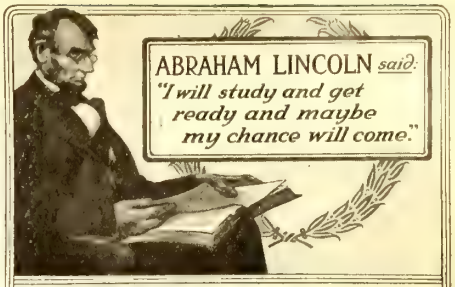


Fig. 2. Electric Stove of Neat Pattern. Consumes 900 Watts.

Superior durability for the heating unit is claimed and from the thermal point of view in regard to durability, the individual parts of the units are being operated on an average of 30 per cent. below fusing point, and this allows for any condition arising which may cause trouble in case of an excessive voltage.

YOUR Chance Will Come

Born in a log cabin, Abraham Lincoln had little chance to acquire an education. But he was determined to succeed. "Some day," he said, "my chance *will* come." So he studied and got ready. And his chance *DID* come.

Your chance will come. Some day you'll be considered for promotion or for a good job in some other line of work. If you are ready, you'll go up.

And you *CAN* get ready. No matter if your schooling was limited—if you do have to work long hours. If you really want a better job, the International Correspondence Schools can train you for it at home during your spare time.

More than *Five Thousand* I.C.S. Students every year take the trouble to report promotions or salary increases due to I.C.S. help. What the I.C.S. have done for these men they can do for *YOU.*

1916 Models Now Ready!

Any Watch You want On Credit

Waltham
Hamilton
Howard
Elgin
Illinois-Rockford

All 1916 Models.

I am the first man in the country to offer the **New 1916 Models** of America's best known watches. I have them all, the latest products of the world's most famous factories. You can get too, the latest mountings for **Diamonds** and the most up-to-date **Jewelry**, at the **right prices.**

NO MONEY DOWN $2.75 A MONTH

GIFT SPECIAL No A1

No Money Down

Express Prepaid in Advance by Me

You take no chances with me. I am "Square Deal" Miller and I trust the people. That is why I am doing the greatest credit Watch, Diamond and Jewelry business in the country. Suppose you want a watch, **a New 1916 Model,** a brand new up to date one. Name any one, I have it for you. **No money down, Express prepaid.** A full month to carry it in your pocket; and the easiest of Long Time Payments. That's the test that tells. All these

Watches Guaranteed for 25 Years.

I Smash the Terms

NO REFERENCES DEMANDED

My terms will surely suit you. You get unlimited credit, with no red tape, notes or collectors

An "Open Charge" Account

the same kind of credit you get from your grocer. No matter where you live or what your income might be, you can now own the finest of watches, a beautiful diamond or any rare jewelry and never miss the money.

1916 Catalog FREE Send me your name and address so I can mail you Free and postpaid, the most beautiful catalog of its kind ever printed. I want you to have this book. It's a gem. It illustrates all makes of valuable **Watches, Elegant Genuine Diamonds** and a vast assortment of **Beautiful Jewelry,** all on the easiest and most liberal terms. Write for book today and get a letter from me that will make you my friend from the start.

Square Deal MILLER, Pres.

Miller-Hoefer Co., 545 Miller Bldg., Detroit, Mich.

THE BOYS' OWN LABORATORY

CHEMCRAFT

A Complete Outfit of
CHEMICALS - (39 Chemical Reagents)
APPARATUS - (All Necessary Apparatus)
INSTRUCTIONS (The Chemcraft Book)

for performing over 50 Different Experiments. Each experiment can be repeated many times.

Under the heading "Chemistry and Its Application to the Industries" are many experiments in which the products of our great chemical industries are really manufactured on a small scale. Everything is explained in a clear interesting way.

Chemcraft also contains 30 mysterious experiments in Chemical Magic. It's great fun to show these to your friends.

If your dealer does not have Chemcraft we will send yours direct. Price $1.50 postpaid. Descriptive literature sent on request.

THE PORTER CHEMICAL CO., Hagerstown, Md.

EXPERIMENTERS

We have what you want. **Samarskite,** radio-active mineral, based upon **Uranium.** 100 lbs. contain 1.75 milligrams **Radium.** Price per pound $4.20; large discounts on orders of 5 pounds and over. 1 oz. sample sent for 60 cts. cash.

Le-Bar Chem. Co., Manufacturers Mineral Prod, **Balto., Md.**

TO BREAK FOGS BY ELECTRICAL WAVES.

Shipping men in New York are interested in an announcement from San Francisco that experiments are to be made there in an effort to dispel fog by the use of electrical waves. The problem of clearing such inland waters as New York Harbor from the dense mists that often interfere with navigation has engaged the attention of experts for many years, but no scheme within reasonable cost has yet been brought forward.

Recently oil has been suggested. The Hydrographic Office of the navy is tentatively considering this subject.

The news from San Francisco is to the effect that Government scientists have constructed a giant electrical machine with which experiments are to be carried on in the harbor. The machine is a giant electrical transformer, the largest one ever built. It can take a current of 1,000 kilowatts at 2,300 volts and "step" it up to 1,000,000 volts. This charge is expected to produce a broad, continuous flash of lightning 100 feet long. Experts believe the result of this electrical disturbance will be to clear up a fog or mist for some distance; that is, in comparatively inclosed waters. The experiments will be watched with great interest by steamship men and navy officers.

Peter Cooper Hewitt, a recognized expert in matters electrical, in expressing his views as to the efficacy of this method, said: "I have not gone into the question, so I am unable to properly discuss it, but I see nothing improbable in its efficiency. It might work in small inclosed spaces and under proper conditions. As I recollect, somewhat similar experiments were conducted several years ago on the Thames at London to clear the deck spaces of the fogs. The results were said to be of a satisfactory character, but what has been done since then, if there has been any continuance of the work, I am not informed."

BOOK REVIEWS.

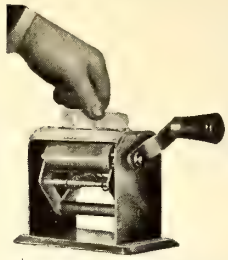
ALTERNATING-CURRENT ELECTRICITY AND ITS APPLICATION TO INDUSTRY. (First Course.) By W. H. Timbie and H. H. Higbee. Cloth covers; 534 pages; 5¼x8 inches; 370 illustrations. Price, $2.00. Published by John Wiley & Sons, N. Y. City.

This book is planned to meet the requirements for a work, simple enough to be readily understood by the beginners, yet sufficiently advanced to form a basis for engineering calculations and practical A. C. work.

Power transmission, fundamental ideas of A. C. currents, different arrangements of circuits, power factors, reactance and construction of single and polyphase generators, are among the subjects covered.

The text is well illustrated with many clear analogies and photos of actual apparatus. The subject is covered in a rather broad manner to give the reader a clear grasp on alternating current theory and practise, while the authors promise another course, soon to be ready, which will cover the subject more in detail, as to the characteristics and operation of commercial types of machines and appliances.

APPLIED ELECTRO-CHEMISTRY AND WELDING. By Charles F. Burgess, E.E., and George W. Cravens. Cloth covers; 140 pages; 135 illustrations; 5¾x8½ inches. Published by American Technical Society, Chicago, 1915. Price, $1.50.



A practical treatise, written in a clear, readable style, that is sure to increase the interest in practical applications of electrolysis and welding.

The first part covers the subject of electrolysis, electro-plating, decomposition, high tension generation of ozone and the method of nitrogen fixation in an impressive and non-technical manner.

The remainder treats of electric welding in all its forms. The various application of electrical, gas and chemical welding, are discussed at length. This book is worthy of perusal by every worker in the above-mentioned field, who will find his time well repaid by such reading.

ELECTRICAL INSTRUMENTS. By W. H. F.

SELF-SHARPENER FOR SAFETY RAZORS

Insert safety blade (any but Durham Duplex), turn handle few times. Hones and sharpens one operation; keen cutting edge like new. Sent anywhere for $3. Money back guarantee. AGENTS WANTED.

Hair Grows

When properly nourished. Our VACUUM CAP used a few minutes each day draws the blood to the hair roots. The blood is nature's nourishment and when properly supplied, it promotes hair growth, stops falling hair, and dandruff disappears. Our cap is used by Physicians, and men who know it to be the Scientific method of promoting "Hair Growth." We send our Vacuum Cap on 60 days' free trial. Write for our booklet on "Hair and its Growth" testimonials, and application blanks, sent sealed in a plain envelope free.

The Modern Vacuum Cap Co.

470 Barclay, Denver, Colo.

Don't Throw Away Your Worn Tires

You can get 5,000 miles MORE service from them

For over three years European Motorists have been getting from 10,000 to 15,000 miles out of their tires by "half-soling" them with Steel Studded Treads, just as we half-sole our shoes when the first sole gets thin.

In the past 8 months over 20,000 American Motorists have followed their example and are saving $50.00 to $200.00 a year in tire expense.

Guaranteed 5,000 Miles without Puncture

Absolute freedom from tire worry—blowouts, punctures, rimcuts and rutwear eliminated—no matter whether your tires are old or new you should put on Durable Treads at once—they cover your tires from rim to rim—nothing can work in between—that's why we guarantee them as we do.

We Deliver Free—prepay the express and allow you to be the judge. Durable Treads are easily applied in your own garage in 30 minutes without extra tools.

Special Discount to motorists in new territory on first shipment direct from the factory. Mail the coupon today and we'll send you full information, sample, and copy of signed guarantee without any obligation to you.

My $3.00 Exerciser Reduced to $1.00

Until further notice I will send one complete

Muscle Builder Outfit

to any reader of *Electrical Experimenter* upon receipt of $1.00—just one-third the regular price. I will also include a complete body-building course of instructions containing 24 selected exercises. The MUSCLE BUILDER will meet the requirements of any person—weak or strong—man, woman or child. Can be used to exercise any muscle in the body.

A Chest Expander Also

with each outfit, I will give an extra handle, without charge, by which the **Muscle Builder** can instantly be converted into a most effective Chest Expander to be used for developing the chest and lungs. Take advantage of this opportunity while it lasts. Send your order today.

Prof. Anthony Barker
Studio 28, 110 W. 42d St., N. Y.

BRAIN vs. BODY IN THE RACE FOR SUCCESS

All you fellows who are devoting every bit of your time and attention to the cultivation of mental efficiency, do you ever

STOP

and ask yourself what it will avail you if you neglect your body? You think the brain is the all important essential in the race for your goal. Is it?

Will your brain live longer than your body? Will your brain live up to its training and do good work if it has to be continually flashing messages from a neglected body, or registering protests from a disorganized stomach? Will the brain of a crooked, scrawny, dyspeptic, or weak, puny, undeveloped man justify the training it has had? Or will a brain weakened by youthful indiscretions be 100 per cent. efficient?

My book **"Intelligence in Physical and Health Culture"** will answer these questions in a way that will interest and surprise you. Send four cents in stamps to cover postage on a copy. Do it now!

500 TYPEWRITERS AT $10 TO $15

Typewriter prices smashed! Underwoods, Remingtons, Royals, L. C. Smiths, Fox, etc.—your choice of any standard factory rebuilt machine at a bargain. Everyone perfect and guaranteed for three years *including all repairs.* My free circular tells how to save 40 per cent to 60 per cent on each machine.

Write for it. C. E. GAERTE, President
EARBORN TYPEWRITER EXCHANGE, DEPT. 62°, CHICAGO, ILLINOIS

Murdock, B.Sc., and U. A. Aschwald, B.A. Cloth covers; 5¼x7½ inches; 366 pages; 164 illustrations. Published by Macmillan Co., New York City. Price, $2.75.

In this work the writers have endeavored to create a work suitable for the advanced "meterman" and have succeeded admirably.

In the historical summary, they show early forms of measuring instruments and then take up each type, going on to explain carefully and at length with many formulæ, the theory, as well as the practical details of each instrument up to and including various forms of demand supply meters.

Closing with chapters on magnetic permeability meters and a discussion of the post office box and slide wire bridges, the chapters form a well balanced and symmetrical whole. This book will no doubt find a place with all specialists on meter work, desiring to keep in touch with the best practise.

ELECTRICAL MEASUREMENTS AND METER TESTING. By David P. Moreton, B.S., E.E. Cloth covers; 4½x6¾ inches; 266 pages; 191 illustrations. Published by Frederick J. Drake & Co., Chicago. Price, $1.00.

In this work the author has succeeded in combining great clearness with conciseness and accuracy. The fundamentals are handled in a manner not surpassed by his treatment of higher and more technical alternating current measurements. Many analogies, combined with profuse illustrations, tend to make the work invaluable, alike to the layman and practical electrician in search of knowledge on the subject of electrical measurements.

Starting with the idea of giving the reader a good grasp on the principles of electricity, the author carries him forward in short steps to a full knowledge of all methods of measuring electricity, making in all, a book worthy of a position in every electrician's bookcase.

ELECTRICITY FOR THE FARM. By Frederick Irving Anderson. Cloth covers; 5¼x7½; 266 pages; 50 illustrations. Published by Macmillan Co. Price, $1.25.

Taking a really difficult subject, the author has treated it in an exceptionally clear manner. Starting off more like fiction than a technical treatise, he shows the great changes on the farm made possible by a small electric plant. He proceeds with an elaborate treatment of water-wheel installations, leading up to the electrical equipment, which is treated at some length.

The final chapters deal with gas engine and wind power as applied to electric generators. With this book at hand, the farmer can start to install an electric plant with full confidence of success.

HOW TO PASS U. S. GOVERNMENT WIRELESS LICENSE EXAMINATIONS. By E. E. Bucher; 70 pages; 37 illustrations; size, 9x5¾ inches; paper bound. Price, 50 cents. Published by Marconi Publishing Corporation, New York City.

This book, arranged in the form of a catechism, fills a long-felt need. Answering as it does 118 questions of actual bearing on the subject, it is an invaluable help to the radio amateur who desires to pass the U. S. Government wireless license examinations.

The questions are answered in a clear, easily understood, manner not untouched with a certain amount of technical terms. The book treats of the different parts of a radio installation in order and covers each quite thoroughly.

It gives numerous formulas for the calculation of the various currents and apparatus. The book appears to have been written in a very hurried manner as the errata is rather large, and in fact it contains a minor mistake in itself. However, this book should find a large demand with students of radio phenomena who desire a better grasp on the subject in a practical way.

YEAR BOOK OF WIRELESS TELEGRAPHY AND TELEPHONY FOR 1915. Published by Marconi Publishing Corporation, New York City. Size, 8½x6 inches; 1,000 pages; 32 illustrations; cloth bound. Price, $1.50.

The year book for 1915 has just made its appearance and it surpasses the 1914 edition both in size and quality of its contents. It contains as usual the complete list of ship and land stations of the world and the laws and regulations of the various countries on radio-communication.

It also contains numerous formulas and tables invaluable to the commercial operator as well as to the amateur and deserves a position on every experimenter's book-shelf.

The chapter on wireless telephony is very brief and treats of the various systems in a general way, going into few details. However, it treats of the entire history of wireless telegraphy in some detail, as to discoveries of the various experimenters in this line, etc.

The various articles by prominent men in the field of radio-communication are of special interest and timely. They deal with the effects of wireless telegraphy on the present European conflict and

Here's *YOUR* Chance to Learn

DRAFTING

This Complete $15 Drawing Outfit and Full Instructions in Mechanical Drawing **FREE**

There's a good job waiting for you. The country is facing greater prosperity than it has ever before experienced. Far-seeing men are getting ready for boom times. Get this training now and share in the coming prosperity. We make the way plain.

CHARLES W. MOREY
President of the College
and Head of a Large Chicago Firm of Civil, Mechanical and Electrical Engineers and Contractors.

Men Wanted AT BIG SALARIES

This is a rare chance for a few wide-awake young men.

On account of the rapidly increasing demand for trained draftsmen Pres. Morey has issued orders that instructions be furnished to a limited number of young men who are inclined along engineering or architectural lines. Read about this great offer below—then mark and mail the coupon.

STUDY AT HOME Devote your spare hours for a short time only and learn this profitable and pleasant profession, and get in the class drawing the big pay envelope. Hundreds of men are in daily attendance at this old established college. In your own home you can do the same work these men are doing, and the same experts that teach them will guide you toward the big job. These well-known engineers prepare your instruction matter. Your work is examined and approved by them. They know exactly the **practical training** you need and **they** train you. No books to sell. Live, up-to-date blue prints of work in actual construction. In your own home you work with plans of machinery, buildings, steel works, etc., actually being constructed in Chicago, New York and other large cities.

Electrical Drafting and Design

No other similar correspondence course in America has a resident college of National reputation back of it, nor a faculty of active experts actually engaged in municipal and corporation engineering work. These men know exactly the kind of training you need because they are in constant charge of big work.

$45 COURSE FREE IN MECHANICAL DRAWING

This College has set aside a limited number of Free Scholarships and will give the regular **$45 Course in Mechanical Drawing Free** with any one of the Home Study Courses named in the coupon below—**this is in addition to the complete $15 Drawing Outfit** which is also furnished to students **free.** Take advantage of this unusually liberal offer today, as it will be withdrawn when the allotted number of Free Scholarships has been awarded. It costs you nothing to get full information. No obligation on you.

CHICAGO TECHNICAL COLLEGE
1060 LAKE VIEW BLDG. CHICAGO, ILL.

the latest developments in long-distance wireless communication. The adaptation of wireless telegraphy to meteorology and surveying are treated on in an interesting manner

The book likewise contains lists of radio societies. wireless telegraph companies, the latest books and periodicals available on the subject, a glossary and dictionary of technical terms, etc.

Presenting in one volume the entire history of wireless telegraphy as well as the latest advances in the art it fulfils its mission as a year book in a satisfactory manner.

THE WIRELESS TELEGRAPHIST'S POCKET BOOK by Dr. J. A. Fleming. Red leather covers, gilt edges, 348 pages; 39 illustrations; 4½x7½ inches. Published by the Wireless Press, London, England, 1915. Price $1.50.

This is a much desired pocket size volume of extreme value to the radio operator and engineer, whether for theoretical or practical consideration. The author is one of the best known writers and scientists in the wireless field, and has here presented a general clean-up on the necessary measurements and calculations occurring in wireless telegraph and telephone engineering. Sufficient diagrams and illustrations are incorporated to make the book of great practical value.

The section covering the different losses and over-all dimensions as well as the efficiency of the individual apparatus making up a complete wireless transmitting set, is of extreme value and has not been covered heretofore in most text-books, which presume to deal thoroughly with the subject. Some of the subjects covered include a considerable amount of mathematics up to Calculus, and this section ends with electrical and other units, dimensions, etc. This is followed by chapters on high frequency and voltage measurements; capacity calculations and absolute measurements by the bridge method; frequency and cymometer measurements; aerial and etheric wave radiation, covering the calculation and determination of radiation resistance and decrement; transmission and transmitting circuits, as well as receiving circuits, with a final section covering routine station practise for radio operators. The book contains an appendix of valuable mathematical tables, including logarithms, circle dimensions, etc.

All in all, this neat volume appears to possess great merit and it should find a ready sale among all radio men who wish to have at their fingers end the latest concise data on this important branch of science.

There are several sections of the book which seem as though they might have been made larger, even if other sections had to be cut down somewhat. This pertains particularly to the opening chapters, which deal with mathematics. Manifestly it is impossible to cover the subject of mathematics in a few pages, and while to many users of this handbook the mathematical notes will be found useful, it would be just as well to have left them out or made them cover less ground, as those who are interested sufficiently can procure numerous treatises at a nominal cost, covering mathematics very thoroughly and completely.

BY WIRELESS PHONE FROM ARLINGTON TO PARIS.

(*Continued from page* 393.)

Paris and also in Honolulu.

"We have now heard from all our expeditions, and it is interesting to note that the circle of the area covered by these expeditions was about 10,000 miles in diameter. Never in history was such an expedition ever undertaken as was this one."

"How long was it before Webb in Arlington was able to establish communication with Shreeve in Paris, and what test words were used?" Mr. Carty was asked.

"Owing to the very limited time at their disposal, it was necessary to cable the exact minute during which the Eiffel Tower plant was available," he replied, "and in those few seconds Webb did his talking. Signals had been previously arranged, first by numbers, and then followed by words. Shreeve was to cable what he got after each test—that is, provided he got anything—and, as you know, the signals were heard on three different nights. Owing to the fact that there is now in existence only one set of transmitting instruments, and that at Arlington, the talk, of necessity, as was the case with San Diego, Honolulu and the other places reached by the expedition, had to be one-sided."

[*Editor's Note.*—For details and illustrations of apparatus used at Arlington in Honolulu talk, see November, 1915, issue of *The Electrical Experimenter.*]

HIGH FREQUENCY CURRENTS AND APPARATA.

(*Continued from page* 405.)

experiments with high frequency currents will be found described in the series of many excellent books listed at the end of this discourse. It can also be said that we of to-day know very little about these high frequency currents and their possibilities. Nikola Tesla has done more in this direction than any other person, as can be readily judged from the fact that over 15 years ago he successfully produced sparks 100 feet long resembling in volume and sound the lightning discharges we have all seen in nature (not imitation ones). It is hoped that this article may serve to kindle the spirit of research along these lines in the young experimenter's mind, and he surely will be amply rewarded for any discoveries he may make in this little-understood branch of electrical science, which bids fair to unlock the door to a future electrical era of which our generation has no reasonable conception at this time.

"HOME ELECTRICAL" WINS AWARDS AT WORLD'S FAIR.

The 900,000 persons who have inspected the "Home Electrical" display at the Panama-Pacific International Exposition will be interested to know that the General Electric Co.'s exhibit has been awarded two gold medals by the international jury of awards. One of the gold medals was awarded for the high educational value of the display, while the completeness of the exhibit and its drawing power as an attraction carried off the other gold prize.

The "Home Electrical" presents a full-sized model home of Spanish-California bungalow design, in which world's fair visitors see a practical demonstration of how electric energy performs all the household labors and adds to the comforts of living.

Can You Accept a Position Paying $125 to $300 a Month?

ARE your services in demand today. Have you the training that equips you to hold a position paying $125 to $300 a month? Have you the same knowledge as the man who gets the fat pay envelope? If you are ambitious—**send the coupon below** and find out about the opportunities that await you in the profession of Signal Engineering. **Salaries are paid to men who know.** You can get just the kind of training you need to accept one of the big jobs, right in your own home—during your spare time. **We need men.** Do not delay. Send the coupon today for the book that tells you all about it.

Be a Signal Engineer

Be the man who gets the fat pay envelope. The profession of Signal Engineering is only in its infancy. There are thousands of miles of block signals to be installed. Signal Engineers, supervisors, inspectors and foremen are required to superintend this installation. Hundreds of maintainers and battery men are needed to maintain the systems already in use.

Your duties may take you from coast to coast. Railroad men are always in a fortunate position to travel and see the world because free transportation is liberally awarded. You can accept a position where you will be located steadily at one place, if you prefer—the position of authority—the high place and fat pay envelope may be yours. Send coupon for free Signal Book.

$125 to $300 a Month

That is an ordinary salary for Signalmen—many Signal Engineers make much more. In the Signal Department, supervisors, inspectors, maintainers, battery men, positions of authority paying from $75.00 a month up, all open to the men who have had the kind of training you can get right in your own home. Even while you are learning you may hold one of the positions in the Signal Department under a Signal Engineer.

We Need Men

The profession of Signal Engineering is calling to ambitious men. Our ranks are not overcrowded. **There are opportunities—golden ones, awaiting the men who answer the call.**

Block signal systems are no longer in the experimental stage. All over the country they are being installed. Some States have legislated to compel the railroads to install systems immediately. In our profession you will have the chance you have been looking for. We are calling you. Take immediate advantage of this wonderful opportunity. Don't fail to send the coupon today for our big free Signal Book and full particulars. Do it NOW.

Two Big Outfits FREE

Complete signal Engineer's Outfit and complete Draftsman's Outfit given away absolutely free to our students

Send Coupon for Big New Book

Put your name and address on the coupon or on a letter or a post card **now**, and send it to us. Absolutely no obligations of any kind. We will send you our big new Book absolutely free, and prepaid. Read about this fascinating profession. Read about the opportunities that await you. The book is free. Send the coupon for it now—it's the first step toward the realization of your ambition. Get your name and address in at once.

Big Money in Electricity

The electrical industries offer wonderful opportunities for boys with a liking for electricity. The salaries paid to trained men are large—promotion comes rapidly, and, best of all, the profession is not overcrowded.

The opening of new lines, from time to time, (such as wireless telegraphy and telephony), promise attractive and paying fields to those who wish to specialize. The *will to do* and *Special Training* will bring success to you.

The International Correspondence Schools of Scranton can help to make you an expert in electrical work. Hundreds of boys have already won success through I. C. S. help. You can do the same. Everything is made so clear that you can learn in your spare time, regardless of where you live or what you do. No books to buy.

There's big money in electricity. Get after it by marking and mailing the attached coupon today. Finding out costs you nothing.

TO FOIL SUBMARINES WITH UNDERSEA SEARCHLIGHTS.

(*Continued from page* 392.)

this end the inventors make use of an observation tube. This can be any of the well-known devices for seeing beneath the surface, but they prefer the *mariscope,* shown at 16, arranged adjacent to the tube 10 and being curved at right angles 17 and 18 at top and bottom. A lens 19 is provided at the lower extremity of the tube, and opposite this is an inclined mirror 20, with another above, 21, at the upper end of the tube; from this the rays are refracted to the sight hole 22, at the end of the tube 17, so that when any object appears in the *illuminated field* its image, or at least a shadow of it, will be caught by the mariscope and seen in the sight opening 22.

As soon as they had devised a means of locating an object in the path of a vessel to be destroyed the inventors next foresaw the necessity for having some means at hand of attaining this end. They devised, therefore, a torpedo tube 23 at the bow of the vessel and adjacent to the means for locating the object. Our illustration herewith shows a torpedo being discharged. The inventors would have it understood, however, that their invention does not lie in any detail of the torpedo tube or of its location, but that any means of discharging a torpedo or other missile from the bow or from the submerged part of a vessel can be employed in connection with their means of *locating the object* to be destroyed and their invention of an electrical device for *exploding a discharged torpedo* when it hits or reaches the vicinity of the object to be destroyed.

As illustrated, the torpedo 24 has connecting wires 25 with any usual or preferred sparking device, wound into a cable 26, which is carried on a reel 27. The terminals 29 on board the vessel are connected by means of two wires with a source of supply of electricity provided with a controlling key 30. When it is seen that the torpedo is in the immediate vicinity of the submarine, mine or other object it can be immediately exploded by closing the circuit.

"We have shown our apparatus attached to the bow of a vessel," said Professor Parker, "but it is obvious that it can be applied to any other part as well, and thus provide a certain means of defense. As a means of offense the importance of the invention will be readily seen, and it will also be noticed that if several vessels equipped with the helioscope and mariscope were approaching abreast a mine field or fleet of submarines a very extensive field would be illuminated and placed under observation, so that the object of danger could easily be destroyed. Furthermore, it is apparent that where the objects of danger are readily located a surface vessel, because of its greater speed and mobility, can easily avoid such objects, even if it cannot destroy them."

ELECTRIC BRANDING IRON.

For branding hams, bacon and other packinghouse products, a new electrically heated iron has been invented, which receives its current from an ordinary lamp socket at a cost of but one-fourth of a cent an hour.

THE UNITED STATES ADVISORY BOARD AND ITS PERSONNEL.

(*Continued from page* 399.)

Society of America. He is also a member of other scientific societies, including the Aerodynamic Commission of the Aero Club of America. Besides his other numerous activities in the realm of flying machines and allied devices, he has investigated the determination of air pressure on arched surfaces, and is the inventor of a stepped aeroplane that is the lightest machine so far built, it is said.

From the realm of mining engineering the Naval Advisory Board has been happily favored with the selection of two eminent specialists nominated by the American Institute of Mining Engineers. These gentlemen are William Lawrence Saunders and Benjamin Bowditch Thayer, both of New York City. Mr. Saunders is a mining engineer of great prominence and was born in Columbus, Ga., in 1856. He graduated from the University of Pennsylvania and for some time was in charge of the hydrographic work of the National Storage Co. He is serving at this time as president of the Ingersoll-Sargeant Drill Co., the Imperial Tool Co., and the Ingersoll-Rand Co., and at one time he was editor of *The Compressed Air Magazine.* He is a specialist in the design of compressed air machinery and has invented many important devices in this field. Mr. Thayer was born in San Francisco and graduated from Harvard University. He is a well-known mining engineer and is president of the American Institute of Mining Engineers, and, industrially, he is president of the Anaconda Mining Co.

This brilliant staff of specialists includes two all-around men of science, as selected by the American Chemical Society, in the persons of Dr. Leo H. Baekeland, of Yonkers, N. Y., and Professor William R. Whitney, of Schenectady, N. Y. As a chemist of repute Dr. Baekeland is well known. He has also produced several important industrial productions based on chemical affinity. He was born at Ghent, Belgium, in 1863 and graduated from the University of Ghent, where he served later as Assistant Professor and the Associate Professor of Chemistry. He also has been Professor of Chemistry in the higher Normal School at Bruges. He is also the inventor of the well-known Velox gaslight paper so widely used by amateur and professional photographers, and besides invented the famous Bakelite used very extensively for all kinds of electrical and other insulating requirements. Professor Whitney was born at Jamestown, N. Y., in 1868 and graduated from the Massachusetts Institute of Technology, where he served afterward as Instructor, Assistant Professor and finally as Professor of Chemistry. The greatest electric corporation in the world—the General Electric Co.—now counts him as one of its most valued men, and he is the director of the research laboratory of that immense industrial and scientific organization, which has solved more problems of an electrical and other nature than probably any other industrial concern of similar age.

From the field of electro-chemistry there has been contributed to the Board two able authorities: viz., Professor Joseph William Richards, of South Bethlehem, Pa., and Lawrence Addicks, of Chrome, N. J. Professor Richards is the instructor in metallurgy and mineralogy at Lehigh University. He was born at Oldbury, England, in 1864 and his early education was obtained in the public schools of Philadelphia. He was honored with degrees from Lehigh University and later spent considerable time in advanced study at Heidelberg, Germany. Mr. Addicks is considered an authority on the metallurgy of copper, and acts in the capacity of superintendent of the plant of the United States Metal Refining Co. at Chrome, N. J. He was born at Philadelphia in 1878 and graduated from the Massachusetts Institute of Technology with the degree of Bachelor of Science in mechanical and electrical engineering. He has held important positions as consulting engineer

and is very well known in his chosen line of work as a man of great ability and resource.

HOW THE "WIRELESS WIZ" CELEBRATED XMAS.

(*Continued from page 397.*)

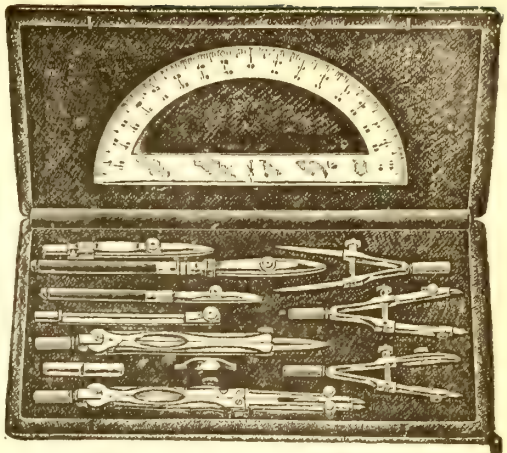
run out again should the current be fed to the third rail of the side-track. The track switch is pulled into the straightaway by operating the switch 10. The express train will then continue to run around and may be reversed and backed into its station, 'B.' The freight train can be backed off the siding by closing the switch 3, and by means of the current reverser, X^2, can be made to go around the track. It is understood that by properly manipulating these switches and working the rheostat R that some quite effective situations may be created.

"An electric whistle was mounted in one of the stations, and this was operated by a push button before the train was started.

"The electro-magnetic stops are made as depicted in sketch C, and consist merely of a bent strip of brass or small wood box supporting an electro-magnet, to which is pivoted an arm, 1, which is raised into position by the electric current in the coil, to throw the current reverser on the train in the usual manner.

"The Christmas tree was supported from the ceiling by means of a turnbuckle, and on the bottom of the trunk were mounted two large wooden pulleys, as in this figure, D. A friction drive from the motor, M, and the pulley, G, gave sufficient reduction gearing, so that the tree would run very slowly. I had concealed about two dozen tiny lamps in the foliage of the trees, which were fed through a commutator (see D), arranged as detailed, to cause the lamps to flash; furthermore, some of the trimmings were coated with calcium sulphide, which glowed in the dark after the lights were shut off.

"The second pulley, H, by means of a belt-drove pulley, I, in the reverse direction to that of the tree. The shaft of this pulley was fastened to the drum in the lighthouse, on which was mounted colored sheets of celluloid. The body of the lighthouse was made of stiff cardboard, and in the top was mounted a high candlepower tungsten lamp. The wires from this lamp and the revolving cylinder were arranged as in sketch E. The rocks scattered around the scene consisted of 'willemite' that glowed under the effects of the ultraviolet light. This light was generated by means of an arc lamp (made as in Fig. F) and hung behind the rear screen, which had a half-moon shaped hole cut in it and cheesecloth pasted over it. The sea was made of thin, blue cloth on which was laid strips of cotton batting. A rotating fan underneath the platform caused upheavals of the cloth, and the cotton rolling back and forth gave the effect of rollers breaking on the rocks. The scenery was made from ordinary sheets, and the mountains, etc., marked in with charcoal."



"I suppose you used the old scheme of the microphone to open the doors," I broke in.

"Yes," he replied, "the same old thing, except that the relay, after once closing, kept the contacts closed and supplied current to the motor until the door was fully opened, when the circuit was broken by means of two springs; here's the hook-up. I'll mark it Fig. G."

"Well, I'll never forget that scene," I remarked as I was leaving.

"Yes, and I'll never forget the job I'll have in cleaning up in time for the New Year's party," grunted the "Wiz."

Free!

Complete Set of Drawing Instruments

YES, I will give you this complete set of drawing instrutments absolutely free. They are regular working instruments—the kind I use myself and they do not cost you a penny. And besides the instruments in this exquisite plush lined leather case, I will give you absolutely free a 20x25 inch drawing board, a 24 inch T-square, a 12 in rule, a supply of drawing paper, two triangles, a French curve, pencils, erasers, thumb tacks, etc., etc. A complete draftsman's working outfit. And I give it to the men who get my personal instruction absolutely free.

Be a Draftsman!

Draw $125.00 to $175.00 Per Month

There is an urgent demand for skilled draftsmen. Companies are issuing calls every day for men to fill positions paying from $125.00 to $175.00 per month. Work is light, pleasant and profitable.

Chief Draftsman Will Instruct You Personally

Pay as You Wish!

WHAT I want is the *right kind* of men. Don't bother about the expense. I charge a very small fee for training you to be an experienced draftsman. You can pay the small cost as suits you best. My object is to develop expert draftsmen.

I am Chief Draftsman of a large and well known firm. I have been doing the highest paying expert drafting work for a quarter of a century and I know the kind of training that is demanded from the men who get the big salaries. I will give you personal instruction, deal individually with you and give you up-to-date, practical working plans just as your ability and advancement require. I train you by giving you actual work—practical work, the kind that you must be able to do in order to hold permanent, big paying positions. I will give you my indivdual instruction. If your work is right, I will advance you rapidly. If it is wrong, I will show you where, and make you do it right, and do all I can to make you an expert draftsman and designer in a short time. *Write today without fail.*

Send Coupon For My Big New Book

Put your name and address on the free coupon or a letter or a post card and send it to me today. I will send you absolutely free and prepaid my new book "Successful Draftsmanship," and the great special offer that I am now making on which you get the $15.00 Draftsman's Working Outfit absolutely free. You assume no obligations of any kind in sending in the coupon. Get in line now for a big paying position. Getting the book and full particulars of the special offer is the first step.

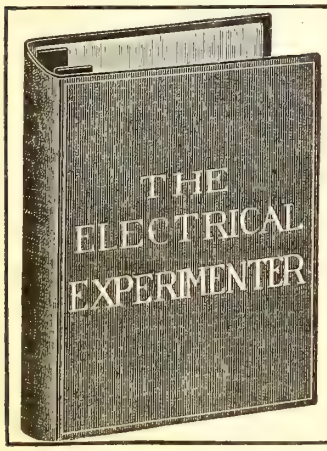
WIRELESS TOP FOR AN AUTOMOBILE.

A report from Belgium tells of the most extraordinary use of an automobile top. It seems that a British patrol succeeded in capturing a German touring car in which two officers were seated. The motor had broken down, and the officers were made prisoners.



In glancing over the car one of the patrol noticed a wire connection to the metallic "skeleton" of the raised top. Following the wire, he pulled from under the seat a telephone receiver, and holding it to his ear was dumfounded when he could plainly hear a message coming from nowhere in particular.

The top skeleton formed the receiving wires of a wireless station, and the message came from the nearest headquarters of the army corps to which the officers belonged.

The companies constructing the new steel barges that will ply the Mississippi River use electricity to insure absolute safety from fire for their cotton and other inflammable cargoes. Electric energy is now used to operate the motor-driven cranes for loading and discharging cargoes and for cooking and heating in the officers' and crews' cabins.

Dyke's Book—FREE interesting, instructive—tells you how to learn AUTO TRADE, how to become a chauffeur and repairman.—SEND FOR IT—To-day—Now! A. L. DYKE, 32 Roe Bldg. St. Louis, Mo.

ACCEPT THIS BOOK FREE

IT'S INVALUABLE YET CAN'T BE BOUGHT

Just as you will receive it, cloth bound, size 7 x 10¼ ins., 160 pages, 20 lessons, 350 illus., 30 tables, with every bit of information on Wireless you can possibly want, besides valuable information on Electricity, Magnetism and Theory of them —**and it's FREE as explained.**

Will you take a 20 lesson Wireless Course absolutely FREE—even postage charge prepaid?

A course that tells you everything you can possibly want to know about "Wireless" starting off in Lesson No. 1 by explaining the Principles of Electricity. The Second and Third Lessons are devoted to magnetism, motors; generators and wiring. And then, by simple easy stages this wonderful Course takes you into "Wireless." The mysteries of "Wireless" are unfolded to you by the use of such simple language so skillfully used, that of necessity you must understand every word. The subject is not treated superficially, however, for there is a whole lesson devoted to the Theory and Mathematics of this epoch marking subject. To lend charm to the Course, the last Lesson (No. 20) is devoted to a history of Wireless and the men who developed it. The wireless course positively cannot be bought, but will be sent absolutely free with a full year's subscription (12 numbers) of the Electrical Experimenter at $1.00. It's the biggest dollar's worth you can ever buy anywhere at any time. Send for it to-day enclosing $1.00. Send now before you forget. The coupon below is a convenient way. **But do it now!**

SEEING A BASEBALL GAME BY WIRE.

(*Continued from page* 400.)

produced that the spectator really thinks he is at the actual field. Every movement made at the regular ball ground is shown instantaneously at the miniature one here shown. This is accomplished by means of an operator situated on the field, who telegraphs each movement that occurs on the whole field; even if the players are practising or the mascot lifting the bat off the ground, etc. All this is carefully and exactly shown on the screen.

The entire scheme is based on the reversed motion picture theory; instead of the film moving from one reel to another in front of a light, the light moves behind a fixed transparent film. This film or transparent screen, to be more exact, is a solid mass of miniature baseball figures, anyone of which becomes animated with the switching on of an electric light in the rear. Each figure is carefully concealed in a light-tight box, and when a play is about to be enacted, the operator moves his light along a line of the figures, each becoming successively illuminated and instilled with life in due course.

The players run bases, sliding head or feet first, jump into the air for the ball and in exactly the same way as the player does in real life. Also, as the photograph shows, a miniature bleacher crowd is placed in front of the screen, and at either side of same are mounted complete score boards, which give the names of the players, their position on the team, the "runs," "hits" and "errors." "Outs," "balls" and "strikes" are duly recorded instantly by electric bulbs, placed alongside these terms, and which appear in the illustration.

This wondrful device is the outcome of three years of continuous labor and ingenuity on the part of George S. Coleman. Photograph by courtesy of I. Stein, of Life-Like Baseball Player Co.

WITH THE AD MAN.

The service as rendered by some magazines to their readers is something like "clam digging," which is "neither fishing nor farming," and always hard to define. The new service we are trying to give to readers of the *Electrical Experimenter* will not be an indefinite something, but always definite, and really valuable.

How many times have you wanted to make some particular article or piece of apparatus, and found when one-half completed you were unable to obtain some part or material which was absolutely essential? Most frequently, when that happened, you had to let matters rest, until by accident or by long search you located the manufacturer or dealer of the article you wanted.

With our wonderfully large research facilities we can almost always place you in immediate touch with the manufacturer or dealer of just the article you want.

This service will be free of charge to you, and we know you will appreciate it.

Address your letter to the Advertising Dept., and I will see that every endeavor is made to supply you with the information you desire. MILTON HYMES.

"Superior" Type Brandes Head Set. Price, complete with german silver headband, $5.

Brandes Trans-Atlantic Type Receiver (price $9) is Used in the Eiffel Tower Station, Paris.

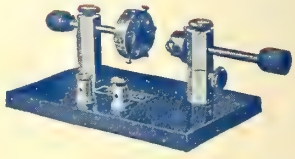
You Can Use It Longer at A Time

IT is so light and permits such perfect adjustment that it doesn't tire you by slipping or pinching. Rests almost as lightly on your head as a hat.

Yet it is *rigid*. Won't work loose right in the middle of a word. Once adjusted to your comfort, there it stays.

Furthermore, a Brandes Head Set is easier on your ears, because both receivers are toned exactly alike, thus making the sound more distinct, and enabling you to pick up the faint, hard-to-get signals.

No other receiver at the price can compare with our Superior Type in efficiency. It is a genuine *wireless* receiver, not a modified *telephone* receiver. Try one. If not fully satisfied, your money will be returned. Prices, $5 to $13



Send 4c. for Catalog E, a book which gives wireless information, valuable to both amateur and professional.

DUCK'S NEW BIG No. 9 320-PAGE ELECTRICAL and WIRELESS CATALOG

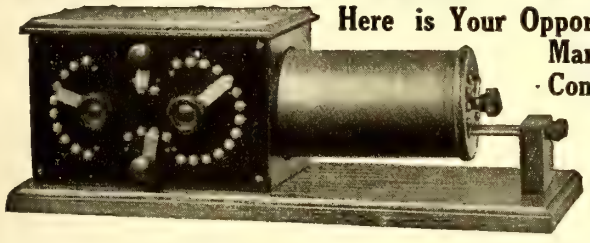
MORE THAN EVER JUSTIFIES YOUR VERDICT
THAT IT IS THE *ONE* CATALOG WORTH WHILE

Everything Electrical
FOR THE BOY—HOME OR STORE

ONLY 8c. in stamps will bring this unrivalled catalog to your home. The great cost of catalog and the exceptionally low prices (oftentimes fully 25% below usual retail price) prohibits its distribution otherwise. You may deduct the 8c. on first dollar purchase.

Our records show that 70% of our catalogs produce us patrons. Many of our competitors admit the waste of 90% of their catalogs. Who pays for them? This is the big, controlling reason why you should have our catalog, backed by a great selling and purchasing power, before even thinking of buying elsewhere.

Over 40 New Pages of Wireless Instruments



and substantial reductions on many popular wireless instruments and standard electrical supplies.

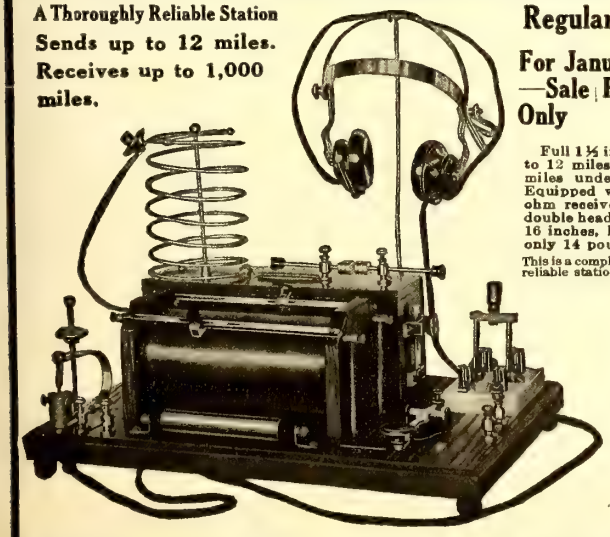
A FEW OF THE ARTICLES IN OUR CATALOG:

129 pp. Wireless Instruments (129 pages) magnet wire of all kinds, raw material, storage batteries, telegraph instruments, battery motors, commercial motors and generators, sewing machine motors, telephones, step-down transformers, massage vibrators, bells, push buttons, auto accessories, flash lights, hand lanterns, auto and miniature lamps, Xmas tree outfits, voltmeters, ammeters, lighting plants, Victrolas, air rifles, electric aeroplanes, model builders, electric railways, electrical and mechanical books and general electrical supplies.

The William B. Duck Co., 230-232 SUPERIOR ST. TOLEDO, OHIO

WIRELESS BARGAINS SAVE 25% IF YOU ACT NOW

Here is Your Opportunity to Secure the Best Navy Type Loose Coupler on the Market. Regular Price - - - - - - $15.00 $10.00
Continued for January—Reduced Sale Price - - -



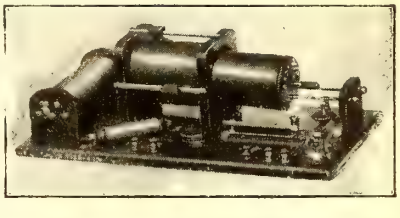
A brass lacquered 6,000 meter inductance tuner, perfect in every detail. Equipped with four point loading inductance which increases the wave length 4,000 meters over the average Navy Type Transformers. The primary winding has 24 taps—one switch controls the primary in groups of tens, the other controls one turn at a time—and is equipped with a dead end switch. Enclosed in a cabinet, the front of which is polished hard rubber. The secondary coil is wound with double silk covered wire and the inductance is varied by a ten point switch. With this coupler the very finest and most accurate tuning is easily and quickly secured. With a good sized aerial the reception of wave lengths up to 6,000 meters is possible.

All Finished Parts Ready For Assembling With Full Instructions, Special $6.50

Our No. 810 Complete Sending and Receiving Station

A Thoroughly Reliable Station
Sends up to 12 miles.
Receives up to 1,000 miles.

Regular Price $20.00
For January —Sale Price Only $14.00



Full 1½ inch coil type. Sends up to 12 miles. Receives up to 1,000 miles under favorable conditions. Equipped with 2 double pole 1,000 ohm receivers, 6 feet silk cord and double headband. Size of base 12 x 16 inches, height 13 inches, weight only 14 pounds.

This is a completely equipped and thoroughly reliable station, mechanically and electrically perfect and ready for instant service. Nothing better in this class was ever constructed. The new improved tuning coil enables you to tune in or tune out any party you might desire, thus eliminating any interference. The set consists of a 1½ in. Spark Coil, 12 Flat Plate Condensers, our "Don't Jar Out" Detector, Buzzer and Switch to tell if your detector is working, Double Slide Silk Wire Wound Tuner for long wave station capacity, Fixed Condenser, Helix, Key, DPDT Switch and complete 2,000 Ohm Headset.

Receive The Time From Arlington

AND ALL NEWSPAPER AND SHIP REPORTS
OUR SPECIAL TIME SIGNAL RECEIVING OUTFIT
REGULAR PRICE $10.85—SALE PRICE **$8.10**

This is our new 1915 model made of the highest grade material obtainable. Double slide coupler for close tuning is wound with No. 24 green silk covered wire on the primary — the secondary with No. 28. There are 8 points to divide its capacity. A 3,000-metre loading coil placed between the coupler and the aerial by a switch that throws it in or out of the circuit enables you to receive amateurs with the coupler alone and long wave stations by the addition of the loading coil. One fixed condenser of proper capacity, improved universal detector, one buzzer test to test your mineral and potentiometer. This instrument is assembled on a highly finished oak base. All metal parts are heavy nickel-plated.

This station, with our Navy Type Loose Coupler, as illustrated above. **$15.00**

Multi=Audi=Fone

The new wonder in the wireless world. It increases the Audibility 1,500 Times

Are you from MISSOURI? Then read these LETTERS

F. B. Chambers & Co., Wireless Engineers, 2046 Arch St., Philadelphia, Pa., write:

"On Tuesday evening we gave a demonstration of the Multi-Audi-Fone, to about 300 men; technical and experimenters.

"The hall in which the demonstration was held is about 75 x 150 feet and the signals from all stations—working at the time—could be heard all over the hall; and the louder ones could be heard in another room, back of the main hall. Even the Amateurs came in 'howling,' and the aerial used was only 3 wires and about 40 feet high.

"Everyone was more than surprised at the results, and believe us when we say—that it surely was some amplifying; *and there is nothing that can anywhere near touch the Multi-Audi-Fone.*"

Jeffries-Young Antenna Co., of Atlantic City, N. J., write:

"The Amplifier and Multum in Parvo Set received from you are giving wonderful results, and come up to the mark on every claim made. The Arlington Signals before audible with the Phones 12 inches away, can now be copied in nearly every room in our house, on St. Charles Place, where our winter station is located."

W. O. Horner, of Cleveland, Tennessee, says:

"I have been trying your Multi-Audi-Fone out as an Amplifier. . . . I was more than surprised at its sensitiveness. . . . It is certainly wonderful."

Again he writes: "Yours of the 28th at hand. I use a Triple Valve Station of highest class and thought I had the best on the market but when I hooked your Multi-Audi-Fone to the third Audion I was astonished at its Amplification.

"I laid your Phones on the table and walked 125 feet to the rear of my store and copied Arlington and Key West at 9:30 P. M. Many 600 Meter stations I also copied at this same distance. *I also hooked your Multi-Audi-Fone to a single Audion and signals were much louder than all three of my Amplifiers.*"

S. Kruse, of Halstead, Kansas, writes: **"Multum in Parvo is a wonder."**

M. B. Schwartz, of Brooklyn, N. Y., writes:

"With regard to results obtained on connecting the Multi-Audi-Fone in my Radio receiving set as an Amplifier, I am glad to say that I was astonished by the roaring and whistling of myriads of stations, near and far, many of which I never heard before; the small amateur stations coming in so loud that they were heard all over the room—it was like opening up a new region, fertile with activity and life, heretofore unknown. It may also probably be of interest to you to know that I heard the SS. Brazos every evening from the time she left San Juan, P. R., Oct. 20, until she reached New York, during the run she came in with remarkable audibility.

"The above is precisely what happened after including the Multi-Audi-Fone. Signals were heard all over the house for a distance of from 50 to 100 feet from Phones."

F. S. Hammond, of St. Marys, Pa., writes:

"With Amplifier, my Tuner Galena and small horn attached to one of your Phones, Arlington can exactly be read in any part of the room. Substituting Audion for Galena nearly doubles strength of signals, making them readable in hall downstairs."

Glenn Sabin & Co., Wireless Engineers, of Northampton, Mass., write:

"We have demonstrated your Multi-Audi-Fone to a number of experimenters and the results were surprisingly satisfactory.

"We have picked up stations with a single Multi-Audi-Fone, coupled to a single Audion, which we have been unable to get with a double Audion."

"*For getting Arlington time there is nothing that can touch it.*"

"On our aerial we can pick up fellows fifty and sixty miles away operating on half and three-quarter inch spark coils, which is excellent work to say the least and proves without a doubt that the Multi-Audi-Fone is an Amplifier that cannot be beaten."

WE GUARANTEE the Multi-Audi-Fone for THREE YEARS

With fair treatment it ought to last one hundred years

REMEMBER THESE FACTS

that the Multi-Audi-Fone works equally well with damped and undamped circuits and will work equally well with any Detector or Receiving Set, and that it will not cost you more for batteries than.....

TEN CENTS A MONTH

Our regular orders have already increased to such an extent that we are now compelled to withdraw our ten-day trial offer

Everybody will EVENTUALLY buy a Multi-Audi-Fone

Why don't you buy yours now and GET THE PLEASURE OUT OF IT?

Multum in Parvo Receiver, including Crystaloi Detector and Buzzer.....$20.00
If you prefer to use your own Detector and not buy the Crystaloi and Buzzer..... 15.00
Multi-Audi-Fone, including our specially wound Head Set..... 30.00

The Collapse of the Submarine War

IN our July issue we stated editorially: "In analyzing past and present means of warfare, we invariably find that it is possible to combat weapon by weapon." After a brief statement showing how at that time the submarine could not be combated with existing means, we continued: "Our imagination need not be stretched unduly to presume that electricity will, in the not too distant future, be employed to render the submarine harmless."

Within less than six months this prophecy has come true, as was to be expected. When Germany declared her historic submarine war against England in February, 1915, things looked indeed black for the British Admiralty as well as for British shippers. Germany, as usual, struck swiftly and with terrifying results. In February her submarines sank 8 vessels. In March, 32 vessels were sent to the bottom, while in April, 21 fell prey to this modern electric monster of the deep.

Thus, from February till August 30 altogether, 197 ships had been sunk at various points around the British Isles. Then suddenly, as if by magic, the sinking of ships by submarines stopped. Indeed, during the entire period from September 1, 1915, until December 1, 1915, only 33 ships had been sunk by German submarines. (The last figure also includes ships sunk by the Austrians in the Mediterranean, as well as small fishing craft.)

Although we know that a great many German submarines were sunk by England and France during the submarine war, it is certain that Germany has more undersea craft to-day than at the start, for submarines are relatively cheap, and can be built quickly if necessary. Nevertheless, as each week passes, fewer and fewer ships are reported sunk, and the day is not far off when German submarines will cease to exist altogether as far as England or France are concerned.

Once more science—and particularly electricity—has triumphed; a silent, but nevertheless a remarkable triumph of mind over matter. War is no longer man against man, brain against brain; it is machine against machine, science against science. England and France have a number of efficient schemes to-day with which they combat the submarine with electricity, either directly or indirectly, and although this particular branch of science is less than six months old, the results have been more than encouraging to these countries. One of the schemes in use, said to give entire satisfaction, is described in this issue of the *Electrical Experimenter*. Various other schemes using super-sensitive microphones under water have been reported from time to time, and we are informed that England has lately equipped all her war vessels with an electrical device which not only detects submarines, but their exact location as well. This device, so far, has been carefully kept secret, as is only natural.

Thus the battleship has come into its own again, instead of going to the scrap heap, as was feared in some quarters when the submarine war was at its height. The submarine, on the other hand, has been relegated to its former station, that of a defensive weapon, for which it is admirably suited, not for offensive purposes.

While Austria has been busy of late sinking a few ships in the Mediterranean, we can safely predict, that as soon as France and Italy have equipped their shores and their ships in the same manner as has been done in the Channel and in the North Sea, these submarines also will be reduced to impotence.

H. GERNSBACK.

THE ELECTRICAL EXPERIMENTER is published on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. The subscription price is $1.00 a year in U. S. and possessions. Canada and foreign countries, $1.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 10 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of THE EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. *A green wrapper indicates expiration.*

Vol. III. Whole No. 33 JANUARY, 1916 Number 9

Electrical Device Detects Submarines 20 Miles Away

THE long sought for solution of the submarine detection problem has apparently arrived in the form of a specially tuned microphonic device which is placed below the surface of the water along the coast line, and in the following paragraphs the general principles utilized in exactly detecting and locating the position of a submarine, when it is totally submerged, are explained.

The American electrical engineer, William Dubilier, recently returned from France, has developed this "submarine detector" to a high degree, and in his research work he had the co-operation of Prof. Tissot, the noted French scientist. A properly designed microphone or sound-operated instrument, which will translate sound energy into a corresponding electrical current, forms the nucleus of this remarkable invention which, it is said, has aided in doing away with a formidable number of German "U" boats around the French and English coasts. When sound waves impinge against the diaphragm of a microphone (which corresponds in general to that fitted on an ordinary telephone apparatus with which we are all familiar), it causes a variation of the inherent electrical resistance of this instrument, owing to the different pressures exerted against a number of small carbon balls, placed in a cup back of the diaphragm.

Contrary to the general opinion which might prevail in such a case, it is not the sound of the propellers or the engines of the submarine that are heard best, according to Mr. Dubilier, but the high humming note produced by the electrical motors utilized in propelling the submarine when submerged beneath the surface of the sea. Thus a most important point is gained, for if it were the former which emitted the sound waves used for the successful operation of this latest scientific device, the possibilities are that very little success would be attained, as the engines are not used except when cruising on the surface. It has been found that if the microphone is placed in a properly tuned resonance chamber, located about 20 feet below the surface of the water at the shore testing station, this particular humming note reverberated by the entire metallic shell of the submarine, can be selected and then intensified by means of suitable amplifiers, such as the well-known Audion type, developed by Dr. Lee de Forest.

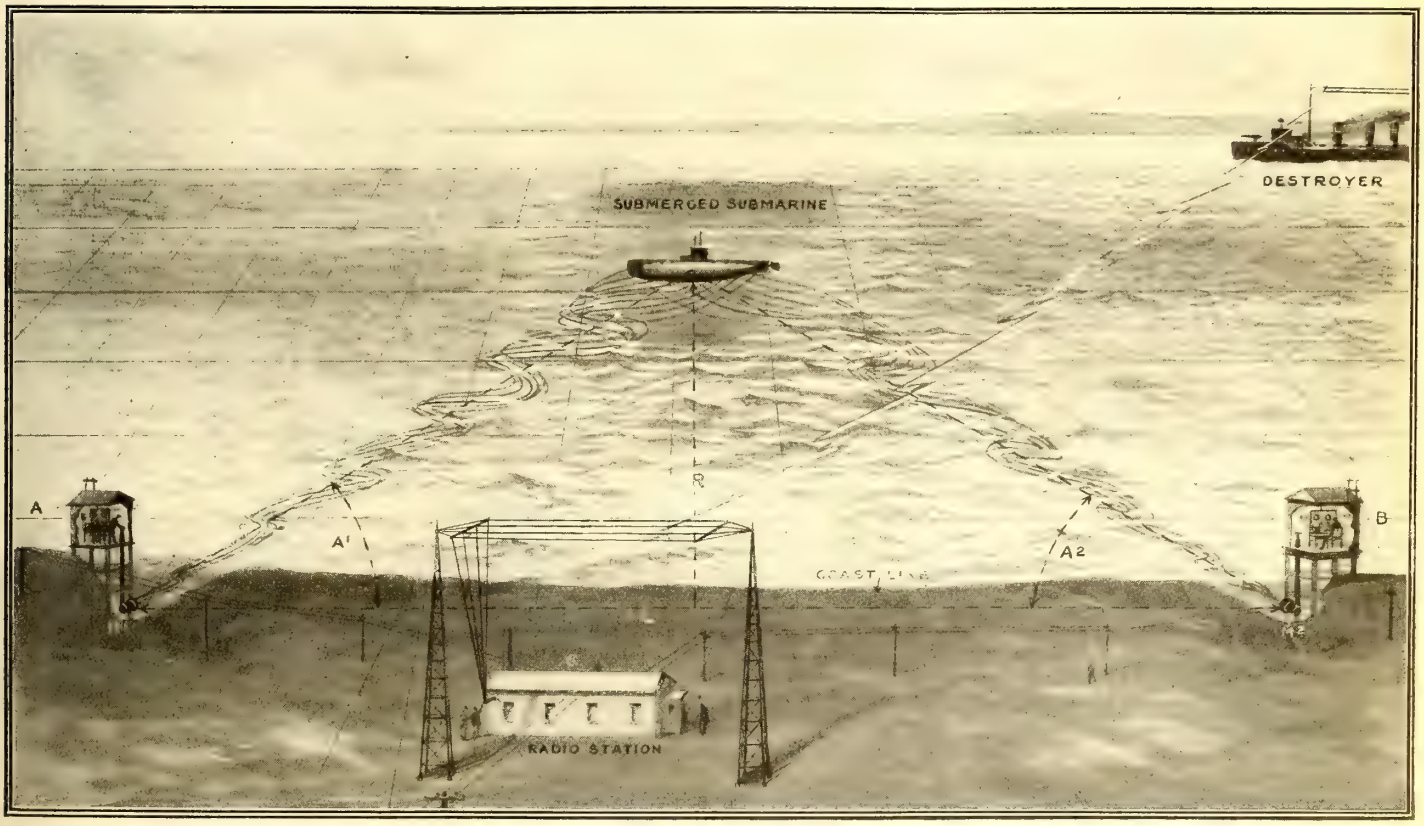

Fig. 1. Diagram Showing How Science Now Locates Submarines, Even When Submerged, by Means of Sensitive Electrical Ears That Pick Up the Peculiar Note They Emit.

This particular note, so effective in the successful operation of Mr. Dubilier's instrument, has been found to have a frequency period of about 750 cycles per second. The illustration herewith shows the inventor of this clever scheme for detecting submarines, holding one of the super-sensitive microphones, and, also Fig. 2, shows a detail photograph of the microphone proper. Several methods for filtering out the extraneous sound waves trans

mitted by passing steamers and the like were successively tried out, but the best method of all was ascertained to be the one embodying the use of resonance tubes, incorporated in the shell containing the submerged microphone. In this way it was found possible to closely tune the micro-

William Dubilier, the American Engineer, Has Perfected for the Allies a Successful Submarine Detector. He is Here Observed Holding the Super-Sensitive Microphone Used.

phone chamber, so that it would respond to the vibrations of the order above mentioned only, or to any desired harmonic of this frequency. These have proven very successful and are now being used by all submarine detecting stations located on the English and French coasts.

The resonance chamber, tunable to any desired musical note frequency, and in which the microphone proper is placed, is shown in Fig. 3. This consists of a stout outer steel chamber A, in front of which is placed a metal diaphragm B. Even at a very little submerged depth the water pressure against the diaphragm is severe indeed, and to counteract this, compressed air is fed into the chamber A, to offset this water pressure on the exterior casing. The diaphragm B is rigidly supported in the heavy outer chamber, which is pivotly mounted on the directing rod, as observed. There

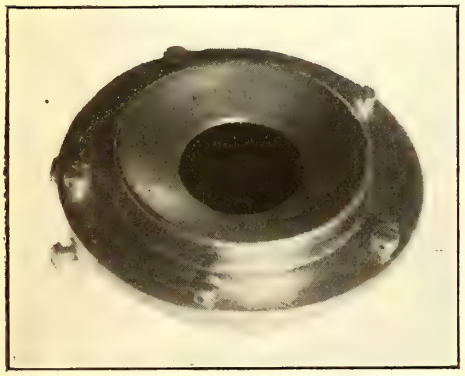

Fig. 2. Appearance of Sound Detecting Microphone Which, Submerged in the Waters Along the Shore, Indicates the Presence of Undersea Craft.

is carefully fastened to this a steel resonance tube, which consists of two distinct tubes, one sliding within the other so that it may be adjusted for any note desired. Both of these tubes have diaphragms in them, as perceived from the sketch, and in the same way as an organ pipe vibrates at different frequencies, depending upon its length; so this resonance tube vibrates to some particular note, depending upon how far apart the diaphragms in same are situated. Hence this remarkable device will not only respond to one particular note accurately, but it will, owing to the phenomenon of resonance, respond with maximum efficiency to that note, and in this way the microphone is affected in the most powerful manner possible for any given signal or sound wave. Flexible and heavily insulated wires lead up from the microphone to the operator in the detecting station, located on the ground above. In this station is located the Audion amplifier apparatus, as well as the telephonic and telegraphic instruments for communication with the wireless station and with the second detection station.

The large illustration, Fig. 1, here portrayed, gives a general layout of the scheme, as it is applied in practice. As observed, a submerged submarine is seen progressing from right to left across the view. Of course, if the submarine should stop its propellers and likewise its motors or engines, and submerge to the bed of the ocean, or bay, no sound would be heard. But, on the other hand, it could not very well start up the propellers and get away without being at once detected by the observers stationed at the various shore stations. The underlying principle governing the detection and accurate location of a submerged submarine is based on the same methods as used in modern long distance gun sighting. Let us assume two detecting stations at A and B, respectively, and at a certain known distance apart, as indicated by the line L. Also that these stations are telegraphically or telephonically in communication with a wireless station C, as well as with each other. Now when the operator located at station B rotates his submerged microphone by means of a suitable shaft and gear arrangement, etc., until the incoming submarine note is heard loudest (or, as a matter of fact, as soon as he hears the note at all), he immediately notifies the operator at station A of this fact. Operator A then endeavors to tune in the submarine's note to a maximum value, and when both A and B have their instruments so set that the note is heard at maximum strength, then the angles A_1 and A_2 are definitely known from the calibrated dials fitted to the microphone controlling shafts. It is now a simple matter to make the calculation (usually by means of a slide rule, specially constructed), to find the exact range or distance R, between the submarine and the base line L.

Also to facilitate matters in this respect, the water is definitely laid out in squares, as indicated by the lines in the drawing. These lines, of course, are only imaginary, but they are exactly plotted on the maps used by the military authorities in charge. All these squares are numbered and, therefore, it is an easy matter to give explicit directions through the wireless station C, to a waiting torpedo boat destroyer so that this terror of the submarines may proceed quickly to the exact square in which the submarine is to be found. The under-water craft may be moving into a second or third square from that first communicated to the commander of the torpedo boat destroyer, but that is a small matter and is checked up constantly by A and B and then transmitted to the commander through the wireless station; thus keeping him acquainted with the definite whereabouts of the under-sea boat every few minutes.

In most cases the submarine, after a short while, comes to the surface to make observations, as otherwise it is running blind so far as events above the surface of the water are concerned. In a remarkable number of instances this method has worked, it is said, with wonderful success, and as soon as the submarine came to the surface, it took but a few moments to either destroy or capture it by means of the destroyer, which was on the spot at the instant the submarine shoved its periscope above the surface of the sea.

So we see that while the submarine has been developed to a wonderful degree, in so far as range and other features are concerned, there has been devised by scientists a method to counteract their efficiency. In less time than it takes to tell, a torpedo boat destroyer may be despatched to the exact spot where the submarine is so peacefully pursuing its way and, as it supposes, unseen and unknown.

Or, again, it is possible to send an aeroplane to the scene, equipped with powerful explosive bombs. On the latest type of these aerial bombs, designed for the destruction of submarines when under water, there is provided fluted tails which cause them to go straight down into the water for a considerable distance without deviating from the point originally aimed at. The aeroplane has proven one of the best detectors of submarines when it happens to be known where the submarine is located. Although not generally known, it has been definitely proven that the observer in the aeroplane flying at a considerable distance above the water, and regardless

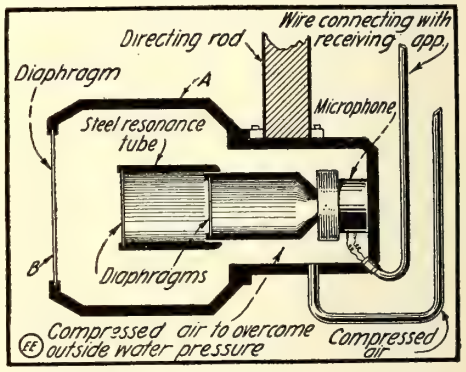

Fig. 3. Details of Specially Contrived "Resonance Tubes" and Microphone Arranged in Stout Water-proof Shell.

of the wave formation on the surface, can detect accurately the presence of a submarine even though submerged 75 to 100 feet below the surface.

It may be said in conclusion that these marvelous submarine detectors have not proven satisfactory for use on ship-board, but this point will probably be overcome in the near future. This is accounted for by the noise and severe vibration encountered on the vessel itself on which such apparatus has been installed. However, it has proven a Godsend to those responsible for the protection of the water adjacent to the English and French coasts, and it is hoped that the United States Government will not be dilatory in recognizing the merits of this most ingenious device which has been the goal of many hard-working engineers and scientists in the United States and abroad for a number of years.

Wellesley College girls will eat electrically prepared food in their new central dormitory. The new wing is equipped with a special three-oven 12-foot range and a bake oven with a capacity of 90 one-pound loaves. The equipment will serve 250 students and help.

New Instrument Eliminates Fog Peril

NAVIGATORS before long may find fog robbed of its terrors through a device invented by Dr. A. G. Webster, of Clark University, Worcester, Mass., for showing the direction of signals, which he demonstrated recently at the final autumn session of the National Academy of Sciences held in the American Museum of Natural History at New York. The apparatus, which he calls a "phonometer," translates the intensity of sound into terms of light or intensified sound, as by ringing a bell, so that, as the inventor expressed it, the deaf may see and the blind may hear it.

Impressed with the loss of the steamship "Empress of Ireland" in 1914, he went to Father Point, on the St. Lawrence, where the vessel was sunk in collision and 1,200 perished, and there made the experiments on which his invention is based.

In a thick fog, when two vessels are approaching each other, it is often impossible for the captains to tell within 45 degrees the direction of the sounds from horns. In the St. Lawrence disaster the masters of both vessels should have stopped, in his opinion, in view of the uncertainty of determining the direction of signals in fog.

First Professor Webster showed a resonator or "phone" which took up the vibrations of a tuning fork and emitted a sound of standard pitch. This instrument took the place of a regular fog signal. The receiving instrument, or phonometer, looked like a small round box on a tripod, and from each end of the box projected a conical horn resembling a megaphone. The small ends of the horns were turned toward each other.

Remarkable Scientific Visual Fog Signal Receiver Devised by Dr. A. G. Webster, of Clark University. Insert Cut at Left Shows Details of Receiver Mechanism.

The device is placed so that the horns are at right angles with the course of the vessel on which it is installed, as seen in our illustration. The vibration caused by the signal is concentrated by the horns and communicated to a metal diaphragm, which is held in place by small steel wires. The pulsation goes to a tiny electric light, and the effect upon it is registered by the reflections of a mirror on a scale which can be read through a glass attached to the instrument (see detail insert cut). The scale shows the intensity of the sound as the image of the light widens or contracts. The horns swing easily upon a pivot (readily controlled from the ship's bridge by an electric controller as depicted, hooked up with a small electric motor geared to the rotatable horn chamber mounted on the mast). When they have been so adjusted by the operator that they show the greatest intensity, the tube of the instrument is pointing in the direction from which the signal is being sounded.

With the phonometer, although it is not absolutely accurate in its present stage, Dr. Webster declares that the direction can be determined within a very few degrees. Experts who witnessed the demonstration said that if the device could show within five to 10 degrees it would be of incalculable value.

The inventor himself saw a practical objection to the device in that to have it of universal use the navigation laws would have to be changed so as to prescribe that all fog horns and sirens be of the same pitch. As at present the actual variation of horns is within an octave or an octave and a half, he does not regard this objection as insuperable. He thinks that the Government of the United States would be well within its rights in standardizing fog horns. It would be too much to expect the masters of vessels to tune up their phonometers to correspond with the timbre of every new siren. In connection with wireless messages, it is believed that the phonometer would be of value, for ships approaching each other could communicate details about the fog horns employed as a further guide.

Dr. A. A. Michelson, of the University of Chicago, said: "I cannot withhold my admiration. This paper marks a most notable advance in the effort to solve a problem of the greatest interest. It seems to me that Dr. Webster has brought to a brilliantly successful conclusion this important research."

It seems that an important function of this phonometer would be in discovering and locating the whereabouts of icebergs. This could be accomplished by sending out a siren note so that it would be reflected, in the form of an echo, from the iceberg. By measuring the reflection angle at two different points, say at either end of the ship, it would be possible to quickly calculate the distance at which the iceberg was situated. This follows the same practise used in getting the range for big guns.

DRIVES AIRSHIP BY WIRELESS.

The invention of a German engineer, Herr Bohle, which he demonstrates nightly in a large vaudeville house of Berlin, is attracting considerable attention. The invention consists of an airship in miniature (about 3 meters long and 1½ meters in diameter), which the inventor drives by means of wireless electric currents from a battery stationed afar. No personnel is required to drive this airship, which executes every maneuver the inventor desires. Even explosives can be dropped from this airship on high at the will of its master at his station below, it is claimed.

Expert engineers declare that the great question is whether this airship can be constructed on a larger scale and managed from a greater distance. If so, another upheaval in military warfare may be expected.

ELECTRIC COMPASSES ON AMERICAN BATTLESHIPS.

Motor-driven gyroscopic compasses have now been installed on 20 United States battleships, one armored cruiser and 15 submarines. Master compasses in duplicate are soon to be placed on all battleships of the Delaware and later classes. The Bureau of Navigation maintains with the Atlantic fleet two chief gunners who have been specially trained as gyro-compass experts, and it is the duty of these men to inspect and adjust the compasses and to give instructions in their use. Special attention is also given to the instruction of officers and men in the care and use of the compasses, the ship's crews who have to do with these compasses being sent to the New York Navy Yard or the works of the manufacturer for 30 days' instruction.

High Voltage Switch Arcs That Resemble Lightning

THE spectacular set of photographs on the opposite page are not those of lightning discharges, although they very much resemble them indeed. They happen to be the arcs occasioned when opening high tension transmission lines with air-break switches.

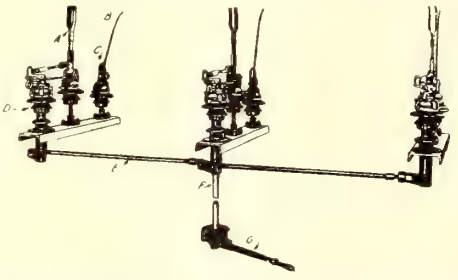
These photographs were taken during night tests made on the efficiency of air-break switches for high tension transmission lines at the Virginian Power Co.'s generating plant at Gainesville, Ga. Oscillograph records were also made to show the fluctuation of the currents on the lines due to the heavy arcs formed when these swtiches were suddenly opened. The tests covered the performance with lines carrying actual energy loads of considerable amperage and, also, with simply a charging current load, which latter reached a value of 22 amperes on the average, with a leading power factor.

Referring now to the illustrations here shown of the arcs created when opening some of these air-break switches, the upper left view shows the spectacular effect due to breaking a line of 50,000 volts potential and 18 amperes of current. Note the wavy formation of the flaming arc produced. It is certain death to be within sparking distance of such a discharge. It lasts usually only a fraction of a minute, or until it has opened the circuit.

The top central photo shows the appearance of the arc when the switch is opened on a 114,000 volt, 27.5 ampere line. Particular attention is called to this excellent picture with respect to the ladder seen in same, and some idea as to the size of the discharge or flame may be thus obtained. This particular flame discharge was over 20 feet high! The ladder is a regular standard size one. The arcs blew downward, then between the phases, with loud reports and also overlapped the overhanging leads. Considerable heat usually accompanies these arcs in air.

The illustration in the upper right corner portrays the arc effect taking place when a 64,000-volt line, carrying 18 amperes, is suddenly disrupted with an air-break switch. Here the arcs were almost perfectly straight between the switch blade and horn, and measured about six feet long. Note the beautiful curved shape of the arcs. The horn wires of the air-break switches are clearly observed.

The lower left view is that of the arc occurring when opening a 111,000-volt line carrying 26.8 amperes. Here the arcs measured about 12 feet long and they tended to hold to the lower part of the blade, breaking before rising along the horns. A particularly fierce and hot arc formed here, and attention is called to the wavy ribbon-like effect developed at the upper end of the flames.



The lower central illustration is that of the air-break switch arc on a 76,000-volt, 21-ampere transmission line. A slight wind was blowing at the time this switch was opened and tended to blow the arcs sidewise. The arcs proper measured about eight feet long, but finally broke all right in a short time. The discharges are more concentrated, apparently, but evinced the same persistency in hanging on as those previously cited.

The final photo, shown in the lower right corner of the group, depicts the performance of one of these switches on a 118,000-volt line with a 21-ampere load. The arcs in this case were very long, but rapidly rose up the diverging horns, and thus got out of the way of the framework and finally broke all right. Note the great spread of the arc flame at the extreme right of this view. The diverging horns of these air-break switches are supposed to cause the arcs to rise quickly and thus lengthen out and become broken finally, but in some instances this action does not take place as per schedule, giving rise to some of the spectacular arcs here portrayed.

These tests were conducted for the purpose of determining the effect on the transmission lines of breaking the circuit with air-break switches, as compared with oil switches, and for the purpose of determining the arcing characteristics of the three different type switches tested.

None of the switches were sufficiently spaced, and the tests proved the minimum distance between phases recommended for 44,000 volts should be at least seven feet. As constructed for these tests one switch was spaced six feet between phases and the others only four feet.

It was found that extremely high winds of about 50 miles per hour velocity greatly aided in breaking the arcs formed by light loads, as the arcs were blown from the diverging horns before the switches were even wide open; but under heavier loads, with the spacing of phases used in these tests, the high winds would blow the arcs across the phases and trip the circuit breakers at the power house before the arcs

Type of Three-Phase Air-Break Switch Employed in Opening High Tension Power Lines. The Insulated Handle G and Shaft F, Swing the Crossbar E. This Turns the Insulated Spindles D, Linked Up to the Switch Blade A. The Jaw of the Switch Appears at C; While B Is the Horn Arc Arrester. Three Switches Are Thus Controlled by the Handle G.

would let loose from the horns or blades. The conclusion was also reached that it was much more difficult to break simply a charging current load than a true energy load of the same K.V.A. value. (One K.V.A. equals 1,000 watts at 100 per cent. power factor.)

The testing engineers stated as their opinion that the proper design of an air-break switch involved a mechanical movement in opening the switch that would aid the arcs in rising up the horns. The theory that the heat of the arc alone will carry it up the horns is doubtless well founded, but this force is only great enough to accomplish this result in a perfectly still atmosphere. With the slightest wind blowing, the arcs are blown sidewise and the tendency of the arc to rise more or less counteracted by this horizontal wind pressure. If, however, the mechanical movement is such as to draw the arcs up the horns, the tendency to rise is increased, and it is much easier then to break the arc. The arc appears to be a sort of uncontrollable featherlike medium, and but a slight wind will blow it eight or ten feet horizontally.

These tests were made in all kinds of weather, such as snow, rain and clear weather.

The chief difficulty experienced in the use of air-break switches is the large amount of space necessary for their construction, and it is plainly apparent that the spacing used by manufacturers of to-day is not sufficient, it seems. In some cases the arcs are blown downward, and this means that the switches must be well insulated from the steelwork supporting them for a distance sufficient to keep the arcs from thus grounding the lines.

These wonderful photographs were obtained through the courtesy of Charles O. Lenz, chief engineer for the Virginian Power Co. and the Georgia Railway & Power Co.

"EDISON DAY" AT 'FRISCO EXPOSITION.

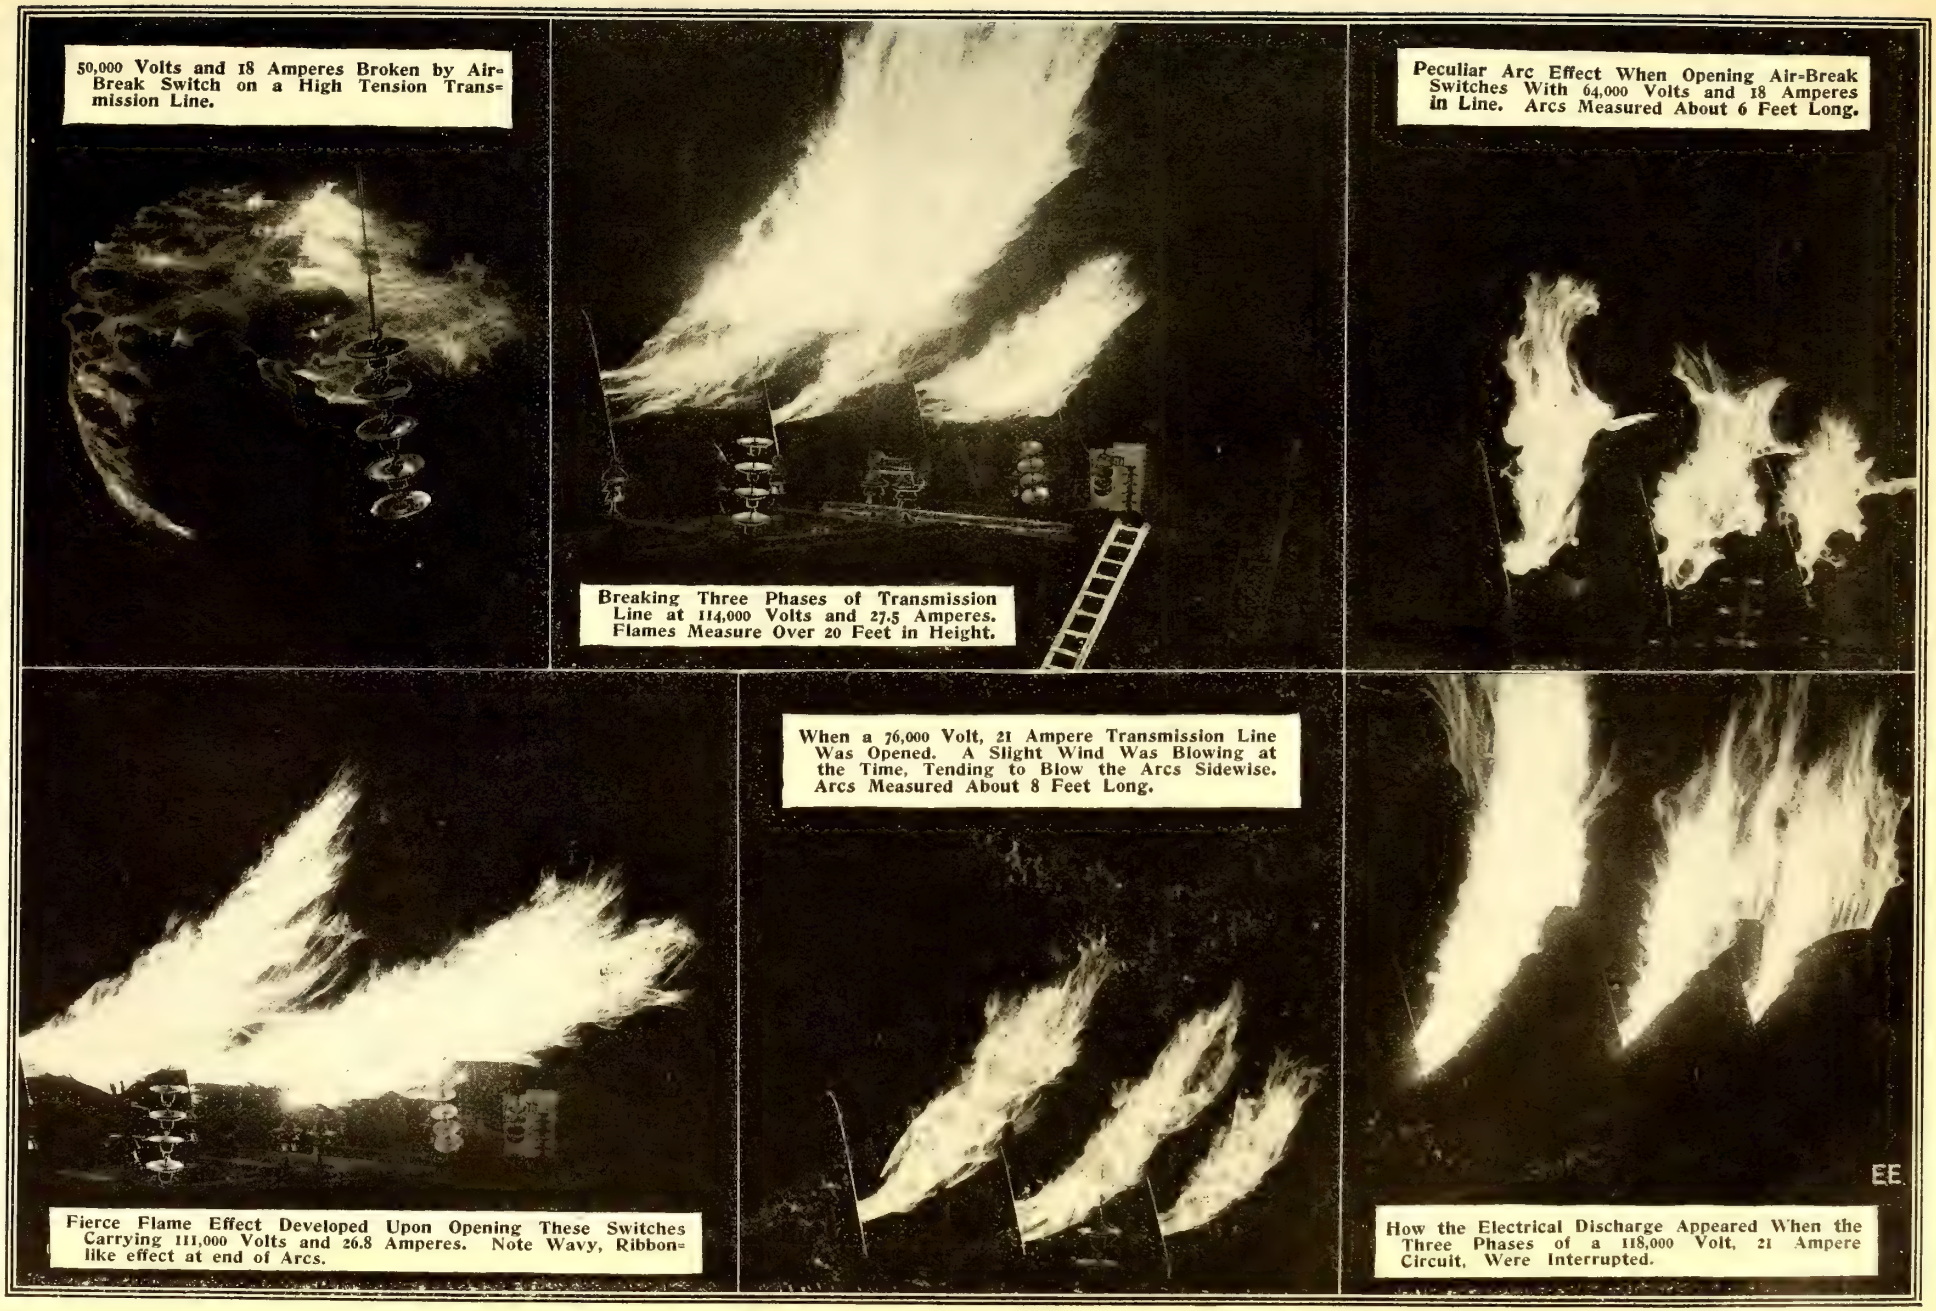
On October 21 the whole country celebrated "Edison Day," commemorating that eventful day just 36 years ago when the first Edison electric incandescent lamp was perfected.

At the Panama-Pacific Exposition in San Francisco, where Mr. and Mrs. Edison were guests, a telephone connection was made between Mr. Edison's home, at West Orange, N. J., and the fair grounds. While the inventor, aided by a special sound amplifier, listened in San Francisco, a long message from Miller Reese Hutchinson, superintendent of the Edison Works, was transmitted by Mr. Edison's own phonograph.

The message congratulated Mr. Edison on the 36th anniversary of his invention of the incandescent light, and told him that several hundred of his friends had gathered in his home to do him honor.

Mr. Edison's reply was received by his latest invention, the "telescribe," and later every one in the room received a cylinder on which the words of the inventor had been transcribed automatically.

Many people of prominence journeyed to Edison's home and found the streets about it lighted by 5,000 candle-power lights, while immense searchlights played on it from the roof of the laboratory.



The trans-continental wire worked perfectly, and the voices of all those who spoke were heard distinctly. Mr. Edison's voice preserved all its characteristics in the transmission over 3,400 miles, and those who knew him instantly recognized the speaker. Mr. Edison, in turn, assured those in his laboratory that he heard perfectly. He then said:

"It may seem strange to those who know of my work on the telephone carbon transmitter that this is the first time I have ever carried on a conversation over the telephone. Trying to talk 3,400 miles on my first attempt at a telephone conversation seems to be a pretty big undertaking, but the engineers of the Bell System have made it easier to talk 3,400 miles than it used to be to talk 34 miles. In my research work I have spent a great many years listening to the phonograph, but it gives me a singular sensation to sit here in California and hear the new diamond disc phonograph over the telephone all the way from Orange, N. J. I heard the record of Hutch's talk very plainly. I should now like to hear a musical record.

"That's fine," he said, after a record had been played. He was asked to play the record back from San Francisco and a machine at that end was started and the West Orange audience heard the music.

John J. Carty, chief engineer of the American Telephone and Telegraph Co., who was "listening in" at Chicago, said:

"This wonderful transmission of sound will become historic because of the conveyance of a perfect recreation of music and voice to the ear of the world's most illustrious inventor by his own invention."

50,000 Volts and 18 Amperes Broken by Air-Break Switch on a High Tension Transmission Line.

Breaking Three Phases of Transmission Line at 114,000 Volts and 27.5 Amperes. Flames Measure Over 20 Feet in Height.

Peculiar Arc Effect When Opening Air-Break Switches With 64,000 Volts and 18 Amperes in Line. Arcs Measured About 6 Feet Long.

Fierce Flame Effect Developed Upon Opening These Switches Carrying 111,000 Volts and 26.8 Amperes. Note Wavy, Ribbon-like effect at end of Arcs.

When a 76,000 Volt, 21 Ampere Transmission Line Was Opened. A Slight Wind Was Blowing at the Time, Tending to Blow the Arcs Sidewise. Arcs Measured About 8 Feet Long.

How the Electrical Discharge Appeared When the Three Phases of a 118,000 Volt, 21 Ampere Circuit, Were Interrupted.

SPECTACULAR ELECTRICAL DISPLAYS OCCURRING WHEN HIGH TENSION AIR-BREAK SWITCHES ON TRANSMISSION LINES ARE OPENED

Taking Moving Pictures with Under-Sea Searchlight

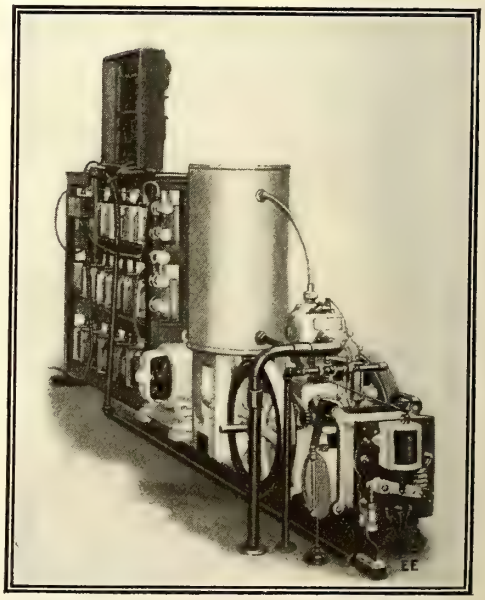
Some time ago there was developed a special submerging bell made of heavy steel and of sufficient size to accommodate a powerful searchlight, together with a motion picture camera and also the operator for same, so that moving pictures of the beds of rivers, coral formations, wrecks, etc., might be taken. Instead of going to such expense and trouble, there is suggested and illustrated herewith a much simpler method which would seem just as effective.

Proposed Scheme for Taking Submarine Motion Pictures by Means of Powerful Electric Searchlight Worked in Conjunction with the Camera From Above the Water's Surface.

In this arrangement there is provided a set of four steel cables properly rigged up with winding drums, etc., on a float or raft, as perceived, and at the end of these cables is secured a motion picture camera, electrically controlled by means of insulated wires leading down one of the cables and secured thereto. In the top of the camera is mounted a powerful electric lamp with lens, etc. The operator on the surface is enabled to view the wreck or other submarine scene through a periscopic tube, more properly known as a "mariscope." The sighting tube may be turned in any direction and, of course, the camera may be raised and lowered to any depth or height in the water desired.

The cables, as will be evident, are wound up over the drums on the float or raft, and to enable this function to be performed properly the mariscope or sighting tube is made in the same fashion as a telescope, i. e., of gradually decreasing sizes of tubes sliding one within the other. A substantial watertight camera and high candlepower lamp are necessary for this purpose; the machine could be constructed of steel and provided with a properly fitted door for permitting a new film to be readily inserted and the old film removed when the device is above water. A storage battery or dynamo on the float will supply current for the lamp, and camera, and pictures can be taken in this way either in the daytime or at night. Undoubtedly many wonderful and valuable pictures could be taken in this way which would not only be instructive for use in theaters, schools, etc., but also vitally important to lecturers on certain subjects and for the benefit of salvage and wrecking companies which have to deal with submerged boat wrecks and the like.

TRAFFIC COP AN ELECTRIC SIGNALMAN.



The traffic policeman in Cleveland has been turned into a "signal officer." The green and red lights adopted on railroads have been installed on all Cleveland's main street corners. Electric lights facing oncoming vehicles and hid from view in the opposite direction are located on the right hand side of each street. The red light denotes "Stop," the green light "Proceed." To clear the crossing in case of fire the officer simply throws on an emergency switch, which sounds an alarm bell and turns on red lights.

AN AUTOMATIC ELECTRIC LIGHTING PLANT.

The problem of electric lighting as regards ease and convenience has been satisfactorily solved in cases where central station service is available, as all that is required is the turning on of a switch. In country houses and private installations of a similar description, however, unexpected difficulties have been encountered, such as the requirement of frequent attention and the employment of some technical man in order to look after the apparatus.

It is, therefore, interesting to note the arrangement of a recently devised automatic lighting generator set which works at all times whenever its services are required. This plant is shown in the accompanying illustration and is the product of an enterprising electrical concern of New York. No attendant is required to start and stop the plant, but it is sometimes necessary to fill the tank with water and to clean and oil the engine, which does not require much technical knowledge. To start the plant it is only necessary to switch on three or four storage batteries, which supply the power; these are shown on the extreme left. As soon as an additional lamp is turned on more current is consumed and a relay is actuated which connects the dynamo to the batteries, which then acts as a motor. This in turn drives the engine until the proper normal speed of same is attained, and at the same time electrically firing a gasoline charge in the engine, which causes it to run and thereby drives the dynamo. As soon as the dynamo begins to generate, a relay is thrown automatically, connecting the lights to the dynamo mains; also, the storage batteries are then being charged. The most interesting point about the engine is that it will run faster when additional lights are put in circuit. This is accomplished by means of an automatic control operating the gas valve, and which is actuated by the current that is supplied to the line.

This is another advance in the realm of the isolated electric plant, and one which undoubtedly will be advantageous to those who lack central station electric service, as in the Middle West and suburban sections all over the country.

Remarkable Electric Lighting Plant That is Entirely Automatic in its Action. Turning on a Single Lamp Starts the Engine and Dynamo, Charging the Storage Battery, etc. It Stops Itself as Soon as All the Lamps Are Extinguished.

NOVEL ELECTRIC CLOCK INDICATES TIME DIRECTLY.

By Felix J. Koch.

"I set my clocks by Edward's watch," the young housewife remarks proudly, as you marvel that every clock in Newly-Wed's home strikes the hour in unison with all others; and this with the time absolutely correct.

"Edward, you know, sets his watch each evening by the big clock at Fifth and Vine streets," and as does "Edward," so does everyone else in Cincinnati; for, in addition to achieving renown for being the most complicated and largest electric clock in the American mid-west, this clock is known to be absolutely correct.

In fact, already, this clock, mounted on the corner of a leading department store in the Queen City, has become a feature of the place.

In addition to being operated by electricity, the correct time comes to the clock from the Western Union people every second. Some notion of the complexity of the arrangement for keeping it exact is to be gained by the statement that in putting it up the services of five men were required for some ten days, and that not less than five miles of wire is used between clock and store. Innumerable lamps are required to give the proper arrangement for displaying the changing time by night, when the clock is, of course, at its best; and with these the connections must be exactly right. To that end, again, the electricians state, there are 800 connections in all. If one of these goes wrong, they are all wrong.

While in course of construction the big clock was tested every two hours, now it is looked over four times a day. In fact, five men were put in charge to test and connect.

And yet, wonderful as it may appear, these experts are on hand, as precaution alone, since *de facto* the great clock now runs itself and does not need this checking up.

Day and Night Views of Unique Electric Clock That Indicates Time Directly in Hours and Minutes, as Observed.

What is more, a clock of this sort will last well-nigh forever. With a dial of 12 inches diameter, the clock itself measures 18 by 36. With sign and other ornaments besides, then, it measures 12 by 15 feet.

Naturally, to the expert, the big clock presents the solution of many problems indeed; but the public finds greatest interest here in watching the momentary changing of the sign when it states:

"The Correct Time Is,"

and then gives this, in hours and minutes, as the illustration shows.

Some Modern Applications of the X-Ray

In order that this country may preserve its strict neutrality, and fearing that the Germans or their sympathizers may place bombs or infernal machines, or copper (which is contraband), in bales of cotton, such bales are daily inspected, the operator's body is exposed to the rays, and to protect him from their injurious effects a lead screen is placed in front of the examiner, as our photograph illustrates.

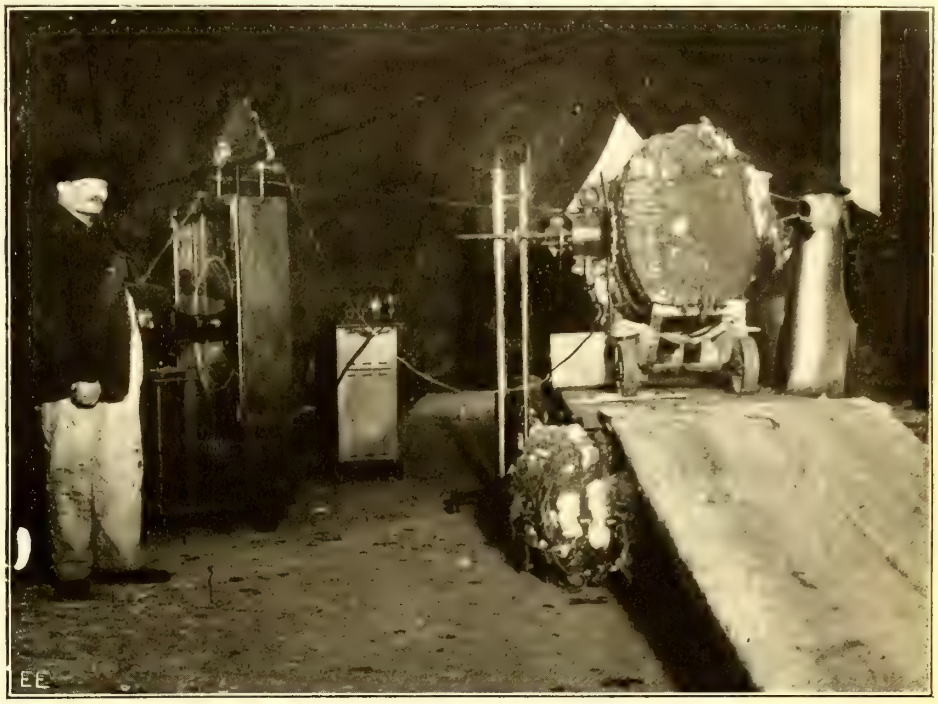


Photo Copyright by Underwood & Underwood.

Powerful X-Ray Machine Used by United States Government to Detect Bombs, etc., Hidden in Cotton Bales Before Shipment.

our Government has taken advantage of the X-rays.

The photograph herewith shown depicts a bale of cotton being examined by a powerful X-ray tube for any concealed contraband. The high-voltage direct-current machine is seen at the left; this is one similar to that described in the April, 1915, issue of this journal. The current is transmitted to the tube on the right by two flexible copper conductors. The tube is supported by means of an adjustable stand, as perceived. Due to the continuous use of the machine, as thousands of such bales are daily inspected, the operator's body is exposed to the rays, and to protect him from their injurious effects a lead screen is placed in front of the examiner, as our photograph illustrates. Note the operator viewing the bale through a phosphorescent or platinum-barium-cyanide screen.

Another application of the X-ray is in detecting marked impurities in coal. This was suggested by S. Cohen, who explained that as carbon is very transparent to the Roentgen rays, while silica is opaque to them, the silicate which is the most common impurity in coal and which forms a slag when coal is burned, can be seen like a skeleton when the shadow of the coal is projected upon an X-ray fluorescent screen.

Another possible use of the X-ray is in testing precious stones such as diamonds. A real diamond is practically transparent to the ray, giving almost no shadow on the screen, while imitation diamonds are opaque to them.

AMATEUR GETS SPECIAL RADIO LICENSE.

The wireless station of John J. Grossman, 181 Hudson street, Tiffin, O. (formerly 8TI), has been recently converted into a special station by Radio Inspector J. F. Dillon (new call 8ZT). This station will be engaged in flood service and newspaper work. He will be glad to hear from anyone wishing assistance in relay work. Working hours, 7 p. m. to 10.30 p. m. Address all communications to above.

THE WASTE IN WOMAN POWER.

No one cares to think of the work that women do in terms of horsepower, least of all the women themselves, but a moment's study of these figures is startling in its revelation.

There are now 15,000 six-pound electric laundry irons in use in a large Eastern city. Few women and no men realize what this means in actual labor saving. Where one electric flatiron is now used the housewife formerly required at least three six-pound "sad" irons, and while one was in use two had to stand on the stove to heat. Fifteen thousand electric irons have therefore replaced 45,000 "sad" irons. At six pounds apiece, this means 270,000 pounds, or 135 tons.

Now, the constant use of this enormous amount of old irons meant a tremendous outlay of energy or exertion of strength that was required every ironing day, equivilent to 2,400 horsepower, and this was simply termed "woman's work!" It should be termed the waste of woman power!

Ball Lightning

BALL lightning, the subject here under discussion, is one of the three principal and distinguishing forms of this marvelous electrical disturbance taking place in nature, and which in its commoner forms all of us have undoubtedly witnessed at some time or other. These three principal forms of lightning, as this electrical phenomenon is called, comprise ball lightning, as just mentioned; streak or chain lightning,

Ball Lightning or "Fire-Ball" as it Appeared in France Some Years Ago. It is Supposed to Be a Gaseous Sphere Carrying an Electric Charge, and Is Liable to Explode if Impeded in Its Travels.

as manifested by powerful discharges taking place near-by, and the third form covers what is commonly termed sheet lightning. This latter is sometimes of an indistinct character, and may not be very noticeable, and this is often caused by lightning actually taking place at a considerable distance from the observer, which reflects from the clouds or firmament. This also includes the form of branched or forked lightning bordering on the kind just mentioned, or combined with it.

Most of us know how to protect ourselves from this pyrotechnical display occurring in nature, and one of the best ways is to recline in a hammock suspended in the center of a room with respect to the four walls, floor and ceiling, the hammock being hung preferably on silk ropes. It should not be placed under a chandelier. Care should be exercised in keeping away from open windows, doors, chimneys, fireplaces and stoves, or, in fact, any metallic or conductive body which might tend to gather a charge or act as a highly conductive path for a lightning discharge which might strike the building. It is a pretty thoroughly accepted axiom to-day that if a building is properly protected with well-grounded lightning rods that they will cause any lightning discharges to proceed harmlessly to earth without any spectacular effect, such as noise or auroral display. It is best during such electric storms to keep the doors and windows closed, as a draft of air often causes a lightning discharge to enter through such openings. Soot-covered chimney flues are another attraction for lightning discharges.

Ball lightning is one of those freakish things which one seldom sees, yet one that does really take place, as many witnesses of such displays are willing to swear to, including a number of irreproachable scientific writers, such as Camille Flammarion. In case ball lightning enters a room it is best to get on a chair or some other article, so that the fire ball may not roll along the floor and burn the person. If the door is left open, the fire ball will most likely proceed on its way. Should one be standing on the floor near the door, it is possible that the ball might explode between the legs and cause fatal injury, as has occurred in a number of cases. Hence the precaution of standing on a chair.

Ball lightning, or the thunderbolt, as it was called by the Greeks, is a gaseous sphere without an envelope. It contains energy which is afterward released with explosive violence.

(1) It is a luminous ball which often occurs after an intense flash of lightning.

(2) As it falls it moves slowly and horizontally some feet above the earth.

(3) At sea it is most frequent.

(4) The mass of a thunderbolt is denser than air. In an air current of ether, or in the neighborhood of electricity, it explodes, and the explosive wave travels outward, followed by a strong smell of ozone. Then the ball is nothing but atmospheric gases, because:

Ozone is denser than air, and is produced under electric stress.

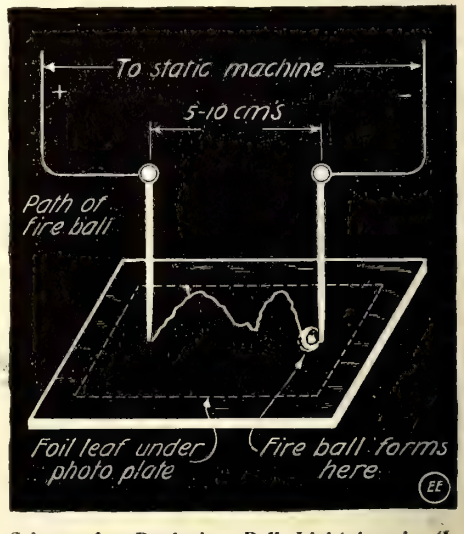
Ball lightning travels horizontally to the negatively charged earth. That it is repelled proves that ozone also is negatively charged. The energy liberated causes a transition of ozone to oxygen, and thus explains the explosion, as it is well known that oxygen supports combustion.

The illustration herewith presented shows a ball of lightning entering a stall in France. It rolled for a few seconds and finally moved toward the chimney, where it exploded with great violence.

Not long ago Count G. Hamilton made a record of a similar freak of electricity. He was sitting at dinner in a house on Lake Wener in Sweden when, just after a vivid flash of lightning, a brilliant white ball appeared, and, after hanging poised over the table for a few seconds, exploded with a loud crash. Fortunately it did no harm to anyone, although it was quite close to several people.

The most amazing effect of lightning was witnessed several years ago in a French field. During a thunderstorm several peasants took shelter near a tree, and a few minutes later a globe of lightning drifted toward them, like a soap bubble of blue fire. It surrounded them, injuring them to the extent of burning their hair and clothes, after which it exploded.

We hardly dare to experiment with lightning in any form as found in Nature. Several investigators have been killed outright by ball or other lightning discharges. Notable in this direction is the case of Dr. Richmann, who lost his life through such research work indiscreetly conducted. He had arranged an insulated iron rod from the roof of his house to his laboratory. This served to conduct the atmospheric electricity to him, and he made a practise of carefully measuring its intensity every day. However, on the day of August 6, 1753, in the middle of a terrific electric storm and while he kept at a safe distance from the metallic rod, awaiting time to measure the spark length, his assistant suddenly entered the laboratory, causing Dr. Richmann to momentarily approach the rod. A brilliant globe of blue fire leaped from the rod and struck him on the head, stretching him out on the floor, stone dead. Our front cover illustrates this sad occurrence vividly. This, to be sure, was hardly an encouraging start to the study of physics and science.



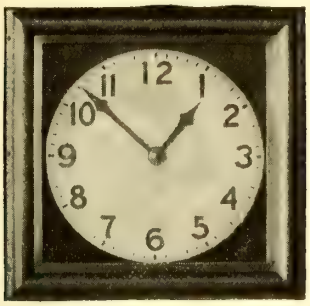
Camille Flammarion, the famous French scientist, cites several very interesting cases of "ball lightning" discharges. One of these occurred on August 24, 1895. During a violent wind and rainstorm several people saw descending to the ground a whitish-colored globe of about 1½ inches diameter. Upon touching the ground it split into two smaller globules which rose at once to the height of the chimneys on the houses close by and disappeared.

One leaped down a chimney, crossed a room in which were a man and a child without harming them. It then proceeded through the floor, perforating a brick with a clean round hole about an inch in diameter. Under this room was a sheepfold. The shepherd's son, seated at the doorway, suddenly perceived a brilliant light shining over the flock of sheep, while the lambs were jumping about in fright. When he approached them he was startled to find that five sheep had been killed. They bore no trace of burning, or of any wound whatever, but about their lips appeared a sort of slightly pinkish foam.

In the adjoining house the second fireball had also gone down a chimney and had exploded in the kitchen, causing great damage.

A peculiar freakish effect often noticed and recorded in numerous instances is where ball lightning has appeared suddenly, passed through and around a number of people in a crowd, etc., and then as suddenly disappeared without doing any harm whatsoever.

In July, 1744, a German peasant woman was busily occupied in the kitchen superintending the family meal, so history relates. Instantly, after a terrible clap of thunder, she saw a fireball about three inches in diameter come down the chimney, pass between her feet without harming her and



Scheme for Producing Ball Lightning in the Laboratory with Static Machine, Photograph Plate and Two Needles.

continue on its course nonchalantly without burning or even upsetting the spinning-wheel and other objects on the floor.

Terribly frightened, the woman tried to escape—she threw herself toward the door and opened it, when the fireball proceeded to follow her, playing about her feet, and passing into the next room, which opened out of doors, crossed it, and went on out

AN ILLUMINATED CLOCK FACE.

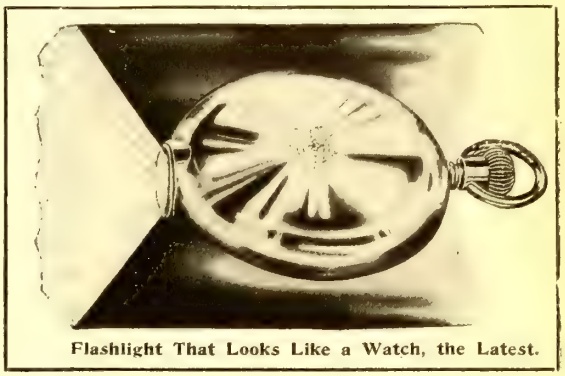
A certain kind of sign recently placed on the market consists of a heavy sheet of plate glass in which the design is deeply sand-blasted. The source of illumination is entirely hidden, and the light is reflected up

Electrically Illuminated Clock Dial in Which the Light Is Reflected Edgewise Through the Glass.

or down, edgeways, through the glass, thus giving a very pleasing and mysterious effect. The same plan has been followed in the design of the clock face shown in the accompanying illustration. The clock can be made to conform to any architectural design and may be provided with or without background. The frame for the clock may be either square, hexagonal or octagonal, employing four lamps, six lamps and eight tubular "linolite" lamps, respectively. The figures seem to stand out in space, giving an extremely novel and pleasing effect.

COLLEGE MEN TALK TO 'FRISCO.

A telephonic conversation between members of the faculty, alumni and student body of Stevens Institute of Technology, Hoboken, and President Alexander Humphreys and members of the alumni was held recently over the new line between New York and San Francisco. Dr. Humphreys was attending the organization meeting of the Stevens Club in San Francisco.



Twenty alumni of the institute formed the club, among them Dr. John C. Carty, chief engineer of the American Telephone & Telegraph Co., an honorary alumnus.

The exchange of greetings between the 'Frisco and New York parties began at 9 p. m. and lasted an hour. The telephone connection for the 3,000-mile talk was made in two minutes. At the conclusion of the conversation those in San Francisco held a banquet.

Those in the New York party included Prof. Albert F. Ganz, Prof. Adam Riesenberger, Prof. Charles F. Kroeh, all members of Stevens faculty; Newcomb Carlton, president of the Western Union Telegraph Co.; John Lieb, vice-president of the New York Edison Co.; Dr. David Jacobus, President Warner, of the Stevens Class, and Secretary Dunn, of the Students' Council. They gathered in the directors' room of the American Telephone & Telegraph Co., at 15 Dey street, New York.

FLASHLIGHT THAT LOOKS LIKE A WATCH.

The latest thing in electrical flashlights of the pocket type is that shown in the illustration and which corresponds exactly in size and appearance with an ordinary watch. The lamp is lighted by pressing on the stem and the specially designed battery is easily replaced by opening one side of the watchcase. This flashlight gives a strong beam of light and is probably one of the neatest designs of its kind brought out in a long time. It will appeal particularly to those wearing a double or breast

Flashlight That Looks Like a Watch, the Latest.

watch chain. This particular flashlight is known as the "Watchlite"; it is fitted with a tungsten lamp of the proper candlepower to be used in conjunction with the battery supplied with the device.

---

into the yard. The fireball darted about the yard, entered a barn by an open door, climbed the wall opposite and, reaching the edge of the roof, it burst with such a terrific noise that the peasant woman fainted. The barn at once took fire and burned to the ground.

Another peculiar instance took place in 1903, while M. Lawrence Rotch (director of the observatory at Blue Hill, U. S. A.) was sojourning in Paris, France. It had for its locale the famous Eiffel Tower, rising majestically 1,000 feet above the earth in graceful outlines. Looking in the direction of this lofty steel structure during a heavy electric storm he saw the summit struck by white lightning coming from the zenith. Simultaneously he saw a fireball, less dazzling than the lightning, slowly descend from the summit to the second platform. It appeared to be about one yard in diameter and consumed less than two seconds to cover a distance of about 100 yards. Then it suddenly disappeared in a mysterious manner. The next day Mr. Rotch ascertained, on visiting the tower, that it had actually been struck by lightning *twice* on the previous day. It is to be noted that the ball did not follow the conductor; but, after all, the whole metallic tower structure certainly is in itself the most powerful lightning conductor imaginable. The enormous mass of steel rising skyward would undoubtedly neutralize in such a case the attraction of the thin metallic lightning rods, effectual for the protection of ordinary buildings, but apparently incapable of competing under such conditions with the attractive force of this gigantic metallic mass.

A thunderstorm burst over Mortrée (Orme), in France, on April 24, 1887, where the lightning played havoc in general. It literally chopped up the telegraph wire on the route to Argentan for a distance of 150 yards. The sections of the wire were so blackened that they could well have come from a forge; some of the longer ones were bent and their sections welded together. The lightning in one case entered a stable door in the form of an iridescent fireball. It approached a person who was preparing to milk a cow, and shortly afterward passed between the legs of the animal and disappeared without causing the least damage at all. The terrified cow raised itself on its hind legs, bellowing frantically, and its master, nearly frightened out of his life, ran away to a more secure place of refuge.

However, the apparently inexplicable phenomenon accompanying this unwelcome pyrotechnical display of Dame Nature was that occurring at the critical moment when the lightning crossed the stable, at which instant a considerable quantity of incandescent stones fell before a neighboring house. Some of them were the size of walnuts; they were, furthermore, not of a very thick material, had a grayish-white color, and could be easily broken by the fingers, when they gave forth the characteristic odor of sulphur. The smaller spheres exactly resembled coke. These facts just mentioned were set down at the time by the Minister of Post and Telegraphs.

It is possible to produce artificial fireballs or ball lightning, as it is more generally called, in the experimental laboratory. A suggestion to this end is given herewith, this idea being due to M. Stéphane Leduc, the noted French scientist. His experiment makes possible the production of a slowly moving globular spark not easily obtainable in any other way, in so far as we know.

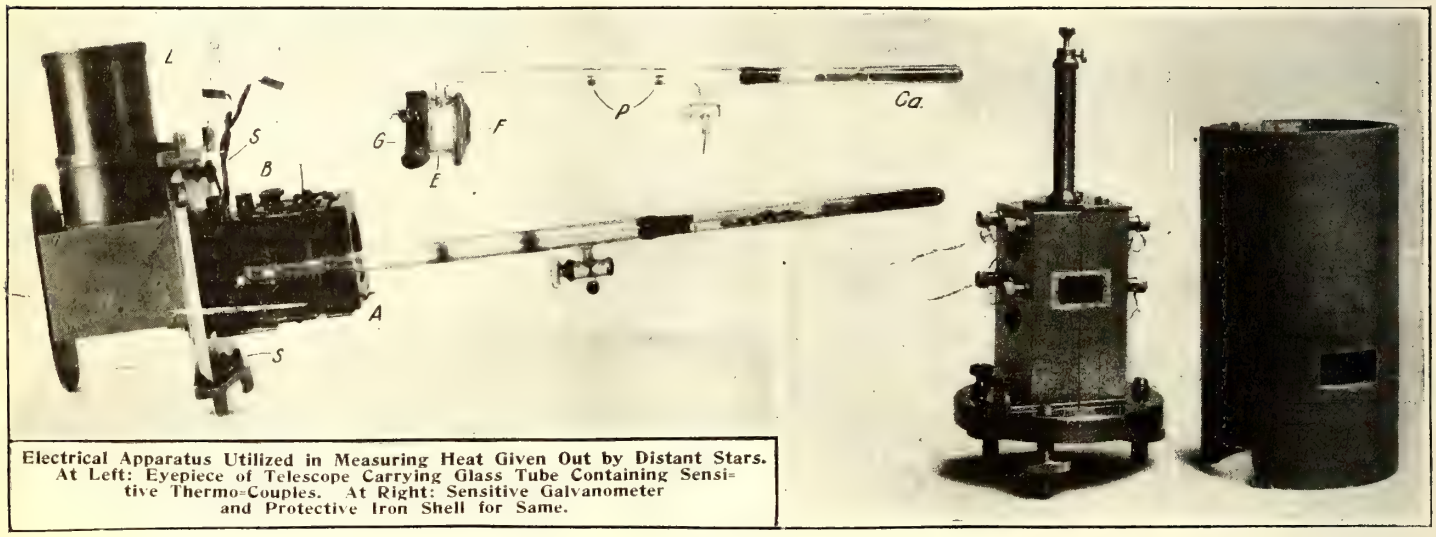
To produce this imitation ball lightning it is necessary to employ two very fine highly polished metallic points, each of which is in connection with the positive and negative poles, respectively, of a static machine of small or medium size. These two metallic points must rest perpendicularly, as our illustration indicates, on the sensitive face of a gelatine bromide of silver photographic plate, which is placed on a metallic leaf, such as tinfoil. The two metal points are spaced about five to ten centimeters apart. When the static machine is operated an effluvium is produced around the positive point, while at the negative point there is formed a luminous fireball or globule.

Now, when this globule has reached a sufficient size, it will be seen to detach itself from the metallic point, which then ceases to be luminous, and the globule will begin to move forward slowly over the surface of the plate, taking various curved paths and eventually it will set off in a direction toward the positive metal point. When it reaches this electrode the effluvium is extinguished and all luminous phenomena ceases. Further, the static machine acts as if its two poles were short-circuited, or, in other words, united by a conductor.

The velocity acquired by the luminous globule as it travels is quite slight, it taking from one to four minutes for it to traverse a path of six centimeters in some cases, and before reaching the positive electrode the globe bursts into two or more luminous balls which individually continue their journey to the positive electrode. On developing the photographic plate (which, of course, should be placed under a ruby light while the foregoing experiment is conducted) there will be found a trace on it of the exact route followed by the spark globule—the point of explosion, the routes resulting from the division, and the effluvium around the positive electrode point. Also, if one should stop the experiment before the globule's arrival at the positive electrode, the photograph will only give the route to that point. The fireball takes for its course the conductor, which apparently short-circuits the static machine. If sulphur or some other powder is thrown on the photographic plate while the experiment is being conducted, and also while the ball is moving, its path will be marked by a line of aigrettes, looking very much like a luminous rosary.

[*The Editors shall be glad to hear from any of our readers who have made experiments in this direction. Photographs are particularly welcome.*—Ed.]

A submarine without electricity is as helpless as a baby. The electric current makes it easy of control by one man. It cooks, heats, ventilates, besides propelling this marvel of boats, when submerged.



Measuring the Heat of Distant Stars

TO most people it will probably seem a waste of time and a useless expense to undertake scientifically the measurement of the heat from distant stars. Undoubtedly the popular question in such a direction would be—of what earthly use such a scientific test could be? But we should at least listen to the logic and scientific deductions of Dr. W. W. Coblentz, of the United States Bureau of Standards, who says that the measurement of the total radiation from stars may possibly be of use to us in answering the question as to whether or not light is absorbed in traversing interstellar space. Many other highly interesting scientific aspects of this problem are involved, and we give herewith a brief discourse on the electrical apparatus used in this most remarkable test. It is extremely interesting to note the fact that the heat measurement of the radiations from "Polaris" (the Pole Star), made in August, 1914, are ether vibrations *which were sent out by that interstellar body 47 years ago.* More remarkable still is the fact that similar radiations from the "Orion" group of stars started upon their long journey through space 160 *years ago!* When one considers these facts, the distances involved are so inconceivable that one naturally wonders how it can be possible that there is not sufficient "cosmic dust" in interstellar space to scatter, and thus diminish, the visible radiations to a greater extent than the invisible adiations; and yet the spectrographic evidence seems to be against this sought-for absorption of light in space. Another question awaiting solution is whether there is a "dispersion" of light in space, i. e., whether there is a retardation of, say, the violet rays as compared with the infra-red rays, so that the infra-red rays get here quicker than do the violet rays. This scientific problem may be determined or solved by measuring the radiation from an eclipsing variable star. If there is retardation of some of the rays, then the maximum and minimum of light emission should be different for different parts of the spectrum.

This and many other vitally interesting scientific conundrums await further investigation and solution.

The measurement of star heat had been attempted a number of years previous to the research work conducted by Dr. Coblentz at the famous Lick Observatory on Mount Hamilton, Cal., in the summer of 1914. In 1895 and 1896 Minchin conducted such tests, using a 2-foot reflector. He utilized the well-known selenium cell, which changes its electrical resistance in accordance with the amount of light thrown on same. It was found, however, that this method was not satisfactory to any extent, owing to the peculiar properties of selenium, which is highly selective, for one thing, in response to the different wave lengths; thus it is impossible for comparison with the present data obtained of the radiations from the different stars. This cell, however, is of practical value in measuring the maximum and minimum light emission from a variable star which does not change in color. It was used for this purpose by Stebbins in 1910 in conjunction with a 12-inch reflector.

Taking up the work of Dr. Coblentz, the photograph herewith shows the apparatus he used and which was placed on the powerful telescope at the Lick Observatory. Extremely sensitive and specially made thermocouples were used in this test, and the heat (light beams) of the distant star was projected through the telescope onto the thermocouple junctions; this created an electrical current which was registered on a sensitive reflecting galvanometer. The galvanometer was shielded by a heavy iron shell, which is also seen in the illustration, so as to be free from any external electric or electro-magnetic influences caused by the various moving parts on the telescope as it followed the star across the zenith.

Electrical Apparatus Utilized in Measuring Heat Given Out by Distant Stars. At Left: Eyepiece of Telescope Carrying Glass Tube Containing Sensitive Thermo-Couples. At Right: Sensitive Galvanometer and Protective Iron Shell for Same.

Referring to the thermocouples, these were composed of platinum and silver or bismuth and silver, in different cases, and encased in a glass chamber E; the projecting glass tube P was fitted with two electrical terminals employed for testing the evacuation value from time to time. In the front of the glass chamber E was placed a fluorite window F, through which the stellar rays were admitted, and which in turn fell upon the thermocouple, in this way producing a minute current, previously referred to. The star image and the receivers of the thermocouple were viewed from the side of the large telescope by means of a right-angle prism and lens which were mounted close to the glass window. The attachment L, containing the reflecting prism and the lens, is shown in the illustration herewith. The glass vessel containing the thermocouples is placed in a metal chamber B, attachable to the permanent equipment L by means of two thumb screws S S. In this way the radiometric attachment could be quickly detached and the regular photographic plate holder substituted, etc. The box B could also be rotated about the optic axis of the telescope. An absorption cell of water 1 cm. in thickness was placed in a hinged metal box observed at A. The resistance of the thin platinum wire used in making the thermocouple was very high, or about 2 to 3 ohms per millimeter. Only about 1.5 mm. of platinum wire was required. This wire was attached to a piece of silver wire 0.0165 mm. in diameter, which in turn was attached to the heavy lead wires. A globule of tin was attached to the platinum and pressed flat to form the receiver.

With this outfit as used by Dr. Coblentz it is possible to measure the heat radiations from stars down to the 6.7 magnitude. With this highly sensitive instrument stars were measured which were only 1/400 to 1/500 as brilliant as those formerly measured, or, in other words, the sensitivity was 400 to 500 times as great as previously attained. A very remarkable test of the sensitivity of the thermocouple radiometric outfit was made in connection with a sperm candle. It is asserted that the outfit was sufficiently sensitive to register the heat given out by a sperm candle when placed at a distance of 53 *miles from the thermocouple,* using a 3-foot reflecting telescope to pick up and intensify the rays given out by the candle at this distance.

A rough estimate of the total amount of heat received from the stars is of interest in this connection as compared with the heat received from the Sun, the latter being of the order of 1.9 gram calories per square centimeter per minute. From tests made on the star "Polaris" it was found that it would require the *total radiations* from that star to fall upon 1 square centimeter for 1,000,000 years in order to raise the temperature of 1 gram of water 1 degree Centigrade. In marked contrast with this figure is the comparison with the radiation from the Sun; in this case the heat falling upon the earth's surface in one minute is sufficient to raise the temperature of 1 gram of water 1 degree Centigrade. Recapitulating, it may be also stated that the radiations from all the stars which at any moment can fall upon 1 square centimeter of the earth's surface is so minute that it would have to be conserved and absorbed continuously for a period of 100 to 200 years in order to raise the temperature of 1 gram of water 1 degree Centigrade. Hence the incoming stellar radiations can contribute to the retarding of the cooling of the earth but little.

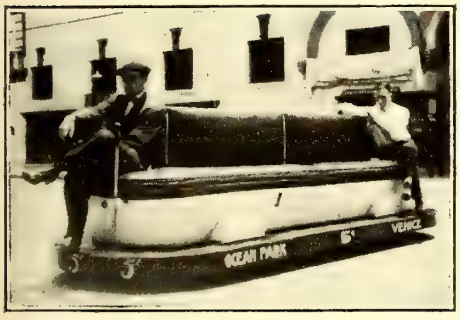
ELECTRICITY RESTORES LIFE IN MOVIE PLAY.

In one of the latest spectacular motion picture productions, known as "Lola" and produced by the World Film Corporation, electricity plays a prominent part, as the photograph here shown portrays. A large static machine may be seen in the background of the picture. This particular photograph was produced by superimposing two other distinct pictures, hence it is really a triplicate print.

The original film production gives a very spectacular and weird effect indeed. The doctor is endeavoring to bring back to life the heroine, known as "Lola" (played by Clara Kimball Young), by passing electric charges into the body through two large-size Geissler tubes held in the hands, as may be observed in the picture. Electricity has made possible some of the very best film plays of a scientific nature, as notably exemplified in the famous "Exploits of Elaine" series, produced by the Pathé Co.



How Electricity Restores Life in Spectacular Film Play, "Lola."

THE ELECTRIC ROLLING CHAIR IS HERE.

The electric rolling chair is here, and by the way it is being patronized one would conclude that it is here to stay. Probably all of the beach resorts of the country of any importance have had rolling chairs of the man-power kind for years, but, so far as known, this is the first instance in which electricity has been brought into play in connection with this feature.

This new kind of "jitney bus," which has just made its appearance in Venice, Cal., is operated between that city and Ocean Park, a mile distant. Between these points a wide cement walk runs along the ocean front, providing an ocean view for the occupants of the car all the way.

Venice, Cal., Boasts an Electric Rolling Chair. It Holds 18 Passengers and the Fare Is a "Jitney."

This car is about 12 feet in length and has a capacity of 18 passengers in addition to the driver. It is operated by a single employe, the practise being to stop the car midway between the two cities and collect the fares. It is impelled by a motor of two-horse capacity and is capable of maintaining a speed ranging from four to 10 miles an hour. The current for the motor is obtained from storage batteries placed under the seat. As may be seen, a "jitney" is charged per ride between these cities.—*Photo by Albert Marple.*

ATLANTIC AND PACIFIC DINERS LINKED BY WIRE.

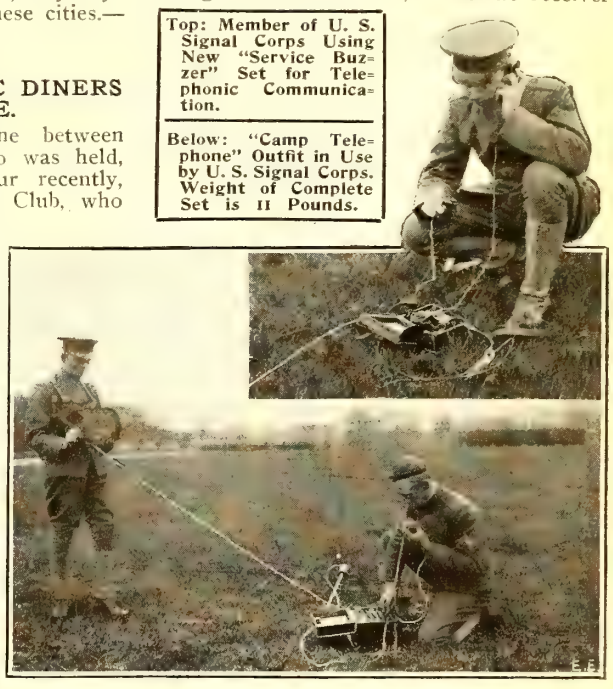
Communication by telephone between New York and San Francisco was held, without a break, for an hour recently, when members of the Rotary Club, who dined at the Hotel McAlpin, New York, talked with their friends who were holding a dinner on the 'Frisco Exposition grounds. The long talk was arranged by the New York Telephone Co., and several of the officials were present, including Belvidere Brooks, the general manager, who had a seat at the speakers' table.

The voices in San Francisco were heard distinctly, and members of the club in New York recognized their friends.

There were 450 at the dinner at the McAlpin, and everybody heard the conversations, as individual telephones had been connected with the tables. They heard also opera selections played in San Francisco on a phonograph. H. E. McClusky, a member of the Metropolitan Opera Co., who was at the McAlpin dinner, then sang for the benefit of the members of the San Francisco club. There was no doubt that they heard each word distinctly, for the applause was tremendous.

NEW ARMY FIELD TELEPHONE AND BUZZER DEVELOPED BY THE U. S. SIGNAL CORPS.

For military signaling requirements a most important device is the buzzer telegraph and telephone apparatus used by the Signal Corps Division of the Army. Uncle Sam's boys have lately developed a new instrument along this line which is shown in the illustrations herewith. It is known as the camp telephone, and the auxiliary apparatus which goes with the set is termed a service buzzer. The principal duty of the buzzer, which is specially constructed for the work, is to produce high-pitched telegraphic signals which may be carried over several miles of ordinary conductor. Besides such a signal can be heard, even when the line is broken in one or more places, as has been frequently found in tests made with this apparatus, or also when the line becomes short-circuited for some reason.



The camp telephone set is being distributed to the troops of the regular army at this time and supersedes the old field telephone outfit of the portable type. It may be used in any location and works remarkably well, indeed. The complete apparatus is enclosed in a rugged and serviceable folding case, weighing approximately 11 pounds. The instrument is of the local battery type and a small two-cell dry battery, such as those used in tubular flashlamps, supplies the current for the talking circuit.

The buzzer telegraph instrument may be utilized as a telephone set when necessary, but if the line should become severed, or if for any other reason, it may then be employed to transmit regular telegraph signals either by Morse or Continental code.

In the large illustration a member of the United States Signal Corps is shown using the camp telephone set, while one of the men holds the reel of flexible conductor used in running the line between two stations. The smaller picture shows the new service buzzer utilized for telephonic communication; the microphone of the set being held in the hand, while the receiver is pressed to the ear of the operator, as in using the regular telephone.

Top: Member of U. S. Signal Corps Using New "Service Buzzer" Set for Telephonic Communication.

Below: "Camp Telephone" Outfit in Use by U. S. Signal Corps. Weight of Complete Set is 11 Pounds.

The housewife walks a mile in an ordinary day's ironing—buy her an electric iron and curtail this unnecessary labor.

The Poniatowski Ray

By George Frederic Stratton

BY the San Elota water-hole on the parched Apirachie Desert the small party of United States troopers were camped, the coatless—some shirtless—men sprawling and gasping while the picketed horses stamped and grunted miserably.

"Mojave Desert is some refrigerator to this!" grunted Dyke Harkin. "All th' same if it wasn't so cussed hot there'd sure be a picnic in this campaign. Four hundred U. S. troopers meanderin' a couple of hundred miles into the midst of these thousands of little Japs an' Chinese an' Mexicans! And never hearin' a yelp!"

"They yelped enough up there on the Rio Grande to carry all over little ole Mexico," chuckled Rickards. "That's when that Nullifier got over 'em and set 'em floatin' real aimless an' disregardful. They sure smeared all over the horizon!"

"And they sure yelled!" broke in Luke Summers. "I was in the old Whiskey Slide mining camp in its toughest days, and heard language, all right, but what you'd heard there was Sunday-school talk 'gainst the saints and devils those Mexicans hollered for when they were bucking each other 40 or 50 feet above the sage-brush. It was simply scand'lous, whatever that might be."

"I reckon they haven't got over it yet," grinned Harkin. "They don't seem to be dead anxious to get where we can invite 'em in for a smoke or a poker hand. This is more like a moving picture stunt than a campaign. Look at them guns—big enough to scare the gall out of a million of men, an' yet—well, you know what they are!"

He waved his cigarette over toward the battery of six guns, appalling in their monstrous length and diameter. As large as 16-inch turret guns, they were mounted on ordinary wagon gears, and although on the march a dozen mules were hitched to each, it was to emphasize the size. Four would have been ample even on bad grades, for they were but wooden counterfeits—all except one.

A laugh broke from the party. "Bob-tailed flushes—every one of 'em!" grunted Summers. "But they've sure got the enemy guessing if their aero scouts have sized 'em up."

"There's one of 'em 'll do something to 'em besides guessing!" grunted Rickards. "That aluminum gun there that looks like the others, only it's different. Four men can dismount that easy an' carry it up any trail that a mule could scramble over. That fellow Cawthorne's had a hand in that!"

"Well, say! Who's this Cawthorne, anyway?" asked Stull.

"He's the son of his father," grunted Rickards.

Stull glared, spat viciously at a cactus, and growled:

"You've got me! I pass! Now, who's his father?"

"Dunno. He's dead! But he was the high monkey-monk of the biggest electric factory in our ole United States; and his son's following in his footsteps—more or less."

"Ugh! An inventor, eh?"

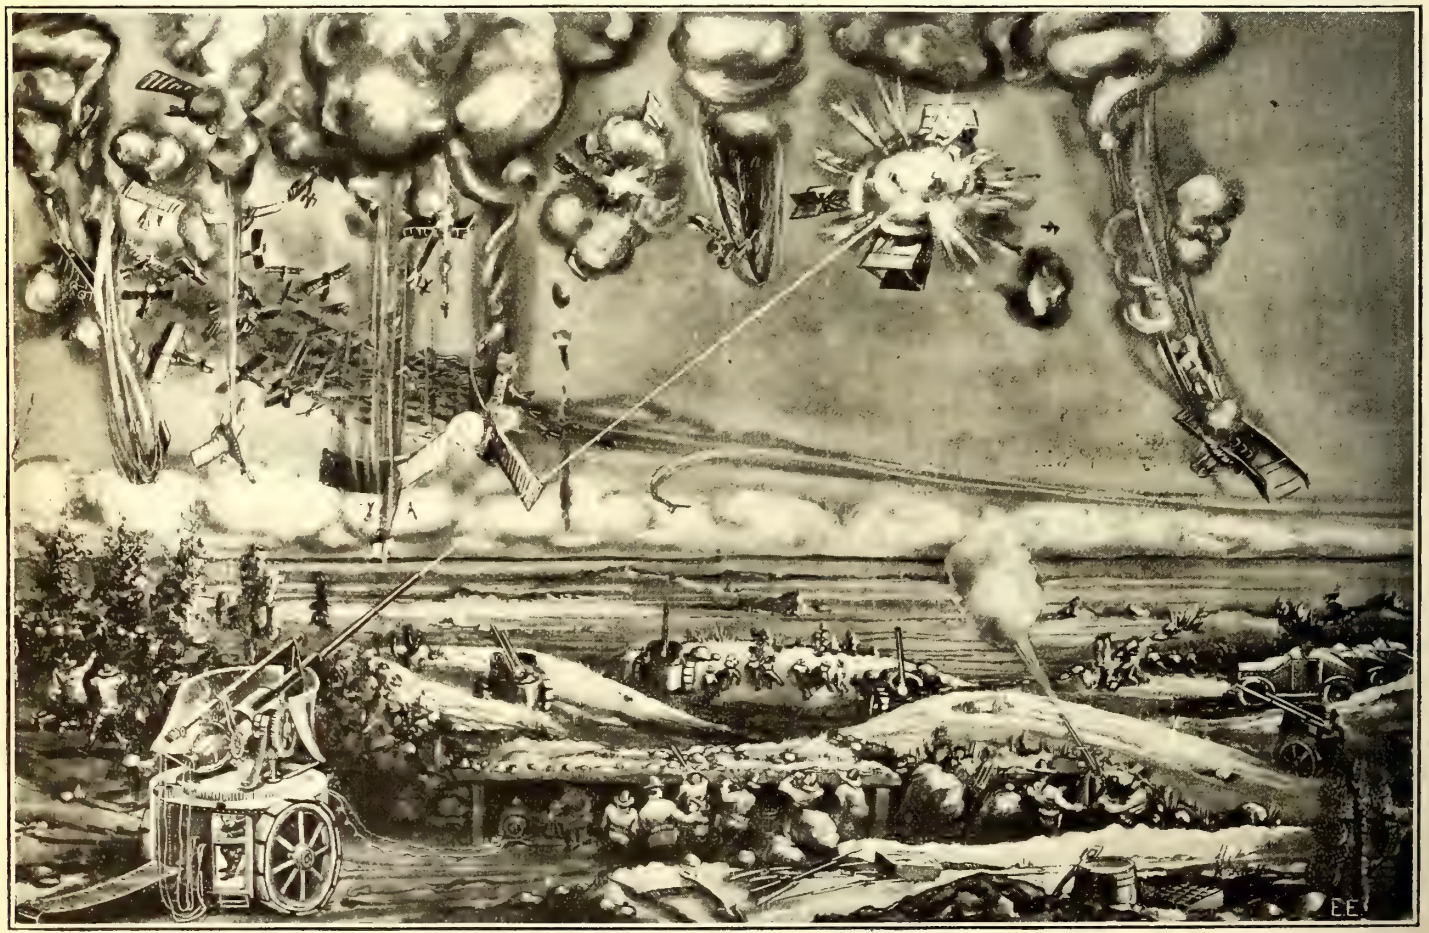
"Nix! He's not an inventor himself, but he antes-up for 'em. He built those submarines that put all the Jap-Chinese battleships to sleep up San Francisco way. Likewise an' also, he got up those Gravitation Nullifiers we've been tellin' you about. An' when you hear that he's got a hand in one of those big four-flush guns, you can look for some play."

From out of the rosy glare of the setting sun a scout aeroplane came over the camp and circled slowly round.

"Signaling the Colonel!" exclaimed Harkin, and a moment later a bugle sounded. It was not a regulation army call; the men recognized it as the special call for Captain Cawthorne's squad, and instantly every man in the camp was on his feet gazing at the group of men who rushed to one of the big guns.

Captain Cawthorne and Lieutenant Sandhurst strode over to the great aluminum tube. A command was given and the muzzle of the gun went up in the air until it pointed to the zenith. Then it was lowered and pointed to the horizon.

"Circle it!" commanded Cawthorne.



The great tube swept swiftly round in a complete circle, and Cawthorne murmured: "In fine control, Lieutenant, and just in time. Here they come!"

Southward was the buzz as of the steady hum of many factory wheels, but nothing could be seen.

"The connections with the producer are all right, Kilroth?"

"All right, Captain. I've turned on the radio selenite plates and the accumulator."

Then in the south appeared a blur like nebulae of a gray cloud. The burr increased and in less than a minute the enemy reported by the scout aero became clearly

"Captain Cawthorne swung the tube across the sky . . . . . and that ray—the marvelous 'Poniatowski ray'—fired every bomb, every gun and every holstered revolver among them."

IF you are at all interested in the wonders of modern science, you will surely appreciate this remarkable story by Mr. Stratton. The Poniatowski Ray, which proves to be the medium whereby the American army annihilates an entire hostile aerial squadron, is believed by many to be a future scientific possibility and one that may become a practical device for military uses within a shorter time than one may suspect. Briefly considered, the Poniatowski Ray may be visualized to consist of a powerful ionized stream of electrons which can be shot forth from a proper directing orifice or tube, in a practically parallel stream, vibrating at millions of cycles a second and capable of detonating any kind of explosive, no matter how well it is protected by external casings. The latest scientific theories advanced endeavor to prove that there really is no solid matter existent, but that what we term matter is made up of electrons electrically related or bonded to each other under certain conditions which obtain in nature. If the key to this situation is discovered, as for instance, is exemplified in the Poniatowski Ray, then indeed the war of the future will be a catastrophous world-wide event unbelievable and we might almost say unimaginable.

visible—a great, scattered mass of aeroplanes.

"They're planning to clean us up," grinned Cawthorne. "I suppose every one of them carries bombs, but they little dream who's going to give the order to fire 'em."

"They're three or four miles off yet," muttered the Lieutenant. His binoculars were at his eyes, and after a steady look he said: "There must be three or four score of them, Captain."

"Put that rapid-fire gun into action!" commanded Cawthorne. "Never mind the aim; just make noise." Then he sprang to the sighting instrument of the projecting tube and pointed it at the approaching aeros.

"Switch in, Kilroth!" he exclaimed.

Instantly a tiny ray of light, so nearly as blue as the sky as to be barely discernible, shot from the tube, and from the aero fleet, a mile away and nearly a mile above the earth, came lightning flashes of flame with terrific crashes, drowning out the continuous rattle of the rapid-fire gun. Cawthorne swung the tube across the sky with some little deviation in the elevation, and that ray—the marvelous *Poniatowski Ray*—fired every bomb, every gun and every holstered revolver among them. The gasoline tanks went as instantly, wrecking the aeroplanes. Even the few which had not been caught in the first sweep of the ray and had circled round or to one side, were caught by the swift, well-judged movement of the projector. Within one minute that fleet of over 80 aeroplanes had come to the earth, most of them smashed to splinters by their own explosions, the others crippled by the near-by concussions or collisions.

"Good work!" exclaimed the Lieutenant. "We've put every one of them out of commission in less than half a minute. Hello! What's that mean?"

A shrill bugle call rang out, "Saddle-up," and all the men of the command were instantly on the jump. Colonel Rutherford, who was in general command of the expedition, strode up to Cawthorne.

"That's simply miraculous work, Captain; but it breaks up this night's camp. We're 40 miles yet from the coast, and we must cover that before the enemy has time to figure out how to meet this astounding attack. One plane got away and will report it all."

"I think they'll lay it all to that rapid-fire gun, Colonel. That ray was scarcely visible to anyone not looking especially for it, and of course they don't know of the existence of such a thing."

"Possibly so, sir. But I wish it hadn't been necessary to use it at all until we could open up on their vessels. Well, we'll advance now, so as to make our main attack to-morrow night."

An hour later, as the officers were butting their armored car through the sagebrush and talking over the instantaneous demolition of the aero fleet, Lieutenant Baxter asked:

"Who is this man Poniatowski who discovered, or invented, that ray, Captain?"

"Discovery is right," smiled Cawthorne, "although I'm sure from what he told me that he used up as much time and intense thought and study in reaching that discovery as if it had been the most intricate invention. He's a Pole and was a man of property over there, and very scientific attainments, but after he had discovered that extraordinary arc—and in spite of his efforts to keep it secret—his Government, with its spies at every man's elbow, heard about it and demanded a full description of its principles and application. They had even ordered his arrest, when a friend gave him a pointer. He smashed his apparatus in his home workshop, secured the gram of radium in which all his wealth—nearly a hundred thousand dollars—was tied up, and fled inside of an hour. He had thrilling adventures and hair-breadth escapes, but reached a port and got passage to this country. But in that struggle for freedom—for life—he lost that radium and landed in New York in poverty. He got a job as laborer in our shops, and I heard of him through one of the foremen and got in touch with him. When he found that I was surely a friend he told me about the arc. That's how it is."

"And you went ahead and developed it?"

"I helped in the only way I can help with such things—by money. I sent him to my experimental shop at my country home, bought another gram of radium and put everything at his disposal."

"And this is the first time the ray has ever been put to use?"

"Absolutely! Poniatowski is no lover of warfare. The fearful calamities of it in his own country made him determined to put no fresh weapon in the oppressors' hands; but, all the same, he sees plainly that, used for defense or repression, it will stop warfare with one-quarter or one-tenth of the sacrifices of life and property of the most deadly up-to-date implements now in use, for it puts the fighting all on one side. It puts the enemy's forces—land or naval—absolutely under the control of our officers, as you will see to-morrow."

"I've seen it to-night!" muttered the Lieutenant grimly. Then, after a pause: "I presume then, Captain, that the projector we have with us is the only one in existence?"

"No; there's another. I built this one at my own expense and offered it to the Government. When they decided on this expedition they planned to have another for a relief machine. Then a dispute came up as to which branch of the service the projectors properly belonged to—the army or navy—and they discussed that for three weeks, and settled it by ordering one projector to be placed on a cruiser and sent round to the Gulf of California to Admiral Roberts' fleet, and the other one to be sent overland to attack the Allies' headquarters at Zapata. You see, Admiral Roberts cannot take his ships into the bay because those Japs have mined and netted the entrance thoroughly, and their submarines prevent all efforts to clear the channel; but if they put that projector in action it will explode every mine and every submarine within reach of the ray, and we've tested that up to six miles."

"What! That marvelous ray can operate under water? Can find and explode the hidden mines?"

"The tests have shown that thoroughly, Lieutenant."

The end of that forced night march took them within 16 miles of Zapata, on the shore of the Cisneros Bay in the Gulf of California. Here was the supply base of the allied Mexicans, Japs and Chinese, the latter two furnishing from their great fleet of transports and supply vessels the munitions which the Mexicans were deficient in, their supply from the United States being, of course, shut off.

A scout aero came in and reported that the enemy had cut a trench five miles from where Rutherford's command was, and had an immense body of men excavating a second trench between the first and Zapata. As that report was made, firing from the first trench commenced, and shells began to drop, although the range and the aim were inaccurate.

"We've got them guessing pretty bad, if not scared," laughed Cawthorne. "Digging trenches to protect 20,000 men from 400! Those Gravitation Nullifiers aren't forgotten yet, and the mysterious explosions of their aero fleet haven't quieted their nerves any."

"Send an order back to our aeroplanes to advance immediately with the two Gravitation Nullifiers!" commanded the Colonel.

The crews of the aeros were bivouacing five miles in the rear, but in 10 minutes they were flying swiftly over the command, one of them coming to the ground to pick up Cawthorne.

From the first trench came volleys of shot and shell, but the aeros had risen 3,500 feet, and no missile reached them. Then the little bullet-like metallic *attractors* were scattered from the escort aeros upon the trench below and the Gravitation Nullifiers Nos. 3 and 4 went into action.

The gravitation of everything below them instantly disappeared. Heavy guns, being fired as the Nullifier influence reached them, recoiled as if they had themselves been struck by a 10 times larger shot than they had fired. Japs and Chinese floated out of the trench clutching frantically at each other or at the wafting cannon or small arms with which they were mixed.

So on to the second trench, where men with picks and shovels found their weight gone; where boulders which two men with difficulty tossed out of the trench suddenly lost the earth's attraction and drifted away in utter aimlessness. Mules hitched to ammunition and supply wagons, frenzied by the astounding conglomerate of men, weapons and rocks which floated against them, pranced into the air and failed to regain any footing. The demoralization was complete.

But from a relief trench guard which was

Baron Münchhausen's New Scientific Adventures

By Hugo Gernsback

Thought Transmission On Mars

I WAS sitting in front of my radio set lost in thought. Yes, perhaps I was dreaming while I blew big gray clouds in the air; you are apt to do so if you are smoking your favorite *Nargileh*—the Turkish water pipe. I personally like the Nargileh, where the smoke must first pass through the water, there to be purified before it enters your mouth, cool and fragrant. If you are a pipe smoker you must get acquainted with the Nargileh by all means, there is nothing quite like it. I am so enthused about it that I would like nothing better than telling you how to make one, but—alas—I am supposed to report Münchhausen's doings; am supposed to be writing fiction, *scientifiction,* to be correct, and not "how-to-make-it" "dope!" The editor says he can get all the contributions he wants for that department, so he doesn't need mine. Between you and I, I like the "how-to-make-it-stuff" better myself. Mars, to be sure, is all right, but we're simply not educated enough to understand all this advanced Martian business. If I could only get a message to Münchhausen and ask him what kind of "dope" is published in the Martian *Electrical Experimenter* in their "How-to-make-it" department! As our venerable friend, Thomas Reed, is wont to say: "Take it from an old bug, that would be a treat, eh, buglets!"

I was still dreaming, lost completely in a blue smoke cloud when my electric chime, controlled by the Western Union clock, which gets the exact time hourly from the Naval Observatory, commenced to sound the eleventh hour in its sonorous, vibrant voice.

At the stroke of eleven—my headset had been already clamped over my ears—the familiar high whistling sound sung in my ears once more. Punctually, as usual, Münchhausen "called."

"Same, good old Münchhausen," I said to myself, and I listened expectantly for that dear, croaking sepulchral voice. Instead of this, however, he had a little surprise for me. He did not speak; instead, without warning, there suddenly broke into my ears the most amazing music a mortal has ever heard. The sound was so loud that I was actually forced to take the 'phones from my head and place them on the table, and I had to go to the far end of my laboratory in order to hear the music at its best.

And to think that I was listening to music which had originated on Mars 60 million miles away! It was almost unbelievable! However, there it was, filling up the entire room with the most delightful music, impossible to describe. Sometimes it sounded like an immense orchestra, then again like a *celesta* instrument. At other times the music sounded like a 'cello mixed with a flute, immediately to change into a mixture of an oboe and a cornet. In between there was a sound like human singing, but altogether different in quality and volume. Moreover, all sounds were sustained, never to break off sharply; and the music from one instrument seemed to melt into that of another without the slightest break. Thus imagine, if you can, that you are listening to a violin which gradually, in a most harmonious manner, changes into a cornet without a break! What I heard is absolutely impossible to describe adequately, for you can't describe music on paper. I can only say that I had never been stirred so deeply by music in my life, and I have listened to exquisite music in my days.

For five minutes or more I listened entranced, when the music gradually died down to a plaintive, almost crying, sound which almost brought tears to my eyes. When the "concert" was over I returned to the 'phones and I had hardly adjusted them when Münchhausen spoke: "Good evening, my dear Alier, how is old Mother Earth and yourself to-night? Sorry you can't tell me, at any rate I trust all is well! I hope you enjoyed my little musicale, there has never been *such* music on earth, to my knowledge. Too bad the telegraphone wire to the moon is so short, otherwise I would have given you a longer program. At any rate, I am certain you liked my little concert. Of course, now that you have heard Martian music you would like to know how it is produced. If I were not so far famed for my veracity I should certainly run the risk of being called something less well sounding than a story teller, but I know you will not question my statements. The undisputable facts are that the music which you just heard was produced from a solid transparent *Tos* rod, about ¼ inch thick and almost 8 feet high. At each end of this rod there is a coil which looks like a big terrestrial magnet coil. It has, however, about 14 distinct

"* * * * * the Ruler of the Planet Mars Was 'Reading' His Morning Correspondence."

Copyright, 1915, by H. Gernsback. All rights reserved.

and separate windings. The ends of these windings go to a sort of switchboard which has a triple keyboard like an organ, and both coils are connected to this organ-like instrument. By depressing a key a certain pulsating current is sent through one of the coils. This in turn sets up Eddy currents in the Tos rod, which is, of course, conductive. These stresses in the rod set up vibrations and cause the rod to swing like a piano string—sound is the result. By using different frequencies different sounds are produced. When both coils are operated at the same time interferences take place within the rod, causing the sound to change in its quality. Thus by operating the two coils while changing the current intensity and by using different amplitudes, most every imaginable as well as unimaginable sound can be obtained. It is thus easy to imitate a cornet or a xylophone in their true musical values. Nor is this all, for the rod can be made to sing and trill, and it can be made to actually speak words; a good player is able to imitate the spoken or the singing voice of any living Martian equally as well as a lifeless, black phonograph disc on earth, can be made to sing the most difficult aria.

Nor does the wonder stop here. By using a sufficient amount of power the sounds can be intensified to such a degree that music emanating from a Tos rod can be heard plainly over a distance of 10 miles. Indeed, all outdoor concerts on Mars are given by means of a single Tos rod. In only one case have I seen two rods being operated simultaneously. The effect in this instance was overwhelming; it was like listening to a thousand-man orchestra and to a dozen tenors all going at one time.

But this is not all. You know that if a rod is vibrated at a sufficient frequency it will sound a certain note. The faster it vibrates the higher the note will be. If we keep on increasing the speed or vibration we finally arrive at a stage where the note is so high that the human ear is no longer capable of hearing it. If we keep on increasing the frequency, higher and higher, a stage is finally reached where the rod sends out waves that have the velocity of light and electricity—186,000 miles a second. This, of course, is well known to your physicists on earth.

Now, then, it is this principle that the Martians make use of in supplying the music loving people of Mars with wireless concerts. The operation is simple indeed.

Not far from the equator of the planet a central music plant is operated by a single Martian, who, of course, is a musical genius. He operates one of the organ-like instruments of which I spoke before. The "plant" comprises besides the instrument, two Tos rods each 20 feet high. These rods work exactly as the ones just described, except that they are operated at an enormous frequency. I have stood in front of them while they were operating, so close, in fact, that I could have touched both rods with my hands. However, my ears detected not the slightest sound. But, incredible as it seems, millions of Martians were listening to the wonderful music at that minute, produced by these same rods, *but not with their ears.* They were listening with their brains!

I told you a few days ago, how, when we first landed on Mars, we had been amazed to "hear" snatches of a wonderful music inside of our heads. What we had been hearing was the wireless music originating from these two Tos rods some 2,000 miles distant! Of course, wireless music is nothing new; the sounds of voices and music having been wafted over thousands of miles on earth already, but your scientists still require huge aerial wires with which to catch the waves. And these waves are, of course, not audible themselves to our ears. You are still using a variety of coils, detectors, telephone receivers and

OUR scientists of to-day as a rule ridicule any attempt of thought transmission and not without good reason, for there does not seem to exist any authentic case on record where thoughts have actually been transmitted freely between two individuals. But, in view of the fact that during the last 20 years we have learned how to transmit wireless impulses through the ether without the use of intervening wires, is it not possible to conceive that given sufficiently sensitive apparatus we will some day find it possible to transmit our thoughts through free space? Baron Münchhausen throws a new light upon this fascinating problem. We are confident that you will enjoy this instalment.

what not in order to translate these wireless waves into sound waves in order that your ear may hear them.

Not so on Mars. Every Martian is required, for reasons which you will understand presently, to wear a peculiar soft metallic cap. From the back of the latter a thin metallic cable runs down the Martian's back and is fastened there to his metallic coat. All Martian clothing, as well as footgear, is invariably of metallic weave. Now as all pavements and all flooring, carpets, as well as rugs, are metallic on Mars, for reasons which will be apparent to you later, a metallic connection with the earth or "ground" is always effected.

The metallic cable of which I just spoke does not make contact with the cap itself, but it is insulated therefrom. It connects, however, with a small reddish metallic plate about the size of an American silver dollar. This plate in turn, by means of a flat spring, presses against the temple of the wearer; the cap itself holds the plate in place. A similar plate presses against the other temple, but this plate, unlike the other, is connected metallicly to the cap itself. From this description you will gather that the metallic cap performs the function of a wireless aerial, while the metallic clothing forms the ground. The two reddish plates pressing against the bare temples are made of two metals unknown on earth, and the metals are distributed over the surface of the plate in honeycomb fashion without touching each other. Now if the two plates are pressed against the temples and when wireless waves are passing through them, the waves are translated into vibrations of a certain frequency. It has been found that if these vibrations reach the conscious sense of hearing which is located in the *Temporal Lobe* of the brain, sounds can be impressed upon the brain without requiring the ear and its auditory nerve. In other words, the sound is "heard" directly within the brain without the agency of the ear's mechanism.

If this should be somewhat hazy to you a homely (though inaccurate) illustration will not be amiss here. At first blush one would think that the ear is absolutely essential for hearing, but this is not the case. Try the following simple experiment: Stop up both your ears as tightly as possible with cotton so that you will not hear a sound from outside. If you are partly deaf—and I trust you are not—all the better for the experiment. Place a darning needle between your teeth by biting on it hard and take care that your lips do not touch the needle. The needle itself should project about 1 inch from your mouth. Now operate an ordinary disc phonograph and with care press down upon the record with the needle's point held at the same angle as the reproducer's needle is held ordinarily. Your whole brain will be filled immediately with music, exceedingly loud and clear. Of course, in this case you still hear with your ear's mechanism, the sound vibrations being carried to the eardrum through the bones of the head; but it is interesting to note that if a truly deaf person tries the experiment he will be enabled to "sense" the sounds, although not perfectly.

Of course, the function of the Martian apparatus is based on an entirely different principle, and the above experiment is only cited by way of comparison.

It goes without saying that these little red honeycombed plates, pressing against the temples are wonderfully sensitive to etheric waves; in that they exceed enormously the most sensitive wireless detector ever invented by your scientists. But not only do these wonderful temple plates serve to bring distant music to the Martian's brain, but they still have a more important function. The fact was already mentioned to you how we first made our acquaintance with thought transmission and how we found it impossible to transfer thoughts without the caps being on our heads.

The act of thinking, as we know it and as has been understood on earth for a long time, is merely the action of certain nerves stimulating certain brain centers. The harder we think the stronger the stimulation. This stimulation in turn sets up an undulatory motion in the effected brain cells, with the result that these cells must of necessity vibrate like a piano wire. But anything that vibrates—no matter what the frequency—must set up waves. Thus we come to the conclusion that the act of thinking must set up certain waves. Now if we can find a medium by which it is possible to detect these waves it becomes as simple a matter of transmitting the thought waves as any other wave.

The medium of detecting these "brain-waves" is found in the Martian temple plates, enormously sensitive to the brain's short wave lengths. But not only do these composite metal temple plates detect the "brain-waves," but they translate them directly into a longer etheric wave length, which in turn is shot out into space similar to a wireless message. While these waves are fairly strong, their intensity is not sufficient to carry them over great distances. As a matter of fact, thoughts have only been transmitted for a distance equaling about 10 terrestrial miles on Mars. And even this was exceptional, extra high sensitive apparatus being used at the time for the experiments. As a rule the Martians do not project their thoughts over 50 terrestrial yards, as the confusion and clashing of the many waves would otherwise become too great. If a number of Martians are assembled in one room they can converse very nicely by thought transmission without interfering with one another.

(*Continued on page 523.*)

How "Wireless Wiz" Welcomed the New Year

By Thomas Benson

I WAS sleepy that night as I sat "listening in" at my wireless to N.A.A. shooting code stuff, and it seemed a sort of dream when about 11 o'clock I heard the "Wiz" break in. His spark note rose rapidly as the rotary gap picked up, and he began to rattle the ether with my call. I O. K.'d him and took down: "Say, old man, I just finished doping out a cracker-jack party for New Year's; come over to-morrow and help me install the junk, will you?"

"Sure!!"—and my spark seemed to wink at me as much as to say: "Some party, fellow," as I pounded the key in reply. "I was wondering why you called so late," I added.

"Oh, I had some battle getting all this arranged, but it will be worth it; now don't forget, come over early!" His code was shaky in spots, and I could imagine him laughing to himself as he handled the lightning, for I knew the "Wiz" of old; the "Wireless Wizard" the neighbors called him.

* * * * * * * *

"Oh! Tom, I'm getting frightened," whispered a trembling voice in my ear as the eventful evening came and we were approaching the Wizard's home. "I'm really afraid of Jim and the tricks he plays on us."

"Too late to think of that, girlie," I replied, reassured by my knowledge of the surprises awaiting us, and I held her the least bit tighter and told her to keep her nerve up, for the male of the species is always courageous when he knows what's coming off!

We mounted the steps and rang the bell. Suddenly, as if by magic, there appeared in letters of fire on the door: "ENTER, YE OF BOLD HEART." Then slowly and mysteriously it swung open.

With a much-scared girl on my arm, I walked into the hall. It was a masked party, and the "Wiz" stepped forward, garbed as Satan, to meet us; and as he led me up to the cloakroom I noted that he seemed to be a living flame, for he was glowing like fire. Most of the others were already there, and it was a great sight to see a *bearded pirate* discussing the heterodyne receiver with *George Washington*, a *straw-chewing farmer* showing the latest fancy steps to an *African chieftain*.

After removing my coat and hat and standing forth as a Spanish bull fighter, I looked around for the "Wiz," who then led us to the Altar of Mystery, in the Chapel of Spirit Worship.

That room was certainly "classy," with its cornshocks, which stood around it on a floor that shone like glass. Imitation logs were arranged along the wall for seats, and the ceiling was draped in a flimsy gray cloth, through which glimmered the light from numerous concealed red and yellow electric bulbs. The girls waiting for the dance seemed like fairies in the dull, soft glow of this cleverly arranged grotto.

A piano started to play somewhere, and as the dancers swayed to the sound of the latest music the notes seemed to come from nowhere in particular. At times it seemed as though the piano was in the basement; at others overhead, in one corner, then another, and everywhere at once.

It was a smiling crowd that retired to the rustic seats after the music stopped, and they waited with unconcealed expectation for the next move. I was watching the silver lemonade pitcher that was tempting me, but I knew better than to attempt to drink any. An unsuspecting guest finally strolled over and seized the ladle. "Ouch! Wow!" and he staggered back 'mid the laughter of the rest. He decided then that he'd forego the lemonade.

The "Wiz" then dragged a tub of water to the middle of the room and tossed in a couple of apples, and the girls started to bob for them. The apples appeared to possess real life, for when approached they would suddenly sink to the bottom only to fly to the surface again. At times they would spin rapidly. The astonishment occasioned by their antics was shared in by all. Then the music started again and the tub was removed as the dancers glided away.

Next the "Wiz" stepped to the center of the room with a hand full of fans and a large balloon. He blew a whistle and instantly the lights were extinguished, and it was a wonderful sight as he stood there with the fans and balloon glowing in the light from the geissler tubes that shed their variegated colors about us.

Two hoops glowed on the walls at both ends of the room and the "Wiz" handed

". . . . . At the Last Stroke of Twelve Bedlam Broke Loose! A Fire Gong Started to Ring, Whistles Were Blowing, and the Centre-Piece Exploded."

the fans around and started a game of aero tennis. The party were divided into two teams and each endeavored to blow the balloon through their opponent's hoop. The game was getting exciting with the score tied, when supper was announced.

The doors were thrown open and the guests gaily tripped into the dining room. Here the "Wiz" had quite outdone himself. The table was decorated with miniature pumpkin heads, electrically lighted, and geissler tubes glowed at every plate. The place cards gave forth a weird phosphorescent glow.

The feast went gaily on without incident; as a lull before the storm. Nothing happened till a clock struck twelve.

At the last stroke bedlam broke loose! A fire gong started to ring, the lights went out, whistles were blowing, the centerpiece exploded—throwing the flowers in all directions. Red and green lights blazed forth in all corners of the room.

The figures "1916" stood out in relief on the shirt bosom of the "Wiz."

Then all was quiet. Suddenly mysterious rappings began to be heard, which seemed to be coming from the table. "Hark," muttered a sepulchral voice, "I, the Spirit of the NEW YEAR am here to do your bidding. I am ready to answer your questions."

One after another we all asked questions, the answers following immediately, and they were tinged with not a little sarcasm that kept the crowd in roars of laughter. I smiled to myself as I noticed the strained look on the Wizard's face as he talked under his breath. He had a microphone fastened to his *chest*, and was answering the questions as fast as they came.

Tiring of this we returned to the parlor, where the music had started again.

"Now," announced the "Wiz" amid many Ha! Ha's! and Tee-Hee's! on the part of the girls, "I am going to show each lady present her future husband," and he led them one at a time into a small room decorated like a cave. In the center burned a charcoal brazier on which he tossed dead leaves, a little incense and a hair from the girl's head. He stood over this muttering incantations. Slowly but surely a face took form in the vapor arising from the fire.

After each overawed, shivering girl had seen her future mate the music struck up "Home, Sweet Home," and the guests prepared to leave.

It was a merry crowd that prepared to leave the "Wiz" that evening, and as the guests were passing out the front door a mysterious gust of air blew their hats off and sent them helter-skelter down the street after them.

After the adieus were spoken and as they started home they were enveloped in a flood of white light from the Wizard's powerful electric searchlight mounted on the roof, and I can still see them as they disappeared from sight with their varicolored suits and the tinkle of bells on their costumes.

I had stayed to say a few words to the "Wiz," and as he came into the room he sank into a chair with a sigh, looking tired and as glum as an owl.

"What's the matter, Jim?" I asked, "we had some time to-night, cheer up!"

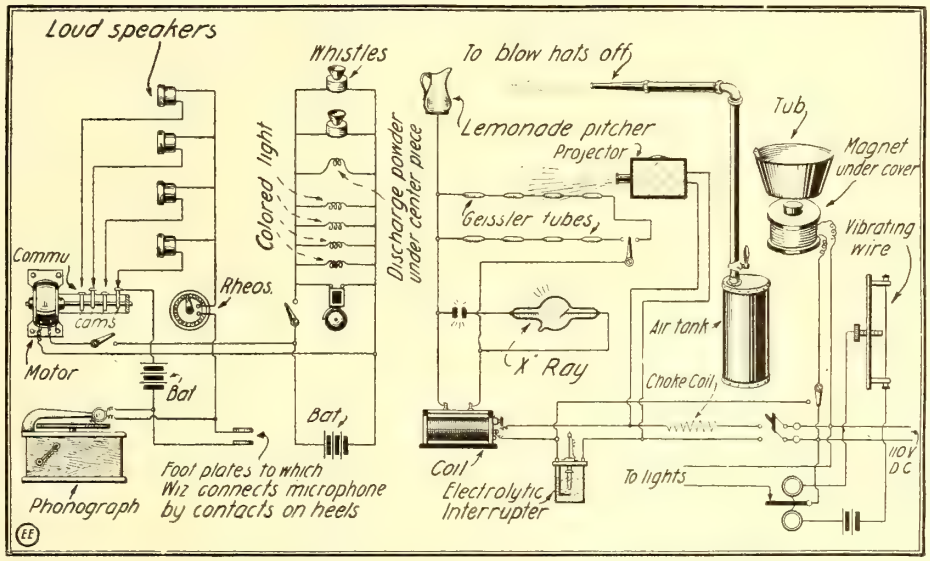
He looked at me in such a pitying way I couldn't help smiling.

"Yes," said he, "but do you realize it is a whole year till next New Years. I'm going to bed. Good night!!"

THE MODUS OPERANDI.

It was several days later before I saw the "Wiz," surrounded by a crowd of youths at the headquarters of the *Gee-Whiz Wireless Association*. They were firing questions right and left and he was at his wits' end to answer them. "Go easy boys," he fairly shouted. "I will send you all a blue-print of how it was done; but meanwhile you can look over this hook-up," and he handed them a sheet similar to the drawing we find here. "Yes, sir, but explain!" they replied simultaneously, and the "Wiz" tackled the job without blinking an eyelash.

"It was all very easy," he went on. "The music was supplied by a phonograph in the basement and four loud-talking telephone receivers did the rest. These were connected up to a commutator and a motor so that the current could be switched from one to the other automatically, and that explains why the music seemed to change its source continuously. I had a 4-inch spark coil, which supplied the high tension current for the lemonade pitcher and the geissler tubes. The apples in the tub contained short steel cylinders stuck in them; by means of a switch in the corner and a large electro-magnet under the floor I was able to make the apples behave in a mystifying manner.



"To extinguish the lights when I blew the whistle I had a tightly strung steel wire tuned to the pitch of my whistle which vibrated, due to the sound waves. This made contact with a fine adjusting screw and operated a relay, thereby extinguishing the lights. As to seeing the faces in the smoke arising from the brazier, that was a cinch. I had a parlor projector concealed behind the draperies and I had a common photograph which was thrown on the smoke, which served as the screen. The girl who saw the picture unconsciously picked out its resemblance to some particular friend of hers and practically kidded herself that he was her future husband, what! The red and green lights around the dining room were easily provided for, as you can well imagine.

"I had a fine wire imbedded in the powder and on closing the switch it was ignited on the table centerpiece. The slight, harmless explosion sent the flowers in all directions and a gong and two whistles completed the noise manufacturing equipment. A nozzle connected to my blow pipe compressed air tank served to blow your hats off as you were going out the door."

"Yes, sir," a wise one among them asked, "but explain that lettering on the front door." "Sodium Tungstate," was the curt reply, "and an X-ray tube concealed on the ceiling served to make a glow when I closed the proper switch. I also used this chemical to write the place cards; to cover the balloon and fans, and I furthermore had quite a large amount of it smeared on my costume.

"The figures '1916' on my shirt front were easily arranged by cutting them out of thick black cloth and securing them to the inside of the celluloid bosom by a little glue. A couple of battery lamps placed inside the shirt and fed from a flashlight battery in my pocket did the trick."

"Oh, yes, it's as clear as mud," another one exclaimed, "but how in the name of the seven stars of the constellation were those questions answered by that supposed Spirit?" "Don't you read the *Electrical Experimenter?*" answered the "Wiz." "I got the idea from that article where they described how the aviators communicate by means of microphones strapped on their chests. So I had a delicate telephone transmitter fastened on my chest and by means of two brass plates on my heels I made connection to the loud-talking telephone circuit," and with a parting smile he left them to puzzle out the other details for themselves.

Diagrammatic Lay-Out of the Electrical Novelties Used for New Year's Party by the "Wireless Wiz."

BIRDSBORO, PA., BOY SCOUTS WORK WIRELESS.

Finishing the week of life outdoors, as required by the rules of the organization, the Birdsboro, Pa., Boy Scouts held the last camp of the year at Neiman's Pond, near Laurel Hill Canal locks.

There was a good attendance and Scout Master Charles Brooke, who had charge of the lads, was well pleased with their conduct and the work they did in conformity with the organization regulations.

The camp was situated upon a hilltop, about one-half mile from the canal, the location being selected for the purpose of erecting a high wireless aerial. This was a new and the most interesting feature of the camp. In an hour after reaching the camp site the wireless corps was in communication with Pottstown, League Island and Washington, D. C., and several amateur stations in these places held conversations with Scout Master Brooke, who is a competent operator. The field set of equipment used was found especially serviceable, light and easily portable, also extremely efficient, loud and distinct.

Perpetual Motion, the Folly of the Ages

By H. Winfield Secor, E.E.

Untold Numbers of Inventors and Even Scientists Have in Years Past, and at the Present Time, Devoted a Vast Amount of Study to the Perfection of a Perpetual Motion Machine—The Problem Remains Unsolved, However, to This Day

PERPETUAL motion is the will-o'-the-wisp that has occupied many brilliant minds in the centuries past, as well as at the present time, and, while we of this age are not entitled, perhaps, to say definitely that all such ideas are absolute folly and baseless from a strictly scientific and physical standpoint, it is pretty thoroughly understood by all well-schooled engineers and inventors of today that there is practically no such thing as *perpetual motion*, in the general sense of the word. Perpetual motion is a very misleading term as applied in various senses, and in treating such a subject as this the confining limits of the points involved should be thoroughly understood. Some theorists and would-be scientists will propose such ideas or phenomena as the light of the sun, ocean waves, rotation of the earth, and what not, as the embodiment of perpetual motion. However, the hundreds, and undoubtedly thousands, of more or less well-trained minds that have endeavored to solve this much-talked-of problem of perpetual motions have invariably had in mind some mechanical, electrical or other machine which, when once started in motion, would continue producing this motion indefinitely, or to the end of time. So far no machine or allied device of any description has been perfected or produced, but several quite remarkable phenomena taking place in nature will be mentioned herein which approach this much-desired goal of inventors past and present.

An old engraving illustrating a "Perpetual Motion" scheme taken from the German work, "Das Perpetuum Mobile," by Andr. Bodler.

This arrangement was supposed to work as follows: The tank of water A discharged through a nozzle on to the water wheel C. This turned the shaft and worm D, likewise the gears E, E, and also the vertical shaft H. Attached to H is a balance wheel K and a pinion I, driving gear L, shaft M and gear wheel R. The latter meshed with the pinion H (at right) secured to the hollow worm Q, thus pumping the water back into tank A. This amazing machine was claimed not only to go on forever, but also to "deliver power," as for driving the grindstone here pictured.

Many extremely amusing situations have occurred between scientists and would-be inventors of perpetual motion machines, and a few of these instances are here cited which may be of more than passing interest to those who have been or who are now thinking along this line.

One of these stories is related of how an inventor of a certain machine betook himself to a mechanical engineer for advice on same. The machine in question was supposed to multiply power and the inventor of this device maintained that if one horsepower of energy was applied to a pulley on one end of the mechanism, then 20 horsepower could be taken from a second pulley placed on the other end of the combination. The engineer asked the inventor if he believed in perpetual motion, and he replied, "Certainly not."

"Well," said the engineer, "if you use one of the 20 horsepower you claim to produce, you will have 19 horsepower left for other work, will you not?"

"Yes," replied the inventor.

"Then take one horsepower from the pulley which will deliver 20 horsepower and drive the other end of the machine requiring but one horsepower, as you mention, and you will then have perpetual motion!"

It is said that the inventor departed forthwith with without even unrolling his drawings.

Again, there is nothing wrong with trying to tap any of nature's reservoirs, but what is wrong is when we try to make 2 plus 2 equal 5 mechanically. It is a consoling fact, indeed, that we should know, as we do know, that an accountant's balance sheet is always possible for any mechanical operation. On the one side we have the money paid in, that is the horsepower available; while on the other side we have the money paid out; that is the work done and the energy wasted; the two sides must balance one with the other eventually. For a given horsepower put into a certain device or machine we are entitled to look for a strict accounting of energy expended by this machine. The final results must show so much work done plus so much wasted, avoidably or unavoidably, and the work done plus the work wasted must in every case equal the work originally put in. Also there must be no pretense made or assumed that any amount of the energy has mysteriously disappeared—in other words, there must be no allegation that the books will not balance.

The inventors of so-called perpetual motion machines have, from time immemorial, evinced a partial or total disregard of the basic laws of physics and mechanics. The term "friction," for one thing, seems to have found no place at all in their vocabulary or knowledge of science. If it had, indeed there would never have been patents issued and whole volumes written covering their early research work or, for that matter, the present-day research on such impossible appliances or machines as we feel called upon to name them in the light of our present-day knowledge of the aforementioned branches of science.

When one of these perpetual motion inventors can show us a machine that will operate absolutely *without friction* and in direct defiance of the *laws of gravity*, and, considering these terms in all their multi-

farious and multitudinous phases, in which we are compelled to apply them to all man-made devices and apparatus, then you will probably see such a machine, which will keep in operation forever.

It will probably bring out the point at issue more clearly if we consider a number

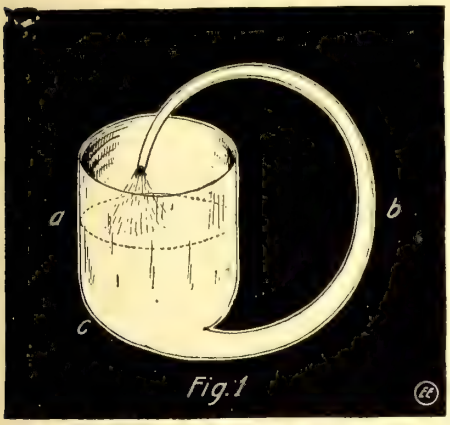

Fig. 1. In This Simple Device the Water in "a" Was Supposed to Overbalance the Smaller Column "b," Causing it to Spout Out Into "a," Ad Infinitum.

of the ingenious ways and methods called into play by the various investigators of this phenomena and consider carefully the deficiencies in same and the reasons therefor.

Referring to Fig. 1, there is observed a hydrostatic device which is supposed to keep on operating forever, and this was invented at an early date. It has been promulgated and adopted over and over again by many sanguine inventors, and it was proposed at one time by the Abbé de la Roque, of France, in 1686. The device comprises a glass vessel of the form shown in the illustration, and, as perceived, the section B is made much smaller than the portion A. When water is placed in the larger chamber A it is, on account of its greater volume and weight, supposed to easily counterbalance the small column of water in the portion B, and hence the liquid would be forced up through the restricted tube section beyond B, and thus discharged back into the bowl A. This is supposed to keep up until the water is evaporated. Needless to say, the inventor, or rather inventors of this apparently remarkable device were con-

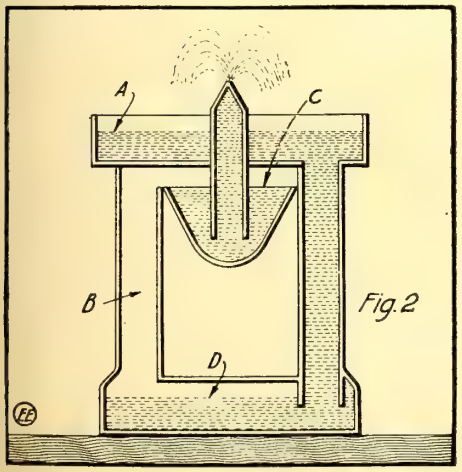

Fig. 2. Hero's Fountain, a Hydro-Static Contrivance Often Considered as a Solution to the Perpetual Motion Problem.

founded when an actual trial demonstrated beyond the shadow of a doubt that the device would not, under any conditions, operate on account of the fact that the liquid maintained an equal level in the chambers A and B in accordance with the well-known laws of hydrostatics. Simply explained, the air pressure per unit surface area remains the same, or, roughly, 15 pounds per square inch. Gravity aids in establishing equal levels in the two chambers or tubes. Reference to any book on physics will serve to clear up this matter thoroughly.

In this direction there was another form of hydrostatic perpetual motion device, known as Hero's Fountain. The sketch at Fig. 2 shows the arrangement of this device, which comprises an upper chamber, A, open to the atmosphere, which chamber is filled with water. The water also passed from this chamber down through a tube or pipe into a lower receptacle D. The pressure was supposed to be transmitted from the water in this way so as to compress the air in chamber B, and thus react on a second water basin C, and thus the liquid was supposed to be forced out of the nozzle at the top of the fountain, as the illustration shows. If such a device would work, needless to say the problem of perpetual motion would have been solved long ago, for this idea dates back hundreds of years. (If the upper basin is larger than the inner one, then the device will operate for a while.)

Electricity, owing to the fact that it has always been but very vaguely understood, even by some of those skilled to a high de-

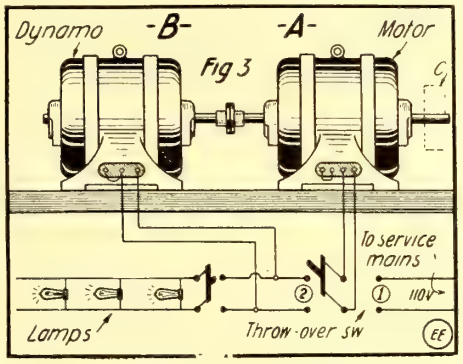

Fig. 3. An Electric Dynamo and Motor, Connected Together, Are Expected to Operate Each Other, and to Even Supply Outside Energy, by Many Amateur Electricians.

gree in the art, has caused a great many students of this branch of science to burn a vast amount of midnight oil in trying to perfect a device employing electricity in some form or other that would keep on the "go" forever.

Among amateur electricians undoubtedly one of the standard forms of this "pipe dream" is that shown at Fig. 3. This necessitates the use of a motor and dynamo connected together in some way or other so that after once starting same from some external source of energy the dynamo will generate the current for driving the motor, and, considering that they are finally interconnected, the motor will in turn drive the dynamo. Thus they will keep on working forever, ad infinitum. To the thorough electrical student this proposed scheme is, of course, absolutely fallacious and ridiculous. In accordance with the well-known law covering the conservation of energy, which states that matter or energy can never be made or destroyed, and also that it is manifestly impossible, at least in our age, to construct a machine that will operate at 100 per cent. efficiency, *without any waste of energy whatsoever,* it will be seen that it is utterly hopeless to think for one moment that such a combination can be made to operate for even a few seconds, let alone months and years, as some inventors fondly think.

As a matter of fact, and to thoroughly bring out the defaults of this arrangement, authentic data is here cited covering the actual performance of such a motor-generator set.

Let us consider that the motor used to drive the dynamo by direct coupling, which is the most efficient method of mechanically connecting the machine, is rated at five horsepower. This considers the five horsepower rating of the motor mechanically at

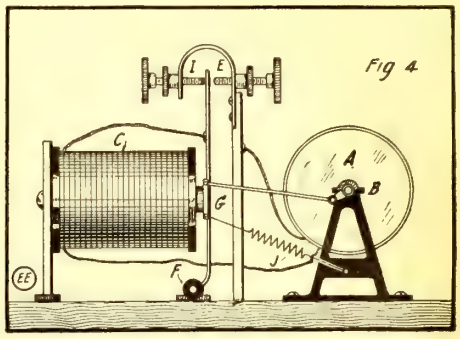

Fig. 4. Electrical Perpetual Motion Machine of an Early Vintage. A Static Generator A Excites the Magnet Coil C, Whose Circuit is Opened and Closed by Contacts E and I.

the driving pulley or shaft. From careful tests made on such machines the relation of the input of the electrical energy to the output of mechanical energy is practically 80 per cent. for this size unit. Hence, if the motor is rated at five mechanical horsepower (in accordance with the rated efficiency), then the electrical input on the motor must be 6¼ horsepower. Considering the aforementioned efficiency loss, the one horsepower is consumed in bearings, windage, copper and iron losses in the motor. There is also some over-all coupling loss in such motor generator sets, and the dynamos are never rated, in properly designed outfits, to correspond with the horsepower output of the motor. If we allow 10 per cent. difference between the mechanical horsepower developed by the motor and the dynamo input, we will then have allowable for this latter value 4.5 mechanical horsepower. Considering, now, that the dynamo has an efficiency of 80 per cent. (for the conversion of mechanical into electrical energy), then it will have an output of 4.5 horsepower times 80 per cent., or 3.6 horsepower. Recapitulating, it is now evident that the gross over-all efficiency of the motor generator set is 3.6 divided by 6.25, or 57.6 per cent.

If the dream of this perpetual motion

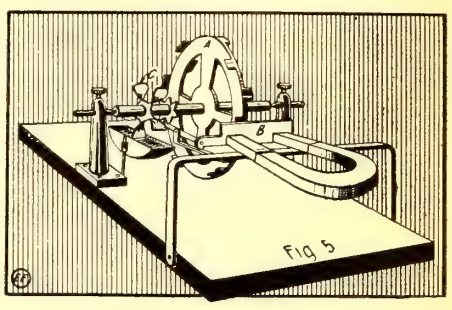

Fig. 5. Another Electrical Wonder Expected to Revolve Forever. A Magnetic Insulator Cuts On and Off the Flux from the Steel Magnet as Perceived.

scheme is to be realized, it will have to be under conditions that will allow of no loss whatsoever, even to the smallest degree; and, of course, as every well-informed electrician knows, this is out of the question. Some of the inventors and re-inventors of this scheme have even claimed that lamps

can be lighted from the dynamo, as well as driving the motor from the same source of energy, and our sketch, Fig. 3, shows this proposed innovation.

There have been thousands of mechanical devices devised to realize the perpetual motion goal, but none of them have proved successful in actual tests. It may be of interest to state that the United States Patent Office experienced no end of trouble with this class of patents and proposed patents some years back, but the annoyance became so pronounced that finally a rule was passed that a "model" of such proposed patents would have to be submitted. Needless to say that this has put a quietus on the perpetual motion dreamer, as there has never yet been submitted to the Patent Office a machine which would keep moving for any appreciable length of time, for the several mechanical and physical reasons well known to any student of the science.

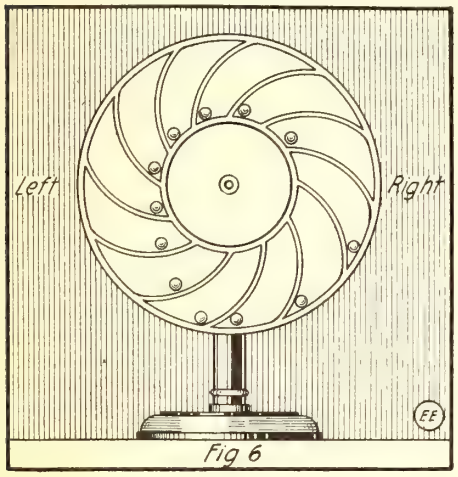

Fig. 6. The Ever-Changing Center of Gravity of the Various Balls in This Multi-Path Wheel Was Expected to Cause It to Rotate Perpetually.

For the benefit of those who have not studied the problem from a mechanical viewpoint it may be worth while to look into the cold facts of "friction." In practically all, or nearly all, of the devices of various types intended to operate forever, there has always been a very appreciable amount of friction to be overcome and which fact was apparently totally ignored in designing the machine. The friction might be very small indeed in the machine, but *it is there invariably*, and cannot be gotten rid of by any method known to us. Some have tried to realize the long-sought-for goal of 100 per cent. efficiency by utilizing devices employing a number of gears —from two to three, and sometimes a dozen or more. As machine designers well know, there is not, nor never has been, a gear train of no matter how few gears that would transmit mechanical energy in a reduced or intensified form (as regards velocity) without some loss of energy in friction and tooth slippage in the gear action. The efficiency of a small gear train may vary from 80 to 86 per cent. or more for medium velocities at the pitch line of the gear. Any machine design or mechanical engineer's handbook will give this data in lucid form, and it has been compiled from many observations and extremely careful tests conducted in laboratories of the leading universities and colleges, which are thoroughly equipped for this work.

Andre Marie Ampère

Born January 22, 1775. Died June 10, 1836

TO this early scientist and investigator, born at Lyons, France, in the year 1775, is due the credit of first discovering the magnetic action taking place between two separate and independent circuits carrying electric currents. He made this discovery shortly after Oersted had found that a wire carrying a current wrapped around an iron core would produce magnetism. With apparatus that was more or less limited he formulated several important laws that are still accepted as being correct in every detail.

The following are the laws discovered and formulated by Ampère:

(a) Two parallel portions of a circuit attract one another if the currents in them are flowing in the same direction, and repel one another if the currents flow in opposite directions.

This law is true whether the parallel wires form parts of two different circuits or parts of the same circuit. The separate turns of a spiral coil, when traversed by a current, attract one another because the current moves in the same direction in adjacent parts of the circuit; such a coil, therefore, contracts when a current is sent through it.

(b) Two portions of circuits crossing one another obliquely attract one another if both the currents run either toward or from the point of crossing, and repel one another if one runs to and the other from that point.

(c) When an element of a circuit exerts a force on another element of a circuit, that force always tends to urge the latter in a direction at right angles to its own direction. Thus, in the case of two parallel circuits the force of attraction or repulsion acts at right angles to the currents themselves.

(d) The force exerted between two parallel portions of circuits is proportional to the product of the strengths of the two currents, to the length of the portions, and inversely proportional to the distance between them.

From the four preceding experimental data Ampère built up an elaborate mathematical theory, assuming that, in the case of these forces acting apparently at a distance across empty space, the action took place in straight lines between two points, the total attraction being calculated as the sum of the separate attractions on all the different parts. The researches of Faraday have, however, led to other views, and we now regard the mutual attractions and repulsions of currents as being due to actions taking place in the medium which fills the space around and between the conductors.

Andre Marie Ampere, After Whom the "Ampere," Unit of Electrical Current Is Named.

Ampère, finding that solenoids act precisely as magnets, conceived that all magnets are simply collections of currents; or that around every individual molecule of a magnet an electric current is ceaselessly circulating. We know that such currents could not flow perpetually if there is resistance when electricity flows from one molecule to another. As we know nothing about the interior of molecules themselves, we cannot assert that Ampère's supposition is impossible. Since a whirlpool of electricity acts like a magnet, there seems indeed reason to think that magnets may be merely made up of rotating portions of electrified matter.

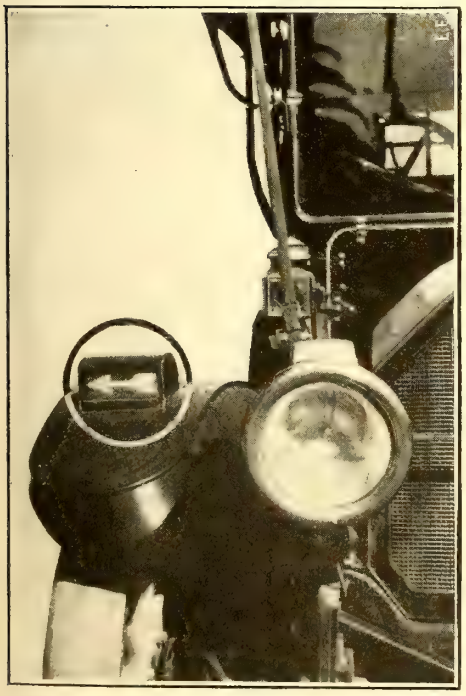
It is worthy of note that Ampère as a boy had very few home advantages, yet by industry and study he managed to acquire a very comprehensive education. When but twenty-six years old the publication of a remarkable series of mathematical papers secured for him the chair of mathematics in the Ecole Polytechnique, of Paris. His knowledge of mathematics was profound and he published a series of memoirs on the mathematical theories of the electro-magnet. This was a task almost beyond human powers at that time, and by successfully accomplishing same he was honored by most of the scientific societies of Europe.

His last work, "Philosophy of the Sciences," showed him to be much less happy in the metaphysical than in his physical and analytical speculations.

In private life Ampère was a man of great simplicity of character and was subject to occasional fits of absent-mindedness, which often made him the subject of much innocent amusement. He was whole-souled and honest, taking no part in petty jealousies, which too frequently disturb the peace of the scientific world even to the present day.

He died universally respected and loved for his great integrity, kindness and scientific abilities. His death, due to a chronic affection of the lungs, came on June 10, 1836. So passed from this world a man who deserves the full admiration of every electrician and experimenter of to-day for his early and excellent basic work in electricity. He paved the way for the rapid progress and development of electro-dynamic machinery.

ELECTRIC FACTORY ON SEA.



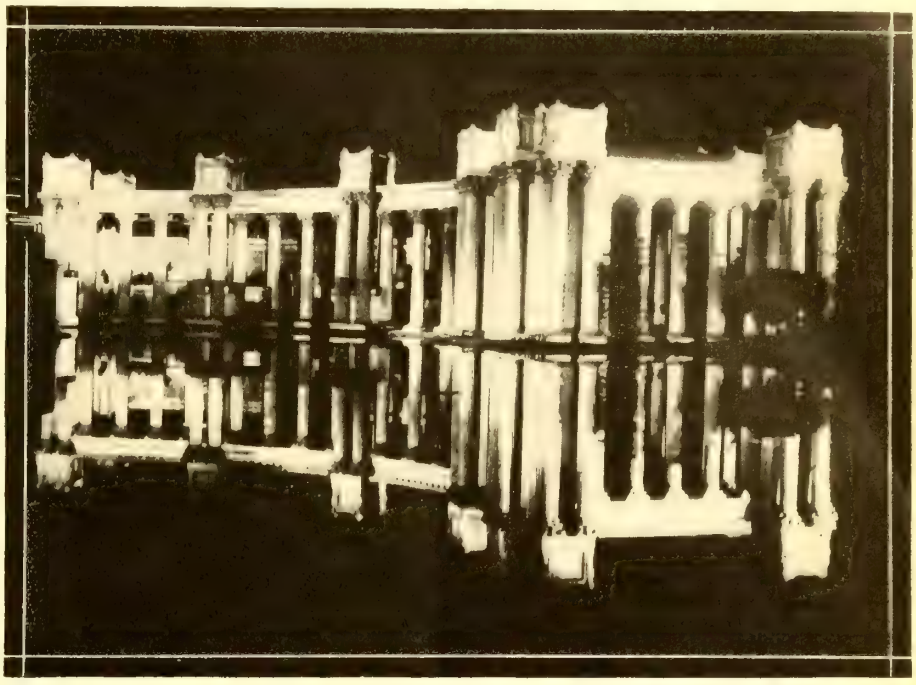
The American ship "Mills" is a floating electrical oil and fertilizer factory. The "Mills" is equipped from stem to stern with electrical machinery. Arc lights and searchlights enable the sailors to catch menhaden fish, similar in appearance to the herring, but not edible. Nets are slung over the side and hauled in by electrical hoists. Electrically driven screw conveyors carry the fish into receiving tanks and automatically feed the steam cookers where the fish are pulped.

The pulp is forced through a rotary press to extract the oil, which is then electrically conveyed into testing tanks, where it is cooled and then carried into storage tanks of 20,000 barrels capacity.

THE LATEST AUTO SIGNAL.

The latest thing in the way of an automobile signal or direction indicator is that recently invented by Ed. E. Peck, of Los Angeles, Cal. This set of signals consists of four small boxes, one of which is placed on the fenders of each of the four wheels of the machine, and which may thus be readily seen from any position.

The operation of this system of signals is extremely simple. When a machine is equipped with this apparatus it is impossible to misunderstand the intention of the driver as to the direction in which he desires turning. If he drives along the street and approaches a corner where he desires to turn to the right he simply turns the little electric switch on the steering wheel to the right. This movement causes the signal over the right front wheel to produce an arrow, as shown in the illustration, indicating that the driver intends turning to the right. At the same time, the two acting simultaneously, the little instrument on the fender over the rear wheel produces the word "Right," so that anyone coming up behind may not be puzzled as to which way the driver of the machine ahead of him is going to take at the next corner. When desiring to turn to the left, the driver simply turns the switch to the "left" position.

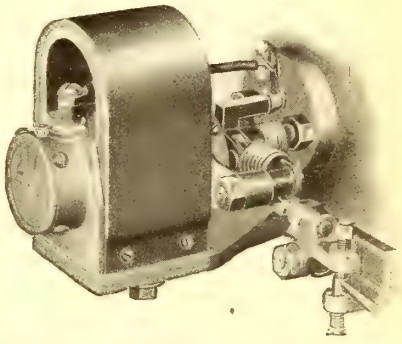


Effective Electric Auto Signal (in Circle) Tells Which Way Driver Intends to Turn.

This signal is so situated that it may readily be seen by the pedestrian and auto driver alike. It is proving quite popular, and promises to be universally adopted before long. The apparatus is waterproof and may be run winter and summer with equally good results.—*Photo by Albert Marple.*

BEAUTIFULLY ILLUMINATED BUILDING AT 'FRISCO EXPOSITION REFLECTS OWN IMAGE.

One of the most brilliantly illuminated buildings at the 'Frisco Exposition is shown in our illustration. This is the Palace of Fine Arts and as observed the reflection in the lagoon at night is so remarkably clear that the picture looks as well upside down as it does right side up. This building is one of those intended to be saved as a memorial of the great exposition, when it shall have closed its doors and will then be no more, except in memory. This picture was taken by the Cardinell-Vincent Co., official photographers of the Pan-American International Exposition.



Almost Perfect Reflection of Wonderfully Illuminated 'Frisco Exposition Building.

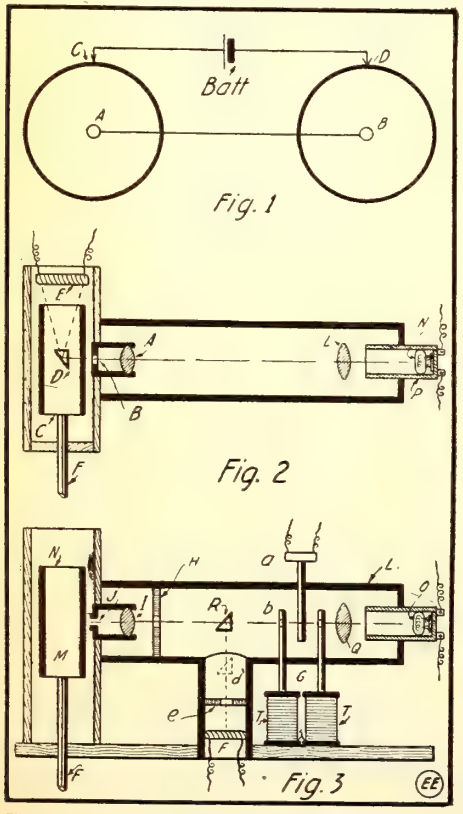
Thousands of deftly hidden electric bulbs create the striking effect here observed, and this was one of the underlying keynotes in the general arrangement of the whole exposition lighting scheme. The age of glaring electric bulbs or, indeed, any highly brilliant source of light, has passed and illuminating engineers of to-day are as one, in the firm opinion that the best light is a diffused one, providing the proper illumination can be obtained without unduly sacrificing the desired brilliancy and illumination efficiency. The glare from unshielded or direct lighting proves a very sever strain on the eyes and one of the greatest American diseases now prevalent, and one that has threatened the health of thousands of people, is thus innocently caused.

Millions of electric bulbs of various sizes, types and shapes served to make the exposition one of the greatest in the annals of history, and it may be truthfully said that it appeared as one great blaze of light against the overhanging mantle of night; a sight once seen, never to be forgotten!

OSCILLATING MAGNETO STARTS GASOLINE ENGINE FROM REST.

The majority of magnetos in use to-day on gas engines are not capable of firing the charge in the cylinder of such engines until they have been speeded up considerably. A novel and important improvement in this line has been brought out by a progressive manufacturer in the form of the Wizard oscillator. This permanent magnet type dynamo is fitted to oil or gasoline engines in such a way that at every stroke of the piston in the engine the electro-magnetic armature of the magneto is rocked through part of a revolution in a rapid manner. As we know, it is possible to produce an electric current with a machine so constructed and in which the armature does not rotate at all. If the armature is turned through, say 90 degrees, against a spring pressure suitably applied to the shaft, and then if a trip or cam allows the electro-magnetic member to fly backward a powerful current will be induced in same. Upon this unique principle, which is thoroughly reliable, of course, there has been developed this new form of machine which, most important of all, permits of starting the engine from an absolute standstill. When the engine is turned over slowly, even through one revolution, a magneto of this type will produce just as hot a spark as will ever be produced when the engine is up to full speed. Thus the use of batteries is done away with. The illustration shows one of these oscillating magnetos mounted on a 2½-HP. floating governor kerosene engine. A standard igniting trip with advance and retard mechanism was used.

Unique Oscillating Magneto for Engine Ignition That Rocks Back and Forth Instead of Rotating.



The Transmission of Photographs Telegraphically

By Samuel Cohen

THE transmission of pictures telegraphically has occupied the minds of many engineers and scientists for the past 60 years, until at present several systems have been perfected, to a degree, and placed upon the market as a commercial product. These machines are at present used by several journals, as the requirements for sending photographs from one place to another requires this service to be very fast.

It seems difficult, at first thought, to conceive how a picture can actually be telegraphed. But a picture, just as a written message, can be split up into more or less minute component parts, thereby making a complete photograph when these parts are combined again.

The transmission of photographs over a wire was promulgated back in 1847, when Bakewells began his research work in this line, and it is upon his system that the three most successful modern methods of picture transmission are based. His apparatus consisted of two synchronously revolving cylinders. Upon one was placed a sheet of tinfoil with the sketch drawn in ink; on the receiving drum there was placed a sheet of paper, prepared chemically, so that on passing an electric current through it a stain was made, due to decomposition of the chemical by the electric current. Fig. 1 shows the general schematic diagram of the apparatus, and it works as follows: When a line in the sketch comes under the stylus C, at cylinder A, the current flowing through the circuit will be broken wherever the cylinder is coated with (shellac) ink; but at such points of the picture where the bare tinfoil lies between the stylus C and the cylinder A the current will readily flow. It therefore flows intermittently through the chemically prepared paper attached to the

Figs. 1, 2 and 3. Telegraphic Picture Transmission Apparatus.

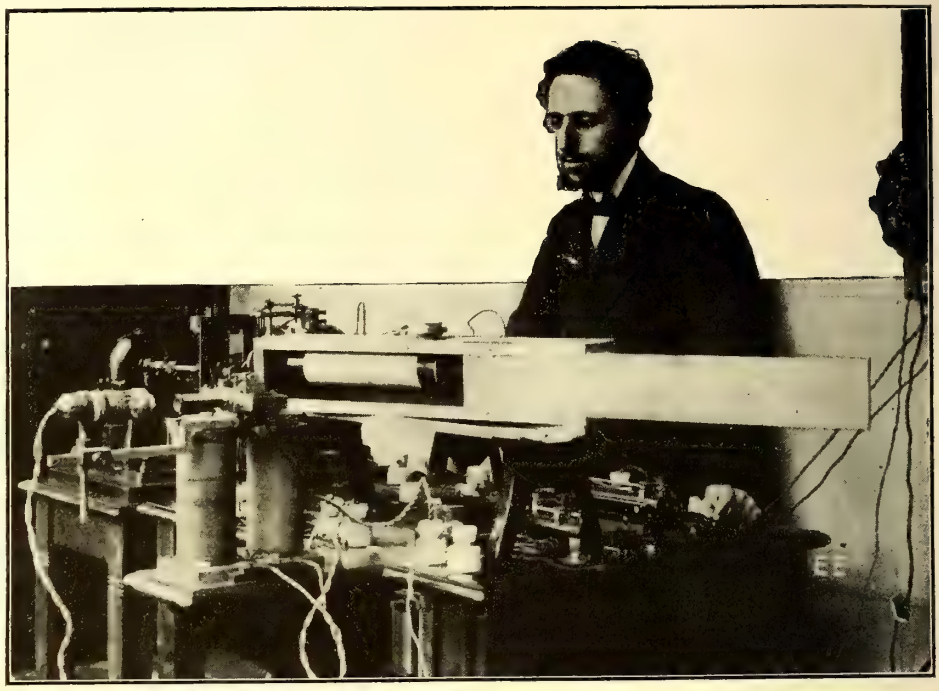
drum B, through the stylus D, and when it flows it makes a (electro-chemical) mark on the paper. Hence, when the stylus has traced over the entire length of the sketch at A, the latter will be finally reproduced at B. Such a system was very readily carried out in the laboratory, but it failed in the commercial field.

Further attempts were made to solve the problem, but it was not until Amstutz and Shelford Bidwell came along and discovered the value of using *selenium*, that mysterious element capable of changing its electrical resistance when exposed to light. The former scheme made use of variations in the strength of electrical current.

The work of these prominent men in this particular field led Professor Korn to develop a new system, and he is to-day the inventor of the most highly perfected machine for transmitting photographs over a wire. His system will be herewith described and is schematically shown in Figs. 2 and 3. The transmitting apparatus consists of a Nernst lamp, N, inserted in a sliding tube, P, provided with the lens L, and in this way a strong beam of light is projected to that part of the apparatus at the left. Here there is placed the lens A, which is mounted in a sliding tube having a small diaphragm at B. This latter comes close up to the glass drum C. Around this drum is wrapped a *positive* photographic film representing the photograph which is to be transmitted. The light passing through certain points of the film is received by a total reflection prism, D, and is sent from thence to the top, where it falls on the surface of the selenium cell E.

As the cylinder is mounted on the rotating shaft F, which operates in the same way as a phonograph cylinder, it revolves and at the same time rises, so that all the points of the image are brought in succession past the beam of light at B. Thus, an opaque point in the film will cut off all the light, and there will be none received on the selenium cell, while a transparent part gives the full light on the cell. The selenium thus receives differing amounts of light, corresponding to each point in the image. As it is connected together with a battery in the line, the distant receiver will receive a current which is variable; these variations following each other in very rapid succession. The receiver then acts according to these changes.

The receiving apparatus employed is outlined in Fig. 3, and it consists of a Nernst lamp, O, and the lens Q, which sends a beam of light toward the left. This beam passes through the apparatus G, which acts upon a galvanometer shutter. G receives the incoming current and serves to cut off more or less of the beam, according to the strength of the current at any instant. The current is received in the upper part (a), which carries the shutter and, moreover, is mounted between the poles of a powerful electromagnet TT. This apparatus is built similarly to the Einthoven galvanometer. The light beam from the Nernst lamp passes through the diaphragm of the galvanometer toward the prism R, on through the screen H, carrying a diaphragm and then passing through the lens I, and small hole J, falling finally upon a photographic film M. This is wrapped about the



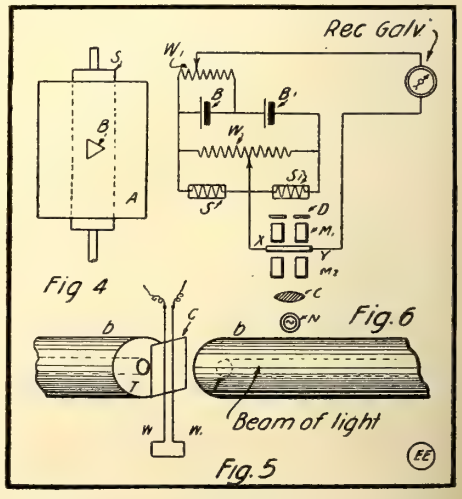


Fig. 7. Prof. Korn and His Apparatus Used in Sending Pictures Over a Wire.

Figs. 4, 5 and 6. Details of Receiving Apparatus.

metal cylinder N, which is rotated at the same speed as that used in the transmitter by means of a synchronous motor. The point of light at J thus acts on the film as it revolves, and as the value of the light corresponds to the white or dark parts of the transmitted picture all the points of the latter are reproduced in succession on the sensitive film; so, finally, we have the whole of the image reproduced. It only remains to remove the film and develop same.

To have the beam of light at the receiver

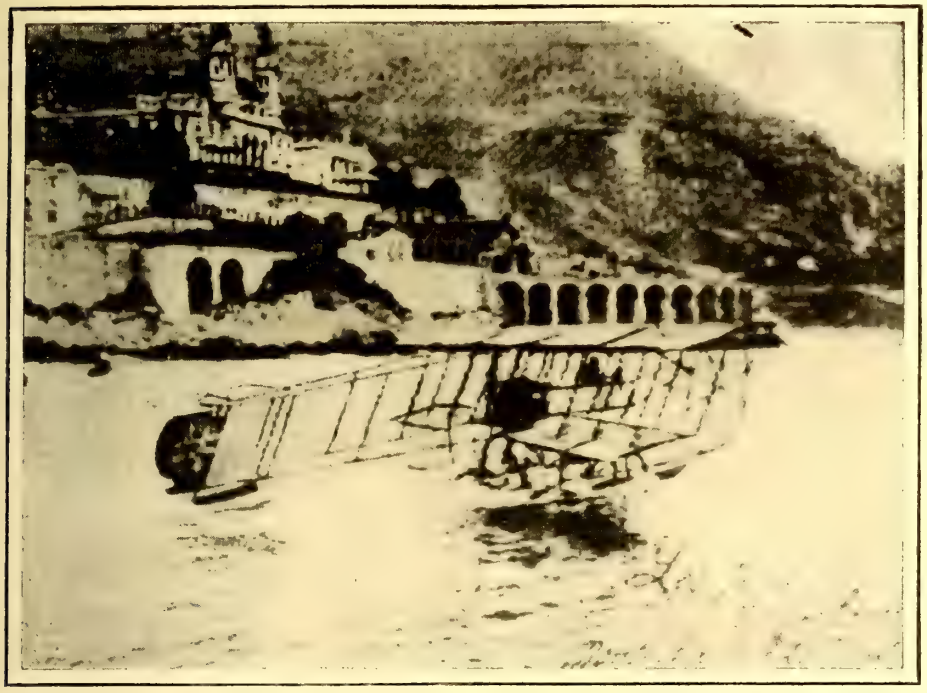

Fig. 9. Actual Reproduced Photograph as Transmitted Over a 400 Mile Telegraph Circuit to a French Newspaper.

correspond exactly to the current values on the line, the swing of the shutter should be proportional to the current, so as to give the proper amount of cut off to the beam of light. But the galvanometer cannot be constructed to have a swing, which is proportional to the current value, and an apparatus to correct this is required. This is depicted in Fig. 4. At A is a screen with a triangular shaped hole, B, which is covered by the shadow of the aluminum shutter C (Fig.

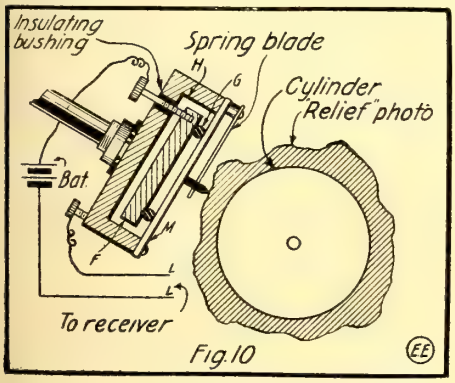

Fig. 10. Microphonic Translating Device for Use With "Relief Negatives."

5); when there is no current passing through wires WW_1. When the shadow moves off the hole the amount of light which is admitted to the lens is varied in a different way from the ordinary, owing to the particular shape of the diaphragm, so that we now have an amount of light which is about proportional to the current in the line. This was one of the hardest problems encountered in the transmission of photographs by this scheme.

While a selenium cell fails to respond quickly enough to the light, due to the inherent inertia of the cell, this was overcome by using another cell in connection with the regular one, and it was also discovered by Dr. Korn. This he called the compensator, and it is schematically depicted in Fig. 6.*

Here the light which has traversed the revolving photographic film falls on the selenium cell S_1. This cell is placed in one arm of a Wheatstone bridge; a second cell, S, being placed in the opposite arm. W is a regulating resistance, and B and B^1 are two batteries of about 100 volts, B being provided with a compensating variable resistance, W_1. The galvanometer is of the "string" form, i. e., two fine wires, X and Y, move laterally in the field of a powerful electromagnet, whose pole pieces, M_1 M_2, are tunneled with a small hole. A small piece of aluminum foil is stuck on to the wire in the center, and it is this shutter which just cuts off the light that would pass from the lamp N through the poles. If current passes through the wires X Y, they are laterally displaced, and the beam of light can then reach the second cell S_1. Now let us see what happens when a bright part in the photograph causes light to be cast on the cell S_1. The equilibrium of the bridge is at once upset, and the current, therefore, passes through X Y; the shutter is displaced and light falls a fraction of a second later on selenium cell S, thereby keeping the current in the receiver constant.

In the receiver we use the total reflection prism R (Fig. 3), which is moved into the path of the light beam, and it sends the beam down the vertical column to the diffusing screen e, and the compensating cell F, as portrayed in Fig. 3. This cell is connected to the main cell, as described above, and the combined current is sent on the line.

Fig. 7 and Fig. 8 illustrate the complete Korn apparatus, while Fig. 9 represents an exact photograph as transmitted over a wire by the above-mentioned apparatus.

One of the most indefatigable workers in the field of photo-telegraphy is M. Edouard Belin, who has been for some years actively engaged in working out a system of his own. His apparatus has been designated the telestereograph, but as his method of transmission has quite recently undergone a radical change it will be better to describe his first successful models by themselves.

The use of a relief photograph in which different tones in the image are represented by different thicknesses of the film, to vary the amount of resistance in an electric circuit containing a suitable receiver, has been referred to in the beginning of the article and the idea is a very old one. But the methods employed by M. Belin, both in the mechanism for varying the resistance and in the means of reception, prove very ingenious, and he obtained some promising results in tests over artificial lines.

The schematic diagram of his sending apparatus is illustrated in Fig. 10. A photograph in relief is obtained by reprinting from an ordinary negative upon what is termed carbon tissue, this being paper coated with gelatine and which is rendered sensitive to light by the addition of sodium bichromate. When sufficiently exposed, the paper is developed in hot water, when the gelatine washes away from the unexposed parts, but remains insoluble where there has been much light exposure; moreover, in the "half-tones" the gelatine washes away only to a certain extent, depending on the amount of exposure, i. e., on the density of the negative. Now let this relief film be wrapped about a cylinder, which quite resembles a phonograph cylinder, as seen in Fig. 10. The transmitter has a special kind of microphone using the metal box H, which contains the metal disc F at the back. Upon this is placed a thin carbon disc having three holes one-tenth of an inch in diameter, and a carbon grain, G, is placed in each hole, so as to make microphonic contact with the outer carbon plate M. The three grains are mounted so as to form an equilateral triangle and thus give an equal pressure distribution. Upon the grains is placed an outer vibrating diaphragm, M, of carbon, as observed. To transmit the movement from the photographic film to the microphone there is used a double point, mounted on a spring blade. One of them bears constantly on the film, and the other against the microphone, so that the latter receives the difference in pressure due to

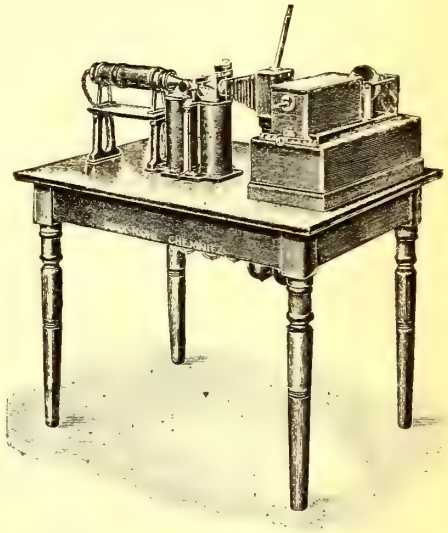

Fig. 8. Complete Telephotographic Apparatus of Dr. Korn.

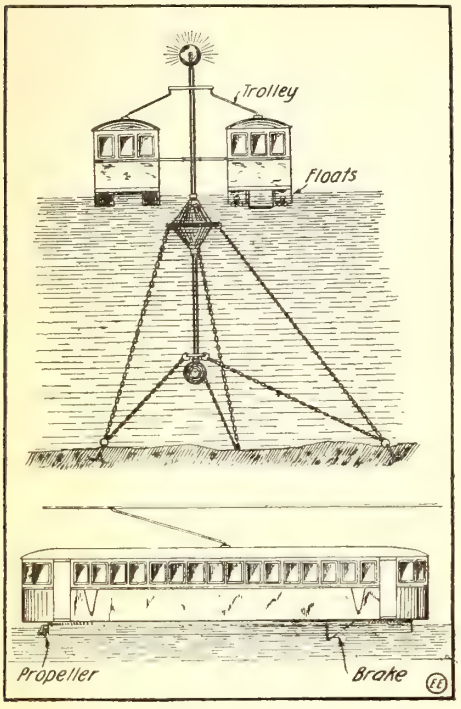

the varying relief on the film. Connection is made between the metal part of the disc F, on one hand, and the carbon plate, on the other, so as to give microphonic action and resulting variations of resistance in the line L L.

(Continued on next page.)

*From "The Telegraphic Transmission of Photographs," by T. Thorne Baker.

A FLOATING TROLLEYWAY AND PASSENGER CAR.

Here is a real seagoing car and a fresh thrill for the visitors to summer resorts

Recently Patented Floating Railway.

and pleasure parks. The new device is intended mainly for recreation purposes, but it could be easily placed in service as a river ferry for the conveyance of passengers.

The floating trolleyway which transmits the power of locomotion consists of a number of poles, arranged as the purpose for which the device is to be used may prescribe, anchored to the sea, lake or river bed. A car body with an electric motor and passenger-carrying equipment is mounted upon suitable floats, which are pointed at the forward end so that they will offer very little resistance to the water.

A special trolley, which always retains its connection with the overhead wire and arms at the side, which engage a stout wire strung midway between the poles of the trolleyway, help keep the car on the right path, though separate steering means are also provided. The electric power is furnished from any convenient source to the electric motor of the car, which in turn drives the propellers at the rear ends of the floats and sets the car in motion.

At night the car as well as the entire trackway is illuminated, electric lights placed upon the tops of the floating poles being the medium through which the floating trolleyway is lighted. To facilitate the stopping of the floating car when a station is reached, a brake placed between the floats which when dropped enters deep water, offers a strong resistance to the continued motion of the car and brings it to a halt in short order. When the car is in motion this brake is swung upward and out of the water.

This scheme will be practical for ferry purposes only on small inland lakes or rivers, where there are no large vessels and the water always calm.

ELECTRIC SEWING MACHINE MOTOR STAYS WHERE YOU PUT IT.

One of the latest household electrical devices is an improved form of sewing machine motor readily attachable to any style of machine and it also requires no screws or clamps to hold it in place. It is known as the "Dumore" motor and is equipped with three special spring feet, as perceived in the illustration. These feet are fitted with rubber cushions to prevent marring the surface of the woodwork, and the cen-

The "Dumore" Sewing Machine Motor Remains Where You Set it Without Clamping.

(Continued on page 517.)

THE TRANSMISSION OF PHOTOGRAPHS TELEGRAPHICALLY.

(Continued from page 483.)

At the receiving end is a similar rotating cylinder, carrying a sheet of photographic paper or a film (Fig. 11), and the currents are received in a galvanometer device which throws a variable spot of light upon the paper. A Blondel oscillograph fitted with a swinging mirror in a strong magnetic field is used in this system. A strong current thus gives more swing and a weak current a lesser swing. The beam of light passes first through a short color screen, C, graduated from dark to light, so that when the beam is at zero it occupies the dark end of the screen. A swing of the beam brings it to the more or less transparent part, and the resulting beam will thus depend in value upon the strength of the current. Fig. 11 shows a diagram of the arrangement of each part of the apparatus. A is the string

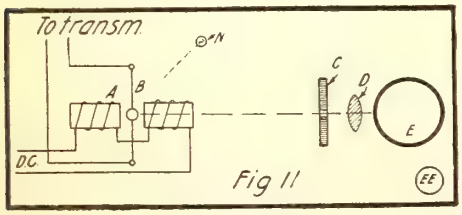

Fig. 11. Details of Receiving Galvanometer.

galvanometer with a mirror, B, attached to a fine wire which is connected to the transmitter, as perceived. A ray of light from a Nernst lamp, N, is focused upon the mirror, which reflects it toward the receiving cylinder E, in the meantime passing through the screen C, and condensing lens D. The revolving cylinder E is kept at the same speed as the transmitting cylinder, this being done by means of a synchronous electric motor on each end.

The latest achievement in the transmission of photographs is that employing wireless telegraphy. The great advantage of wireless over wire telegraphy is quite well known to-day for its long distance and the communication with ships at sea, and the same application can be applied to photo-telegraphy when a proper system is developed. For instance, pictures of criminals could be readily telegraphed to ships fitted with proper receiving apparatus, and sketches or plans could be transmitted between different corps of an army or between ships.

Various systems were developed, but the most practical one is that which T. Baker, of England, has perfected, and this is schematically illustrated in Fig. 12. The upper one shows the transmitter, while the lower one is the receiver.

At D is a drum, the same as used in the wire photo-telegraphic apparatus, a stylus tracing over a sketch drawn with insulating ink on a sheet of leadfoil; D and the stylus are shunted with a condenser, C, to prevent sparking. The current from the battery A is interrupted by the lines of the picture, the magnetism in M being thus intermittent. The relay at M breaks the contact of the battery B in circuit with the primary P of an induction coil; S being the secondary, and thus electrical oscillations are set up in the aerial AN and ground GR. A negative print is placed on the drum D, so that sparking between the balls B_1 takes place only when a line in the picture comes in contact with the stylus. The capacity K and inductance J in the oscillatory circuit can be adjusted as required, and for long distances the aerial and earth would be connected inductively.

Turning now to the receiving apparatus, the aerial and ground are connected to the primary of a loose coupler, LC, the current being transformed into the secondary, S, and passed through a sensitive coherer, C, with a condenser, K, in series. A rather insensitive relay is inserted in the coherer and battery circuit, the battery consisting of the two dry cells. The local circuit of this relay actuated a second relay through another battery, and the local circuit of this second relay included the receiving circuit of the photo-telegraphic apparatus, as becomes apparent.

The use of a shunt circuit running through the receiver was necessary to render the marks clear and short.

A local shunt circuit was also used from the first relay to actuate the de-coherer, which consisted of a very lightly built electromagnetic striker which tapped the coherer.

Quite wonderful results were obtained

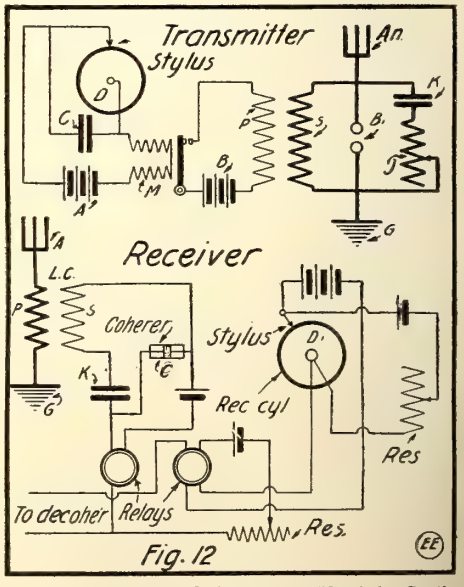

Fig. 12. Circuits of Apparatus Used in Radio Transmission of Pictures.

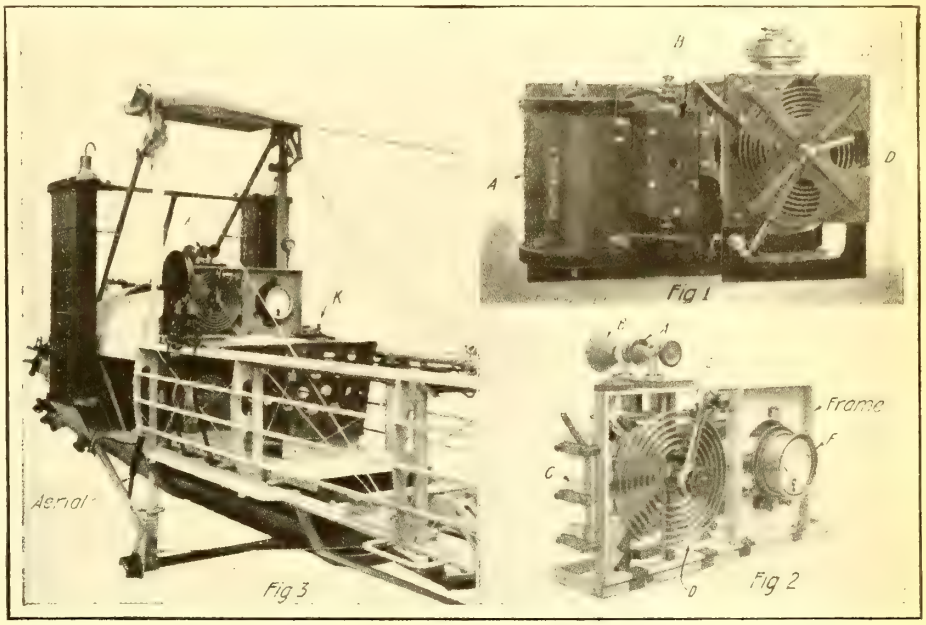
with this apparatus, and photographs were readily transmitted for short distances, although the received pictures were not very clear.

The time is near at hand when we will be able to send our pictures to our friends in distant cities and ships at sea as easily and cheaply as in sending word messages.

RADIO DEPARTMENT



Wireless on the Firing Line

ONE of the most important elements in the present European conflict is wireless telegraphy, which is very extensively employed for directing squads of soldiers, communicating between trenches and exposing the enemies' position by means of aerial reconoitering.

Various types of instruments are being used and we herewith present some views of the transmitting sets which are in use for this purpose. Fig. 1 illustrates a typical synchronized outfit, comprising an open core, oil-cooled, transformer A, connected to an alternating current supply, through a key, as usual. Its secondary is linked to a specially designed condenser B; this is carefully built, as it is sometimes necessary to overload it. The spark gap C is of the rotary synchronized type, and is mounted on the end of the generator shaft. The helix D is of the standard type, consisting of a spiral of brass strip held in fiber supports, as perceived. This outfit has a capacity of 150 watts, with a radiation of one ampere in the aerial. The ground connection is simply made to the base of the engine. The set has a spark frequency of 800 per second; complete, it weighs about 30 pounds. The apparatus is designed and constructed particularly for operation on an aeroplane, where the air draft created by the motion of the machine is utilized for cooling the various parts, especially the spark gap.

Another unique wireless plant designed especially for use in aeroplanes is depicted in Fig. 2. This is somewhat different from the one previously described, as it employs a stationary gap A, instead of a rotary one. The gap cooling funnel B is used for concentrating the forced air produced by the motion of the aeroplane. The high tension condenser tubes C are placed behind the frame, as perceived. These are of a similar type to those used in the previously described set. The helix D is of standard type; note the method of changing the wave length on same by means of a switch. It employs a novel scheme, on the rotating arm E, which does not scrape the metallic band when the arm is revolved. A hot wire ammeter F is employed for indicating the current in the antenna circuit.

A very interesting illustration is shown in Fig. 3. This is an actual photograph of an aeroplane of the biplane type, fitted out with a wireless transmitting outfit of the same design as that just described. The stationary air cooled spark gap is shown at A, while the key K is located on the operating table. The aerial is sometimes made to comprise the guys of the flying machine, providing they are insulated from the engine proper, as the latter is employed for the ground. If these guys are grounded, then a long wire is lowered from the aeroplane, which is wound up and let out from an automatic winding drum, easily controlled by the aerial radio operator.

French Aeroplane Radio Equipment. Note Aerial Weight at Left, Which, Attached to a Flexible Wire, Enables Antenna to Be Unreeled to Any Length Quickly.

TWO NEW WIRELESS DETECTORS.

An enterprising wireless concern of New York City has recently developed an improved mineral wireless detector which undoubtedly will find great favor with both amateur and commercial radio operators. This detector is of very sturdy construction and rests on a marble base (see Fig. 1). Two hard rubber uprights support a glass cylinder, which incloses the working parts of the detector proper and thus prevents dust settling on them, besides keeping out dampness, etc. The hard rubber knob A, at the left, has a rotary movement and carries the "cat-whisker" wire, which rests against the mineral mounted in a cup and carried on the stem connected to the knobs B and C, at the right. The knob B permits of rotating the shaft on which the mineral cup is fastened in an eccentric manner, so that any portion of the mineral becomes accessible to the contact wire or "cat-whisker." By means of the smaller knob C, and by turning it, the cup may be approached to or receded from the "cat-whisker" wire; a strong spring placed under the mineral cup tends to push it forward normally. A distinct novelty in this detector is the tube D, which connects with an inner passageway opening into the glass chamber. This tube is for the purpose of introducing any gases or compressed air, etc., into the detector chamber, so their effect on the operating characteristics may be noted and experimented with. Ordinarily, if no gas is to be used in the detector, the tube may be closed with a cap. It has been found that, for instance, illuminating gas increases the sensitiveness to a remarkable degree. A novel way in treating the galena renders this detector practically immune from all light shocks.

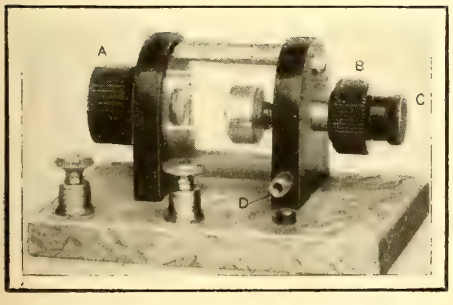


Fig. 1. Improved Dust-Proof Detector Fitted With Gas Inlet for Experimental Work.

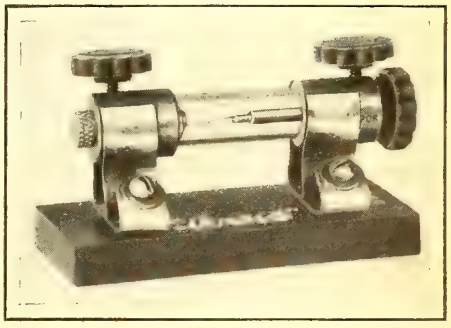
Another detector of the mineral type and of commercial pattern is shown in Fig. 2. This detector resembles a cartridge fuse and may be snapped in and out of place in



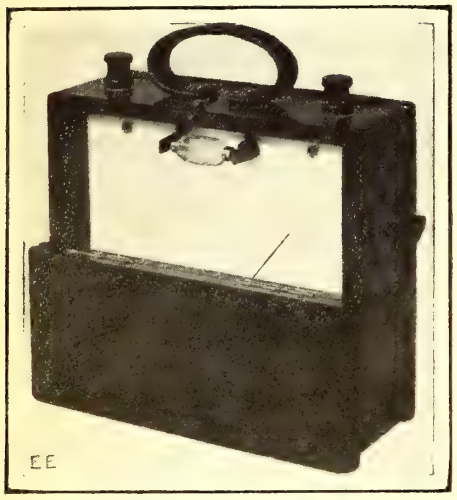


Fig. 2. The Lenzite Detector Utilizes a Synthetic Mineral and Is Also Dust-Proof.

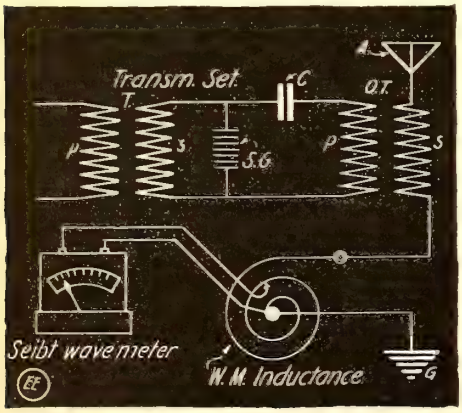
(Continued on page 516.)

A DIRECT READING WAVE METER FOR RADIO MEASUREMENTS.



In the accompanying illustration is depicted the first commercial type produced of a direct reading wave meter as developed and perfected by Dr. Georg Seibt, of Berlin-Schoenberg, Germany. This instrument is connected in the ground wire of the wireless transmitting system and as near to the earth connection proper as possible. It is inserted in the circuit by shunting the meter itself across an adjustable inductance composed of a few turns of copper ribbon, which inductance is hooked up in series with the ground wire, as diagram shows.

A Direct Reading Wave Meter That Resembles Ordinary Voltmeter.

This particular instrument has two calibrated scales, the first scale reading from 300 to 1,500 meters wave length, the second scale from 1,500 to 3,000 meters wave length. It is quite delicate in construction, but, however, is more rugged than would seem at first possible. This was demonstrated in a test of same which was conducted on an aeroplane wireless set, where very severe vibrations were encountered.

This meter is very peculiar in action as compared with most other direct reading electrical instruments, in that its needle does not have any definite zero point, and it may come to rest at any point along the scale, depending upon the wave measured when last used. When the meter is connected in circuit the needle of same very quickly takes up the proper position, indicating directly the wave length in meters of the circuit to which it is attached. One feature about this instrument is that the scale divisions are equal and thus easily read.

How the New Wave Meter Is Connected to a Radio Transmitting System.

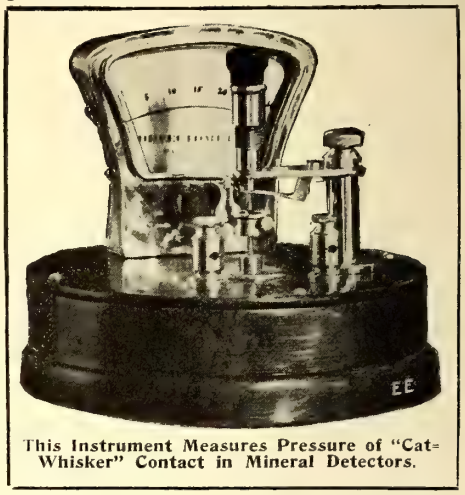
It has been tested by Dr. Austin, of the United States Bureau of Standards, and found to have an accuracy of approximately 1 per cent. Readings are preferably taken with this instrument when it is placed in a horizontal position.

No iron enters into the construction of the wave meter, and motion is produced in its mechanism by means of two hemispherical coils, oppositely disposed on either side of a very light aluminum member, which is mounted very delicately on a pivot and an indicating needle is attached to this movable member.

A switch mounted on the side of the wave meter permits of changing the internal connections, so that either scale may be used. Directly above the scales may be observed an indicating glow lamp, which is used for the following purposes: Theoretically the indications of the wave meter are independent of the current flowing, but in actual practise it is necessary to keep the current between certain maximum and minimum limits for best results. When very small currents are passed through the instrument there can be no certainty that the friction of the pivots exerts no effect on the reading, or that a slight unbalancing of the armature will not render negligible the effect and also that the slow motion of the pointer or needle under the action of small currents makes the reading uncertain. To readily ascertain that the current flowing through the meter has the correct value the small indicating (tungsten) lamp above the scale is noted. This lamp is so chosen that the slightest dark red glow indicates the minimum allowable current, while a bright white light in the bulb denotes the maximum permissible current which should be passed through the wave meter. It does not matter whether any particular degree of brightness is obtained, but in order to have the small glow lamp last the longest possible time it is desirable to work nearer the lower current limit. For those interested in the details of the actual construction and peculiar operating features of this very ingenious device it would be well to refer to Vol. 1, Part 3, of the Proceedings of the Institute of Radio Engineers.

MARCONI RADIO SCHOOL IS OPENED.

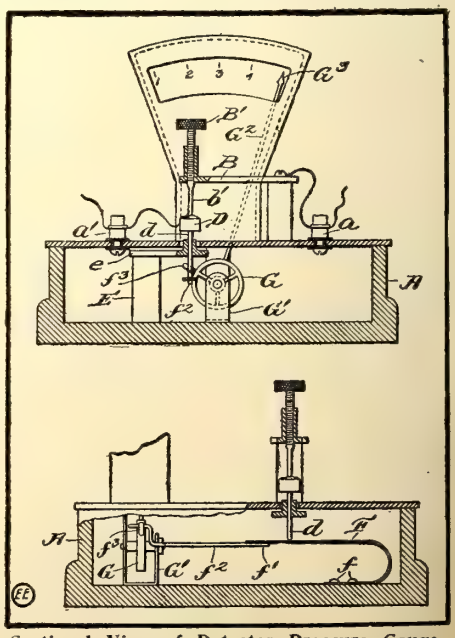
Telling of the wonders accomplished by wireless telegraphy of late, Instructors Warren C. Graham and T. George Deiler recently opened the new school for the training of commercial radio operators, recently recommended to be placed in New Orleans, in the Young Men's Christian Association building in St. Charles street, by the Marconi Wireless Telegraph Co. of America.



The opening of the new institution was well attended and a large number of pupils were enrolled. The successful operation of the school is now assured, and it will be permanently established in New Orleans.

The novel institution, which is the only one of its kind in the South, has been thoroughly fitted out with Marconi apparatus valued at $4,800, similar in type to the sets used on ocean liners, and will not only instruct students in the operation but also in the maintenance of commercial wireless apparatus.

A DEVICE THAT MEASURES PRESSURE ON DETECTOR CRYSTALS.



A novel and apparently quite useful wireless device, known as a Detectometer, has been perfected and patented by Arthur G. Carlson, of North Easton, Mass. Mr. Carlson is a rather youthful inventor and he has apparently developed in this instrument a more or less useful device for the measurement of the pressure exerted on wireless detector minerals. The photograph and sectional drawing herewith will help to bring out the general appearance and working arrangement of this apparatus.

Referring to the sectional sketch, there is observed a standard form of mineral detector having a lower cup D, containing the mineral proper. On the mineral there presses downward an electrode b^1, carried by the metal bridge B. As increased pressure is exerted on the mineral by threading downward the electrode B^1, the lower end of the cup shaft, d, presses down on spring F. This spring is connected through f^2, with a small balance wheel G, supported in the bracket G^1. As will be evident, increased pressure downward at D thus causes the pivoted wheel G to rotate, and in consequence the attached needle, G^3, will indicate on the calibrated scale at the upper part of the instrument.

This Instrument Measures Pressure of "Cat-Whisker" Contact in Mineral Detectors.

The inventor of this device claims that it will be of superior value, as proven by actual tests, when, for instance, a radio operator may wish to readjust the detector with a certain mineral and under certain conditions. Presumably such is the case, and the patentee mentions also that it often happens that 15 to 20 minutes or more are wasted in trying to adjust otherwise the mineral in the detector to its maximum sensitivity; whereas, with this calibrated electrode pressure indicator, it is the work of but a minute or so to instantly readjust the detector to its most favorable condition.

Sectional View of Detector Pressure Gauge.

AN ULTRA-SENSITIVE WIRELESS RECEIVER.

The accompanying sectional drawing Fig. 1 illustrates the mechanism of a telephone receiver which is designed especially for increased sensitiveness. This receiver is

Fig. 2. Appearance of New Amplifying Wireless 'Phones.

of the watch case form and is adapted particularly to service in wireless telegraphy. Other forms of the receiver embodying the same general principle are useful in cases of partial deafness, for noisy places and in long-distance telephony.

The diaphragm 12 (see diagram) is not acted upon directly by a varying magnetic force as in other receivers, but it is made of mica and receives its impulses from a thin iron armature 9, to which it is connected by the link 14. This armature passes through an opening in a spool 8 (upon which is wound the single energizing coil of magnet wire) and is poised at the middle upon a pair of pivots, or preferably a fine wire loop, which is attached to the center of the spool. A spring 16 is arranged to press upon one end of the armature 9 in such a way as to produce a slight tension upon the link 14 and diaphragm 12, and at the same time hold the armature in proper position.

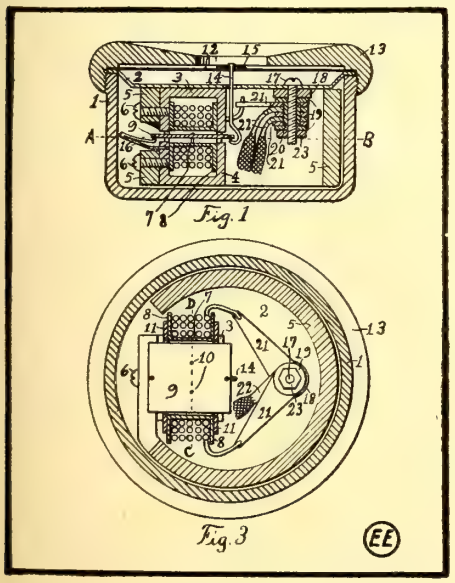


Fig. 1. Diagrammatic Sketch of Amplifying Receivers.

The spool is nearly surrounded by two U-shaped pole-pieces 3 and 4. A permanent steel magnet 5 surrounds these parts, and its poles, being made narrow, overlap and are secured to the pole-pieces by screws 6, 6. This holds the pole-pieces and spool together, and the cup-shaped member 2, which is secured to the pole-piece 2, forms a support for all these parts. This cup-shaped member, together with the diaphragm 12, is clamped between the shell 1 and ear-piece 13.

It will be seen that the flux from the permanent steel magnet 5 has a double path between the pole-pieces 3 and 4 across the armature 9. When there is no current in the spool of magnet wire the armature remains balanced. When a current traverses this coil the armature becomes polarized; and readily it can be seen that the magnetic action of all four ends of the pole-pieces will co-operate to produce a deflection of the armature 9 upon its fulcrum 7 in a direction depending upon the polarity of the energizing current. An alternating or varying current will produce oscillations of the armature, and this motion is transmitted to the diaphragm.

The following are features of advantage in the instrument. It has a long permanent magnet, being more than a complete circle, since the ends overlap. The magnetic circuit has comparatively little reluctance, having a double path between the pole-pieces. The air spaces are thin and the flux from the permanent magnet does not have to pass lengthwise through the armature.

These features of the magnetic circuit favor a strong flux and permanency of magnetization.

In the electro-magnet the thin armature is the main part which is affected by the energizing current; therefore the loss of power by hysteresis and eddy currents is reduced to a minimum. The winding is concentrated in a single spool and its effect upon the armature is utilized at both ends and on both sides at each end. In this way the force due to the polarization is increased to a maximum.

The diaphragm, being of thin mica, is very light and sensitive to the impulses from the armature. The diaphragm, armature, link and spring, together, weigh only a fraction of that occasioned by using a common iron diaphragm.

For wireless service these receivers are provided with a new form of head-band, which is very simple and somewhat automatic in adjustment. Fig. 2 shows the appearance of a head-set consisting of receivers, head-band and cord.

In this set two leather-covered, spring steel wires carry sleeves at their extremities. These sleeves hold heavy German Silver wires, which are split at one end and formed into arms which partly encircle the receivers. Pivots in the extremities of these arms engage with sockets in the receiver shells.

These wires can turn in the sleeves and the receivers can turn on the pivots. The wires can also slide in the sleeves to adjust the length; but when the set is upon the operator's head the binding effect of the wire in the sleeve prevents slipping. With these adjustments made, the set is simply placed upon the head in proper position, and it will stay there. There are no screws or fastenings to tighten.

NEW CABINET STYLE RADIO RECEPTOR.

The sponsors of the well-known Crystaloi detector have recently developed and commercialized a high-grade wireless receiving cabinet set which our illustration herewith shows. This set includes switch style tuning inductances and the outfit may be tuned to quite long wave lengths up to 3,800 meters. Special switching arrangements have been developed in this outfit which conduce to very rapid tuning, and the central dial switch has its contact points so arranged that with very little movement same is easily made to throw in either the short or long wave inductance sections which are, of course, inductively related and controllable by means of the two end dial switches.

The Crystaloi detector is seen mounted on the set, as well as the sliding plate, variable condenser, and this is perceived mounted at the center of the cabinet shelf. This condenser was described in the September, 1915, issue of the *Electrical Experimenter* and varies its inherent capacity by sliding more or less plates along two brass bars, half the length of which are specially insulated. By varying the distances between the plates by means of spacing washers it can thus, if necessary, be made up to cover a pretty fine range of adjustability, although, apparently, on first sight it would not give the fine range of adjustability procurable with the standard rotary variable style condenser.

This set tunes very sharply and also very quickly, all things considered, and the detector is indeed very rugged and permanent in its adjustment, a feature not to be

Newly-Developed Radio-Receiving Set Equipped With Crystaloi Detector.

found in ordinary radio receiving sets. This outfit comes complete and is furnished in a polished mahogany cabinet, while the shelf on which the switches and various parts of the apparatus are mounted is made of Bakelite. Even a dust brush is supplied with this set, as perceived, so that the apparatus may be kept scrupulously clean! This applies particularly to the space between the closely arranged switch points, where dust is likely to collect and the high frequency currents flowing through these parts may thereby be short-circuited, which will naturally lower the electrical efficiency of any apparatus of this type.

THE WIRELESS 'PHONE WILL GET YOU.

Many a man in the spring of the weather and of youth has stood on his doorstep and longed to be able to shout his thoughts to all the world. Many have felt this, but few have ever thought they could do it. Wireless telephony has made such a scheme within the range of the possibilities. If your wife is cross, or your enemy is hot on your trail, or the partner wants to tell you that note falls due to-morrow, don't think you can go to San Francisco or China and get away from her or them. Gadzooks! You can't—the wireless 'phone will get you.

Regenerating Audion Circuits for Wireless Receiving

By Frank J. Collins

THE arrangement of circuits and apparatus described in this article were invented by Edwin H. Armstrong, of Columbia University, and are to be used experimentally only.

While the coils described herein may be constructed by experimenters, they are not permitted to sell them to others for the purposes described, as the invention is patented.*

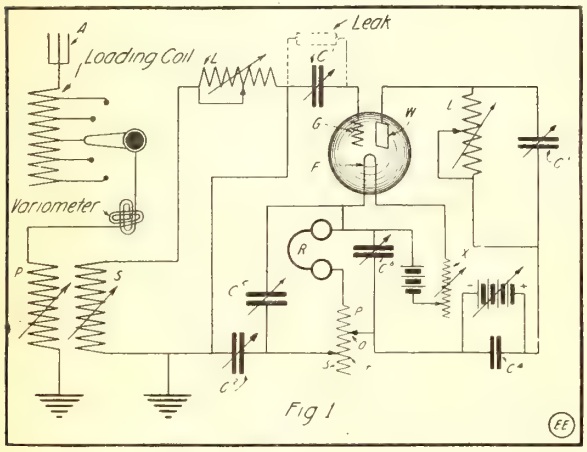

Diagram 1, for Regenerative Audion Detector Circuits.

The purpose of this discourse is to describe in plain and simple language the operation of this scheme, so that amateurs may construct and use same. While this arrangement may seem quite complicated in comparison with the ordinary audion circuits in common use, still, with a little practice all difficulties may be overcome.

These circuits are adapted to the reception of both damped and undamped waves, and are particularly suited to the latter.

When properly adjusted, this arrangement has an amplifying figure of from 10 to 500 times or more, depending on the amplitude (strength) of the incoming signal. In contrast to the ordinary audion amplifying circuits, only one audion is required, thus eliminating two or more audion bulbs, extra rheostats, batteries, etc.

As most of the high-power transatlantic and transpacific stations use wave lengths of from 5,000 to 10,000 meters, dimensions are given to cover these wave lengths only.

With an aerial 500 feet long, one wire elevated at least 40 feet above the ground, no difficulty will be experienced in reading stations 2,000 to 4,000 miles distant, day or night. Aerials 100 feet and up in length may be employed with good results, but for reliable communication a length of 500 feet or more should be used whenever possible on account of the long wave lengths employed.

The dimensions and description of the apparatus to cover the range of wave lengths mentioned are as follows:

Loose coupler primary tube 4 inches in diameter, 5 inches in length, wound full with No. 32 S. S. C. wire, bringing both ends of the winding to binding posts. No sliders or switches are necessary, as the full winding is always required.

The secondary tube is 3½ inches in diameter and 6 inches in length, wound with No. 32 S. S. C. wire; no taps are required in this case either, as the full winding is always in use.

As a great many of the high-powered stations use the "arc system" requiring very sharp tuning, a variometer is necessary. While a variable condenser may be shunted across the loose coupler or loading coil, or both, for sharp tuning, a variometer is preferable. A loading coil will also be required in order to tune to the long wave lengths.

The Grid and Wing Coils, L and L¹, Fig. 1, are identical in every respect. They consist of cardboard tubes, 30 inches long and 4½ inches in diameter, wound full with No. 32 S. S. C. wire. About fifteen equally spaced taps should be taken from each coil and brought out to switch points.

The switch on the Grid Coil should be connected to the last tap of same in order that the unused turns may be short-circuited or the entire coil cut out of circuit.

The switch on the Wing Coil should be connected likewise, viz., to last tap of the Wing Coil. Care should be taken in connecting these coils up to the other apparatus to see that the switch on the Grid Coil is connected to one side of the secondary of the loose coupler and that the switch on the wing coil is connected to the positive side of the high voltage (40-50 vts.) battery.

By short-circuiting the unused turns of the coils in this fashion, it prevents the operator's hands from interfering with the tuning to a large extent. These coils are very sensitive and should be placed at least two feet from each other, or at right angles, in order to reduce the mutual inductance between them.

The wing condenser, C 3, Fig. 1, is used for the purpose of tuning in longer waves than the inductance of the coil itself affords. It is also used for the purpose of "cutting in" between the taps of the wing coil, and has a maximum capacity of .0004 m. f.

The tuning condenser, C, is for the purpose of tuning the grid coil and the secondary of the loose-coupler to the incoming signal; it is very essential. It has a maximum capacity of .0004 m. f. In most cases a maximum strength of signals will be obtained with large values of inductance and small values of capacity, for a given wave length.

Since the internal resistance of the high voltage telephone battery constitutes a path of comparatively high impedance to the high frequency oscillations (incoming signals) it is advisable to use condenser C 4 (Fig. 1), connected directly across the battery as shown, in order to reduce this impedance. This condenser is not really necessary. It has a capacity of about 2.5 m. f. and may be adjustable in steps.

Care should be taken in constructing this condenser, for should it "break down" it would result in the complete loss of the high voltage battery by short-circuiting the same. Paraffin paper and tinfoil may be used in its construction.

Condenser C¹, Fig. 1, is very important and is placed between the grid coil and the grid of the audion, and it is used for the purpose of holding the charge which accumulates on the grid due to the incoming signals. Its capacity is very small, seldom exceeding .0002 m. f. This condenser is preferably shunted by a graphite resistance (leak).

This *leak* may be constructed by clamping a piece of cardboard 1½ inches long and ½ inch wide, between two binding posts, the whole arrangement to be connected across the condenser C¹. Then while "listening in" draw a few lines with a lead pencil from one binding post to the other on the cardboard. (These lines of graphite constitute a high resistance.)

This process should be kept up until the incoming signals reach a maximum of strength, as the effect of this resistance is to materially increase the strength and clearness of the signals. By decreasing this resistance (in ohms) static disturbances are decreased to a large extent, but at the expense of the incoming signal strength.

This resistance should be connected up after all the apparatus is hooked up and working, as the right amount can only be ascertained while signals are being received.

Condenser C 5, Fig. 1, is connected directly across the telephones and is very essential. It maintains the stability of the audion when receiving long waves and prevents the audion from generating high frequency oscillations. By keeping sufficient capacity across the telephones at all times this generating feature may be eliminated. The capacity of this condenser is .001 m. f. (maximum). The generating feature of the audion may be recognized by the signals losing distinctness, and a hissing or rumbling noise is noticeable in the telephones.

By grounding the grid circuit, as indicated in Fig. 1, the generating function may be eliminated to a certain extent.

The amount of voltage required in the telephone circuit will depend to a large extent on the degree of vacuum present in the audion bulb. Since all audion bulbs vary in their characteristics, the adjustment of apparatus obtained with a given audion bulb, when receiving signals from a certain station, will change when another bulb is substituted. The change of adjustment being principally in the grid condenser C¹ and inductance coil L¹, Fig. 1. It has been found best to have the ratio of transformation 2 to 1 in the transformer T, when its primary inductance value is equal to that of the telephones. (Or a telephone induction coil may be used.)

While the ordinary audion bulb is admirably suited for the reception of undamped waves, the double wing and grid audion bulb will give better results, as it is more stable and shows less tendency to "paralyze."

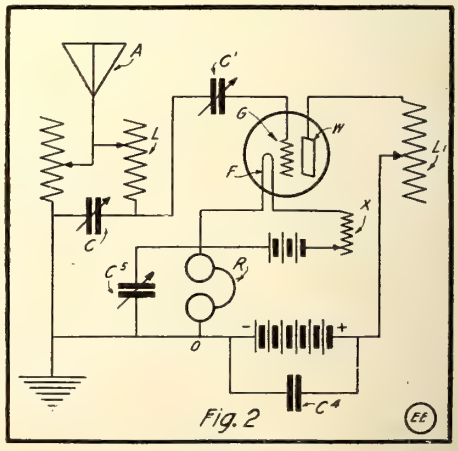

Diagram 2, for Simplified Armstrong Audion Circuits.

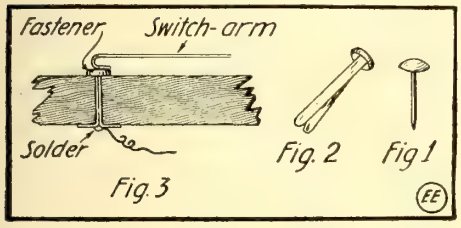
Another feature of this arrangement is the fact that the filament of the audion bulb may be adjusted to a comparatively low temperature, thereby prolonging the life of the bulb.

(*Continued on page* 517.)

* Patented Oct. 6, 1914, by Edwin H. Armstrong.

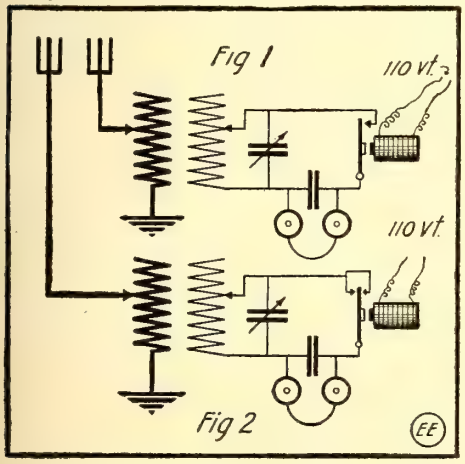
REGARDING SWITCH POINTS AND TIKKERS.

In making switch contact points a common practise is to use upholstery tacks as in Fig. 1, but frequently the shank is not long enough to pass through the mounting. In that case ordinary paper fasteners, Fig. 2, are used as sketched at Fig. 3.



They may be obtained in many sizes and lengths, and are almost as cheap as the upholstery tacks.

They are excellent to use where it is necessary for the points to be set closely, in which case the manufactured switch contacts cannot be used because of the nut on the back.

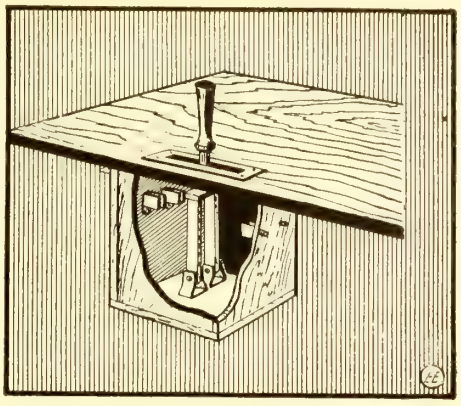


Many amateurs within range of the "Poulsen Arc" sets are making use of various forms of "tikkers."

Some of them use telegraph relays connected on 110 volts alternating current, as in Fig. 1. This does not give good results for the reason that the interruptions are too slow. Much better results are obtained by following the circuit shown in Fig. 2. This simply makes use of the "back stop" as a contact, and when connected as shown the arrangement gives twice the number of interruptions as before, consequently better results. It must be remembered that neither arrangement approaches the "wheel" or "tube" tikker in efficiency, and the relay should only be used when the other forms are impossible of attainment or impracticable. Contributed by

FREDERICK J. SCHLINK.

Using Paper Fasteners as Switch Points.



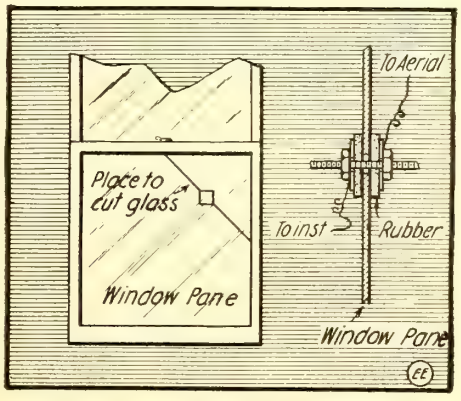
Two Methods of Utilizing Telegraph Relays as "Tikkers."

QUICK-THROW AERIAL SWITCH.

An aerial switch is an awkward thing on a radio table. It is always hard to place effectively. Here is a new way.

The ordinary double throw switch is used. Take it apart and mount in an enclosed frame, as shown in drawing. This frame is fastened to the under side of the table and the switch handle, by means of an extension, projects through a crevice in the table top. The slot is covered with a brass slide way, to give a neat appearance.

This method of mounting the "aerial switch" ensures increased speed and comfort in operation. It also has the much desired nifty "commercial" appearance. Contributed by EARL H. SWANSON.



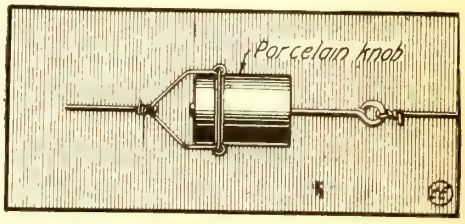
Nifty Form of Aerial Switch.

A SIMPLE EAR CUSHION FOR 'PHONES.

Many amateurs and even professional wireless operators often become very uncomfortable after listening for a long time on account of having the head receivers pressed against their ears. Many of them have purchased pneumatic ear cushions to overcome this, but a cheaper way is always patronized. Any person can construct these by taking a piece of rubber sponge about 2½ inches in diameter and about a half inch thick, allowing an inch on either side to fasten to the head-band clamp that holds the receiver; then punch or cut a hole about a half inch in diameter to allow the sound to reach the ear. It is now complete, and will also serve as an "ear muff" for the cold weather as well as a cushion. A piece of sponge may be bought for a dime in a drug store or novelty shop. Contributed by IRWIN DERSCH.

FILING GLASS WINDOWS FOR LEAD-INS.

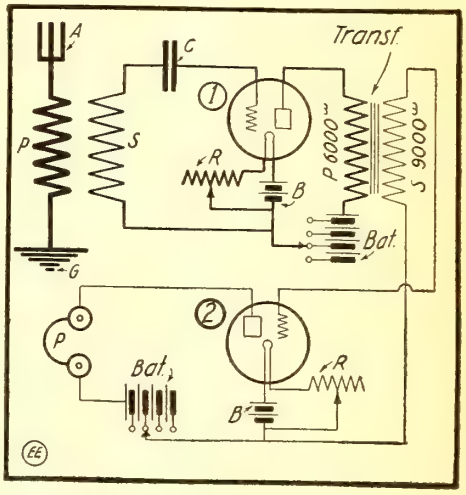
In building my wireless station I had some trouble with the lead-in. I did not want to disfigure the window frame, so I decided to cut off a large corner of the window pane itself. Then I filed a notch in each piece large enough to receive my lead-in wire without touching the sides of the hole. I used a threaded copper rod for the lead-in. A rubber washer with a nut was placed on each side to keep out the air. The best way to file glass, without danger of breaking it if you are careful, is to hold it *completely under water* while filing the notches. I found this lead-in suitable for a 1 k.w. set. Contributed by WALTER FRANSEEN.



Way to Cut Window Glass for Lead-In.

PORCELAIN KNOBS AS STRAIN INSULATORS.

A simple method of using porcelain knobs as strain insulators is shown in the sketch herewith. A nail or piece of steel wire is arranged as perceived, so that it cannot be pulled through the center hole and a loop is formed of one end of the knob into which a guy wire or Antenna wire is secured. The second support from the insulator is made of a piece of wire clamped around the groove of same, as shown.



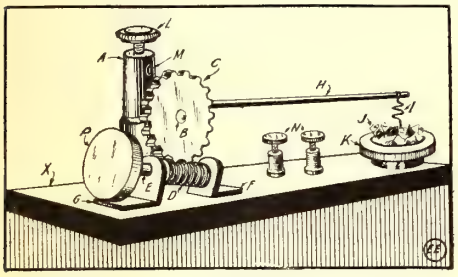
A number of these knobs may thus be placed in series, of course, in the usual way, to increase the resistance of the arrangement and to provide in this way, increased insulation value. Contributed by F. W. SULLIVAN.

Strain Insulator Easily Made from Porcelain Knob.

AN AUDION TRANSFORMER.

An Audion transformer has recently been put on the market by a well-known electrical concern, which is herewith shown. It consists of a primary coil wound over a soft iron wire core about 9 inches long and having 6,000 ohms resistance. Over this winding a secondary is made with fine wire (about 36 B. & S.) having a resistance of 9,000 ohms. This is then connected as outlined in diagram. The primary coil is connected to the first detector, which can be either of the crystal rectifying or Audion type, while the secondary is connected to an Audion detector in connection with a loud-speaking telephone for amplifying the incoming radio signals.

Audion Transformer Hook-Up.



BRASS POLISH.

This formula consists of the following: 16 lb. *Crude Oleic Acid*, 5 lb. *Kieselguhr*, 4 lb. *Tasteless Mineral Oil*, 1½ oz. *Lemon Oil*. Mix the powders into a paste and gradually thin with the mixed fluids, being careful to prevent formation of lumps. Apply with a rag or waste, and when practically dry rub with another rag or waste.

A NOVEL DETECTOR STAND.

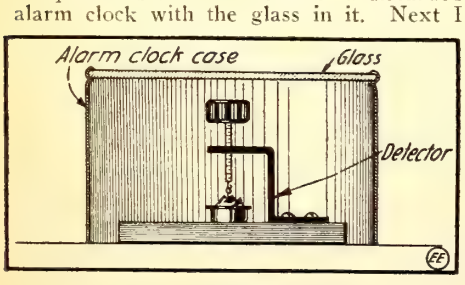
The illustration shows a type of galena detector which is capable of extremely minute and delicate adjustments.

The base X should be about 4x3x¾ inches. Locate a point on the base about 1 inch from one end and 1¼ inches from the side and fasten a large double binding post A to the base at that point. Next

Worm and Gear Adjustment for Detector.

obtain a piece of brass rod B, about 2 inches long, which should fit snugly the lower hole in A. On one end of B fasten a brass gear C. Drill a hole through the other end of B to take H, a brass rod about 3 inches long and a trifle smaller than B. Near the projecting end of H solder a small spring I, made of No. 20 brass wire, to make the contact with the galena crystal held in the cup K.

Cut a strip of 1/16-inch brass ¼ inch wide into two pieces ½ and ⅝ inch long, respectively. Drill two small holes near one end of each of these pieces to fasten them to the base. Near the other end of the longer piece drill a ⅛-inch hole, and near the end of the shorter one solder a small tack with just a little of the point left. Bend these brass pieces so as to hold the worm D in mesh with C, and also to give D a slight upward angle sufficient for the typewriter knob P to clear the base.



Make a slight indentation in the exact center of one end of D to turn on the tack soldered to F. This may be done with a center punch. Solder a ⅛-inch rod E to D. This rod passes through the hole in G, holding D firmly between F and G.

To assemble the whole suspend the worm D between G and F and secure them to the base with small round-headed screws. Care should be taken that D turns easily and does not bind. Pass the rod B through the lower hole in A. After placing the gear C in mesh with D tighten the set screw that clamps it to B so that C will turn, but will not move out of mesh with D. Wedge or solder the rod H in the hole in B. Secure the typewriter knob P to E and mount the binding posts N—N on the base and the detector is complete except for the crystal J.

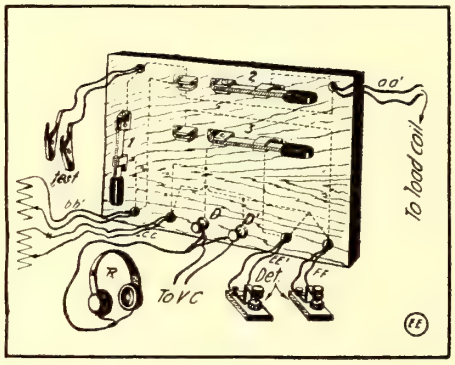
Contributed by K. ROBERTS.

DUSTPROOF COVER FOR DETECTOR.

I procured the metal case of a discarded alarm clock with the glass in it. Next I

Alarm Clock Case Forms Efficient Detector Cover.

unscrewed the legs and the post which holds the bell, then I assembled it as shown in the accompanying sketch. The whole arrangement presents a very neat appearance, and the detector is always in view.



Contributed by J. WALLACE PECKHAM.

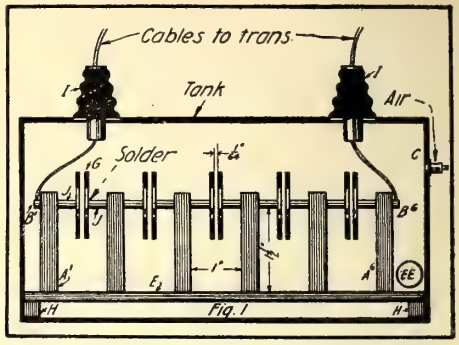
A WIRELESS RECEIVING "TEST" BOARD.

Many radio experimenters, when conducting tests, employ an extra receiving set, and during the operation usually cause the regular set to become deranged, thereby necessitating the rearrangement and putting together of the set every evening. However, by mounting the "test" board described below at some spot where it will remain unmolested and using flexible leads, the main apparatus will be left intact, while it will be possible to use both receiving sets at the same time on different wave lengths, if desired.

Two good points about this arrangement are that, instead of using binding posts, *long leads* in the form of stranded wire are brought out from the board through small holes. The leads to the aerial and ground have clips on their ends, which connect to the aerial switch blades.

The diagram is explained as follows: Switch No. 1 turns on test set; switch 2 cuts in or out a loading coil connected to leads A A^1, while switch 3 gives the choice of two detectors connected to E E^1 and F F^1. For connecting receiver tips, spring binding posts should be used at D D^1. A

Handy Test Board for Radio Receiving Station.



secondary loading coil may be connected at X.

Contributed by W. R. COTTRELL.

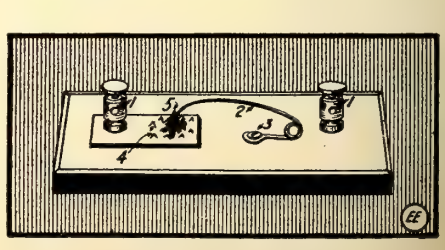
A COMPRESSED AIR SPARK GAP.

The average experimenter is not very familiar with the qualities possessed by the compressed air spark gap, due to the reason that it is seldom used. I present herewith the method of constructing a gap which radiates a sharp, pure wave, very similar to the well-known quenched type. If constructed right it will give as much satisfaction as a quenched gap and is, besides, much cheaper to build.

Obtain a heavy metal can about 6x3 inches, and two spark plug porcelains; in my case these were 2x¼ inch. Through the top of the can (Fig. 1.) bore two holes which have a diameter large enough to admit the insulators I. Cut out of hard rubber the base E, which measures 6x1 inch. Bore five holes, each hole being 1 inch from the other and large enough to admit an 8/32 machine screw. Cut out of ¼-inch brass rod (five) or six standards A, each 1½ inches high. Drill a 3/32-inch hole for ¼ inch up into the standard. At the top of the standard also drill a 3/32-inch hole at right angles to the length of it and which extends through same. This drilling having been done on the other four, they are screwed into place on the base so as to have the top holes in a line. Ten zinc discs G, 1 inch in diameter by 1/16 inch thick are turned out and are welded or soldered to the threaded rods J, as per illustration, so as to face each other. The discs G should be 1/64 inch apart. The rods J should be, when adjusted, soldered to the standards B. The gap thus being completed, should now be mounted on two blocks H, which measure

This Spark Gap Utilizes Compressed Air, with a Gain in Efficiency.

1x¼ inch high by ¼ inch thick. Take care not to have any metal part of the gap touch the can. The posts H may be glued onto the can so as to hold them in place. A No. 8 copper wire should be run through both insulators I, long enough to run to the transformer and reach the standards B_1 and B_6. This being done, the space left in the insulator should be cemented up. In some convenient place on the can bore a hole large enough to admit the air valve C, which may be of the bicycle tire variety. Solder the valve to the can and cement a 1-foot length of the right size rubber hose to the valve.



The most important thing is to reinforce the can by recementing and resoldering all metal joints (solder the cover on very firmly). Be sure to cement up joints where holes have been drilled. The whole gap is next immersed in hot sealing wax so as to completely cover can, the thicker the cement and wax film is the better, taking care not to get the air hose leading from the valve C clogged. For cooling purposes immerse gap in oil. By referring to the drawing all omitted details may be found.

Operation: Attach tire pump to valve hose and pump in at least 40 pounds of air. The pressure may be obtained by a tire gauge. Do not have more than 50 pounds pressure or the experiment will likely prove decidedly disastrous.

The RADIO LEAGUE of AMERICA

HONORARY MEMBERS
CAPT. W.H.G. BULLARD, U.S.N. NIKOLA TESLA.
PROF. REGINALD FESSENDEN. DR. LEE DE FOREST.

Manager, H. Gernsback

IT is with the greatest pleasure that we report the exceedingly large response from prospective members to the RADIO LEAGUE OF AMERICA.

When the December issue first appeared we had an idea that the movement surely would be endorsed by a great many wireless amateurs, but we did not expect the extraordinary support which has been experienced up to this writing. Every mail brings dozens of applications, and there seems to be no let-up whatsoever; quite the contrary, the replies seem to increase daily. Present indications are that before the month is over the LEAGUE will have considerably over 5,000 members.

This response of patriotic wireless amateurs is certainly more than gratifying, but we are quite certain that we are only at the beginning and that within the next two months, when the movement becomes better known, that the response from the amateurs will become still more insistent. We have heard from every corner of the Union and from almost every city of any importance. A very encouraging result is that the parents of the younger boys are very much interested in the movement, there having been received hundreds of letters from them congratulating the LEAGUE upon the movement.

If by any chance you should not have seen the December issue carrying the announcement of the RADIO LEAGUE OF AMERICA, we urge you by all means to send for that number, as it explains the movement in detail.

While we thought we had stated everything in plain language, in the announcement we have been asked quite a few questions which we try to answer here.

Many prospective members desire to know if it is necessary for a member to be of age in order to be eligible. The answer to this question is that *anyone* born in the United States is eligible as a member, providing he is at least 14 years old.

Although we stated the fact, and although reproduction of the membership certificate in our December issue shows it clearly, there have been quite a number of inquiries if there are any dues to be paid in order to become a member. To this we again would state emphatically that *there are absolutely No Dues whatsoever to be paid* and that anyone born in the United States or anyone who is an American citizen can become a member of the LEAGUE.

Quite a few prospective members wanted to know if more than one application would have to be filled out in case the station was owned jointly by two or more amateurs.

Answering this question, it has been decided upon that where two or more persons own a wireless station, each will be entitled to become a member, providing the back of the application states this fact. Thus on the back of the application the following line should be written and signed:

The above instruments are owned jointly by: (Insert here the names of parties owning the station.)

There seems to be some misapprehension in the minds of most persons as to pledging their stations to the Government in case of war. A number of prospective members have an idea that in case they pledge their station to the Government they thereby automatically pledge themselves and their services to the Government. Nothing could be more wrong.

In this case the owner would be pledging his station to the Government in the same manner as he would pledge his automobile to the Government while he himself would not necessarily have to serve in the army unless he expressly desired to do so.

We call particular attention to the annexed blank published at the suggestion of Capt. W. H. G. Bullard, U. S. N. After carefully reading its contents it will be apparent that even though you do pledge your services to the national Government, *you are at liberty to withdraw this pledge at any time you desire to do so.* While this would, of course, not be a very patriotic act, the Government realizes that not everybody who pledges himself for service now can possibly be expected to do so five or 10 years hence. Conditions may change, as well as health, etc., which may make a future withdrawal not only logical, but it may, indeed, be to the benefit of the country.

As to pledging the station to the national Government, the underlying idea of this is that in case of necessity the Government could count upon using your station should it become necessary for the welfare of the country to do so. It, of course, would not matter whether you were there to operate your station or not. In this case your station would be used in the same manner as the Government would use a private telephone or telegraph line which it would operate in war time the same as if it belonged to the Government.

The manager will at all times be glad to answer any questions pertaining to the movement which are not entirely clear to prospective members.

The following letter has been received from Capt. W. H. G. Bullard, U. S. N. We urge every LEAGUE member, as well as every prospective member, to read it carefully:

NAVY DEPARTMENT,
U. S. NAVAL RADIO SERVICE,
Office of the Superintendent.

RADIO, Va., November 23, 1915.

Mr. H. Gernsback, Editor, THE ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York:

DEAR SIR: In reply to your letter of November 22, 1915, which I have read with much interest and for which I wish to thank you in connection with your offer to co-operate with this Service in obtaining volunteers for the Naval Radio Service in time of war, I am enclosing herewith a copy of the original circular letter drawn up by this office, changed in some respects so as to suit the circumstances, and which I shall be pleased if you will publish in your magazine.

Very truly yours,
W. H. G. BULLARD, Captain, U. S. Navy,
Superintendent of Radio Service.

NAVY DEPARTMENT,
U. S. NAVAL RADIO SERVICE,
Office of the Superintendent.
RADIO, Va.

SIR: The necessity of having a list of experienced radio operators who would be available for service on naval vessels and all naval shore radio stations in time of public peril is very evident, and it is desired to obtain the names of such men in times of peace, and to revise the list from time to time as required, so that the Navy would not suffer from lack of operators or delay in training them, when the necessity arises.

The form attached should be filled out and mailed to the Superintendent of Radio Service, if you will signify your intention to offer your services to the Navy as a radio operator as outlined in the first paragraph of the form.

This will in no way interfere with your occupation in time of peace, and can be withdrawn at any time, should you so desire (see last part of paragraph 11 of form).

Referring to paragraph 7 of the form, it will be the intention as far as practicable, in accordance with your qualifications and the needs of the service, to assign you to the duty for which you express a preference.

The Navy will offer an opportunity to operators to continue in their chosen profession and at the same time give them an opportunity of serving their country in its hour of need. This latter, it is believed, should be a determining factor in assisting you to decide to offer your services to the Navy at that time.

The office of the Superintendent will be very glad to furnish upon your request, any further information in regard to this important subject.

The enrollment of your name among those who signify their intention to serve the country when required for the national defense will be of great assistance in the efforts the Navy is making to carry out its policy, "In time of peace prepare for war," and in this policy, you, as well as every American citizen, should be deeply interested. In the particularly important branch, the Naval Radio Service, you will not only show your interest, but will aid in making it effective by a declaration of your intentions to offer your services.

Very respectfully,
W. H. G. BULLARD, U. S. N.

[NOTE.—If you do not wish to tear this page out of the magazine you can make a copy of the form on a sheet of white paper. The questions should be filled in carefully and the blank sent to Radio, Va.]

(Place).....

(Date).....

Superintendent U. S. Naval Radio Service, U. S. Naval Radio Station, Radio, Va.:

SIR: 1. In the event of the United States needing my services as radio operator, owing to exigences due to public peril, it is my intention to offer my services to the Navy Department as a radio operator during the time for which the exigency exists, according to such regulations or laws as may be in force at the time covering enlistment in the Navy.

2. I am a citizen of the United States
3. My age is at the present date
4. My present address is
5. My home address is
6. My present occupation is
7. My preference for duty is (state ship or shore station)
8. I hold a license as radio operator issued by the Department of Commerce with number, date and class as given
9. My experience in radio telegraphy is as follows: (State briefly experience in operating radio sets, names of stations, ship or shore, with types of apparatus. Also give any experience with land telegraph or cable companies, and any other qualifications in reference to ability as operator).
10. I can send in Continental Morse Code, ... words; American Morse Code, ... words; I can receive in Continental Morse Code, ... words; American Morse Code, ... words.
11. In case of any change in the information given under 4 and 5, or if for any reason it becomes necessary for me to change my views concerning my present intentions, as expressed in paragraph 1, I will so inform the Superintendent of Naval Radio Service.

Very truly yours,

Name .....

Address.....

THE CONSTRUCTOR

How to Make a Simple Static Machine

By E. F. Hallock

THE experimenter, especially the fellow who dabbles in things electrical, oftentimes finds himself in a bad way for want of a static electric machine of one sort or another. Just why he should go without is a mystery; for, while the machines on the market are, for the most part, 'way beyond the reach of the average experimenter, so far as price is concerned, anyone who is handy with tools can make

A Simple Static Machine Constructed from Phonograph Record and Other Everyday Materials Found About the House.

a real serviceable frictional electrical machine in a few hours' time. And, far from being complicated, the construction of the machine is the acme of simplicity. The materials to be used are right at hand in most workshops, all save the disc itself, which is nothing more nor less than a simple phonograph record, made of hard rubber composition or vulcanite.

Just why the hard rubber disc is used, instead of the more commonly employed glass will at once be apparent to the experimenter who has endeavored to , or perhaps has, cut out a nice, perfectly round disc of glass, and ground the edge to a fine finish, only to break the fragile material when it came to drilling the hole for the passage of the mandrel or spindle. The record is all prepared; perfectly shaped and ready "drilled," and, after all, is just about as good a dielectric as the glass and in every way suited to the work it is to perform in connection with the electric machine.

The photograph gives a very good idea of the appearance of the finished machine, and comparison with the six-inch pliers shown in the foreground will give a good idea as to the relative dimensions of the various parts of the machine. In connection with its serviceability, it might be well to point out that this little machine will give a spark well over 2½ inches long, when used in connection with the small Leyden jars shown, and that the character of the spark can be varied from a sharp, snappy crackling spark to a wide brush discharge. For igniting gases, demonstrating electrical principles, illuminating Geissler tubes and a variety of other experimental uses, this simple machine answers all requirements.

The base is a piece of wood about three-quarters of an inch thick, roughly 15 inches long and nine inches wide. Hard wood is preferable to soft, and close-grained wood to the open-grained variety. For appearance sake it should be neatly planed, the edges beveled somewhat, and the whole smoothed off with sandpaper. Of course it can be painted; but, in view of the fact that most paints are made from a base of white lead, which is an electrical conductor, it is best to varnish the base, preferably with shellac, so as to preserve it from moisture.

In the machine shown the standards through which the mandrel passes are turned on a lathe, but even this is not necessary, for perfectly plain uprights will do just as well and will not be far behind the more ornate ones in appearance. These standards are about nine inches in height and the shaft is journaled in babbit bearings cast in them.

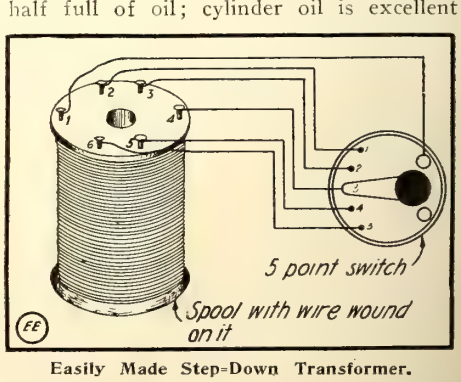
The phonograph disc is prepared by sandpapering the record side down till the surface is perfectly level, using finer sandpaper after the greater part of the lines has been removed. The surface is then given a polish with rouge cloth, so that both sides are perfectly smooth. The disc used is 10 inches in diameter.

The electrical effect is created by means of a rubber, or a pad of silk mounted on a fork, which, in the illustration, is hidden from view by the handle of the machine. This silk is stretched tightly over a packing of silk trimmings, so that the inside surfaces of both branches of the fork are covered; the fork, which is made of brass, straddles the disc, so that the pads are in contact at all times with both surfaces of the record. The fork is supported from a brass ball, in turn mounted on a hard rubber rod. The latter is held firmly in place by means of a wooden cup turned for the purpose and firmly attached to the base of the instrument, as perceived.

A similar arrangement of insulating rod and ball supports a brass collecting ring at the opposite side of the disc. This ring, which is rounded and free from sharp edges from which the current escapes more readily, is provided with a number of sharp points on the side facing the disc, which *very nearly* touch the surface of the plate.

The plate is mounted on a shaft of Bessemer (machine) steel, a few nuts and washers serving to hold the plate firmly to the shaft, which is threaded from one end to the middle to provide the bearing for the nuts. Care should be taken in mounting the plate perfectly true. The handle can be formed simply by bending the rod to form a crank, though in the machine shown a built-up handle was used.

Jelly glasses form the better part of each of the Leyden jars. The glasses are coated with tinfoil half-way up on both inside and outside surfaces. Hard rubber tops should be used, through which protrude brass rods provided with short lengths of brass chain at their lower ends to form the contact with the inner coatings of the jars. Similarly, chain is used as a ready means of connecting the jars to the respective sides of the machine.



As was said before, the whole machine can be made within a few hours' time, but for all its simplicity it is effective. Its operation is improved somewhat, and at the same time the life of the silk pads is increased if the pad is rubbed with a small quantity of amalgam made of zinc and mercury.

LEATHER DRESSING.

An effective rain-proof leather dressing can be made as follows: To 2 parts of *Common Glue* liquefied by heating, add 3 parts *Castile Soap;* dissolve by heating together with 120 parts *Water,* stirring until a good mixture is obtained. Add 4 parts *Spirit Varnish,* and then mix 2 parts *Wheat Starch* with *Water* and throw in. For black leather sufficient *lampblack* can be added without killing the gloss of the dressing.

HOW TO MAKE A STEP-DOWN TRANSFORMER.

First obtain ¼ lb. of cotton covered No. 36 gauge copper wire, which comes on a tin spool which you will need later. Unwind the wire and then rewind it, tapping off six places at equal distances to control the current. It is best to number the taps as you wind the spool, the first, No. 1; second, No. 2, etc. Now place the tin spool and coil in a pint fruit jar and fill it one-half full of oil; cylinder oil is excellent

Easily Made Step-Down Transformer.

and can be procured at a garage at a small price. Placing the coil in oil prevents it from becoming hot. The next step is to connect the spool to a five-point switch, as in the diagram, and the coil is ready for use. It should be connected to the apparatus it is to operate in series with the 110-volt lighting current.

Electrical Helps for Amateur Photographers

By P. Mertz

HERE are, doubtless, quite a few readers of *The Electrical Experimenter* who dabble in photography. These frequently find it of great advantage to be able to apply their experience with electricity to the taking and making of pictures. It is for them that this article has been written, and it is hoped that it may be of some benefit.

1. An Electrical Shutter Release.

There frequently come up cases when

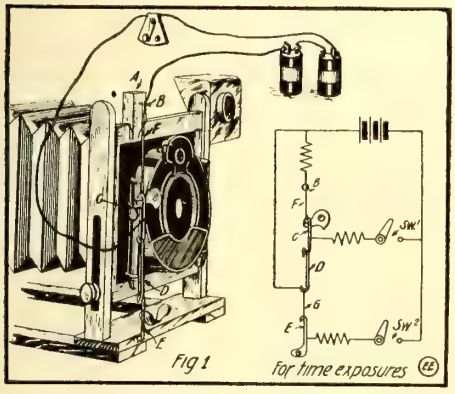

Fig. 1. Electric Fuse Arrangement for Releasing and Closing Camera Shutter.

the photographer cannot stand near the camera to release the shutter, such as when he wants himself to be included in the picture, or, in bird photography, or in a number of other circumstances.

There are several devices for this purpose, each with its advantages and its disadvantages. The writer has devised an apparatus, which has given perfect satisfaction, and which he believes has some advantages over the others.

Its principle of operation depends upon the melting of a fine (No. 40 B. & S.) iron or copper wire, which releases a spring or rubber band, which, in turn, trips the shutter.

The details of construction, as devised for adaption to a 3A Kodak, fitted with automatic shutter, are shown in Fig. 1. A wooden bar A has a slot cut in at the bottom, and fits closely on the lens-board between the front upright and the bellows. It holds a nail or screw B. A piece of wire C is bent into shape and fitted on the finger release. A strong rubber band D is hooked on to the lower end of C. For instantaneous exposures the lower end of the rubber band is hooked on to another piece of wire E, which itself is hooked to some part of the frame. One end of the fine wire F (of iron, if possible, as it will require less battery; and size No. 40) is twisted around C, the other end around the nail B, its length being so adjusted that it just prevents C from tripping the shutter. At the time of exposure a battery current is turned on between B and C; which will melt the wire and allow the rubber band to pull down the finger release.

If a time exposure is desired, the additional fine wire G (shown in the supplementary illustration) should be attached between the rubber band and the frame, and the shutter set at BULB (*not time*). Wire F is fused first, and, after the required time has elapsed, wire G is fused.

For the connections, annunciator wire or flexible cord of the same size are very good—a too fine wire should not be used, as it will reduce the current appreciably. Care should also be taken to use the smallest possible amount of connecting wire, as too much of this, also, will tend to weaken the current.

The switch used should preferably be of the lever type rather than the push-button type, as, unless a heavy current is used, the fine wire does not fuse instantaneously. If it is not inconvenient to keep up the pressure for a second or so, however, a push-button may be used. For time exposure, two switches are required, as shown in the illustration.

As to the amount of battery required, I have found one dry cell to be sufficient, although two would be better. A flashlight battery of three cells may be used if the wire to be melted is very fine, *short* and of iron, and the connections rather short and heavy.

The device has been described for use with only one make of shutter, as there are too many different types used. The use of a little ingenuity will, however, enable the "electrician-photographer" to devise one for his own particular make of shutter and camera.

2. An Electrical Flashlight Apparatus.

It is frequently convenient to set off a flashlight from a distance. For such purposes an electrical arrangement is extremely useful. However, the usual method is to use a spark coil and have the spark ignite the flashlight powder. A much simpler device is to use (as in the preceeding article) a piece of fine iron or copper wire, which will become red hot when the current is turned on and ignite the magnesium mixture.

The powder is put into the cover from a tin can, which itself is on a board (see Fig. 2). Two nails are driven into the board, on each side of the tin cover, so as to hold two pieces of fairly heavy wire, between which the fine wire to be fused is attached. It should be arranged so that the middle of it will just touch the top of the heap of magnesium powder.

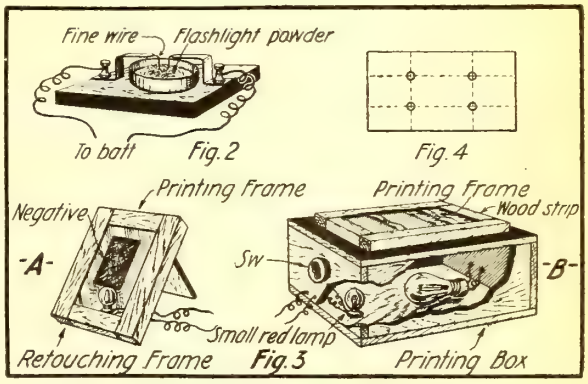
In order to obtain better results, the powder should be stretched along a length of about 10 inches or a foot on a metal plate. Still better results may be obtained by putting a fairly large cheesecloth screen in front of the flashlight, but then more powder is required. This last method is the one usually employed by professionals.

If desired, the electrical shutter release may b used in connection with this device, and flashlights may then be taken inside in the daytime. The operator simply releases the shutter a few seconds before the exposure, then sets off the flashlight and closes the shutter.

The details regarding the connections are the same as for the shutter release. It will be found, however, that a little less battery will be satisfactory, as the fine wire does not have to be melted, but merely heated red hot.

3. Handy Uses for Electric Lights.

Electric lights are very handy things for the photographer.



A retouching frame can easily be made, as shown at A in Fig. 3, by taking a printing frame several sizes larger than the negative, and laying it on a table with either part of the back swung out, so that it raises the whole above the table, and gives the surface a slanting position, easy to work on. Then a small electric light bulb underneath, on a piece of white paper, allows one to see the work distinctly. Before retouching, the negative should be treated by painting it with a thin coat of varnish made by dissolving a little rosin in turpentine.

A convenient printing box (see B, Fig. 3) may be made by taking any wooden box of reasonable size (as compared to the size of the printing frame), and cutting a rectangular hole on top, the size of the *opening* in the printing frame. Strips of wood are then nailed on the box so as to closely fit the frame, in this way preventing light from coming out. (This is to permit the box to be used in the dark room.) A Mazda lamp of a size depending upon that of the print is placed inside the box, the connecting wires being carefully brought in through holes, finally packed with putty to prevent light from leaking out. A switch of any convenient type is fastened on the outside of the box, for turning the light on and off.

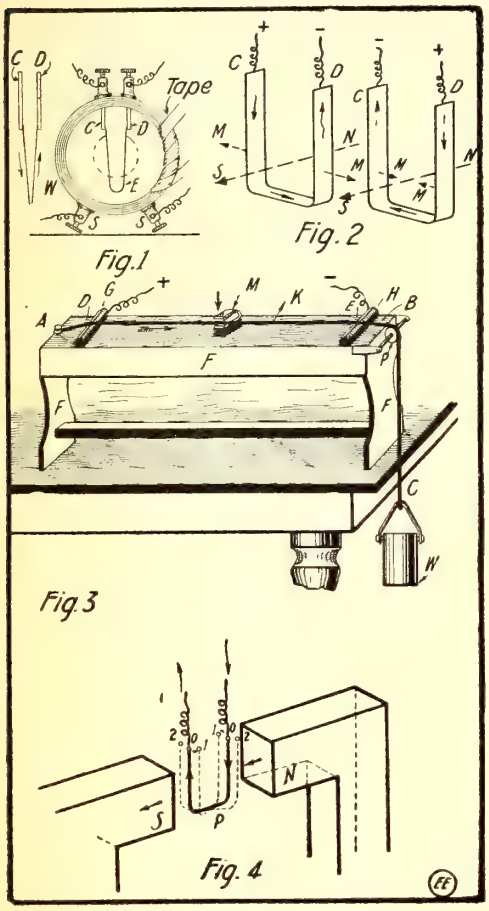
In use the box should be placed near the developing tray, with the light turned off. A negative is put in the frame, a sheet of printing paper placed on top of this, and the back clamped down over the two. The light is turned on, left on the required time, then turned off. The print is now taken out and developed. As soon as this is completed it is rinsed and dipped into the hypo and another print started. This permits of very fast work, and yet each print is perfect. If desired, a small red light may also be put inside the box so as to help in adjusting the negative over the mask.

A help in developing (when using transparent trays, such as glass or amber composition) is to stand the tray on two strips of wood and put a miniature incandescent lamp (dyed a very deep red) underneath. The formation of the image on the plate, as development proceeds, can then be observed better than with the ordinary dark room lamp.

Another great help in the dark room is a "fountain pen" flashlight, with the little bulb dyed a very deep red. This allows one to get at bottles, trays, etc., lying around on shelves or elsewhere, without having to either grope in the dark or disturb the regular dark room lamp.

Figs. 2, 3 and 4 Showing Several Useful Electrical Ideas for the Amateur Photographer.

4. Taking a Picture of the Wireless Set.



Many an amateur would like to take a picture of his own wireless set, but after the first trial the results are usually so poor (unless he has had a little more experience than most fellows) that he seldom has the incentive to try again.

This is because taking a picture indoors, usually in front of a window, where every-

(*Continued on page* 521.)

SIMPLE ELECTRO-MAGNETIC DEMONSTRATION APPARATUS.

The apparatus described below demonstrates very effectively several important electro-magnetic principles of great importance. The exact dimensions make little or no difference and the cost is very small.

Easily Made Apparatus for Demonstrating Electro-Magnetic Phenomena.

Let us take the instrument as shown in Fig. 1. It consists of a coil about 2½ inches in diameter and made up with 100 turns of No. 24 B. & S. cotton-covered or enameled copper wire. This coil is wrapped all the way round with linen tape, with the exception of a space about 1½ inches long at the top. The coil can be mounted in any manner in an upright position and the ends brought out to two binding posts.

Separate the turns carefully where the coil is untaped and insert the two binding posts with extensions C, D, shown in the illustration. Between the ends of these extensions is fastened a very thin sheet of metal foil. Gold leaf is the best; a piece ¼ inch wide and 2 inches long will do and can be attached to C and D by slightly moistening them and pressing the foil carefully in position. It is advisable to place the instrument in a bell jar or similar arrangement to protect it from draughts.

One or two dry batteries will be sufficient for the experiment. One should be used at first, and more added as found necessary. The one set of batteries may be used for both circuits.

Connect all the batteries to the coil and connect one or two to the posts connected with foil. The magnetic field formed by the coil will pass through the loop at right angles as shown in illustration. If the current is passed through the foil strip as shown by the arrow "F," the loop will open out to form a circle (see dotted lines, Fig. 1). Should the current be sent in the opposite direction, the loop will collapse. This effect can also be produced by reversing the current in the coil.

The current should be shut off immediately when the gold leaf collapses, or the battery will be run down or the gold leaf damaged. Reversing the current for a second will spread the loop again, and it is much better than attempting to open the loop with the hands.

So much for the effect. Now for the cause. This can be best understood by imagining the lines of magnetic force created by the coil as pieces of stretched rubber that have a tendency to shorten and so spread sideways. When current flows in the loop as indicated in Fig. 2, the field inside the loop is strengthened and that outside weakened, and the loop is forced outward to form a circle. The opposite is the case when the current is reversed; the field inside is neutralized or weakened and that outside strengthened, and the two sides are forced together.

Another experiment showing nicely the behavior of a wire carrying an alternating current in a magnetic field may be made by arranging the apparatus shown in Fig. 3. This apparatus is to be used in connection with 110 volts alternating current.

If we mount a copper wire A B C as in Fig. 3, stretching it along some such wooden framework F as that sketched and carrying it over a free-running pulley P to a loading bucket W, we may pass current through a length D E of the wire by making the bridges G H, which hold the wire clear of F, of metal, and using them as terminals. Current taken from lighting mains must, of course, be passed through a 16 or 32 cp. lamp as when charging accumulators, and care must be taken to avoid shocks and short-circuits.

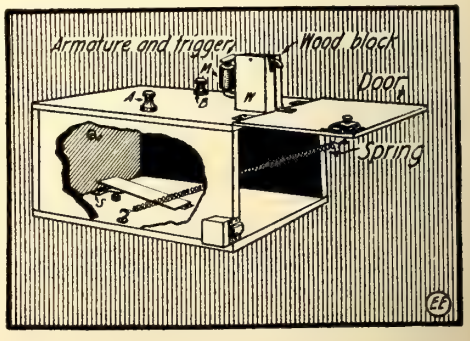
At the center of the wire mount a small permanent magnet M so that its poles lie above and below the wire, but not touching it. When current passes along the wire in the direction shown the wire will be moved electro-magnetically in direction K. If the current be alternating, the wire will swing to and fro in a horizontal direction with the same frequency as that of reversal of the current.

As the apparatus is first set up, it will probably be difficult to observe the vibration of the wire, because the current reverses so often that the wire has not time to move far before it is pulled back again. It is a very simple matter, however, to magnify the motion of the wire so that it becomes very noticeable. The wire thus mounted has a "natural frequency" of its own (indeed, readers who have experimented in sound will recognize this apparatus as the "sonometer" applied to a new use). This natural frequency depends on the material and size of the wire, the length of it between the bridges G H and the tension on the wire. When the natural frequency of the wire is the same as the frequency of the electro-magnetic alternations which vibrate it "resonance" takes place, and the swing of the wire becomes quite considerable. The most convenient and gradual way of varying the natural frequency of the wire (so as to "tune" it to the supply frequency) is to increase the tension on the wire by pouring water into the bucket W. Using 2 or 3 feet of No. 24 copper wire between G H, Fig. 3, it will generally be found that a two-quart can is a suitable size to hang on the wire at C, assuming 60 cycles per second alternating current to be employed. Having switched on current, pour water slowly into C till the swing of the wire attains a maximum. Variations in the supply frequency will then be shown by variations in the width of "blur" made by the quickly moving wire. It is possible, but not easy, to calculate the supply frequency from the length, size and load of wire with which resonance is attained.

The same phenomenon of electro-magnetic vibration may be demonstrated in another effective way, and without making any special apparatus, by placing between the poles of a direct current electro-magnet or permanent magnet, or between two bar magnets in "series," an electric glow lamp supplied with alternating current and having one or more loops of filament, which loops are now placed *parallel* to the magnetic field and not perpendicular thereto as in our first loop experiment. Referring to Fig. 4, it is clear that when current flows as shown the filament loop O P O will tend to twist in the direction 1 P 1; and when the current is reversed the loop will tend to move to 2 P 2. If lamp current and magnet field be reversed simultaneously (by connecting lamp and magnet coils in series) the lamp filament will remain stationary. In the lamp the points OO of the filament are fixed; but if the lamp is a high voltage, low candlepower lamp—i. e., if the filament is long and slender—it will twist very appreciably (sometimes through 30 degrees or so) under the action of the alternating electro-magnetic forces. This will give the appearance of a broad, bright band at the sides of the loop, the point P (Fig. 4) remaining stationary. A very pretty effect is obtained by using a three-loop lamp. If the filament be wound in the shape of a drum, or in any other shape than a U-loop or number of parallel loops, its motion in the alternating field will be complex, but very interesting. Some lamps will show the vibration better than others, and the filaments which vibrate through the widest angle will break soonest. (This particular experiment is not calculated to reduce lamp bills, and is apt to be unpopular on that account.)—*Junior Mechanics and Electricity.*

AN ELECTRIC TRAP FOR CATS, ETC.

The electric circuit through this trap is as follows: From binding post A, through contact spring S, through one hinge of door to upright W, then through trigger and armature, through electro magnets M, and then to binding post B.

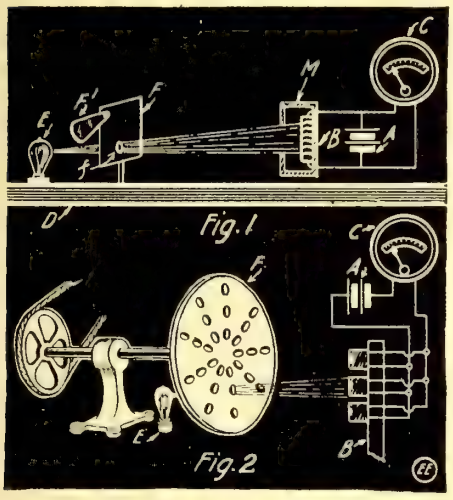


The contact spring may be placed on bait hook if desired instead of under board.

This is a very efficient trap, as the contact is so much more easily closed than the *figure-four trigger* or any other kind. The trap will serve as well for birds as for animals.

Battery is connected to binding posts A and B. There are no dimensions given, as the trap can be made in any desired size. For large traps an ordinary electric door opener will do very well for a trigger.

Contributed by



J. E. HENDERSON, JR.

Simply Constructed Trap With Electrical Release Magnet for Door.

A SELENIUM PHOTOMETER.

The inaccuracies of the photometric methods now in common use are well known. In many cases differences amounting to as much as 10 per cent. will exist between the estimates made by different observers with best available scientific means of comparison. Furthermore, the colors of the lights to be compared are of great importance. The colors differ in the intensity of the effect produced upon the eye of an individual, and there is a marked variation between different persons in this respect. By some observers two lights of the same color may be compared with considerable accuracy, but a change in the color of the standard with the common standard of comparison (the now well-known "Pentane Lamp") will render the determination worthless. The color of the standard lamp is toward the red end of the spectrum, and to most eyes it shows decidedly pink. Hence, when an attempt is made to compare a yellow incandescent lamp, for example, with the standard, the results obtained from different observers are often so discordant as to make them of little use.

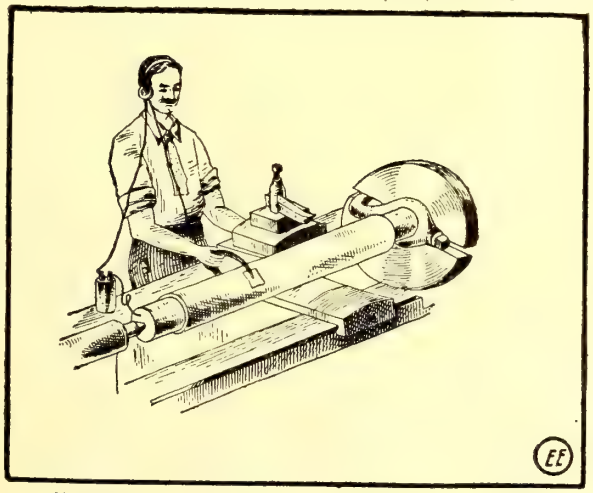
Simple Form of Selenium Photometer.

To obviate all these difficulties William J. Hammer has devised and patented a very simple and ingenious photometer in which the sensitivity of selenium to light is practically applied.

In Fig. 1 A is the battery connected in a circuit with a selenium cell B, which is preferably of that form in which the selenium, after being coated upon a suitable conducting support, such as a coil of nickel wire, is sealed in a tube of nearly perfect vacuum. C is a measuring instrument, being in the case illustrated a milli-voltmeter, responsive to small variations of electrical pressure.

Upon a suitable table D is arranged the lamp E to be tested. At F is a screen having a hole f, which may be closed by a slide F_1; in practise it is preferable to place the selenium cell in a light, tight box M having free ventilation, so that the indication may not be affected by exterior light.

The method of operating the arrangement thus described is as follows: A standard lamp of any desired construction is placed in a proper position adjacent to the apparatus lighted, being screened, completely from the cell B. A small current is then caused to flow in the circuit, including the selenium cell, and after it has attained a steady value the fall of potential around the cell is measured by the milli-voltmeter. After this the light of the standard lamp is allowed to fall upon the cell, and the change in the resistance of the circuit (as indicated by the change in the voltage drop), caused by the action of the light upon the selenium, is measured and recorded; this then becomes a constant for the particular "cell" employed. After this the light which is to be compared with the standard may have its specific effect upon the cell determined in the same way. Obviously, the indication of the cell for the first specimen constructed must be calibrated by comparison with the results obtained by photometers, since the measurements of light now in use are purely arbitrary and have no relation to any definite physical quantity; but this relation having been once established in the manner indicated, may be indefinitely perpetuated by periodic comparison of different cells to guard against change.



Another good arrangement is shown in Fig. 2. In this figure the cells B are arranged upon a stationary support and the screen disc F alone rotates, cutting off and admitting the light periodically by its rotation. This construction is cheaper, and yet substantially effective. This is another practical use of selenium.

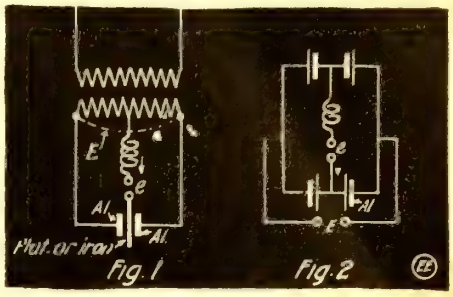
TELEPHONE RECEIVER AIDS THE MACHINIST.

A telephone receiver has been my constant friend about the plant for the past 12 years, says A. J. Carr, in *Power*. I use it for various purposes, one of which is in connection with calipering, especially the work inside of engine cylinders. The most convenient way is to have the two sides of the calipers insulated from each other. In the illustration, where the work in the lathe completes the circuit, causing a click in the receiver, an ordinary pair may be used with a cigarette paper between the work and one side of the calipers. This method is especially useful in aligning engines.

Use a slender German silver wire for the "center" line, taking care that it is insulated from the ground if an ordinary caliper is used, or put a cigarette paper next to the cylinder wall; then, with one side of the circuit connected to the aligning wire and the other to the calipers, a circuit will be completed when the two come in contact. A click will be heard when a contact is so slight that it cannot be seen or felt. Care should be taken not to use too much battery power, as it is annoying to the ear.

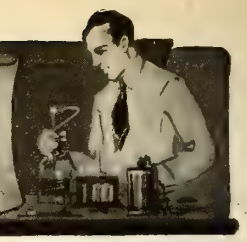
Telephone Receivers Aid the Machinist to Calliper.



Brass Cleaning Paste.—The following makes a good cleaning paste: *Rotten Stone*, 6 ozs.; *Oxalic Acid*, 1 oz; equal parts of *Whale Oil* and *Spirits of Turpentine* sufficient to make a paste.

A general metal polishing paste may be made as follows, the quantity of the parts being by weight: *Petroleum Jelly* (white), 90 parts; *Kieselguhr*, 30 parts; *Refined Paraffine Wax*, 10 parts; *Refined Chalk* or *Whiting*, 10 parts; *Sodium Hypophosphite*, 8 parts. A little *Citronelle* can be added to cover up disagreeable odors and scent to paste.

A polishing powder may be made as follows, the quantities being by weight: *Putty Powder*, 14 parts; *Pipe Clay*, 14 parts; *Kieselguhr*, 42 parts; *Tartaric Acid* (powdered), 1½ parts.

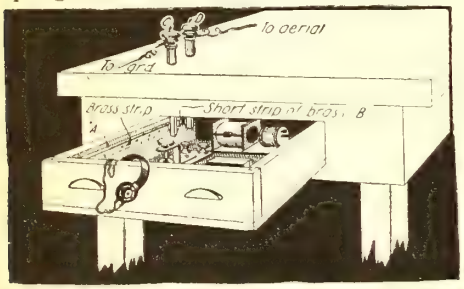


ALUMINUM RECTIFIER EFFICIENCY

In a recent article Günther Schulze discusses what maximum efficiencies may be expected from electrolytic rectifiers with aqueous solutions. The efficiency is limited by three kinds of losses. The first loss is due to the fact that a certain minimum voltage must be reached before the current will pass in the permissible direction. This minimum voltage is a function of the formation voltage of the aluminum plates. The second loss is caused by the ohmic resistance, and the third by the fact that the impermeability of the rectifier (in the direction opposite to the permissible direction) is not perfect. The last two losses may be made small, but the first loss due to the minimum voltage cannot be reduced at will. The author makes the calculations for two arrangements of the rectifier. The first, shown in Fig. 1, is the transformer system in which *E* is the transformer and *e* is the available direct-current voltage. *Al* represents the aluminum plates, and between them is a platinum (*Pt*) or iron (*Fe*) plate. The second system discussed is the Graetz system, shown in Fig. 2, in which *E* is again the alternating voltage and *e* is the available unidirectional voltage. In both cases an induction coil is inserted in the direct-current circuit to make the voltage practically constant. The author first determined the minimum voltage as function of the formation voltage for different electrolytes and calculated the maximum voltage obtainable both for the transformer system and the Graetz system. In both cases the possible efficiencies reach a maximum which is from 80 to 85 per cent., but this maximum is reached for a unidirectional emf. of from 60 volts to 80 volts for the transformer system and for from 100 to 150 volts for the Graetz system. For small voltages the maximum possible efficiencies are low. For a unidirectional emf. of five volts the maximum possible efficiencies are about 40 per cent. for the transformer system and only 25 per cent. for the Graetz system.—*Archiv. f. Elek.*, Vol. 3, No. 1, 1914.

Two Methods of Connecting Up Electrolytic Rectifier.

HOW TO MAKE IT



This department will award the following monthly prizes: FIRST PRIZE, $3.00; SECOND PRIZE, $2.00; THIRD PRIZE, $1.00.
The idea of this department is to accomplish new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best ideas submitted a prize of $3.00 will be given; for the second best idea a $2.00 prize, and for the third best a prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings.

FIRST PRIZE $3.00.

RADIO SET IN TABLE DRAWER.

The diagram represents a scheme which I have worked up and would like to contribute to the "How to Make It Department." As I wanted my receiving set near at hand and yet ordinarily hidden from sight and protected from dust, I hit upon the following plan:

I took out my top bureau drawer, and after cleaning and sandpapering I gave it a couple of coats of black shellac. I then fastened my various instruments to the bottom in the most convenient way. Along the inner top edge on one side of the drawer I fastened a thin strip of copper "A" on a ⅛-inch piece of pine as shown in the diagram. This was separated about ½ inch from the aerial plate "B," also fastened on side of drawer as shown. Two binding posts "C" and "D" were screwed through the top of the bureau, as close to the inside of the drawer as convenient. On the under side of these binding posts (which were parallel to the side of the bureau) two copper strip brushes were fastened and bent so that they would brush against the strip on the side. The different instruments I connected up as usual. When the drawer was now closed the aerial was automatically *grounded*, and when the drawer was pulled out as far as possible the aerial was connected to apparatus ready for use. In one corner of the drawer I arranged a large twine spool with an old alarm clock spring. On this I wound my receiver cord

Mounting Radio Set in Drawer Makes It Dust and Fool-Proof, Besides Being Quickly Connected.

so that it would be wound up normally. In this way it takes me only a second to get my set ready for use, although it is not exposed to dust or to my younger brother's fingers.

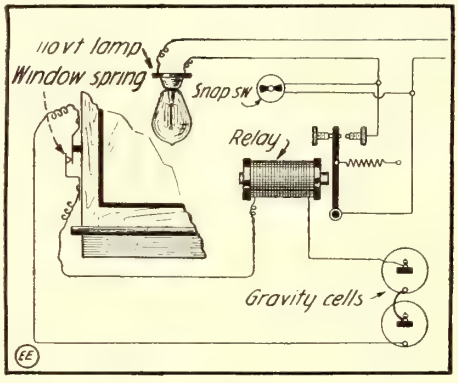
POINTERS ON STORAGE BATTERIES.

The following are some miscellaneous pointers on storage batteries:

Restoring weakened cells. There are several methods of restoring cells that have become low.

1. Overcharge the whole battery until the low cells are brought up to the proper point. 2. Cut the low cells out of the circuit during one or two discharges and in again during charge. 3. Give the defective cells an individual charge.



Idle batteries. If a battery is to be idle for, say, six months or more, it is usually best to withdraw the electrolyte as follows: After giving a complete charge, siphon or pump the electrolyte into convenient receptacles, preferably carboys, that have never been used for any other kinds of acid, and that have been thoroughly cleaned. As each cell is emptied, *immediately* refill it with water. When all the cells are filled, begin discharging and continue until the voltage falls to or below 1 volt per cell at normal load, and then draw off the water.

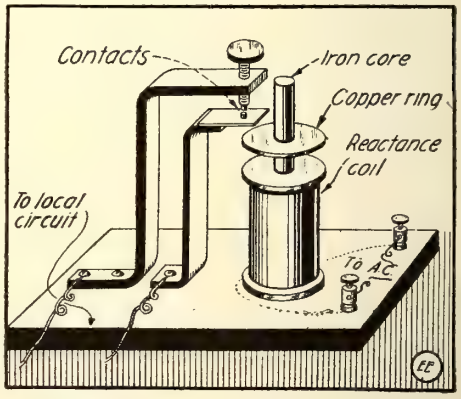
Contributed by EDW. CONNELLY.

SECOND PRIZE $2.00.

BURGLAR ALARM THAT TURNS ON LIGHTS.

A very reliable, closed circuit burglar alarm may be made from the following articles: Two or three gravity cells for battery, some closed circuit door and window springs, some double cotton covered wire, an old telegraph relay and some regular electric light wire. The relay and gravity cells and contact springs are set up in the usual way, for an ordinary closed circuit system, but instead of using dry cells and electric bells in the local circuit two wires are run from the lighting switch wires in such a manner as to connect the relay in parallel with the snap switch. The system works like this: Before going to bed as many lights as desired are left on and then turned off by the regular snap switch. If during the night an intruder should raise one of the windows or open a door, or even cut the wires, the circuit would be broken and this would allow the magnets to release the relay armature. Of course, as soon as the armature was released a contact would be made and the lamps would light up; current finding its way to the lights through the relay instead of through the snap switch. As everyone knows, a burglar is afraid of light and consequently he would be scared away before he even got into the house.

Scheme for Burglar Alarm Relay to Turn on Lights.



Contributed by GEORGE M. GILBERT.

THIRD PRIZE $1.00.

A NOVEL A.C. RELAY.

This relay can be constructed by anyone wanting a relay for handling heavy currents. First a core of transformer iron is procured. This should measure ½x½x6 inches. Around the core is wrapped two or three layers of friction tape. Then wind 135 turns of No. 11 D.C.C. over this. Wind a layer of tape around this and then a piece of empire cloth. Cover the cloth with shellac after it is on so that it has a smooth surface. Next procure a piece of about No. 20 B. & S. gauge copper sheet. From this is cut a circle 4 inches in diameter with a hole 1 inch in diameter in the center. Two supports are required for the contacts. These comprise two pieces of brass strip, one 9 inches and one 8 inches long, tapped 8/32 at each end. A bend is made at the top of the 9-inch support as shown, and a set screw with a silver contact placed on the end of it. To the 8-inch support a piece of spring brass with another silver contact is secured. These supports extend above the copper ring which is placed over the end of the reactance core. Now place the coil on its end, and firmly mount it. Next place the copper ring over the core. When the current is turned on, the copper ring jumps up and closes the contacts

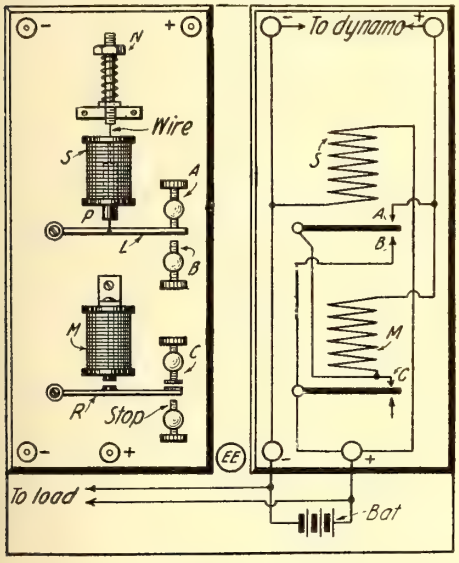
Contributed by ROBERT CHANDLER.

An Alternating Current Relay. The Copper Ring is Repelled Upward, Closing the Contacts.

WAVES OF LIGHT AND ELECTRICITY.

There is a close similarity between light waves and the Hertzian waves employed in wireless telegraphy. The latter are subject to reflection and refraction, like light. Electrical waves will pass through many substances quite easily, while they are stopped by a sheet of metal. In a similar manner some materials are transparent to light waves, while others are opaque. It is now generally admitted by scientists that all forms of radiant energy—heat, light, Hertzian waves, etc.—are essentially the same, being of an electro-magnetic nature.

AN AUTOMATIC BATTERY CHARGING PANEL.



This is a simple device that will automatically switch on and off the charging current for storage batteries.

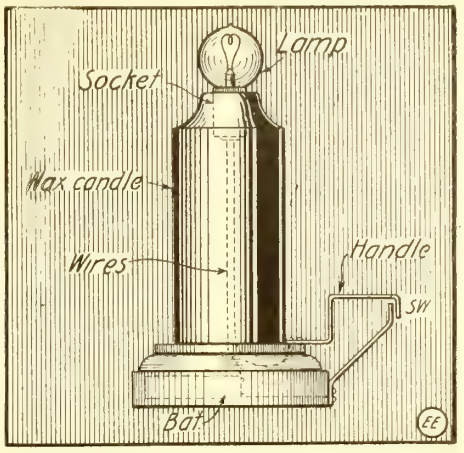
When batteries are discharged the drop in voltage will cause the soft-iron plunger P and lever L to drop away from the solenoid S, which is shunted across the terminals of the battery. Upon touching contact B the lever L closes the circuit for the charging current, which flows through magnet M, attracting armature R and closing the heavy copper contacts at C. These heavy contacts at C are to take care of any arcing that might occur should the charging current be broken by the smaller contacts at B.

When the battery is fully charged the effect of the rise in voltage will draw the plunger up into the solenoid S until lever L touches contact A; this short-circuits magnet M, causing the armature R to drop and open the charging circuit.

Solenoid S is wound with fine wire to the resistance of 120 ohms (one pound of No. 28 S. C. C. wire) for a 6-volt battery. Magnet M is wound with No. 16 S. C. C. wire (three layers).

After the battery is fully charged the first time the device must be adjusted by

Automatic Battery Charging Cut-Out.



regulating nut N, which controls the pressure of the spring directly under it, and contact A. In like manner adjustments of contacts B and C are necessary when battery is in discharged condition.

If the load on the storage battery consists of any apparatus, such as lamps, etc., that cannot stand the gassing voltage of the battery (which is about 2.5 volts per cell) the idle contact marked "Stop" can be used to open the circuit marked "To Load" while battery is being charged. Contributed by ALBERT F. MURRAY.

A CHEAP ELECTRIC CANDLE.

An interesting and novel manner of transforming an ordinary wax candle into an electric one deserves consideration. It will prove invaluable in dark rooms and at night, where others grope around in darkness. It may also prove surprising that candles (though more elaborate) such as described here are retailed at prices ranging from $3 to $4.

A wax candle is first procured. At the top of the candle bore a small hole with a penknife, leaving a hollow opening into which the electric socket is later to be placed. The wick is pulled out entirely. This process leaves a hollow and empty center, into which the wires are run. The socket is slipped in at the top and wires are

Cheaply Made Electric Candle.

inserted through the center space where the wick formerly was.

Next obtain a hollow base of wood, which may be of circular shape. In the center of this base is drilled a small hole to admit the wires from the socket to be connected up to battery. A flashlight battery is necessary and the two wires are soldered to same, one to carbon, the other to zinc. A suitable handle is fastened to the base, wherewith the candle may be easily held in the hand. If desired the electric current may be controlled by a switch conveniently located, or the electricity supplied by the battery can be cut off by simply unscrewing the electric lamps in socket.

AN ELECTRIC BULB BAROMETER.

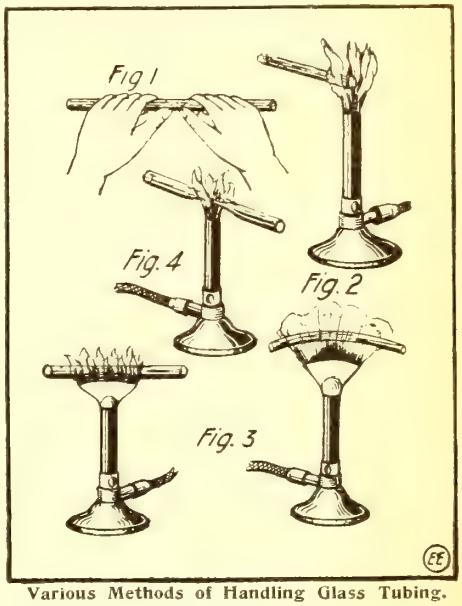
It is an easy matter to convert a burned-out, incandescent light bulb into a barometer that will foretell changes in the weather with remarkable success.

Place a discarded bulb under water in a deep basin, and after protecting the hands against danger from broken glass, break off the pointed bit of glass at the very end of the bulb with a pair of pliers. As soon as an opening is made in the glass the bulb will fill with water, which rushes in to take the place of the vacuum.

Tie a cord or stout string about the neck of the bulb and hang it on a hook or nail.

Barometer Constructed from Electric Lamp Bulb.

If the weather is to be fine, no water will drop from the hole at the bottom of the bulb. When the water begins to bulge out of the opening until drops fall from the bulb, you may expect a change in the weather.



Atmospheric pressure governs the action of this simple barometer. When the pressure increases—a sign of fair weather—it pushes the water back from the mouth of the bulb, and no drop can form; when it falls, the water expands through the opening, until a few drops fall. As lower pressure nearly always precedes a change of weather, a drip from the bulb usually indicates a coming storm.

HOW TO HANDLE GLASS TUBING.

To break small glass tubes simply make a small file scratch on one side and then grasp the tube on each side of the scratch, placing the thumb nails together opposite the scratch and pull back. By using this method the tube will break evenly. (Fig. 1.)

Never leave the rough edges on the ends of the glass tubes, as it is dangerous and may result in cuts on the fingers. To round off the edges place in a gas flame (as from a bunsen burner) and allow the tube to remain until it becomes red hot, when surface tension will round off the edges. (Fig. 2.)

When bending glass tubing it is best to use a "fish-tail" burner, a burner giving a long flattish flame. When this kind of a burner is utilized the bend will be round

Various Methods of Handling Glass Tubing.

rather than angular and hence will be better, as angular bends are more likely to break, besides obstructing the flow of a liquid. Place the tube in the flame and turn it slowly, so as to distribute the heat uniformly. When the glass begins to redden stop turning and hold the tube by one end only. Leave the tube in the flame until it bends to the right angle. Always let gravity do the bending, as it is much more uniform and steady than bending by hand. Care should be taken to have the two sections in the same plane. (Fig. 3.)

Glass tubes can be closed by heating the end until it is very hot and then keeping it in a molten state for some time. The surface tension will gradually decrease the hole until it finally closes. Tubes can also be closed by pulling them apart. They should be heated to a cherry red color and then pulled gently on each end until they separate. (Fig. 4.)

In heating all glass care should be taken that it is perfectly dry, as any moisture is liable to crack it. Always heat gradually at first, and also let it cool gradually. Never try to heat real thick glass because, glass being a poor conductor of heat, it expands unevenly and is likely to break.

Hearing Through Your Teeth

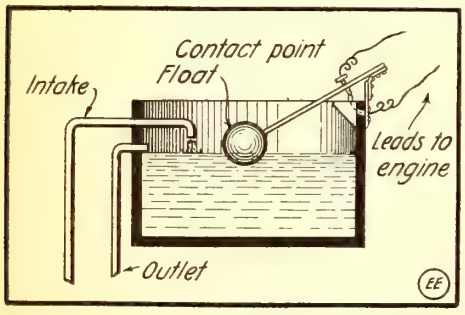
By H. Gernsback

THE following interesting experiment can be performed by anyone who has an ordinary disc phonograph. It is interesting, in so far as it shows the transmission of sound through the teeth, and through the bony substance of the human skull, which in turn reacts upon the auditory nerve. It is not well known but it is a fact nevertheless that sounds do not necessarily have to enter through the oral opening in order that we can hear sounds. Physicians in testing for hearing sometimes use a tuning fork which, after struck, is pressed with its lower part against the back of the skull, right behind the ear. The sound is then heard inside of the head the same as if it had actually entered through the opening of the ear itself. This principle is made use of in the experiment described here, and while it is not electrical by any means, it probably will interest every experimenter who owns a phonograph.

Stop up both of your ears with cotton as tightly as possible so that no sound will be heard from the outside. Now place an ordinary darning needle between your teeth by biting on it hard, taking care at the same time that the lips or tongue do not touch the needle. The latter is important because if either lips or tongue touch the needle the sound will be decreased considerably. For best results the needle itself should project not more than 1 or 1½ inch from the mouth. For that reason the darning needle should be broken off about one and one-half inches from its sharp point. It goes without saying that the sharp point should project out of the mouth while the broken off end should be inside of the mouth.

Using the Head as a Reproducer on a Phonograph.

Now start an ordinary disc phonograph and carefully press down upon the record with the needle's point held at the same angle as the reproducer's needle is held ordinarily. With a little practise one will become proficient in moving the head at the same ratio of speed as the ordinary reproducer arm is moved from the outside of the record towards the inside. As soon as the needle touches the record with sufficient pressure, the inside of the head will be filled immediately with music exceedingly loud and clear.



A curious result of the experiment is that a person standing near by can bear the music, the head acting as a reproducer in this case.

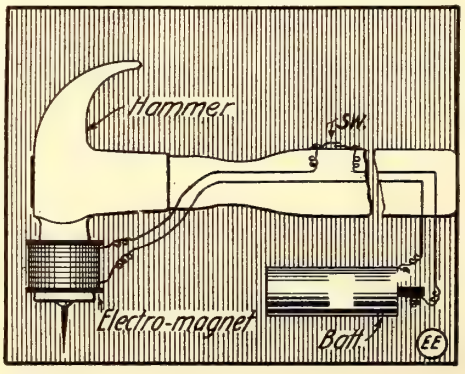
Of course, it will be understood that a totally deaf person will not be able to hear any sound if the auditory nerve is dead or inactive. It is, however, interesting to note that *partly* deaf people can hear the music quite well. This is particularly true of persons hard of hearing who cannot ordinarily hear the sounds of a phonograph.

The writer should like to hear from readers, particularly from those who are partly deaf, who have tried this experiment; *The Electrical Experimenter* will be glad to publish the results in subsequent issues.

AUTOMATIC STOP FOR PUMPING STATIONS.

The following is a suggestion to those who have pumping stations using gasoline or oil engines to pump the water into a tank. A great deal may be understood from the cut, but a little explanation may

Pumping Engine Cut-Off Switch Equipped With Float.



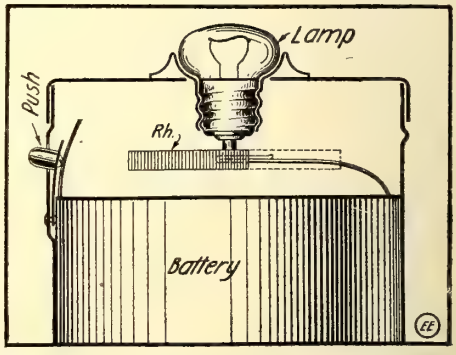
be necessary. On the side of the tank, just above the level of the outlet, is placed a triangular block of wood to which is fastened a contact point of suitable size, with a wire leading to the outside, and just above this is placed a shaft, which is hinged to the side of the tank and has a float at the end of it. A contact point on the end of an adjusting screw is put through the shaft vertically and is connected to another wire leading to the outside. The adjusting screw is put so that when the water is down it will rest on the other contact, and when the water rises to the overflow outlet the shaft rises and breaks the contact. The wire leads go to the engine (the negative one may be grounded to the water pipe if desired) and are connected in series with the batteries or magneto.

As soon as the water rises and fills the tank the contact is broken; the ignition current ceases to go to the engine and it stops, thus saving the waste of water and gasoline and making it unnecessary for anyone to keep watch over it.

Contributed by W. F. ALLSTON.

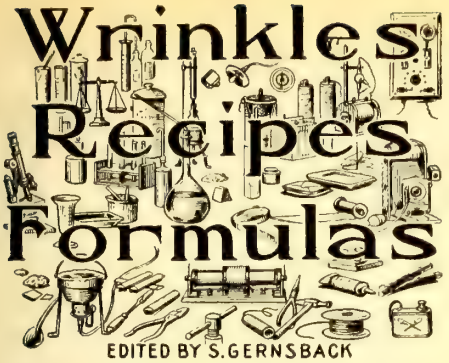
ELECTRO-MAGNETIC HAMMER.

Obtain a hammer, and if the end or tip of the hammer head is rusty, clean off the rust by using a piece of emery paper. Wind on five or six layers of No. 18 magnet wire. Leave leads on the magnet for about 6 inches. Take a small piece of brass (from a small flashlight battery) and bend as shown in diagram for a switch. With some small staples tack the wire firmly on the hammer handle and connect with the switch. Bring the wires to the end of the handle and tack them down firmly, leaving a few inches to connect with some flexible cord. A connector should be placed in the circuit, so that when the batteries are not



An Electro-Magnetic Hammer Proves Useful in Handling Small Nails, Tacks, Etc.

needed the cord will not be in the way. This hammer will work on three or four batteries nicely. Contributed by



WALTER BRAHANEY.

GERMAN FLASHLIGHT HAS RHEOSTAT.

A unique, adjustable type of pocket flashlight has been developed for use in the German army, and it is useful in giving different kinds of signals, etc. The flashlight is shown schematically in the drawing herewith. It does not differ in a general way from those with which we are familiar, but the lamp may be lighted with different degrees of brilliancy by the use of the adjustable resistance coil placed against the back of the lamp. This coil is made to slide back and forth on the brass connecting lug from the battery as perceived. This is also of service in compensating for the drop in voltage of the batteries if a lower than normal voltage lamp is employed. It is, of course, apparent that if such a below normal lamp is employed, that it would undoubtedly be burned out in short order by a fresh battery. Hence, some of the resistance may be cut in, in this event, and as the battery voltage falls, after it has been used awhile, some of the resistance may be cut out; thus keeping the voltage on the lamp approximately constart.

Miniature Rheostat Controls Current Supplied to Flash-Lamp Bulb.

EDITED BY S. GERNSBACK

Under this heading we will publish every month useful information in Mechanics, Electricity and Chemistry. We shall be pleased, of course, to have our readers send us any recipes, formulas, wrinkles, new ideas, etc., useful to the experimenter, which will be duly paid for, upon publication, if acceptable.

FORMULA NO. 17.
Composition of All Kinds.

1. *Flexible Insulating Mass.*—Forty parts of *Shellac;* 40 parts of dry, finely pulverized *Asbestos, Flax Cotton, Wood* or *Paper;* 25 parts of *Wood Tar;* 1¼ part of *Paraffine.* Mix together in a vessel at 100 to 200 degs. F.

2. *Gutta Percha Composition.*—Six parts of *Gutta Percha;* 2 parts of *Bone Dust;* 1 part of *Pipe Clay.*

3. *Insulating Compound.*—One part of Stockholm *Tar;* 1 part *Resin;* 3 parts of *Gutta Percha.*

4. *Composition for Mouldings, Frames, Etc.*—Twelve parts of *Whiting;* 6 parts of fine sifted *Sawdust;* 1½ parts of *Linseed Oil Cake.* Knead this mass to a paste with a strong solution of glue.

5. *Another.*—Eight parts of *Pulverized Litharge;* 16 parts of *White Lead;* 2 parts of fine *Sawdust;* 20 parts of *Plaster of Paris.* Stir these ingredients into 26 parts of glue dissolved in sufficient water.

S. G.

POISON PREVENTER.

The following will be found a useful prevention from taking poison by accident: In the cork of the bottle insert some pins so that they extend above the cork slightly and are thus exposed. Cover the cork with these except a small space so that the fingers can hold the cork without being pricked. The idea is that when a person takes hold of the cork of this bottle in the dark they invariably will be pricked by the pins, which warns them that the bottle contains poison. Contributed by

ANDREW W. GALLAGHER.

A GOOD WRITING FLUID EASILY MADE.

A good writing fluid, of a rich, dark black, can be put up by following this formula:

Two and four-tenths grams of logwood extract, should be mixed with 100 cubic centimeters of distilled water. Heat should be applied until the substance is dissolved. After it is cooled potassium chromate should be added, until the desired shade is attained. From 2 to 3 c.c. is usually sufficient. A little gum arabic, or gelatine, may be dissolved in the matter to give it a good consistency, or "body."

If this method is followed the solution should then be filtered through silk. This finishes the fluid, and it is ready for use.

For Users of Fountain Pens.

I have always had great difficulty in unscrewing my fountain-pen for refilling. I found out, however, that if the threaded piece of the pen is slightly greased with a little vaseline the parts will unscrew much easier, and the contained ink cannot leak out, thus eliminating soiled fingers.

CHEMICAL BAROMETER AND FLASHLIGHT POWDER.

To make a chemical barometer take potassium nitrate, 30 grs.; ammonium chloride, 30 grs.; camphor, 120 grs.; alcohol, 2 ozs. Put the mixture in a bottle ten inches long and ¾ inch in diameter. Cover the bottle with a piece of perforated plaster. If fine weather is indicated the insoluble matter will settle at the bottom of the bottle; previous to a change for rain the compound gradually raises, the fluid remaining transparent. Twenty-four hours before a storm or very high wind the substance will be partly on the surface, the fluid being turbid and in a state resembling fermentation.

Flashlight powders: Take powdered magnesium, 3 ozs.; powdered chlorate of potash, 6 ozs.; powdered sulphide of antimony, 1 oz. Mix by sieving. One hundred grams to be used each time a photograph is taken.

RICHARD GAILLARD.

MAKING A HECTOGRAPH.

As the price of a good printing set is usually beyond the means of the average experimenter, the following device will not be found amiss as an excellent substitute:

First obtain a shallow tin dish (the cover of a bread box will answer the purpose well), an ounce bottle, an ounce of gelatine, 1 ounce of brown Demerara sugar, 6 ounces of glycerine and 2½ ounces of barium sulphate. Break the gelatine into small pieces and place in a sauce-pan with 3 ounces of water and let this steep overnight. Next pour in the glycerine and heat over a fire. Put in the sugar and let it heat until dissolved. Then take the barium sulphate and mix with 1 ounce of water in a separate cup. Pour this into the sauce-pan, and when thoroughly mixed pour it into the flat tin dish (which should be well cleaned) and then allow the mass to harden.

Buy some hectograph ink, or make it at home by filling an ounce bottle with 2 drachms of methyl-violet aniline and 2 drachms of spirit and dissolve it in 1 ounce of water. Write on a piece of paper whatever you want to reproduce, and place the paper, face downward, on the rubber-like surface, rubbing same gently on the written matter. After one-half to one minute, pull the paper off. Then take another paper and press upon the hectograph, and it will be reproduced as many times as you repeat this operation.

To clean the hectograph wash it first with water, mixed with an eighth part of hydrochloric acid, also known as spirit of salt; then clean the surface with pure water. Let it stand for 12 hours before using again. Contributed by

H. J. GUTHRIE.

A Bright Polisher.

A few grains of butter of antimony added to a bottle of ordinary machine-oil proves to be an excellent polisher for old furniture. It is easily made and brightens wherever applied to.

Contributed by W. W. J.

To Clean Brass.—An economical method of cleaning brass is to rub it with a mixture of *Vinegar* and *Salt,* or *Oxalic Acid,* then wash with *Water* and polish with *Tripoli* and *Sweet Oil.*

Another liquid polish for metal is as follows: *Jewelers' Red,* 25 parts; *Oil of Turpentine,* 15 parts; *Oil of Stearine,* 25 parts; *Animal Charcoal,* 45 parts; *Alcohol* sufficient to make the mass practically liquid. Apply with a brush. After the alcohol has evaporated rub with a cloth.

HOW TO PUT A PIANO FINISH ON WOOD.

If the wireless man wishes to finish his instruments or table with a finish which will not only last indefinitely, but closely rival the finish on his piano, the following process must be closely adhered to. The method described below is that which the manufacturers of fine pianos use.

1. Sandpaper the wood thoroughly with fine sandpaper. Do not sandpaper across the grain.

2. Use oil stain or dye. Put on heavy and wipe off surplus.

3. Next put on a good wood filler. Rub filler into the wood with excelsior. The pores of the wood should all be filled. Rub across the grain.

4. Sandpaper very lightly.

5. Give three coats of shellac. Thin white shellac is preferable. Sandpaper each coat when the shellac is dry before applying the next coat.

6. After the last coat of shellac is sandpapered apply a coat of the very best grade of varnish obtainable. Sandpaper this coat when dry.

7. Apply another coat of varnish. When *thoroughly dry* rub with *coarse* pumice stone. The pumice stone is put on *wet felt* and rubbed hard until the wood is entirely free from lumps and perfectly smooth. Wipe off all traces of the pumice stone with a wet rag or chamois skin.

8. Give the last coat of varnish.

9. Rub with *fine* pumice stone in the same manner as with the coarse, but do not rub as hard or as long. Rub just hard enough to take off any lumps which the varnish might have left. Wipe off any of the pumice stone remaining.

10. Rub with rotten stone in the same manner; that is, very lightly. Rotten stone is sold in small cakes about the size of your fist and is likewise applied with wet felt. Wipe the wood clean and let it dry.

11. Now rub with the palm of your hand. Rub hard until the wood is clear and smooth. You will now have a mirror-like finish. The wood becomes slippery after the hand rubbing and will not catch the dust.

In applying the varnish and shellac put on a thick coat roughly. Then use long sweeping strokes with a fine brush. Always wait until the varnish is dry before sandpapering. See that the varnish is always thin and plastic before applying.

RECIPES FOR JEWELERS' ENAMELS.

Melt together the combinations of materials as given below to make the various colors of enamel. Portions by weight.

Transparent Red—Cassius gold purple, 65 parts; crystal glass, 30 parts; borax, 4 parts.

Transparent Blue—Crystal glass, 34 parts; borax, 6 parts; cobalt oxide, 4 parts.

Dark Blue—Crystal glass, 30 parts; borax, 6 parts; cobalt oxide, 4 parts; bone black, 4 parts; arsenic acid, 2 parts.

Transparent Green—Crystal glass, 80 parts; cupric oxide, 4 parts; borax, 4 parts.

Dark Green—Crystal glass, 30 parts; borax, 8 parts; cupric oxide, 4 parts; bone black, 4 parts; arsenic acid, 2 parts.

Black—Crystal glass, 30 parts; borax, 8 parts; cupric oxide, 4 parts; ferric oxide, 3 parts; cobalt oxide, 4 parts; manganic oxide, 4 parts.

White, 1—Crystal glass, 30 parts; stannic oxide, 6 parts; borax, 6 parts; arsenic acid, 2 parts.

White, 2—Crystal glass, 30 parts; sodium antimonate, 10 parts. The glass used for this one must be free from lead.

Contributed by JOHN McCAFFERY.

WITH THE AMATEURS

Our Amateur Radio Station Contest is open to all readers, whether subscribers or not. The photos are judged for best arrangement and efficiency of the apparatus. To increase the interest of this department we make it a rule not to publish photos of stations unaccompanied by that of the owner. Dark photos preferred to light toned ones. We pay each month $3.00 prize for the best photo. Make your description brief. Address the Editor.

AMATEUR RADIO STATION CONTEST.
Monthly Prize, $3.00.

This month's prize winner.

E. JACOBSEN'S LABORATORY.

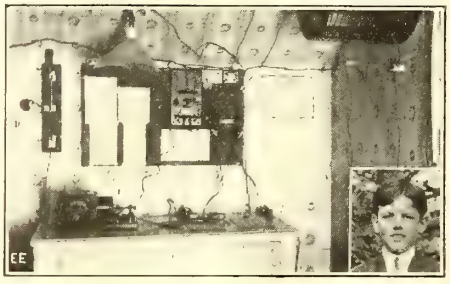
During my spare time I do considerable experimental work and am sending you some photos of my laboratory. I haven't any good photos at hand at the present time, so I am sending you just what I have available. I am going to high school at present and don't find much time for taking and finishing photos.

The views herewith show part of my photographic and chemical laboratory, also a flashlight of my "high tension" apparatus When this photo was taken I cut down the

Above: Edwin Jacobsen in his Chemical "Lab." Below: Taking Sparks from His Tesla Coil.

length of the high frequency spark from 12 to 6 inches, so that I could get a better picture.

I am always interested in seeing pictures of other laboratories published in the *Electrical Experimenter*, so that is the reason I am sending you these. I would say that most of my "lab' is located in the attic and that accounts for the slant to these pictures.



I will send you some illustrations of my wireless telephone and telegraph experimental sets in the near future.

EDWIN JACOBSEN.

Seattle, Wash.

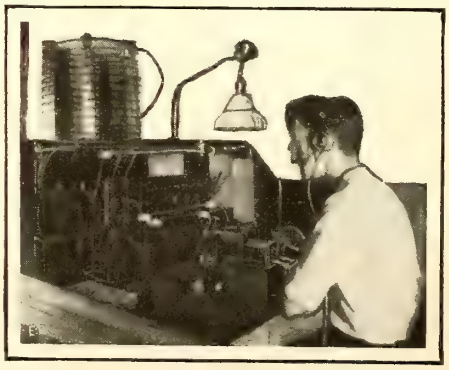
RADIO SET OF B. W. DAVIS.

The accompanying photograph is of my wireless station. I will give a brief description of the station. Sending set: Thordarson 1 kw. transformer, home-made oscillation transformer, straight spark gap and 5-gallon bottle condenser, key and switches. Receiving set: 1,500-meter loose

Benton W. Davis and His Wireless Outfit.

coupler with hard rubber contact and switch point bases, hard rubber base galena detector and buzzer test, Electro Importing Co.'s loading coil and fixed condenser, Brandes' 2,000-ohm 'phones. I have 1 T. P. D. T. aerial switch and 1 S. P. D. T. lightning switch, also 1 D. P. S. T. switch for power circuit control. I also have radio maps of this city, Great Lakes, United States and the world. The aerial is 35 feet high, 65 feet long, with a one-wire 15-foot lead-in. It is composed of four strands of No. 14 Antenium wire, spaced 3 feet apart on 9-foot bamboo spreaders.

The local amateurs come in loud, and I also copy Arlington (NAA), Buffalo (WBL), Detroit (WDR), Ashtabula (WSA), Cleveland (WCX), Sarnis (VBE) and Point Burwell (VBF), Canada, besides many boat stations on the Great Lakes.



I have a Government operator's and station license, and my official call is 8QZ. I think your magazine is now the best of its kind in the field.

BENTON W. DAVIS.

Cleveland, Ohio.

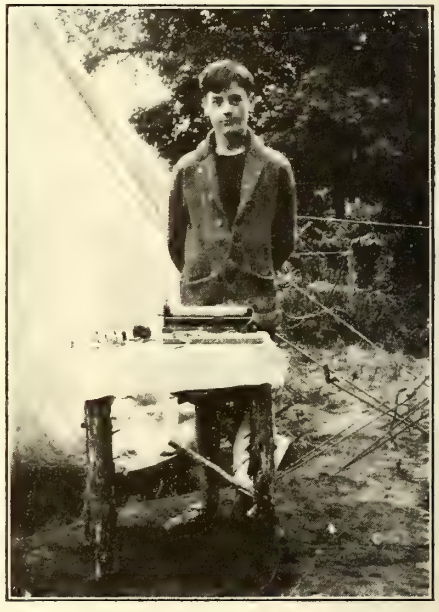
RADIO STATION OF THOMAS R. HICKS.

I would like very much to see the accompanying picture of my station in *The Electrical Experimenter* radio station contest.

Thomas R. Hicks Gets All the Long Distance Stations.

My aerial is 70 feet high and 70 feet long and is composed of four cables, each consisting of seven strands of No. 22 B. & S. gauge copper wire. The ground is a No. 4 copper wire 40 feet long.

My receiving set contains a type A.A. Crystaloi detector, an inductive tuner, a 35-plate variable condenser, a home-made condenser and one set of Brandes' transatlantic 'phones. My sending outfit is composed of a 1-inch E. I. Co. Bulldog spark coil, E. I. Co. spark gap, aerial switch and electrolytic interrupter, a Brandes' heavy service key, a home-made helix and a high-tension condenser.



I get very good results with this set and can receive N.A.A., W.C.C. and N.A.R., besides all the amateur stations around West Chester.

THOMAS R. HICKS.

West Chester, Pa.

RADIO SET OF L. H. BUEHL.

The accompanying photgraph is of a wireless set I made in camp. I constructed

Louis H. Buehl Owns an Efficient Portable Radio Set.

it with a pair of pliers, a pair of scissors and a saw. The two-slide tuning coil was a rolling pin on which was wound bare copper wire with string as the insulating material. This was then shellacked. The end pieces and the base were made out of a soap box and the slider was made from a barrel hoop straightened out. The slider was a block of wood and a piece of tin; the condenser was also made of tin, with air as a dielectric, and last of all the detector was made from a safety pin and some mineral. I brought the 'phones, binding posts and minerals with me. The shellac was obtained at a near-by farm-house.

LOUIS H. BUEHL.

Philadelphia, Pa.

Electricity is man's most willing servant. It does all his tasks gladly, but, like a snake, will strike back when least expected.

EXPERIMENTAL STATION OF DAVE BORDWIN.

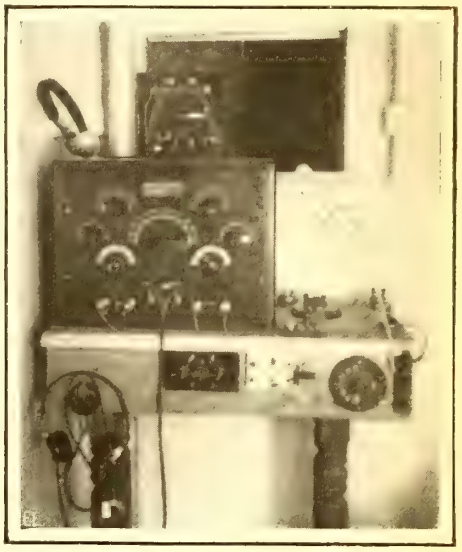
I present herewith photograph of my wireless station and myself, which I would like to see published in the monthly prize contest of your dandy magazine.

My aerial is 64 feet long, 38 feet high and is composed of four strands of No. 14 copper wire spaced 2 feet apart. The lead-in is of No. 4 wire run to a large 600-volt,

Compact and Serviceable Radio Station of Dave Bordwin.

100-ampere lighting switch. From there a No. 4 wire is run from the switch to a pipe driven 7 feet into the ground. The receiving set contains a large double-slide tuning coil, loading coil (next to tuner), fixed condenser and galena detector; these are all my own make. I also have one 1,000-ohm Brandes' receiver and an Electro leather-covered headband, which I like best, for it fits the head just right. A buzzer test is also used, which I can work from the table and also with my foot if desired. I shunt my detector while sending, so that I do not loose my "spot" on the galena and also do not then hear the noise in my receiver. The sending set has a 1-inch spark coil, Amco key, Electro spark gap and home-made glass-plate condenser. Both table and instruments are stained a light mahogany.

I hear Arlington very loud without using my loading coil. My receiving range is about 300 miles and sending range eight miles. I am very well satisfied with my station. I would be glad to hear from other amateurs. DAVE BORDWIN.



Paterson, N. J.

WIRELESS ON THE FARM.

Clement & Taylor, two Winthrop, Me., farmers, have a wireless telegraph installed on their farm. Mr. Clement, who was a telegraph operator before he was a farmer, has installed a receiving apparatus at their farm and they are thus able to get the standard time and the weather reports from Washington every day, learn the latest war news, and oftentimes catch messages sent out from boats at sea signaling in their location. He generally knows when the Boston boat gets in at night, and although the change from the Morse code to the Continental, used by the Government, bothered him a little at first, he is able to decipher most of the messages which his receiver is sensitive enough to take.

WIRELESS OUTFIT OF F. B. MEEKER.

Below is a picture of my wireless station, and the following comprises the apparatus which I am using: One type R. L. C. 3 special Mignon receiving cabinet, one E. I. Co. vario-selective cabinet set, one Perikon, one Gribe and one Electro detector; also one E. I. Co. loading coil, fixed variable and fixed condenser, a set of their 3,000-ohm 'phones and one set Navy type 2,000-ohm receivers. I have two aerials; the larger

F. B. Meeker's Modern Wireless Outfit.

one is 110 feet long and consists of two wires on 3-foot spreaders, and the smaller one is 50 feet long, with four wires on 6-foot spreaders. Both of these are supported on masts located on the roof.

New York City. F. B. MEEKER.

Amateur News

Radio Prizes Offered by Troy Amateurs.

The Amateur Marconi Radio Association, of Troy, N. Y., and vicinity, is planning an active fall and winter season. Extensive experiments with portable wireless receiving sets will be conducted and prizes will be awarded to members transmitting messages the greatest distance. The association has a large membership and practically everyone of its members has his own wireless plant. The association, however, is desirous of increasing its membership so its work can be carried on along broader lines, and the president, W. W. King, would like to hear from amateur wireless operators not already members. The association has its meetings in the North Troy Young Men's Christion Association building, and each of the meetings is addressed by experts. Malcolm Williams, of 1627 Seventh Ave., Troy, has been elected secretary in place of Harold Connor, who recently resigned. Communications relative to membership should be addressed to Secretary Williams.

Radio Club of Hartford News.

About 50 members of the Radio Club of Hartford, Conn., gathered at the State armory recently for the purpose of inspecting the new wireless apparatus received by the National Guard. After the apparatus had been thoroughly looked over in the squad drill room, it was carried out to the armory lawn and set up there and the members of the club picked up many messages from the sky. At the conclusion of this test the members gathered in the company room of the signal company and listened to Captain George E. Cole, who told them the nature of the service in the National Guard, its good points and bad. As a result it is expected that a signal section of 20 members of the club, all more or less acquainted with the art of wireless signaling, will soon be enlisted and put in service.

Western Students to Have Radio Club.

The students of Western High School, at Bay City, Mich., are working on a wireless station which will be in receiving range of all high power stations on the coast. The aerial was constructed and put up last June and the students are now working on a condenser, oscillation transformer and rotary spark-gap. Mr. Crawford, one of the instructors, is in charge of the work.

The object of the station is not to make wireless telegraphy a part of the course of study, but to organize a club of enthusiasts. One meeting has been held by the students who expect to join the club, and it is expected that in the course of one or two more meetings the organization will be perfected.

Wireless for Boy Scouts.

At a meeting of the Boy Scouts of Orange, Texas, of which Stanley Barnes is the scoutmaster, a movement was started for the establishment of a wireless telegraph station at that place. The boys will seek the assistance of citizens. They believe that it will come in for good service in the event that the telegraph and telephone wires should cease to work, as they did during a recent storm.

Radio Apparatus for Hartford, Conn., Y. M C. A.

The educational department of the Y. M. C. A., of Hartford, Conn., has bought a complete wireless telegraph receiving set, and is having erected on the top of its new seven-story building a large aerial for the use of a class of boys. This class will have for its object both instruction in the use of the wireless apparatus and its construction, and also the principles of electricity. The class will be taught by Clarence Tuska, who is already well-known in wireless circles as the secretary of the Radio Relay League, which has stretched across the continent within the last few years. He is also well-known in Hartford because of his ability in the use and construction of wireless apparatus. Without doubt this class will prove to be the most popular of the new boys' courses which the Hillyer Institute is putting in its curriculum this year.

RADIO CLUBS ATTENTION!

We are always pleased to hear from young Edisons and Radio Clubs. Send a write-up of your Club with photos of members and apparatus to-day to: Editor "Amateur Gossip" Section, The Electrical Experimenter, 233 Fulton St., New York City.

RADIO LEAGUE OF AMERICA.

(*Continued from page 491.*)

ciated by every radio amateur in the United States:

NEW YORK, November 27, 1915.

Editor of ELECTRICAL EXPERIMENTER, 233 Fulton Street, City:

DEAR SIR: Thank you for your favor of November 22.

I fully realize that the Radio League of America may accomplish much good in the development of the art, particularly in bringing influence to bear on Congress in the interests of new legislation regarding regulation of wave lengths and interference.

The Institute of Radio Engineers is now seriously considering a propaganda for bringing about new legislation, which will probably be in the form of permitting more or less individual freedom of wave length within certain restricted zones. For example, the amateur should have individual freedom within a certain zone of short wave length, commercial vessels should have two zones, one for smaller vessels and one for the larger ones, equipped with high power apparatus. The Government should have two or three zones, and the commercial shore stations also should have one or two zones of wave lengths allotted to them.

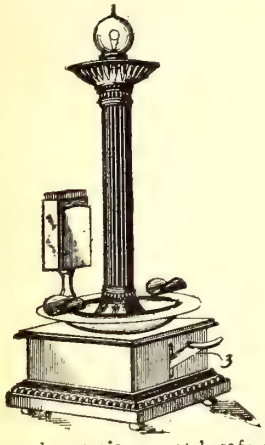
If such a proposition as this is carefully looked into and energetically brought to the attention of Congress, I believe much good will result.

I have no doubt that most of the members of the Radio League will enthusiastically champion such an effort, if it is properly put before them.

I would suggest that when the time comes you would consult with the authorities in the Institute of Radio Engineers, so that all may co-operate and work together towards a common end.

Wishing the Radio League of America every success, I am, Yours very truly,

LEE DE FOREST.



Do not fail to read the big announcement of the *Radio League of America* in the December issue.

LATEST PATENTS

Electric Waiter-Signal.

(No. 1,149,933; issued to Antoine Martzolf.)

A novel device, which embodies a miniature electric lamp and pedestal

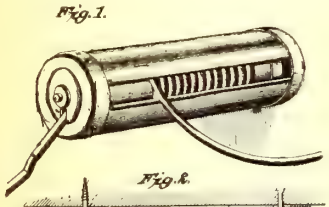
which also carries a match safe and ash tray. One purpose of this device is stated to be that of lighting up the match holder and the second distinct purpose called for in the use of this arrangement is in restaurants, so that by pressing the switch lever 3, on the side of the pedestal base, the patron can silently engage the attention of the waiter without annoying other guests. A miniature battery lamp is used in this device, together with a regular flashlight battery of small size contained in the base of the pedestal.

Take-Up for Flexible Conductors.

(No. 1,153,829; issued to Ernest F. Rueckert.)

A useful device in the form of a

Fig. 1.



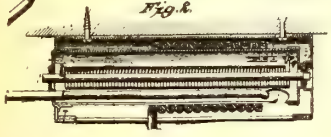


Fig. 2.

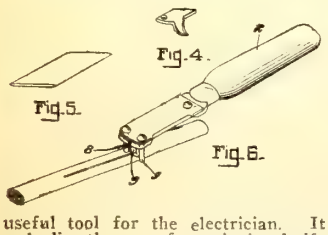


spring actuated drum and shield over the outside of same for automatically taking up or letting out flexible cord such as used for electric lamps or heating devices, etc. The drum is arranged so that by a slight pressure it will be released and as much cord as required may then be drawn out from the slot in the outer shield.

Tool for Stripping Wire Insulation.

(No. 1,153, 286; issued to Henry D. Cahill.)

This device for stripping insulation from electric wires should be a very

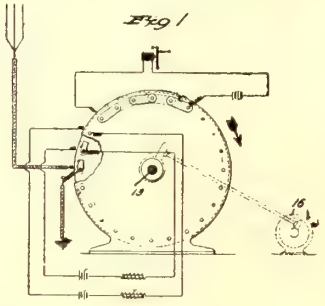
useful tool for the electrician. It embodies the use of a stripping knife 8 and two guide pins 8 and 9. These are suitably supported on the handle 2 and when the device is drawn along the insulated conductor, such as duplex cable for instance, the braid covering is easily slit open. As observed this tool is much more accurate and satisfactory than a common penknife for the purpose, unless the latter is wielded by a skilled mechanic.

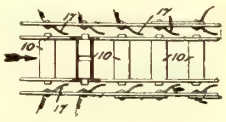
Multiple Detector Scheme for Radio Receptors.

(No. 1,155,653; issued to Edwin R. Gill.)

A scheme utilizing the principle of successively switching into circuit, a number of coherers in the radio receiving circuit proper, and which may be successively hooked up in a common circuit in series or in parallel with respect to themselves. A motor or other device 16, is utilized to constantly rotate a wheel and axle

Fig. 1





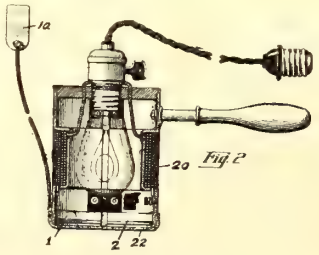


Fig. 2

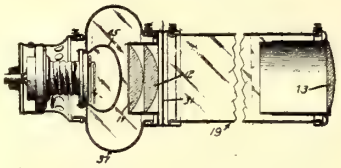
13, and the coherers are mounted on the periphery of the wheel, as depicted at 10. Spring contact 17 closes the circuits of the various coherers as perceived. Several advantages are claimed for this arrangement including the operation of mechanical devices by means of a relay. Also steady operation is said to be obtainable owing to the constantly changing number of detectors, which are de-cohered in a separate electric circuit and revolved back into the radio receiving circuit proper again, etc. Several features which cannot be covered here for want of space are incorporated in this patent and it will pay those interested to procure a copy of same.

Thermo-Electric Treatment Apparatus.

(No. 1,154,144; issued to Alma M.



Wagoner, administratrix of the Estate of James B. Wagoner, deceased.)

The patentee of this device for electro-therapeutics has provided same with a pilot lamp as perceived, to indicate whenever current passes through the instrument. At the lower end there is stretched a fabric diaphragm 22 to be placed in contact with the patient's body. The electrode 10 is applied on another portion of the body. Surrounding the lamp are two semi-cylindrical plates 1 and 2. At the center there is wound a primary and secondary coil. When the apparatus is in use an induced current from the A. C. supply is produced in the secondary coil 20 and by means of a condenser action a mild current is thus caused to pass through the patient's body, from the electrode 10, through the nerves and muscles, to the semi-cylindrical plates 1 and 2.

Electric Advertising and Illuminating Lamp.

(No. 1,153,445; issued to Joseph T. Roffy.)

This idea covers an arrangement

for utilizing a single electric lamp 45, which projects a beam of light through the lenses 11 and 12 and advertising stencil at 31. This stencil has its image thus projected through the tube 19, and lens 13 onto the sidewalk in front the store, etc. Simultaneously the lamp 45 is here used by the inventor to provide general illumination through the special glass shade 37.

Combined Lamp and Telephone Cover.

(No. 1,153,507; issued to James McIntosh.)

This patent covers a special form of electric or other lamp as observed the pedestal of which is so formed as to readily contain an ordinary desk type telephone within it. This apparatus is accessible by simply

Fig. 1

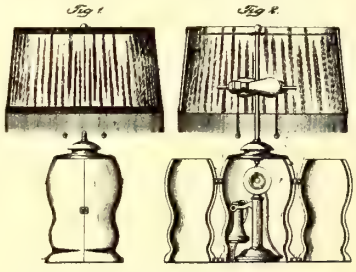


Fig. 2.

opening the double doors forming a part of the lamp pedestal.

A Watch Style Flashlight.

(No. 1,155,249; issued to Harry M. Koretzky.)

A much desired style of electric flashlight resembling the ordinary watch in size and appearance has been here developed. The drawing shows clearly how the inventor arranges the battery B, and also how the push button S is incorporated in the special stem 5. The tungsten lamp appears at 9 and the patent also

Fig. 1.

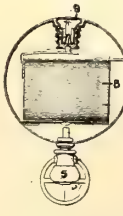

Fig. 2.

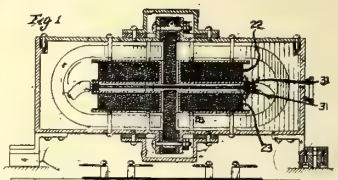
covers the arrangement of this lamp crosswise in the case.

Sound Intensifier and Reproducer.

(No. 1,153,431; issued to Clinton Horace Hulbert.)

A distinct and novel form of sound amplifier and reproducer adaptable to telephonic or radio purposes is here shown. It is provided with four permanent steel magnets, placed 90° apart, in a special sound insulated box, as drawing shows. Between the magnet poles are mounted two electro-magnet coils 22 and 23. A laminated iron core appears at 16. When a telephonic or other current passes through the coils, it causes a compound polarization action in the two magnetic diaphragms 31 and 32. These diaphragms are placed close together and form a gas-tight chamber between them, which chamber is joined to the rubber tube 33 and nozzles 34 and 35. Compressed air or gas may be used in the chamber formed between the two diaphragms and when these are pulled apart, by the electro-magnetic action due to currents in

Fig. 1



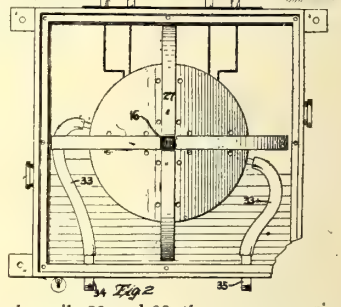


Fig. 2

the coils 22 and 23, they cause a variation in the gas pressure, which may be manifested at a gas tip, thus making possible the recording of a voice on a moving strip of film, photographically.

Flashlight Attachment for Pencils and Pens.

(No. 1,148,661; issued to Hunter Dennis.)

A unique flashlight attachment including miniature battery B, is contained in an insulated cap 25, attachable to the end of any ordinary pen or pencil. Connections are arranged to be carried in the device, down to

the miniature electric bulb 33, provided with a reflector 34. A timely invention which should prove of value to reporters, professional men and others, when properly commercialized.

A Cigar Style Flashlight.

(No. 1,153,420; issued to Alexander Brody.)

The inventor of this flashlight proposes to make same in the form of a cigar and also to finish the outside of it to resemble such. The usual battery and flashlight bulb are contained within the shell and instead of using an ordinary switch or push

button to light the lamp, he makes use of a split push 17, intended to be gripped between the teeth and in this way closing the circuit through the device. This leaves both hands free. Presumably the whole affair has been gotten up more as a novelty than anything else.

COPIES OF ANY OF THE ABOVE PATENTS SUPPLIED AT 10c. EACH.

Phoney Patents

Undef this heading are published electrical or mechanical ideas which our clever inventors, for reasons best known to themselves, have as yet not patented. We furthermore call attention to our celebrated Phoney Patent Offizz for the relief of all suffering daffy inventors in this country as well as for the entire universe.

We are revolutionizing the Patent business and OFFER YOU THREE DOLLARS ($3.00) FOR THE BEST PATENT. If you take your Phoney Patent to Washington, they charge you $20.00 for the initial fee and then you haven't a smell of the Patent yet. After they have allowed the Patent, you must pay another $20.00 as a final fee. That's $40.00 ! ! WE PAY YOU $3.00 and grant you a Phoney Patent in the bargain, so you save $43.00 ! ! When sending in your Phoney Patent application, be sure that it is as daffy as a lovesick bat. The daffier, the better. Simple sketches and a short description will help our staff of Phoney Patent examiners to issue a Phoney Patent on your invention in a jiffy.

PHONEY PATENT OFFIZZ

O. WHATAHED, CITY OF HADES

No. .01 ($.9\sqrt{6^n}$) **LAZY MAN'S DELIGHT** **Patent Applied for at Bedtime Regularly.**

To All Gents and Others.
Whoever It Concerns:

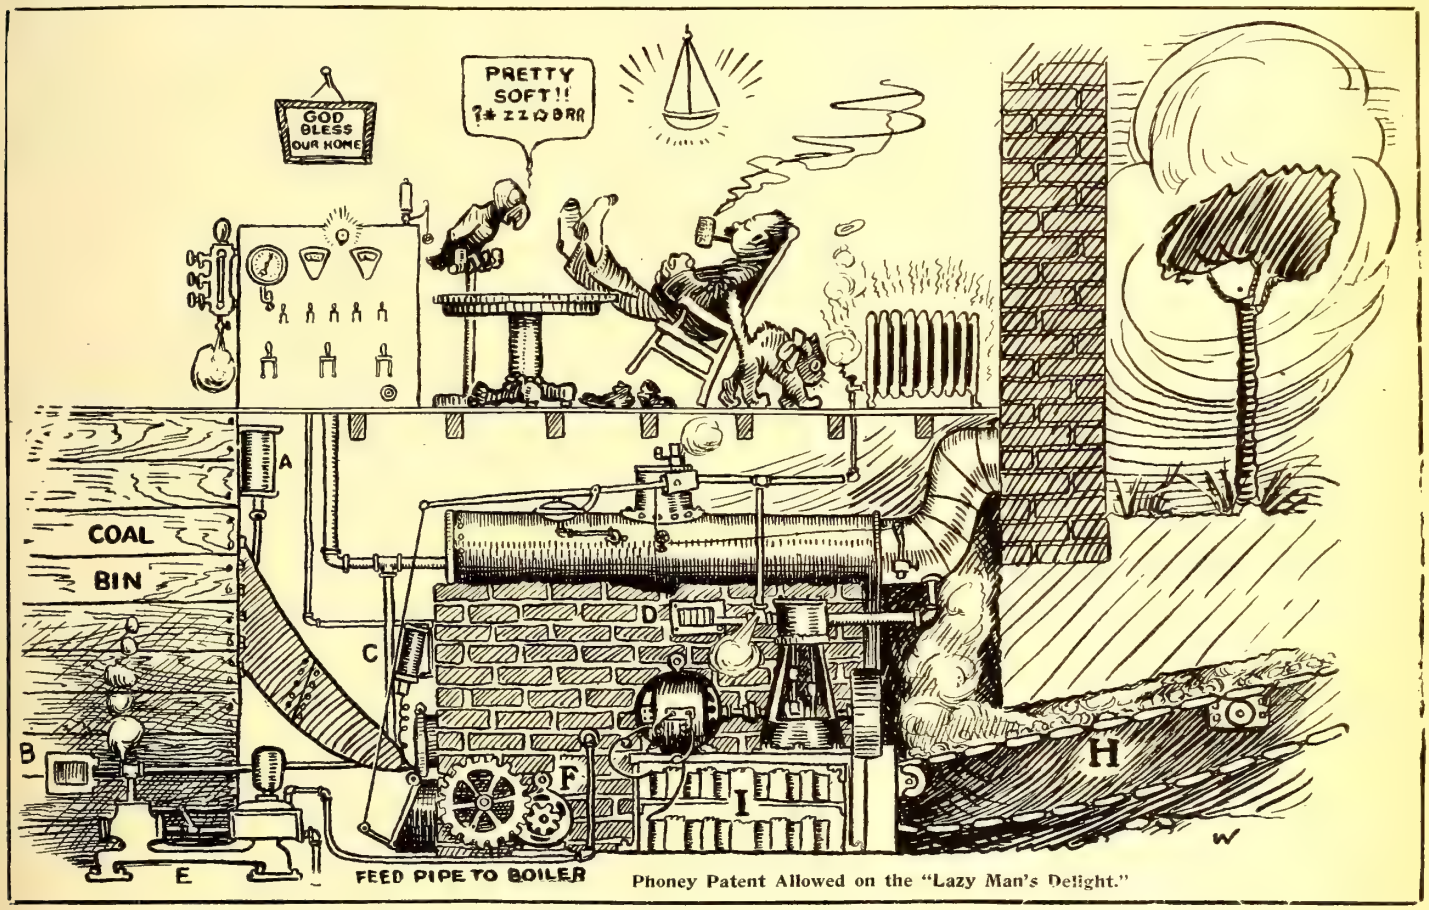
May it be known that I, O. Whatahed, of the City of Hades, State of Indolence, have at last, after many nightmares, rescued the poor married man from the bugaboo of laboring deep in the cellar while "She" rests comfortably in the arms of Morpheus. No longer does he have to get up at 5 o'clock in the morning to woo the furnace and "go six rounds" with the ash can, besides wasting matches and temper trying to get the furnace started. Now all he has to do to keep the house, feet and heart warm is to 'phone to the coal dealer and make out the check. The rest of the hard work around the household is taken care of by my apparatus, which has taken the lifetime of my father, his father and myself to perfect.

A can of opium and a glance at the specifications attached will clear away all fog as to how this wonderful apparatus operates. It may be attached to any common furnace by merely removing the ashes and coal that normally lay about and putting the apparatus in place. The operation of this device will be understood by all mechanical and electrical husbands skilled in the art of coalfurnacing.

The operation of this apparatus is entirely automatic. The solenoids A and C operate, when the pressure drops below a certain point, to feed more coal to the furnace O. The surplus steam drives a triple expansion cross-compounded engine operating the generator, which in turn charges the storage batteries I. These storage batteries are used for lighting the house and for sundry other purposes, such as dispelling the fog in the fire room and operating the various solenoids. The feed pump E is controlled by solenoid B, which is regulated from the well by the water level indicator and keeps the proper amount of water in the boiler and thus prevents explosions and also any disturbance of the owner's dreams. The solenoid D automatically turns on the engine when the charge in the batteries drops below a certain predetermined but unknown point.

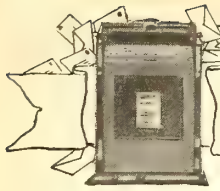
By means of the switchboard mounted in the kitchen it is possible to keep tabs on the apparatus and control the "juice," which is so freely generated by this magnificent plant. The switchboard also has mounted on it the usual steam pressure indicating apparatus and a whistle.

This whistle may be put to several uses, among which may be noted that it will play *"I Didn't Raise My Boy to Be a Stoker,"* to call the family to breakfast and to hail passing mortals who are rolling heavily on account of undue cargo and who consist mostly of the flotsam and jetsam cast aside by the sea of Fate.



The main defect with furnaces and such allied appliances is that they provide no means for the removal of ashes, but I get away from this by having a traveling grate driven by the motor F and the conveyor H. These take care of the ashes from the furnace and remove them to regions unknown and unexplored by others than the employes of the Ash Removing Contractional Corporation.

At present the only thing that is lost with this apparatus is the "smoke" and the sound of the steam whistle; however, plans are being made to utilize both. Thus tobacco will be used as a fuel, and by running a pipe into the chimney I will be able to compress the smoke and supply it to the consumers in large quantities and thus put the ever-grasping Tobacco Trust out of business. This latter detail is of so much importance that I have applied for a separate Phoney Patent on same. Arrangements have also been made to sell the whistle's sound to the Phonograph Trust.



In testimony thereof, for or against, etc., ad infinitum, I hereto attach after heretotore disattaching one certain and specified seal (live, stuffed or coat) this night of horrors in the City of Hades.

Witnesses:
G. Wilikens,
O. Piffle,
I. Gotbit.

O. WHATAHED,
By his attorney,
Alvin L. Akers.

Phoney Patent Allowed on the "Lazy Man's Delight."

QUESTION BOX

This department is for the sole benefit of the electrical experimenter. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be published. Rules under which questions will be answered:

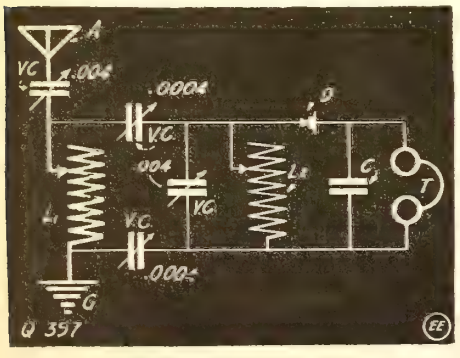
1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered.
3. Sketches, diagrams, etc., must be on separate sheets. Questions addressed to this department cannot be answered by mail.

Radio Engineers.

(395.) Frederick B. Stock desires to know the training necessary to become a radio engineer.

A. To become a first-class radio engineer, worthy of the name, it is necessary to have a complete knowledge of mathematics and more or less information on general electrical subjects. The best thing to do is to take a course in electrical engineering at some college or university, and after graduating from same to take post-graduate work of about two years in some school that teaches radio-telegraphy.

Radio Licenses.



(396.) George E. Watt, Brooklyn, N. Y., requires information on the necessity of obtaining a license for wireless apparatus.

A. In answering this we can do no more than quote the law on this point, which states that no person, company or corporation shall use apparatus "for the transmission of radiograms or signals, the effect of which extends beyond the jurisdiction of the State or Territory in which the same are made, or where interference would be caused thereby, with the receipt of messages or signals from beyond the jurisdiction of the said State or Territory, except under and in accordance with a license, revocable for cause, in that behalf granted by the Secretary of Commerce and Labor upon application therefor." No license is required for receiving wireless messages.

Details of Dr. Cohen's New Set.

(397A.) T. C. Potts, Pittsburgh, Pa., writes us asking: 1. The size and amount of the wire used in the inductances in Dr. L. Cohen's receiving set. 2. Will this set be superior to a set composed of the standard instruments, loose coupler, etc.?

A. 1. The accompanying hook-up gives the size of the condensers used with the Cohen apparatus. The inductance coils, L_1 and L_2, for this set may be made on a tube 18 inches long by 6 inches in diameter, wound with No. 28 S. C. C. wire. This size will be sufficient for all-around amateur use, and you will be able to tune to wave

Dr. Cohen's Radio Receiving Hook-Up.

lengths in the neighborhood of 4,000 meters.

A. 2. This apparatus is vastly superior to the loose coupled tuners, as it takes up less space, is easier to adjust, and is, besides, more efficient and selective.

Step-down Transformer.

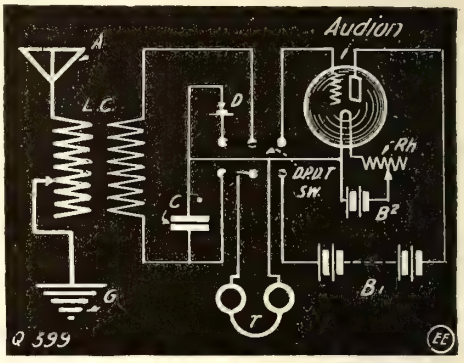
(397-B.) Joseph G. Reed, New Lambton, N. S. W., Australia, desires to know the dimensions of a step-down transformer for changing 240-volt, 50-cycle alternating current to 110-volt alternating current having a capacity of 1 K.W.

A. This transformer should be wound on a rectangular core having a cross-section of four sq. in. and forming a square 12 in. wide by 14 in. long. The primary should consist of 720 turns of No. 12 D. C. C. wire insulated from the core by four or five layers of Empire cloth. The secondary contains 330 turns of No. 10 D. C. C. wire and is also insulated from the core. This transformer can be connected direct to the 240-volt supply and will be self-regulating, have an over-all efficiency of about 80 per cent. if high-grade transformer iron is used in constructing the core.

Harnessing Gravitation.

(398.) George Abkemeier, Washington, Mo., writes us about an original scheme intended for use in driving a small 80-watt generator. He intends to use a drum on which a rope is wound, and a heavy weight is attached to the end of the rope. He intends to gear this arrangement up with a set of six pulleys, with a ratio of approximately 50,000 to 1. This is to be used to drive the machine at 2,000 r. p. m. and to run for four hours with the weight to drop only 60 feet. He wishes to know if this scheme is practical, and the weight to be used?

A. We would like to say that this scheme may be feasible, but the great loss entailed in so many gears reduces the efficiency of the apparatus. We have calculated the weight necessary, taking for granted that the rope is to be wound on a drum one foot in diameter and the efficiency of the arrangement 80 per cent.; when, as a matter of fact, it will hardly exceed 40 or 50 per cent. With the above arrangement it will require a weight of 18,000 pounds to drop 60 feet for four hours' run, or 15 feet an hour, to drive the dynamo up to full capacity. The only way to offset this tremendous amount of weight is to use a smaller weight arranged to drop through a greater distance.



Hook-up for Detector and Audion.

(399.) James L. Autry, Jr., Houston, Tex., writes us asking: 1. How to connect an audion with a crystal detector so that either can be put into the circuit by means of a switch? 2. How to connect his 2,000 and 2,800 ohm head sets so they will give the loudest signals under all conditions? 3. How to use a Knapp type battery motor on a bell-ringing transformer?

A. 1. We give herewith illustration which will enable you to quickly switch from mineral detector to audion for receiving wireless messages. One D. P. D. T. switch is necessary for this purpose.

A. 2. The 'phones you mention are nearly of the same resistance, and you may connect them in series in accordance with the usual practice, and the results will be very satisfactory.

A. 3. You may operate the small battery

Audion or Mineral Detector Controlled by D. P. D. T. Switch.

motor from alternating current by two methods. One is to short-circuit the commutator by wrapping a few turns of bare copper wire around it and removing the brushes. The field is connected direct to the current supply, and the motor will operate as an induction motor. Another method of accomplishing this result is mentioned in the December issue of *The Electrical Experimenter* on page 422.

X-Ray Screens.

(400.) Gerry Davis, Union City, Pa., wishes to know what chemicals are employed in making a fluoroscope screen for X-ray work?

A. Several chemical preparations are used for this purpose, particularly sulphide of zinc, tungstate of calcium, platino-barium-cyanide. The latter is the one most used, giving excellent results, but is rather expensive.

The Sayville Station.

(401.) George Huss, Lakewood, N. J., desires to know: 1. The type of radio transmitter used at Sayville, L. I., and wave length of this station. 2. Whether Sayville has any regular schedule for transmission; and, if so, at what time? 3. The power of several other stations.

A. 1. The transmitter used at the Sayville station at the present time is of the well-known frequency changing type described several times in the past in *The Electrical Experimenter* and gives a high frequency current without the use of spark gaps. The wave length used by Sayville is, to the best of our knowledge, about 6,000 meters.

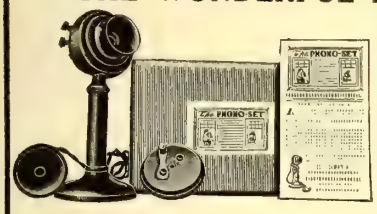
A. 2. Sayville starts to send "press" to ships at sea at about 9 o'clock in the evening and repeats the messages. The length of time the operator sends depends on the amount of business to be transacted. The station works at frequent periods during the day, depending, of course, upon the business on hand.

A. 3. We are not aware of the power used in the various stations mentioned in

(*Continued on page* 506.)

THE ELECTRO-SET CO. PRESENTS THIS PAGE FOR EXPERIMENTERS

Showing a few of the Extraordinary Values in their Catalogue and Listing Several Bargains in Used Parts and Apparatus that no Experimenter can afford to miss

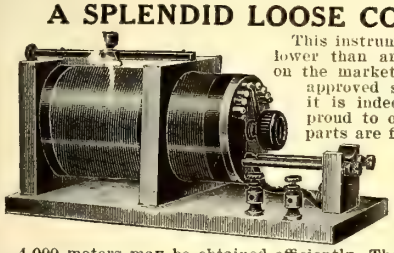


OUR FAMOUS 1-6 K. W. TRANSFORMER

Thousands of amateurs will welcome the advent of this instrument who either did not require ¼ K.W. power or who did not care to spend the money for it. The transformer will send messages for twenty miles—not a wild figure, but an actual fact — if a good aerial is used. **Under extraordinary circumstances it will send one hundred miles.** No trouble with vibrators and adjustments, reactances or resistances. **Just connect the primary terminals to 110 volt, 60 cycle A. C. mains and press key.** Best silicon transformer iron is used in its construction. The primary is wound with cotton covered, enameled wire, costing more but safer than single cotton. The secondary is built in sections each wrapped in empire cloth. Mica insulation is used where necessary. It will throw a heavy crashing spark that, with proper condenser, will fill a gap with a ball of white flame ¼ inch in diameter. This comparatively small but powerful spark will send **six times as far as a 1 inch spark coil.**

No. 1000 1-6 K.W. Closed Core Transformer, without case, shipping weight 10 lbs. **$6.95**

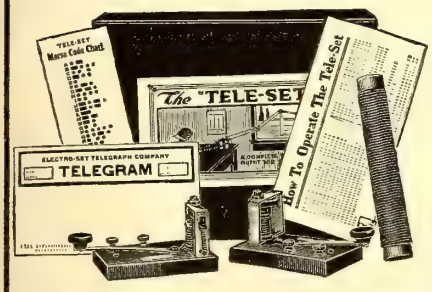
THE WONDERFUL PHONO-SET $1.00



A handsome, perfect working miniature desk telephone, 7½ in. high. Talks for hundreds of feet (¼ mile) between any two points.

Outfit consists of regulation pattern desk 'phone with carbon grain transmitter, and a handsome little watch case telephone receiver with flexible cord for connections. A polished wood base switch is included FREE with each outfit. Handsomely finished in black enamel. Works on one 15-cent dry battery. Two outfits are required to talk both ways. One outfit talks one way. Full instructions included. A 10-year-old boy can connect and operate it. The first time an Electric Telephone ever was made at the price; only tremendous production makes it possible.

Price, postpaid **$1.00**



A SPLENDID LOOSE COUPLER AT $6.85

This instrument is priced at from 20 to 50% lower than any other instrument equaling it on the market. Made throughout in the most approved style and of the best materials, it is indeed an instrument which we are proud to offer to our customers. The wood parts are finished in polished mahogany and are carefully screwed together. They will not fall apart or warp, as do the instruments of some manufacturers. Our "Senior" Loose Coupler will respond to wave lengths up to 1,800 meters, and with a loading coil 4,000 meters may be obtained efficiently. The secondary has 10 contact points varied by a large, rotary, rubber composition knob. The primary is varied by a slider. Size 5x6x12 inches. Shipping weight 10 pounds.

No. 1696 "Senior" Loose Coupler **$6.85**

A REAL TELEGRAPH OUTFIT $1.00

A remarkable little telegraph outfit that telegraphs TWO WAYS for a distance of one-quarter mile and more if sufficient wire and batteries are used.

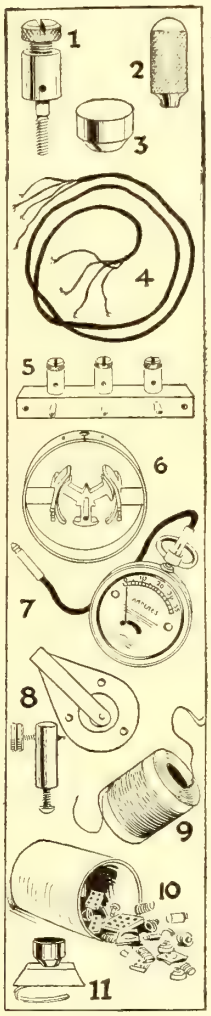
A FASCINATING TOY
A Practical TELEGRAPH

The outfit includes instruments for two stations with keys and sounders, Morse Code Chart, Miniature Telegraph Blanks, full instructions and enough wire to start experimenting. Works with any dry cell or doorbell battery.

ANY ONE CAN LEARN TELEGRAPHY
Boys Can Have Great Fun

Price, complete as above; neatly packed in an attractive box..... **$1.00**

Do not confuse this outfit with those sold at a higher price for only ONE station. This outfit has TWO stations.



THIS FINE LITTLE ROTARY GAP $5.50

This Rotary Spark Gap is without an equal. It is made in every particular as well as any of the more expensive gaps, the only difference being the size. It operates in series with a 16 C. P. lamp on 110 volt alternating or direct current or from batteries. The Rotary Electrode is of cast aluminum alloy and is perfectly accurate. The wheel is mounted with genuine hard rubber on a heavy brass bushing which fastens to the motor shaft. The stationary electrodes are mounted on brass posts and are fully adjustable. Will stand ¼ K. W.

No. 476 Type "A" Rotary Gap, shipping weight 4 lbs..... **$5.50**
No. 477 Type "A" Rotary Gap, wound to operate on 3 dry cells..... **5.00**
No. 478 Three Inch Rotary Disc Only, mounted on hard rubber, with brass bushing, ⅛ in. hole; shipping weight 4 oz..... **1.50**

THESE PRICES WILL SELL THESE GOODS

Here are extraordinary bargains for experimenters. We want to dispose of them quickly. The prices are ridiculously low. Get out a memorandum and decide what you can use. Order now. Many were disappointed last month. The prices hold good only as long as the specials last.

No. 1—Binding Posts, ¾ in. high, handsomely nickeled, patented design. Worth 6c. ea. Special, ea. 2½c.; per doz., **25c.** Postage per doz., 5c.

No. 2—Hard Rubber Knobs, ½ in. in diam., threaded for 6-32 screw. Worth 3c. each. Have been used. Special, per doz. **10c.** Postage extra per doz., 3c.

No. 3—Hard Rubber Handles, ⅞ in. long, threaded. Have been used. Worth 4c. each. Handy in making apparatus. Special, per doz. **15c.** Postage per doz., 4c.

No. 4—Triple Receiver Cords, new; 4 feet long; contain 3 separate cords. No tips. Worth 50c. each. Special, postpaid **20c.**

No. 5—Connecting Blocks, genuine hard rubber with 3 handsome, nickeled binding posts. Useful for many purposes. Worth 25c. each. Special, each **9c.** Postage each, 3c.

No. 6—Motor Parts, consisting of 3-pole laminated armature and frame with pole pieces. Make your own motor. Parts worth 40c. Special, per set **10c.** Extra postage, 5c.

No. 7—Ammeter, 0 to 35 amperes; new and in perfect condition. Regular $1.25 value. Very special; while they last, **75c.** Postage extra, 5c.

No. 8—Spark Coil Secondaries, ½ in., spark length. Two assembled on a primary coil will give 1 in. Each one tested and in perfect condition. Make your own spark coil. A wonderful bargain. Worth 90c. each. Very special, each **30c.** Postage extra, 6c.

No. 9—Spark Coil Vibrators, for small coils only. New, perfect condition. Very special, complete **25c.** Postage extra, 3c.

No. 10—Experimenters' Handy Box, a splendid bargain; useful for all experimenters. Consists of a box containing between 40 and 60 odds and ends of electrical parts, coils, nuts, knobs, posts, rings, washers, etc. Useful in constructing apparatus of all kinds. We've sold hundreds of them. Every experimenter needs this box. An unusual and extraordinary offer. Get yours **now.** While the parts last, per box, postpaid **20c.**

No. 11—Sliders, for ¼-in. square rod; in good condition. Each **9c.** Postage, 1c.

Electro-Set "Arlington-Tested" Crystals

When testing out a wireless receiving installation for the first time, you want to know that your mineral crystal is sensitive. Then, too, why buy minerals on a gamble? Be sure of results—good results. Buy our "Arlington Tested" Crystals. Every one is tested for Arlington time signals. Each crystal comes in a sealed Metal Box and is carefully tested before leaving our factory. **Only one crystal in 20 passes our examination.** Arlington Tested Crystals are the most sensitive you can procure. They are worth the price. Each one is individually examined and packed.

No. 301 Arlington Tested Galena, individually packed and tested; postpaid **$0.15**
No. 302 Arlington Tested Silicon, as above..... **.15**
No. 303 Arlington Tested Bornite-Zincite Couple..... **.40**

ELECTRO-SET MINERAL ASSORTMENT, 50c.

Here's something every experimenter will welcome. Five different minerals, each in a metal container (5 boxes) for wireless detectors—only **50 cents,** postpaid! Included in this offer are the following minerals: Silicon, Galena, Molybdenite, Ferron and Carborundum. **Free** with each set, a piece of phosphor bronze detector wire. One of the most interesting experimental fields is in wireless detector minerals. Send for an outfit to-day.

CATALOGUES

SEND 4c. TO-DAY FOR OUR BIG NEW CATALOGUE containing description of dozens of new wireless and experimental instruments, parts and raw materials. Prices are new—instruments are new—a catalogue every experimenter MUST HAVE.

WRITE TO-DAY—SPECIAL CATALOGUES

Send **6c.** in stamps for our SPECIAL ELECTRIC TRAIN CATALOGUE, illustrating scores of models. Send 4c. in stamps for our Electric Vibrator and Medical Coil Catalogue.

WE ARE AGENTS FOR MARCONI USED APPARATUS

Send **5c.** in stamps for new, interesting catalogue of used Marconi Wireless Instruments at ridiculously low prices. We are agents for this line and can ship promptly anything from a Type "D" Tuner to a Motor Generator.

UNMOUNTED TRANSFORMER

You Can Get Results with a small condenser and this transformer

It is a 1-2 K. W. size and is built on the same specifications as to material and workmanship, etc., as our big central station transformers.

Hundreds of stations are now using these transformers. This transformer gives you 13,200 volts.

Let us tell you how you can do part of the work yourself and get this transformer at a remarkably low cost.

THE PACKARD ELECTRIC CO.

CHEAPEST ELECTRICAL NOVELTY HOUSE ON EARTH

QUESTION BOX.

(*Continued from page* 504.)

your third question, and therefore cannot be of service to you.

Transformer Efficiency and Condensers.

(402.) Forbes St. John, Noroton, Conn., desires to know: 1. Which type of transformer is used most in wireless work? 2. A formula for calculating the capacity of condenser for any transformer with a given secondary voltage, etc.?

A. 1. Closed core transformers are used almost exclusively at the present time, because they have the highest efficiency and the arcing at the gap is prevented by rotary or quenched gaps. Open core transformers were used extensively at one time, but they were required, due to the fact that the science had not progressed to the point of using the rotary gap, and as open core transformers have a very sharp peak in their secondary wave form, they gave better results with the straight gap formerly in vogue.

A. 2. We give you herewith formula for calculating the necessary condenser capacity for any transformer with a given secondary voltage, etc.:

$$C = \frac{K.W. \times 10^8}{f \times Sec.\ Volts}.$$

In this formula, sec. volts is the secondary voltage of transformer; f is the frequency of the primary current of same; C is the capacity in micro-farads, and K.W. is the kilowatt rating of the transformer.

Poulsen Tikker and Aerial Construction.

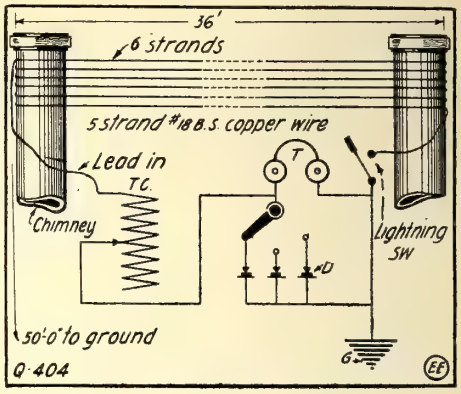
(403.) C. M. Wickes, Bradford, Pa., asks for information on: 1. The Goldschmidt tone wheel and Poulsen tikker. 2. Which is the best way to connect an aerial, to leave the free ends of the strands open or to connect them together?

A. 1. You probably would do best to experiment with a "tikker" of the Poulsen type as described in the April (1915) issue of *The Electrical Experimenter* on page 228 thereof. When the Goldschmidt tone wheel is employed, no other detector is utilized, as you mention.

A. 2. It has come in practice to consider a wire grid aerial of the "L" or "T" type as simply a large capacity condenser and hence will be seen the idea involved in cross connecting the free ends of such aerials. In other words, they simply act as a large metallic spread which comprise a few wires spaced several feet apart, and it has been found that this gives practically the same effect as if the aerial were made of a broad metal sheet.

AN EXPLANATION.

We feel that an explanation is due to the readers of the *Electrical Experimenter* concerning the full page advertisement of the Electro-Set Co., Cleveland, O., which appeared in our December issue. Through a misunderstanding this full page ad was run in the November issue and, as stated in the original insertion, certain of the goods advertised were special lots at greatly reduced prices and orders could only be filled from quantity on hand. As additional quantities could not be furnished, we trust that those of our readers who have tried to order after certain stocks were exhausted will understand the circumstances. The Electro-Set Co. intends to act at all times in strictly good faith.



NEW SWEDISH RADIOPHONE.

Two Swedish army officers have invented a wireless telephone which is reported to have been used to talk from a moving train 740 miles, and it is to be used by aviators to connect them with their bases at all times while flying and to afford the commanders of warships means of direct communication.

Unique Aerial Construction.

(404.) C. Dyson, Roxbury, Mass., has sent us details of a peculiar aerial construction he has been using, and wishes to have our opinion on same.

A. We do not see how you can receive wireless signals at all, or at least it will be with very poor results, as your aerial apparently does not have any insulators on same. You should have all of the strands of your aerial insulated very carefully by

Novel Antenna Construction.

means of aerial insulators, or at least by some porcelain cleats. As the wireless currents are very weak indeed, it is extremely important that the aerial is very well insulated.

Transformer Design.

Francis De Kalb, Pine Bluffs, Mo., asks several questions regarding transformer construction for wireless purposes, particularly the action of the magnetic leakage type.

A. A transformer will work quite efficiently indeed in this manner, provided a variation in the output is controlled by adjusting the amount of primary inductance used.

The one-quarter kilowatt wireless transformer to be used under the requirements of the radio law, now in effect and specifying 200 meters wave length, should yield 12,000 to 20,000 volts preferably. This is necessary, owing to the very small condenser capacity, which is allowable in the oscillatory circuit, when 200 meters wave length is to be adhered to, and also in due consideration of the inductance which must be used in the circuit.

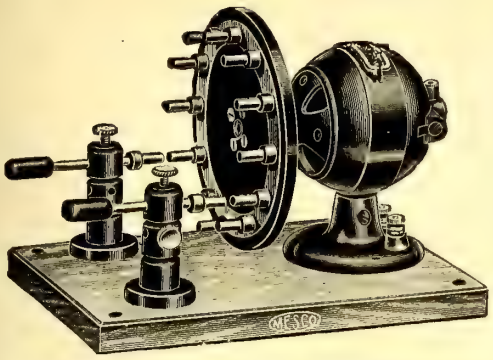
You may have as many taps in the primary winding of your transformer as desired; but, of course, it is not well to take taps from such a small number of turns that it will cause fuses to be blown, when the transformer is hooked up across the circuit.

Aerials for Air Craft.

(406.) Louis Schneck, New York City, desires information on the method employed by air craft for suspending their aerials when wireless messages are to be transmitted.

A. In aeroplane aerial construction a wire is generally run from the tips of the wings to the tail of the machine for an aerial, and for the ground a wire is dropped about 100 to 500 feet long from the bottom of the machine. This gives fairly good results.

In the larger types of the lighter-than-air machines, particularly the Zeppelins, a small aerial is erected above the gas bag, or a wire is suspended from each end of the machine, using one as an aerial and the other as a ground.



On Wireless Transmitters.

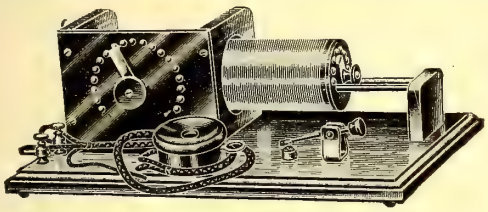
(407.) Orin F. Davis, Somerville, Mass., asks us: 1. What form of radio transmitter produces a hissing sound between the dots

(*Continued on page* 508.)

Be a Wireless Santa Claus to Your Boy

GIVE HIM WIRELESS APPARATUS GUARANTEED PERFECT OR MONEY REFUNDED

Mesco Rotary Spark Gap

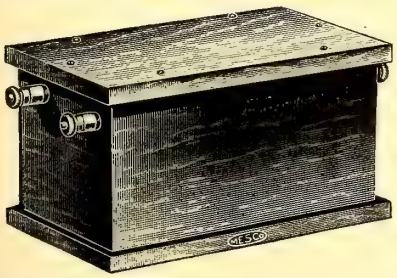


Emits a high musical note. Can be heard at greater distances than the note from the stationary type. Cannot be mistaken for static or other atmospheric disturbances. Produces pure wave of low damping decrement. Increases transmitting efficiency 20 to 30 per cent.

The rotating member has twelve sparking points mounted on a hard rubber disk and is carried on the motor shaft. Can be used on our spark coils or transformers up to 1 K. W. Has two stationary electrodes with special adjusting devices.

Our Globe Motor is used. Will operate on 110 A. C. or D. C. circuits; speed of 4,500 R.P.M. Also made with our Globe Battery Motor, which can be operated on a six-volt circuit.

List No.		Price.
222	Mesco Rotary Spark Gap, 6 volt	$12.00
223	Mesco Rotary Spark Gap, 110 v., A. C. or D. C.	13.00
216	Rotary Unit Only, with two Stationary Electrodes, 1 3/16 in. shaft	5.00

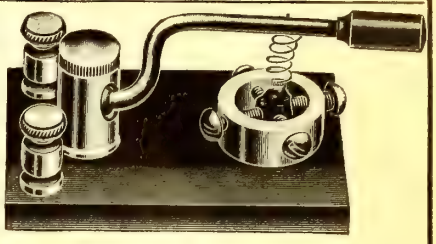


Manhattan Wireless Receiving Set

Consists of a loose coupler, fixed condenser detector, and an 80 ohm receiver with cord. Will tune up to 1,800 meter wave length on a 60-foot aerial. Can be tuned to waves over 4,000 meters with larger aerial and properly connected to loading inductance and variable condenser shunted across the secondary of the receiving transformer.

List No.		Price.
210	Manhattan Wireless Receiving Set	$10.00

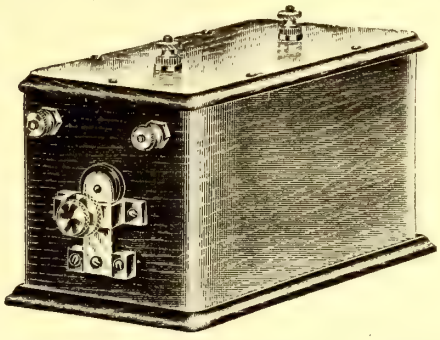
Mesco Intensifying Transformer



Used for intensifying signals received from any crystal detector by connecting an audion detector on the other side of the transformer winding. Used between two audion detectors, signals will be intensified 10 to 25 times.

As many as three of these transformers can be connected between audion detectors in cascade, forming an intensifier, making it possible to read signals not heard with any single known detector. Diagram of connections with full directions with each instrument.

List No.		Price.
224	Intensifying Transformer	$12.00



Mesco Universal Detector Stand

Has a heavy brass cup, with four binding screws; will hold crystals up to ¾ in. diameter. A hollow standard encloses a brass ball. Through an opening a brass arm with hard rubber handle is secured fast to the ball, making a ball and socket joint, allowing it to be adjusted at any angle or used in any position.

Hard rubber base 2¼x4¼x⅜ in. All metal parts nickel-plated. Remains permanently in adjustment under jars and vibrations of every description.

List No.		Price.
248	Mesco Universal Detector Stand	$3.00

Mesco Wireless Spark Coils

Have low current consumption. Best to operate on dry batteries. Contact points of heavy platinum iridium. Has primary condenser in case. Made for wireless work. Permits of close tuning. Spark at interrupter reduced to a minimum, spark is heavy; made in ¼-inch to 4-inch sizes. Our Manual gives all the technical points.

List No.		Price.
462	Spark Coil, 1 inch; can be operated on 6 Red Seal dry batteries	$5.40

Send 10c. for Copy of Our Wireless Manual No. 9

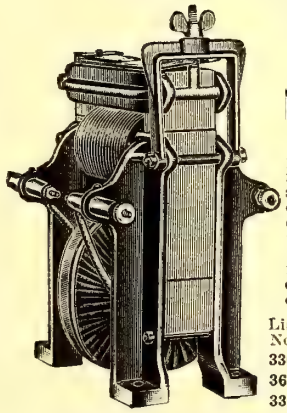
Mesco Codegraph



A dandy practice set for the beginner. Just the right kind for the apt boy.

The Codegraph Plate is of metal with insulated dots and dashes. The Pen is connected with the Red Seal Dry Battery and the Wireless Practice Set. When the pen is drawn across the dots and dashes it closes the circuit, and the buzzer sounds. It is possible to attach a sounder to the outfit and get the telegraph click also. A practical and efficient way of learning wireless and telegraph signals.

List No.		Price.
303	Mesco Codegraph Set	$2.50
304	Codegraph Plate, Pen and Book	1.00

MANHATTAN ELECTRICAL SUPPLY CO.

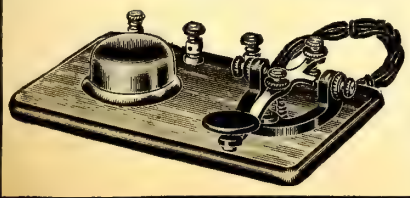
New York, 17 Park Place. Chicago, 114 S. 5th Ave. St. Louis, 1106 Pine St.
San Francisco Office, 604 Mission St.

Mesco Flexible WIRELESS TRANSFORMERS

Will make wireless apparatus 200 per cent. more efficient. When short circuited or when charging condensers does not consume any more power than the magnetic shunt is set for. Can be connected direct to alternating circuit.

List No.	Capacity.	Secondary Voltage.	Pr.
330	½ kw.	5,000 v.	$15
363	¾ kw.	10,000 v.	20
331	1 kw.	20,000 v.	25

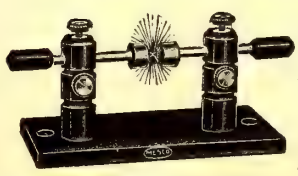
Mesco Wireless Receivers



Have powerful field magnets and thin diaphragms, and are very sensitive. Our No. 480 Double Head sets complete have been used in receiving commercial wireless messages over distances of 2,000 miles. All receivers are wound with silk-covered copper wire.

Best steel obtainable used in construction of the permanent magnets. Users have had head sets for five years and over without any deterioration in sensitiveness. This cannot be said of any light-weight receivers.

List No.		Price.
480	Double Head Band, with six-foot green silk cord and two receivers, 4,000 ohms each	$6.00

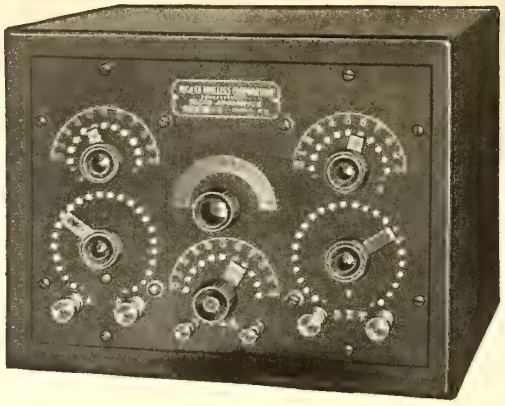


Mesco Wireless Practice Set

Comprises a regular telegraph key, without circuit breaker, a special high pitch buzzer, one cell Red Seal dry battery, and four feet of green silk-covered flexible cord. The main object of the set is to enable the beginner to master the wireless code, and the buzzer reproduces the sound of the signals of the most modern wireless stations perfectly.

List No.		Price.
342	Wireless Practice Set, with battery and cord	$1.50

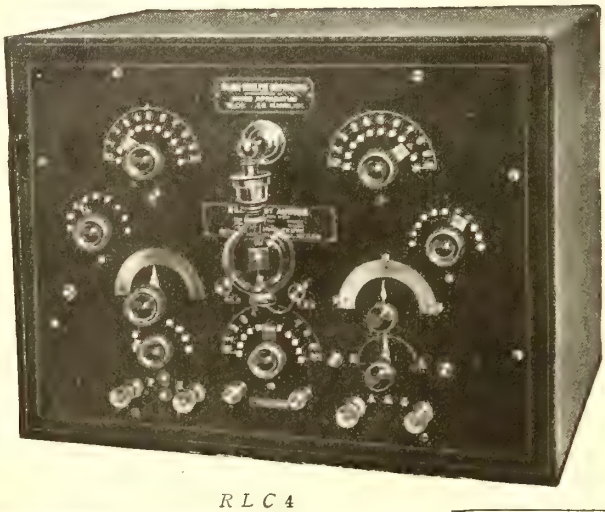
Mesco High Efficiency Spark Gap



Adapted for stations up to ¼ K.W. capacity. Base is of polished hard rubber. Standards are of hard rubber composition of the highest insulating properties. Hard rubber ends on the brass rods permit the length of the gap to be varied, while sending. Spark terminals are of zinc, and are renewable.

List No.		Price.
465	High Efficiency Spark Gap	$3.00

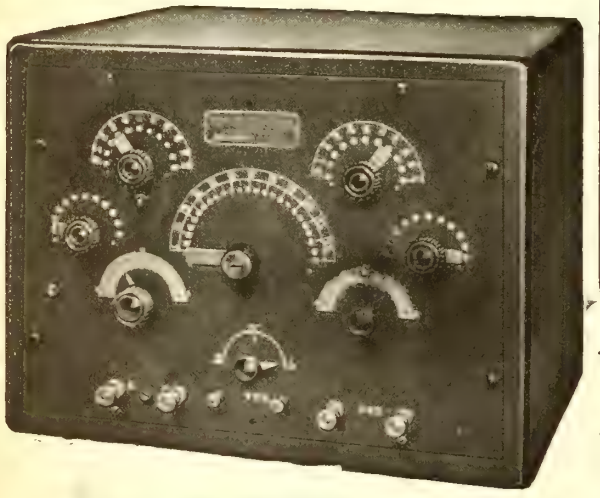
"MIGNON SYSTEM"



Radio Signal Receiving Apparatus

R L C 2 Special

For Commercial and Amateur Wireless Stations



WRITE FOR CATALOG R5

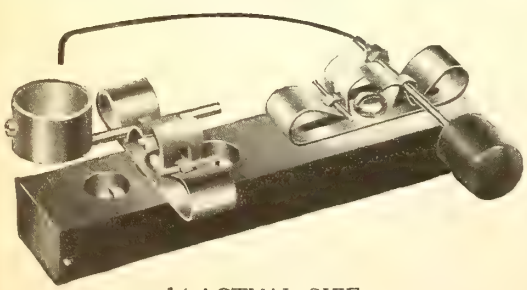
R L C 4

Apparatus of Scientific Construction for the Reduction of Static Interference.

High Resonance Unapproached Selectivity and Durability

R L C 3 Special

The "Mignon System" Radio Receiving Cabinets RC2—RLC2 Special—RLC3 Special and RLC4 are not guaranteed for the reception of continuous wave signals. However, through the persistent efforts of our untiring laboratory staff, they have been decidedly improved upon, with the gratifying result of being able to hear the above signals in our daily tests of apparatus before shipment is made. These signals will greatly improve by the shunting of a fixed or variable condenser of suitable capacity across the 'phone terminals.



We receive many gratifying letters from our satisfied patrons verifying the above statement.

"SOME" DETECTOR!

Absolutely the **simplest** and **most practical Detector** of the Cat Whisker type yet devised. Lacquered Brass for the metal parts and Polished Fibre for the base. Has the usual merit of the **"Winger"** products.

Winger Electric & Mfg. Co.

711 So. Dearborn Street, Chicago, Ill.

QUESTION BOX.

(Continued from page 506.)

and dashes, the latter being somewhat more intense? 2. What form of winding is most efficient for a loading or coupling coil, the straight coil or the layer wound? 3. Wave length of tuning coil 10 inches long by 3½ inches in diameter, wound with No. 20 bare wire?

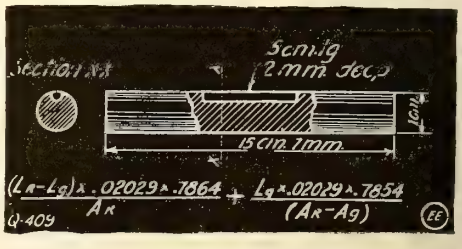
A. 1. The peculiar note you hear in your 'phones is due to the compensating wave emitted by arc transmitting stations. In this system the key is shunted around a few turns of the helix, and when the key is closed it throws the aerial circuit in tune, and when the key is raised the aerial is out of tune, but you can hear the waves emitted, although they are much weaker. This method of control is necessary when it is considered that the arc must be continually burning, and any interruption of the circuit would perhaps extinguish the arc. Therefore, all of the controlling is done in the aerial circuit, but no means can be used which will alter the amount of current drawn from the arc.

A. 2. The best form of winding for inductances in general is the single layer winding, as this cuts down the distributed capacity effect.

A. 3. The wave length of the tuning coil you mention is approximately 200 meters.

Miscellaneous Radio Phenomena.

(408.) Russell Baley, Hillsboro, Wis., desires to know: 1. Why it is that the color of his spark gap changes from blue-white to a yellowish hue when the aerial is disconnected from same? 2. An explanation of why a 220-volt, 75-k.w. alternator has the effect of attracting a 25-watt lamp suspended three feet above it. The latter being equipped with a tin shade.



A. 1. When the aerial is connected to your spark gap it acts as a capacity and increases the intensity of the discharge, but when the aerial is disconnected this capacity is removed and the current merely arcs in the gap.

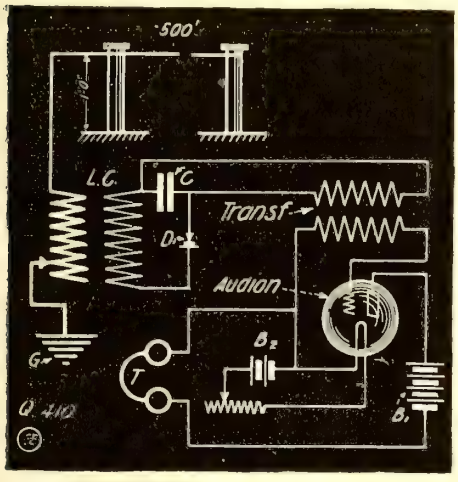
A. 2. The large generator, having a powerful magnetic field, will no doubt attract the lamp, due to the tin shade on same, but as the current also sets up a magnetic field around the lamp when it flows through the filament this may also be a factor in the attraction of the lamp. Magnetism might be set up in the tin shade, also, by induction currents flowing around it.

Resistance Formula.

(409.) Roy Ostend, Wurtsboro, N. Y., ask for a formula to be used in calculating the resistance of a rod, the dimensions of which are given in the attached illustration.

A. The formula for calculating this rod is given in the sketch.

Formula for Calculating Resistance of Slotted Bar.



In this formula Lr is the length of the rod over all in cms., Lg is the length of the groove in cms., Ar is the area of the rod in sq. cms., and Ag is the area of the groove in sq. cms. The other figures are

constants. The resistance calculated by this formula will be the resistance of a copper rod of the above dimensions. Other metals may be figured by multiplying this result by the relation of this metal's resistance to that of copper. Thus, if the rod is of 18 per cent. German silver, the result should be multiplied by 18, because the resistance of this metal is 18 times as great as that of copper.

New Type of Aerial.

(410.) U. R. Fox, Dobbin, Tex., informs us that he has read of an antenna made by laying a wire straight on the ground, and that the inventor of this method was enabled to pick up Honolulu when the aerial was tried in California.

A. To the best of our knowledge the wire employed for such experiments is raised about one foot from the ground on posts and is insulated. In some cases the far end of the wire is grounded. We believe that this will work all right, provided a detector is used that operates on the current-effect principle and that the rectified current obtained be intensified by using one or two audion amplifiers. We are attaching

Single Wire Aerial and Audion Amplifier Hook-up.

an illustration which will no doubt be of assistance to you in your experiments.

Spark Coils as Open Core Transformers.

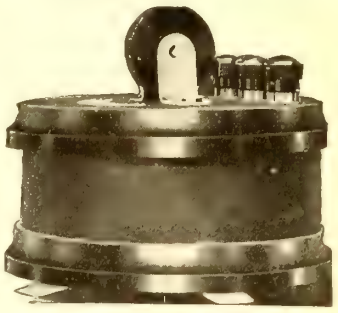
(411.) Peter J. Welcome, Port Jefferson, N. Y., writes us, asking several questions: 1. Why it is that he can obtain a spark from the secondary of his induction coil when same is connected direct to the 110 volt, alternating current mains and vibrator is screwed up tight? 2. Why it is that a small condenser connected across the 'phones has the effect of cutting out the signals? 3. What effect the wide spacing of his aerial wires will have on receiving range, and if the addition of more wires will increase the range?

A. 1. When a spark coil is connected direct to the 110-volt, alternating current mains and the vibrator is screwed up tight the coil will operate as an open core transformer; but it will be very inefficient, due to the fact that it is not properly designed for such work.

A. 2. The condenser connected across the 'phones should be in series with a switch, which will enable you to cut out the instrument under certain conditions.

A. 3. It will be of no advantage to add three or more wires to your aerial, for it should give very good results as it is, and the addition of more wire will not merely lower the inductance, but will increase the capacity also and the gain thereby will be very little.

Converting Transformers from Open Core to Closed Core.



(412.) Lamar Boyett, Tampa, Fla., writes

CRYSTALOI

A PERMANENT WIRELESS DETECTOR THAT HAS MADE A WONDERFUL RECORD

The **CRYSTALOI DETECTOR** will do for you exactly what you would have a detector do. It will put you in touch with the *Distant Stations*. It is not affected by near By-Stations. It is capable of the finest adjustment and will last a lifetime if properly cared for. We guarantee every instrument to be and do everything we claim for it. Ask any one of the thousands that are using them—they are all for us.

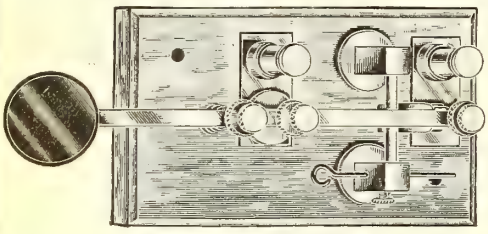
2 NEW BUNNELL WIRELESS SPECIALTIES

The Jove Crystal-Detector-Holder is the simplest, handiest and most perfect arrangement yet produced. It holds crystals **without using clamp screws.**

It firmly holds crystals of different minerals at the same time—change of contact from one to the other can be instantly made; a sensitive point quickly found, and the correct pressure held constantly, all without using a single screw or nut. It is designed and finished in our well-known high grade style. Mounted on dark **enameled porcelain base** with metal parts nickel-plated and highly polished.

Price, Net $1.00



Jove Crystal-Detector-Holder.

The Straight-Line Renewable-Contact Radio Key is much superior to other types of Radio Keys.

Not only are the contacts renewable; but, no matter how much worn, full contact surface can be maintained between them, and the lever retains its normal horizontal position.

This is accomplished by mounting the upper contact on an adjusting screw, which is threaded through the lever and held in position by a check nut. The lower contact is so arranged that it may be loosened for adjusting.

By holding the lever down, with lower contact loose, and then clamping it, perfect surface alignment between the faces of contact pieces is secured, and thus fading or irregularity in strength of signals caused by varying resistance of contact points is eliminated and the contact pieces may be practically used up before renewal becomes necessary.

Straight-Line Radio Key.

Another desirable feature of our Straight-Line Radio Keys is the self-clamping binding posts with which they are equipped. These posts make loose connections impossible.

The Keys are mounted on heavy, **polished marble bases** (6 in. x 3½ in. x 1 in.). The metal parts are heavily nickel-plated and polished, making a strikingly handsome symmetrical instrument.

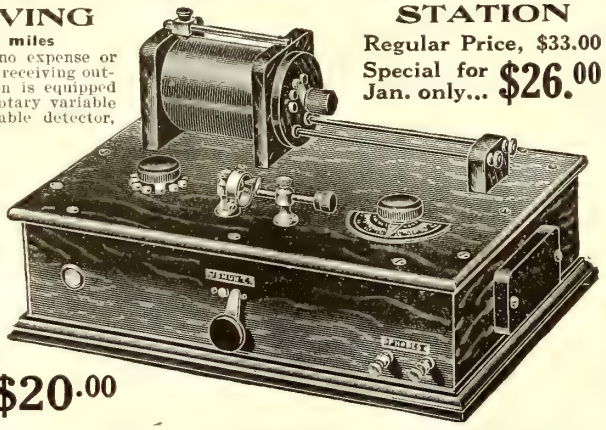
Price, with ⅜ in. hard silver contacts; postage weight, 4 lbs..... net, **$7.50**

Send for descriptive circular and copy of our Wireless Catalog.

THE J. H. BUNNELL CO., Inc., Electrical Manufacturers, 32 Park Place, New York City

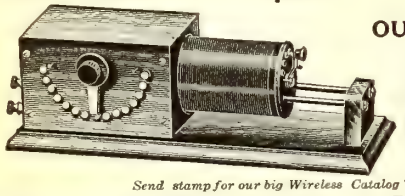
This Highly Efficient Jeweler's

TIME RECEIVING STATION



Will receive up to 2,000 miles

Regular Price, $33.00



Special for Jan. only... $26.00

In this set we have spared no expense or labor in construction. As a time receiving outfit it has no equal. The station is equipped with a 12-point loose coupler, rotary variable condenser, new feature adjustable detector, fixed condenser, large capacity loading coil, including a 2,000 ohm D. P. Headset.

All instruments mounted in a specially constructed oak cabinet 16½ inches long, 12 inches wide by 10 inches high over all. A buzzer is connected so as to enable you to secure proper adjustment in your detector in order to receive wireless. This station is fully guaranteed to give you satisfactory and reliable service

Complete Parts for this Station all wound and drilled ready to put together and start to work, with full directions. **$20.00**

OUR JOVE RECEIVING TRANSFORMER

Regular Price, $8.00; for January only $5.00

This is a very superior transformer. Has 15 taps brought out to contact Points mounted on the side of the primary cabinet and controlled by a quick acting radial switch—making rapid variation a feature. The secondary is wound with fine silk covered wire having 6 taps brought out to the contact points on the end of the drum and controlled by a quick acting, self-adjusting spring type lever. The secondary is direct connected to binding posts mounted on the back of the primary cabinet, thus avoiding noises in the receivers and breaks in the message due to loose and imperfect contacts.

COMPLETE PARTS, all wound and ready for assembling. **$3.50**

Send stamp for our big Wireless Catalog "E" and free code chart made of unbreakable fibre.

Universal Wireless Co. 19 E. 32 Street N. Y. CITY

All "Universal" sets are sold with 10-day trial privilege and money back guarantee. Prompt shipment guaranteed.

RADIO-UN-DAMPED-WAVER

DO YOU WANT TO HEAR

Nauen, Hanover, San Francisco, Honolulu, Darien, Sayville and Tuckerton on just an ordinary aerial . . . . .

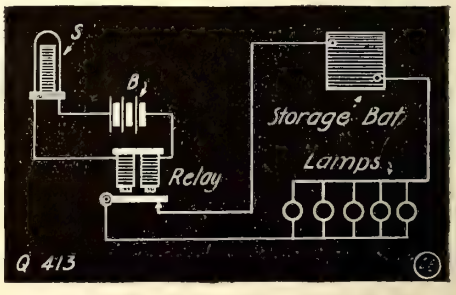
You can do it on our instrument

TEAR THIS OUT AND SEND FOR CIRCULAR

UNIVERSITY APPARATUS CO. 275 MORRIS AVE. ELIZABETH. N. J.

us, asking for instructions for converting a transformer coil into a closed coil transformer.

A. This may be very easily accomplished by following the design shown herewith. A



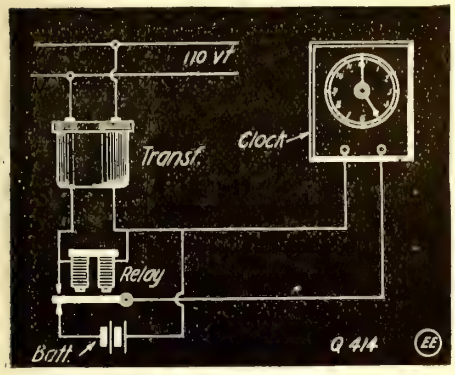
Making Closed Core Transformer from Transformer Coil Secondaries.

square core should be built up of transformer iron in the usual manner. It should be made of such dimensions that it will fit inside the secondary of the transformer coil, the holes in which measure 1½ inches in diameter. The core should be insulated under these coils with three or four layers of Empire cloth or silk. The primary consists of four layers of No. 16 D. C. C. wire wound on the opposite leg of the core, as shown.

Automatic Control of Sign Lights.

(413.) J. F. Jones, Ontario, Canada, wishes information on a method by which he can control electric lights on a sign placed some distance from his home. The arrangement is to turn the lights on at night and switch them off in the morning and is to be used for advertising purposes.

A. One of the methods by which this can be accomplished is to use a selenium cell, and the sketch herewith shows the wiring to be used. The cell is shown at S; B is a battery of 10 or 15 volts (determined by experiment), a relay and a storage battery supplying the lights. During the daytime the current will be flowing through the selenium cell and the relay will hold the contacts open. At night the cell will increase its resistance and the contacts will be closed, thus lighting the lamps. The circuit will again be opened in the morning as soon as the sun's rays strike the selenium cell.



Using Selenium Cell to Turn Lamps On and Off at Sunrise and Sunset, Respectively.

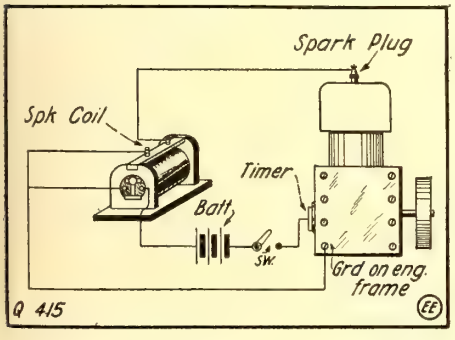
It is well known that a selenium cell becomes more or less fatigued when exposed for long stretches at a time to strong light and will fail to respond; to offset this we suggest the use of a cell shielded by a

semi-opaque substance, which will prevent the direct rays of the sun from falling on same, and thus the life of the cell will be appreciably increased.

Automatic Clock Switching Mechanism.

(414.) Irwin C. Ryan, Elgin, Ill., writes us, asking for a method whereby he can

Relay Scheme for Transfer of Power to Electric Clock.



switch an electric clock, that is normally operated from a step-down transformer, to a set of batteries when the alternating current is cut off by accident or otherwise.

A. We are giving herewith a diagram of an arrangement by which you can switch your electric clock from the transformer mains to batteries, so that the clock will not stop when the lighting current goes out of commission. The method shown utilizes a relay. As long as the lighting station supplies current the armature is held away from the contact and the clock is operated by alternating current. However, should this circuit be opened, the armature will drop, making contact and thus closing the circuit through the batteries. When the alternating current starts to flow again, the armature will be attracted, thus breaking the circuit. The relay used should have a resistance of about 1,000 ohms to prevent undue draw on the transformer's secondary, and the spring on the armature of the relay should be very carefully adjusted.

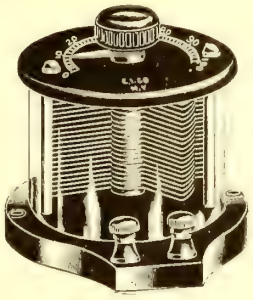
Gas Engine Ignition.

(415.) Elmer D. Gehman, Macungie, Pa., wishes information on how to connect a spark coil to a single cylinder gas engine for ignition purposes.

A. The accompanying diagram shows the method of wiring an ordinary spark coil to a gas engine for ignition purposes. The hot spark delivered by these jump spark coils

Jump-Spark Coil Hook-up for Gasoline Engine.

will prevent, to a large extent, carbon deposits and will give more power in the engine.



General Radio Queries.

(416.) Harold Brown, Walden, N. Y., asks: 1. Can a rotary spark gap be used

Chicago Wireless Headquarters

CLOSING OUT LARGE LINE OF RAW MATERIALS, PARTS, Etc.

ROTARY VARIABLE CONDENSERS

Only transparent rotary variable condenser made that can be screwed down, filled with oil to increase capacity and has binding posts on bottom where they belong. The 43 plate condenser has a capacity of .001 m.f. The 17 plate has a capacity of .0003 m.f.

KNAPP ELECTRIC & NOVELTY CO.
523 West 51st St. N. Y. CITY

with a small spark coil? 2. What is the wave length of his aerial 125 feet long and having a mean height of 43 feet? 3. The best size aerial to be used for all-around amateur work.

A. 1. A rotary gap cannot be used on a spark coil, due to the fact that the interruptions in the primary occur independent of the time when the plugs on the gap are in the sparking position, and if no plugs are opposite when the break occurs no spark will occur and the note will thus be badly broken up and distorted.

A. 2. The wave length of the aerial you describe is approximately 250 meters.

A. 3. For all-around amateur work it is advisable to have two aerials, one between 250 and 500 feet long and comparatively low, say, 40 feet, and the other about 80 feet long and 70 to 80 feet high. The former is to be used for receiving long wave lengths from high-powered stations, and the latter for transmission purposes and the reception of amateur signals.

Direct Current on Arc Lamps.

(417.) Osmond S. Ryer, Pasadena, Cal., wishes to know: 1. Why alternating current is changed to direct current for operating motion picture machines? 2. How motor generator sets change alternating current to direct current?

A. 1. Direct current has been found to be superior to alternating current for feeding arc lamps, due to the fact that less current is consumed, and the light emitted is much stronger and whiter than from arc lamps operated on alternating current.

A. 2. A motor generator set consists of an alternating current motor and direct current generator mounted on the same base with their shafts connected. The operation of this machine is as follows: The alternating current is fed to the motor and, of course, drives same. This motor, in turn, drives the generator which generates direct current and is used on the arc. The alternating current does not flow over the shaft of the machine, and there is no electrical connection between the two machines.

HUTCHISON, EDISON'S CHIEF ENGINEER, ON NAVY BOARD.

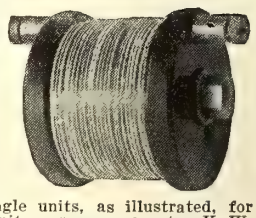
Dr. Miller Reese Hutchison, of Llewellyn Park, West Orange, chief engineer for Thomas A. Edison, recently received appointment to membership on the Naval Advisory Board. Dr. Hutchison is the second to be appointed by Secretary Daniels, the first being Mr. Edison. Other members of the board have been selected by groups of scientists.

Dr. Hutchison was born in Montrose, Ala., Aug. 6, 1876, and was educated at the Marion, Ala., Military Institute. He took a technical course in the Alabama Polytechnic Institute, and was graduated in 1897. While in school he invented a device for assisting the deaf to hear that won him recognition. He attended the coronation of King Edward in 1902 and was presented by Queen Alexandria with a gold medal in recognition of a device he invented that helped her to hear, for she was quite deaf.

He is a member of the American Society of Mechanical Engineers, the Society of Automobile Engineers, the American Institute of Radio Engineers, the National Geographic Society, the Engineers Club of New York, the National Institute of Social Sciences, the New York Electrical Society, the American Society of Naval Engineers, the Navy League of the United States, and the American Association for the Advancement of Science.

A DANDY LIGHT

which won't start fires, and which stays lit in the rain or in the wind; that's what you've always wanted—haven't you? No matches, no wires, just a big, bright, powerful white light to help you find your way at night along dark streets or dim hallways—a light you can depend on always.



FRANCO

PATENT ADVICE

Edited by H. GERNSBACK

In this Department we will publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Questions addressed to "Patent Advice" cannot be answered by mail. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

TELEPHONE DIAPHRAGM.

(39.) C. G. Black, Worcester, Mass., has sent us a sample of a telephone receiver diaphragm perforated in a certain manner. Our correspondent claims that by so perforating it will become more sensitive, particularly when used for receiving wireless telegraph signals.

A. We have examined the diaphragm and we have also tested it, and admit that it works slightly better than the ordinary receiver diaphragm. We should think that it would be possible to exploit this commercially, as an article of this kind is surely in demand.

We would advise our correspondent to apply for patent on this device, but it would perhaps be a good idea to first have a search made to find what has been done in the art before. There are a great many telephone receiver patents as well as patents on telephone diaphragms, and it is always safe to investigate what predecessors have done in the art.

REINFORCING STEEL RAILS.

(40.) J. M. Bennet, Mt. Washington, Pa., sends in a device on reinforcing steel rails for heavy track service. He also encloses a detailed drawing on same and wants to know if the invention is patentable and practical.

A. Devices of this kind are in use practically all over the world wherever the tread has to stand a heavy load. There is nothing new to this and it is being used in ordinary every-day practise.

DETECTOR.

(41.) Fred R. Bullis, Omaha, Neb., submits an idea on a new detector whose operation is based upon using sponge platinum in a certain manner.

A. Without practical research work it is impossible to state if the device will work or not. On wireless detectors or any device of this kind speculation is of little use, as it is impossible to foretell whether such a device will work or not. The scheme looks feasible on paper the way our correspondent puts it, but as stated before, without practical experience it is fruitless to go into the merits of the invention. We would advise our correspondent to experiment with the device, by all means, and in case encouraging results are obtained apply for patent. This is the best suggestion we have to offer now.

INTERCOMMUNICATING 'PHONE.

(42.) S. A. Vedri, New York City, has invented a new intercommunicating direct-line telephone which is supposed to do away with the ordinary telephone receiver, the idea being that by pressing a button the sounds will come out of a horn. A super-sensitive transmitter is used, so the person does not actually have to speak into the mouthpiece but can be as far as 2 feet away from it. He wants to know if such a device is practical and whether there is a demand for same.

A. Without knowing the full details of this scheme it is impossible to say whether a device of this kind can be patented or not. The mere idea of using a loud-talker in connection with a very sensitive microphone does not entitle you to a patent, as such devices have been used right along in every-day work. If, however, the interior (operating) mechanism of the telephone represents a new idea not having been used before, a patent might be obtained. We advise you to get in touch with a reputable patent attorney to look up the art and see what has been done previously.

FRANCE TO MOBILIZE INVENTORS ALSO.

A minister of inventions whose duty it is to effect a mobilization of the inventive genius of the country is the latest project of the French Government. It is one of the new necessities of modern warfare just as England's new minister of munitions. The plan is similar in some respects to that adopted in America by the formation of the naval advisory board.

From this it must not be inferred that France is suffering from a dearth of war inventions. It is quite the contrary that has given rise to this fresh need. The principal task of the minister will be the sorting out of the more important of the thousands of war devices with which the French patent office is being flooded and the quick placing of them at the disposal of "la patrie."

X-RAY MAY STOP CANCER'S RETURN AFTER OPERATION.

That the X-ray apparently has no effect on cancer itself, but that it will stimulate the growth of lymphocytes, a sort of white corpuscle, and thus prevent a recurrence of cancerous growth, was stated in a paper read by Dr. James B. Murphy, of the Rockefeller Institute to the members of the National Academy of Sciences at the American Museum of Natural History recently.

Dr. Murphy reached his conclusions after many experiments with rats. The treatment, he hopes, will be found of value when applied to humans from whom cancerous growths have been removed.

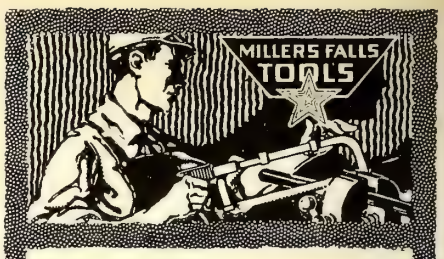
PERPETUAL MOTION, THE FOLLY OF THE AGES.

(*Continued from page 480.*)



chine must of necessity be supported on spindles or shafts resting in bearings. These bearings are bound to exert some frictional effect, and the following formula gives the loss in foot-pounds per minute for such horizontal bearings. This rule states that the loss in foot-pounds per minute is equivalent to .2618 times the coefficient of friction, times the weight on the journal in pounds, times the diameter of the shaft in inches, multiplied by the revolutions per minute at which the shaft rotates. The value of the coefficient of friction varies, of course, but it has a value of approximately .008 for a cast-iron shaft running in a steel box or sleeve when the pressure is 100 pounds per square inch, and, considering that sperm oil is used as the lubricant.

Many people who have a slight knowledge of physics have promulgated designs for perpetual motion employing liquids, somewhat after the fashion shown in Figs. 2 and 3, and some of these machines have appeared to be very ingenious on first inspection. However, friction is also present here, as liquid cannot flow through a pipe or nozzle without encountering a reactional or frictional effect.

A number of electrical machines intended to produce perpetual motion have been devised from time to time, and Fig. 4 depicts a design which might appeal to the amateur electrician or inventor. This instrument is of the electromagnetic type, and A represents a frictional electrical machine. At B there is a crank connected to a pivoted armature situated in front of the electromagnet C. The frictional electric machine is started and so magnetizes the (temporary) magnet, which pulls the armature G toward C; the circuit is broken at E, and thus the magnet loses its power, temporarily. The spring J now pulls the armature back against the contact screw E, and thus the magnet is energized once more. Thus the action is supposed to keep up forever. The explanation previously given in connection with the motor-generator set illustrated in Fig. 3 will help to elucidate the fallacy here involved. Besides a static machine cannot operate an electromagnet.

Another inventor devised a magnetic wheel machine, pictured at Fig. 5. This wonderful machine constituted a rotating wheel having oppositely disposed magnetic segments, such as those made of iron (A), while a powerful steel magnet acted on these wheel segments in turn. Attached to the wheel shaft was a crank motion which alternately and in proper sequence raised and lowered a magnetic shield (B) in front of the permanent magnet poles, so that as soon as the iron segment approached the magnet the shield would be interposed between them, and the momentum of the wheel would carry it past this point, etc. This action was repeated *ad infinitum*, as will be apparent. The most remarkable claim made by the inventor of this particular device was that the magnetic shield was to be composed of brass, coated with a "chemical and mineral substance" which would make it an insulator of magnetism. (As a matter of fact there has never been found a substance to insulate magnetism, except iron.) Again, the wheel C attached to the shaft of the device turns in a trough of water, as perceived, and it is supposed to serve in equalizing the motion, thus keeping the machine from running away with itself and committing self-destruction!

One of the "simplest," apparently, solutions of the perptual motion problem and devised at an early date involved the use of some form of revolving wheel made up with spiral paths in same, in which paths

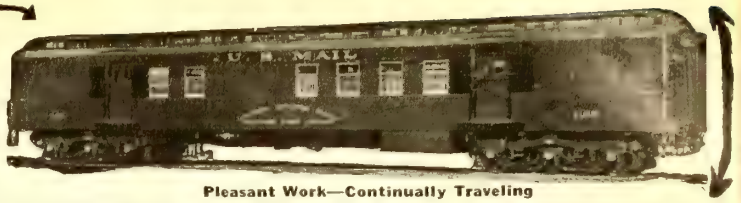
READ the Classified Advertisements in this issue. They are small but contain big bargains and opportunities.

a number of metal weights or balls could travel back and forth as the wheel rotated, and thus change their center of gravity. This would eventually overbalance the wheel proper, it was claimed, so that they would produce a greater force on one side of the wheel (in a descending sense) than that offered by the balls being raised on the other side of the wheel. This is shown very clearly in Fig. 6. Moreover, the friction and windage of the rotating member proper, with respect to the bearings, etc., have to be taken into account, even though it is placed in a vacuum, as gravity will cause the wheel to exert weight on the points of suspension which would, of course, be the bearings. Disregarding these facts altogether, it can be seen that although it looks quite certain that the balls falling out along the spiral grooves of the wheel at the right will surely tend to exert a greater force "downward" in a turning effort on the wheel than the counteracting "lift" force required to raise the balls as they move backward to the center of the wheel, such is not true.



It will be found upon critical inspection of all such wheels that, although some of the weights or balls are more distant from the center of the wheel than others, yet there will always be a proportionately smaller number of them at that part of the wheel on which they exert the greatest power, so that these exactly counterbalance each other and hence the wheel will stand still. Hundreds of similar designs employing liquids, such as water, mercury, etc., bellows, weighted collapsible leaves and what not, have been devised and thought out to bring about the much-desired function of "perpetual motion," but without avail.

Of later years and in view of the marvelous characteristics of radium, for instance, which was supposed at one time to give off energy forever, there have been many pseudo-scientists who, in speaking of perpetual motion, simply mention the word, Radium! as if they had solved the whole question finally and completely. The latest research work on radium has brought out the fact that it eventually loses its power to give forth energy in the form of electrons at the end of about 2,500 years. To some of us no doubt this would seem near enough to the goal of the perpetual motion dreamer, and a radium clock would seem to put any of the devices of this ilk invented in past years away in the shade. A radium clock that undoubtedly will work all right has been devised by Prof. Struts. This may be said, without a doubt, to be one of the nearest ap-

WANTED

Railway Mail Clerks $900 to $1800 a Year

($75 to $150 a month)

Rapid advancement to higher Government Positions. "No lay-offs" because of STRIKES, WARS, FINANCIAL FLURRIES or the WHIMS OF SOME PETTY BOSS. THE POSITION IS YOURS FOR LIFE.

Country residents and city residents stand the same chance for immediate appointment. Common-sense education sufficient. Political influence NOT REQUIRED.

Write immediately for schedule showing the places and dates of THE SPRING GOV'T examinations. Don't delay. Every day you lose means the loss of just so much coaching before the rapidly approaching examinations.

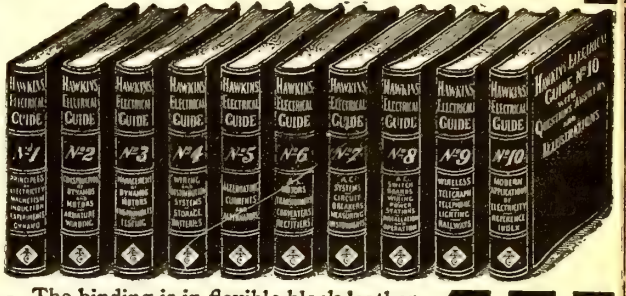
Do It Electrically



The applications of electricity are increasing every day. The man who has an exact knowledge of electrical science has ever growing opportunity for profit. Ten years ago practically all machines in use were run by steam engine and countershaft. Statistics now show that most of the machines used are now operated by the electric drive. A generation ago gas was the only known means for lighting and cooking. Now almost every modern house is lighted by electricity, and electric cooking utensils are coming more and more in use. Even the steam locomotive, that great achievement of the twentieth century, is being gradually replaced by electric power. Whether it be for driving machines, for railway transportation, for lighting, for heating, for cooking, for a thousand daily necessities, the watchword of the age is "Do It Electrically."

Hawkins Electrical Guides Will Show You How

Electrical knowledge means money to you and these books will show you how to get it. Hawkins Electrical Guides are the standard works on Electricity. They cover every single phase of the subject and they are written in a way you can understand. The text matter is arranged in questions and answers, and contains several thousand illustrations. No more groping for a solution of your electrical problem. You find the answer at once, clearly and concisely.

A Most Complete Library of Electricity at the Lowest Cost

Look at the titles and convince yourself that Hawkins Electrical Guides tell you everything you want to know in Electricity. They are a complete course in Electrical engineering, written especially for the ambitious man who is training himself for advancement, for the wide awake man who is likely to be called in for work outside of his regular line, for the man who needs at his elbow, for ready reference, an accurate up-to-date work on electricity. An examination of these books will convince you of their value instantly. They cost $1 per volume. They are a wonderful buy at this price, and they are the best electrical books at any price. Don't take our word for their merits. Fill out the coupon today and the books will be sent you absolutely FREE for your own examination. You have seven days full use before you pay a cent.

In Handy Separate Volumes The binding is in flexible black leather with gold edges—very durable and attractive. The books are easy to handle and easy to read. They fit your pocket and your pocket-book as well.

Shipped to You FREE

Send no money. Examine the books first. Decide for yourself that they are the most complete library of electricity ever published, and that you cannot afford to be without them. Every book is complete in itself. The price is only $1 per copy, but the complete set is the best bargain. Settlement can be made at only $1 per month. EIGHT NUMBERS ARE READY.

A FEW OF THE SUBJECTS

Magnetism—Induction—Experiments—Dynamos—Electric Machinery—Motors—Armatures—Armature Windings—Installing of Dynamos—Electrical Instrument Testing—Practical Management of Dynamos and Motors—Distribution Systems—Wiring—Wiring Diagrams—Sign Flashers—Storage Batteries—Principles of Alternating Currents and Alternators—Alternating Current Motors—Transformers—Converters—Rectifiers—Alternating Current Systems—Circuit Breakers—Measuring Instruments—Switch Boards—Wiring—Power Stations—Installing—Telephone—Telegraph—Wireless—Bells—Lighting—Railways. Also many Modern Practical Applications of Electricity and Ready Reference Index of the 10 numbers.

Easy Payments

Accept this great offer now—today. Each page—every illustration will convince you of the big value we are offering. See the books first, then decide. If you decide to keep them you can make settlement at only $1 monthly until paid for.

Learn Electricity!

"I'll Pay You $175 to $300 Per Month!" That's what many superintendents and managers have said to OUR GRADUATES. That's what one will say to YOU. It's not out of the ordinary. In fact it is just what can happen if you become a COYNE trained man. It means success for you for life. Any man between the ages of 15 and 50 who has ambition, no matter how little education, can learn this big paying trade in our schools in a short time and at small expense.

COYNE NATIONAL TRADE SCHOOLS

Largest and best equipped trade school in America. For 15 years we have sent hundreds of men out annually as skilled mechanics to help supply the rapidly increasing demand. Let us train **you** for one of these big jobs. Our employment bureau places graduates in to big paying positions free of charge.

Men Wanted For These Trades

Our Own Building

Electricity
Plumbing
Bricklaying
Motion Pic. Opr.
ech. Drafting

We teach all these big paying trades under actual working conditions. We do not have classes, do not use books, do not teach by correspondence. Each man is instructed individually right in our big shops. Drafting, Estimating and Plan Reading included IN ALL courses.

We charge a small tuition fee which can be made in easy payments if desired. All tools, equipment and material is furnished by the school FREE. Our institution is open Day and Evening. Many of our students earn a part or all of their expenses while attending. Our employment bureau is always ready to assist a man to earn expenses, without charge.

SEND COUPON FOR FREE BOOK

Be a man of action. Send today for our book of trades—fully illustrated. It costs you nothing and shows how you can earn more money, make a bigger success than you ever dreamed of. If you live near, come over and go through our shops—visitors are always welcome.

proaches to a practical perpetual motion device ever invented. It comprises a glass bulb, as perceived in Fig. 7, inclosing a gold leaf electroscope, some radium salts and a metal wire which has one end connected to the earth. The action is as follows: The emanation of the radium in the form of electrons shot forth at high velocity, charges the leaves, which diverge slightly, until one of them touches the wire at A. As this terminal is connected with the ground, it carries off the electrical charge, leaving the gold leaf discharged, but which are then recharged from the electrons continuously given off by the radium. This charge is again carried off to earth, and so on, *ad lib.* No doubt a suitable electrical contact of delicate mechanical construction could be arranged so that every time the leaf touched the wire A it would cause a secondary electrical circuit to operate some electromagnetic device connected to a standard clock mechanism. Also it might be possible to construct a sufficiently sensitive mechanical arrangement inside the bulb, which would be actuated by the movement of the gold leaves as aforementioned.

The life of such a clock would be 2,500 years, if our present knowledge of radium and its characteristics are correct. Thus we see that, in so far as practical results, or in fact any results worth mentioning are concerned, the problem of perpetual motion is practically as far from solution as it ever was since the dawn of creation.

Wherever you find practical engineers and scientists at work in the laboratory or in the field, you will always find some practical form of energy being utilized, either from waterfalls, some form of gas or coal, mineral oils or windmills, etc. There are a number of mighty forces as yet unharnessed in nature, which so far have baffled the many master minds trying to solve their mysteries; notable among these there is the almost unbelievable force available in the ocean waves, which perpetually wash our shores; the energy in the sun's rays, which has been used practically in some apparatus devised in the past few years, but not to any extent worth mentioning; the efficient use of wind energy, and the direct generation of power from coal, which at present entails 90 to 98 per cent. loss in boilers, engines and piping. But let the perpetual motion specialists dream on, for he who never dreams never accomplishes, someone has said.

TWO NEW WIRELESS DETECTORS.

(*Continued from page* 485.)

a couple of seconds. The mineral, *lenzite,* employed in same is probably one of the most interesting features of this particular piece of apparatus. It is said to be one of the very best materials ever discovered for the purpose in question. Lenzite is a composite substance, made up from a number of different metals, and the secret of the composition is known only to the sponsors of the instrument. It sells at a nominal price and makes a very businesslike appearance in any radio station. The manufacturers claim to have had this detector tested by Government and other bona fide radio stations with very successful results. Fiber thumbscrews enable the mineral cup within the glass, dust-protecting tube to be moved as required. The "cat-whisker" wire at the right is controlled by a substantial thumbscrew, as perceived. This is held in a bushing surrounded by a soft rubber gasket to overcome vibrations, which, of course, always tend to easily knock such detectors as these out of adjustment. The terminals are of substantial pattern, as ob-

THE REGENERATING AUDION CIRCUITS FOR WIRELESS RECEIVING.

(*Continued from page* 488.)

Referring again to Fig. ., transformer T, condensers C^3 and C^2, may be eliminated and the simplified Armstrong circuits connected together at junction point O, Fig. 2. Transformer T (in Fig. 1) may be compensated for by increasing the telephone inductance. This may be accomplished by using telephones in the neighborhood of 3,000 or 4,000 ohms; although telephones of 1,000 or 2,000 ohms may be used, it is advisable to use the higher ohmage, with its corresponding higher inductance. This somewhat simplifies the arrangement, giving practically the same results. After the apparatus are all connected up the following instructions should be followed in adjusting the instruments to any given station.

Set condenser C^5 at its maximum capacity, inductance coil L^1 at zero, and tune the primary inductances and inductance coil L, condenser C and grid condenser C^1 until the incoming signal is at a maximum, then increase inductance coil L^1 (which will increase the signal strength many times) until the audion is below the point of generating. Finally decrease condenser C^5, keeping the audion below the point of generation until the maximum strength of signals are realized. This indicates that the limit of amplification is reached, and beyond this it is impossible to go. When connecting the secondary terminals to the grid coil and junction point O, a trial should be made to determine which side of the secondary connects to the junction point O, as it makes a slight difference in tuning.

A simple test to determine whether the audion is oscillating is to *touch the grid connection* (where it leaves the audion) *with the finger.* If a sharp click is heard in the telephones the circuits are oscillating. This condition is necessary in order to receive the "undamped waves," utilizing the "beat" principle.

All connections should be of stranded wire. While the dimensions given are for the longer wave lengths, apparatus may be constructed for wave lengths of 200 meters and up by simply making the wing and grid coils L and L^1 much smaller with finer graduations of inductance. In this case the loose coupler will obviously require taps or sliders, using No. 24 wire on the primary of the coupler. The rest of the apparatus remains the same. This type of apparatus and connections are well worth constructing and using, as it constitutes the most advanced means known at the present time in the reception of both damped and undamped radio signals.

ELECTRICAL SEWING MACHINE MOTOR STAYS WHERE YOU PUT IT.

(*Continued from page* 484.)

ter of gravity of the whole motor and pedestal is so balanced out that when the friction pulley of the motor shaft is placed underneath the hand-wheel of the sewing machine, it will drive it without the motor tilting upward at the back, as might be suspected on first sight. The motor comes with plug and flexible cord so that it may be attached to any convenient lamp socket. It is furnished wound for any commercial voltage or frequency. The manufacturers of this unique motor drive for the sewing machine claim that it performs its duty all day without getting out of alignment, and it should indeed prove a boon to those who have any extended use for such a labor-saving device.

"Instruction by correspondence is the cheapest and best way for the poor man"
Thos A Edison

Edison is Right!!!

You admit the International Correspondence Schools are a good thing. You'd take a course right now "if"—"except"—

"If" what? If you weren't so "overworked," with such "long hours," or had more strength and energy?

Wasn't it Edison who stayed up half the night to educate himself in spite of every handicap you could ever have?

All big men who have made their mark in the world had the *ambition*—the *determination*—to improve their spare time, to train themselves for big work. You, too, can possess power, money and happiness if you'll only make the effort. The reward is great—it's worth it.

Here's all we ask: Merely mail this coupon. Put it up to us without paying or promising. Let us send you the details of others' success through the I. C. S., and then decide. Mark and mail this coupon now.

THE POINATOWSKI RAY.

(*Continued from page 473.*)

approaching from Zapata came a chance shell among Rutherford's men, and exploding, wrecked the projector, put Captain Cawthorne to the ground and killed three others. Kilroth sprang to his Captain, slipped his arm under his head and asked: "Where are you hurt, Captain?"

"Leg smashed again," grinned Cawthorne. "Get me the other if you can, Kilroth!"

Kilroth glanced at the debris of shattered poplar and steel wire which had been his Captain's false leg, and with a muttered "Thank God!" dashed away to the supply auto, where a substitute had been carried. As he came back Cawthorne was sitting up gazing ruefully at the wrecked projector.

"It all depends on the Admiral now, Kilroth. We're out of the game, except for the Nullifiers. They can probably protect us in our retreat to the Rio Grande."

"Hard luck!" grunted Kilroth. "They should have let us have both projectors. Four hundred troopers with only one effective weapon sent out againt 20,000 of the enemy—not counting their fleet."

The Colonel came up, glanced at Cawthorne adjusting the fastenings of his false leg, and exclaimed: "I didn't expect to see you able to move. It's fortunate for all of us that you were not injured."

Cawthorne shrugged his shoulders. "The only possible use I have been to your command, Colonel, is smashed out of commission—almost out of recognition." He pointed to the wrecked projector and added: "I suppose that means that we draw out of the game now?"

"Only as far as that cañon!" asserted the Colonel grimly. "We must have cover from the battleships' guns. They're getting into action now, and when they get our range we must be behind rocks."

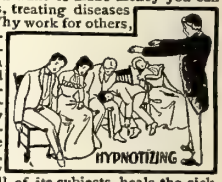
He gave the command: "Leave those big guns and retreat instantly to that cañon! Signal Nullifier No. 3 to draw back here. We must not risk both those machines at the same time. Order Nullifier No. 4 to continue operating over the enemy's trenches."

Then to the wireless operator he ordered: "Call up Admiral Roberts' flagship and report that our projector is wrecked. Tell him that we will hold our position here, and if he succeeds in exploding the mines and coming up into the bay to engage the enemy's fleet, we'll keep our Nullifiers in action on the land enemy at Zapata."

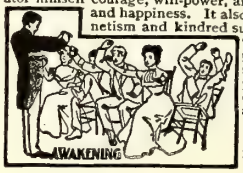
And a rapid command to Cawthorne followed: "Captain, have the muzzles of those big guns elevated so as to draw any enemy's fire. Also leave that rapid-fire gun among them. Attach the wireless firing mechanism to it, and then draw off every man into the cañon!"

The retreat, or perhaps side-step, was quickly made, and with the rugged, hoary Chapaderas Range between them and the coast, the command, with horses and supply autos, were safe from the fleet guns, the shells from which, however, were directed at the five great wooden counterfeits and the smoke from the rapid-fire, which were clearly visible from the bay across the open mesa.

"That deceives them, all right," laughed the Colonel, "and if we keep quiet here for a while they'll believe that they've wiped us out completely. There go the guns!" as a shell exploded and scattered the images over the plain.



A scout aero was signaled to come down, and as it reached level ground at the mouth of the cañon the wireless officer reported an answer from Admiral Roberts:



"Our projector has destroyed apparently every mine and several submarines. Am advancing up the bay to

HYPNOTISM!

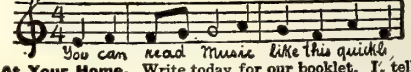
Be a HYPNOTIST and MAKE FUN and MONEY!

It takes but a few hours to learn. The study is both easy and fascinating. Hypnotism is an endless source of fun and wonder. If you know how to Hypnotize you can perform some of the most marvelous feats imaginable. You can do a hundred amazing things that other people cannot do. You can surprise your friends and make yourself popular. You can place others under this strange and mystic spell. You can compel them to think, act and feel just as you wish. If you want to make money you can do so by giving entertainments, treating diseases or teaching the art to others. Why work for others, when you may master this money-making profession so easily? Investigate NOW! You may learn at your own home. I will send you my free treatise for the asking. It tells you about Hypnotism and how you may easily learn it. It is profusely illustrated and is written in a simple style easily understood by all. Anybody may learn from it of how the Hypnotic Spell sways the will of its subjects, heals the sick, reforms the degraded, overcomes bashfulness, helps to trade or position, amuses an audience for profit, and gains for the operator himself courage, will-power, and a means to health, wealth and happiness. It also treats fully on Personal Magnetism and kindred subjects. Remember, this treatise is absolutely free. Simply write for it, and it will be sent by next mail, all charges paid. Don't send any money or stamp, but send your name and address today. Address:

M. D. BETTS,
Sta. 563, Jackson, Mich.

New Illustrated Book FREE Write at once for your free copy of this intensely interesting illustrated book showing how disease is successfully eradicated through advanced Drugless Healing.

CHIROPRACTIC Our direct, practical, profusely illustrated course surely and quickly prepares you at home, during spare time, to enter this amazingly profitable profession. Everything so clear and easy that if you can read and write, you can readily master it—splendid openings. Easy, pleasant and surprisingly lucrative. Chiropractors make as high as **$25 a Day** while yearly incomes of $5,000 and $6,000 are not uncommon.



Free Charts and Lessons For a short time only we offer five complete lesson sections of the Course and $15 set of 8 charts, absolutely free. This offer strictly limited. Send your name and address today for valuable free illustrated book on drugless healing and full particulars.

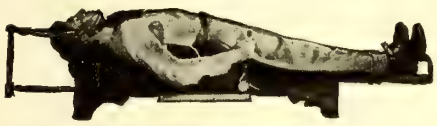
BRAIN vs. BODY IN THE RACE FOR SUCCESS

All you fellows who are devoting every bit of your time and attention to the cultivation of mental efficiency, do you ever



STOP

and ask yourself what it will avail you if you neglect your body? You think the brain is the all important essential in the race for your goal. Is it? Will your brain live longer than your body? Will your brain live up to its training and do good work if it has to be continually flashing messages from a neglected body, or registering protests from a disorganized stomach? Will the brain of a crooked, scrawny, dyspeptic, or weak, puny, undeveloped man justify the training it has had? Or will a brain weakened by youthful indiscretions be 100 per cent. efficient?

My book **"Intelligence in Physical and Health Culture"** will answer these questions in a way that will interest and surprise you. Send four cents in stamps to cover postage on a copy. Do it now!

THE PANDICULATOR

This University discovery is the most important health invention of the century. It remakes and rejuvenates the Human Body. It produces normal spines. It frees impinged and irritated nerves, corrects contracted muscles, shortened ligaments; eliminates congestion, improves circulation and drainage of the body. IT WILL INCREASE THE BODY'S LENGTH.

THE BOYS' OWN LABORATORY
CHEMCRAFT

A Complete Outfit of
CHEMICALS - (39 Chemical Reagents)
APPARATUS - (All Necessary Apparatus)
INSTRUCTIONS (The Chemcraft Book)
for performing over 50 Different Experiments. Each experiment can be repeated many times.

Under the heading "Chemistry and Its Application to the Industries" are many experiments in which the products of our great chemical industries are really manufactured on a small scale. Everything is explained in a clear interesting way.

Chemcraft also contains 30 mysterious experiments in Chemical Magic. It's great fun to show these to your friends.

If your dealer does not have Chemcraft we will send yours direct. Price $2.00 postpaid. Descriptive literature sent on request.

THE PORTER CHEMICAL CO., Hagerstown, Md.

BOYS! Best Boy's Magazine in the world at the price
DO YOU LIKE RATTLING GOOD STORIES?

Are you interested in baseball and athletics, electricity, mechanics, photography, carpentry, stamps and coin collecting, amateur journalism, gardening and pets?

If you are sit down right now and send a quarter for a year's subscription to Boys' Companion a large 32 page illustrated boys monthly magazine. It is chock-full of the very best boys' stories, clean and wholesome, full of life and action, and has regular departments every month on all the above subjects besides special articles of great interest to boys. ALL BOYS WANT IT

If you will send 25 cents at once for a year's subscription we will mail you a copy of Connie Mack's new Booklet,
"The Secret of Success in Baseball" FREE
One year 25 cents, Half year 15 cents, Three months for 10 cents.
Boys' Companion, 104 South La Salle Street, Chicago, Ill.

engage the enemy's fleet, and shall then proceed to Zapata to take the land forces. Hold your position until I arrive. It will be safer than retreat."

The Colonel scowled grimly as he handed the paper to Cawthorne. "The Admiral assumes that he gets not only the surrender of the fleet but of the entire land force; and we are to sit here and wait till he comes in to protect us. Fortunately we are not under his orders. Cawthorne, step this way for a few moments."

Ten minutes later the two officers grasped hands, their faces beaming, and Cawthorne strode over to the scout aero, climbed into a seat and went into the air, heading across the great Cisneros Bay. With him were the operator and a wireless man.

They passed directly over the Japo-Chinese fleet—16 battleships, seven of which were the most modern and powerful dreadnoughts ever designed. Every vessel was under steam, and while two had run up close to the Zapata shore in order to meet any further attack from Rutherford's command the other great ships were speeding down the bay toward the point around which Roberts' fleet would have to come.

The aero flew swiftly, and the 18 miles to that point were quickly covered. Beyond it they saw the Stars and Stripes floating from the fleet, which was moving very slowly. One vessel only—a light cruiser—was pushing ahead, and through his glasses Cawthorne saw the big projector tube at the bow. Almost at that moment the cruiser slowed down as her nose poked round the great perpendicular Vaquera Rock, which had obstructed any view of the enemy, and as she reached that position the projector tube was swung over to port, pointing at the approaching Jap battleships, four miles up the bay. With a gasp of delight Cawthorne saw the puffs of smoke from every turret of those vessels, and the next instant the crash of the detonations reached them.

"Firing down the bay with not an enemy in sight except that cruiser!" ejaculated Cawthorne. "And they haven't had time to aim at her. Roberts gave the order for that firing, and the ray—the wonderful Poniatowski Ray—did it!

At the rear of the enemy's battleships were several light-armored cruisers which, as the ray reached them, exploded their magazines.

"Absolutely unnecessary!" growled Cawthorne. "He's using too heavy penetration. I was afraid of that, and warned them against it. If they concentrate much more than they're doing, they'll get through the heaviest armor to the magazines and blow up those dreadnoughts, and our good old country'll lose them all."

But the Admiral must have ordered less penetration, for no more magazine explosions took place. For a few moments the battleships were maneuvered to bring their turret guns to bear upon that one mysterious cruiser in the shadow of the great Vaquera Rock, but before any gun could be aimed or elevated or depressed the ray struck the charge and discharged it. In less than three minutes the firing ceased and the United States battleships were under forced draft, dashing round the point.

Cawthorne howled delightedly to the wireless officer: "Send word to the Colonel that Roberts is steaming up the bay. All firing ceased." Then to the operator: "Work up the bay and over Zapata!"

As they glided over the great horde of tents, supplies, munitions and men Cawthorne waved a white flag until an answering flag showed that he would be received. They glided to the ground, and the Captain was escorted to the Allies' headquarters and received by Ito, the Japanese General, who understood English perfectly.

Here's *YOUR* Chance to Learn DRAFTING FREE

This Complete $15 Drawing Outfit and Full Instructions in Mechanical Drawing

There's a good job waiting for you. The country is facing greater prosperity than it has ever before experienced. Far-seeing men are getting ready for boom times. Get this training now and share in the coming prosperity. We make the way plain.

CHARLES W. MOREY
President of the College and Head of a Large Chicago Firm of Civil, Mechanical and Electrical Engineers and Contractors.

Men Wanted AT BIG SALARIES

This is a rare chance for a few wide-awake young men.

On account of the rapidly increasing demand for trained draftsmen Pres. Morey has issued orders that instructions be furnished to a limited number of young men who are inclined along engineering or architectural lines. Read about this great offer below—then mark and mail the coupon.

STUDY AT HOME Devote your spare hours for a short time only and learn this profitable and pleasant profession, and get in the class drawing the big pay envelope. Hundreds of men are in daily attendance at this old established college. In your own home you can do the same work these men are doing, and the same experts that teach them will guide you toward the big job. These well-known engineers prepare your instruction matter. Your work is examined and approved by them. They know exactly the **practical training** you need and **they** train you. No books to sell. Live, up-to-date blue prints of work in actual construction. In your own home you work with plans of machinery, buildings, steel works, etc., actually being constructed in Chicago, New York and other large cities.

Electrical Drafting and Design

No other similar correspondence course in America has a resident college of National reputation back of it, nor a faculty of active experts actually engaged in municipal and corporation engineering work. These men know exactly the kind of training you need because they are in constant charge of big work.

$45 COURSE FREE IN MECHANICAL DRAWING

This College has set aside a limited number of Free Scholarships and will give the regular $45 Course in Mechanical Drawing Free with any one of the Home Study Courses named in the coupon below—this is in addition to the complete $15 Drawing Outfit which is also furnished to students free. Take advantage of this unusually liberal offer today, as it will be withdrawn when the allotted number of Free Scholarships has been awarded. It costs you nothing to get full information. No obligation on you.

100 PAGES, 88 ILLUSTRATIONS

TWO REMARKABLE BOOKS

How to Make Wireless Sending Apparatus

THIS book will surely be welcomed by every wireless enthusiast and by everyone who is fond of making his own apparatus.

This book contains more information on how-to-make up-to-date sending apparatus than any other book we know of. Thirty different pieces of apparatus can be made with materials that most anyone can obtain without much trouble; the illustrations and descriptions being so clear and simple that no trouble will be experienced in making the instruments. Only strictly modern and up-to-date apparatus are described in this book and if we asked you 50 cents for it we are sure that you would consider it a bargain.

This book has been written by twenty radio experts who know how to make wireless sending apparatus and for that reason you will gain by their experience as well as by their experiments.

The size of the book is 7x5 inches substantially bound in paper; the cover being printed in two colors. Contains 100 pages and 88 illustrations. There are quite a few full page illustrations giving all dimensions, working diagrams as well as many photographs showing the finished apparatus.

PRICE 25c. PREPAID

How to Make Wireless Receiving Apparatus

WE know that this book will surely be a boon to every "How-to-make-it" fiend. It has been written and published entirely for the wireless enthusiast who makes his own receiving apparatus; the twenty radio constructors who have written the articles are well-seasoned in the art and know whereof they speak. You consequently profit by their experience.

Only strictly up-to-date and modern apparatus are described and only those that the average experimenter can make himself with material that can be readily obtained.

We believe that *this book contains more information on how to make wireless receiving apparatus than any other book in print* and you will find that it is easily worth double the price we are asking for it.

The size of the book is 7x5 inches, handsomely bound in paper; the cover being printed in two colors. Contains 100 pages and 90 illustrations. There are a number of full page illustrations giving all dimensions, as well as photographs showing finished apparatus.

PRICE 25c. PREPAID

THE PONIATOWSKI RAY.

(*Continued from page* 519.)

Cawthorne stated his mission concisely and very determinately. "Your fleet is silenced, General, by the marvelous ray projector which Admiral Roberts has, a duplicate of which destroyed your aero fleet to-day. The power of tnat ray has not been fully demonstrated to you yet, for if the penetration was increased to capacity it would explode every magazine behind the heaviest armor on the greatest dreadnought out there.

"And if we put our land projector into action again against your camp here, not one grain of explosive will escape. Your entire force will be annihilated! I am ordered by my commanding officer to demand your unconditional surrender!"

An hour later two wireless reports were sent to Washington. One, from Admiral Roberts, was:

"The enemy's fleet has surrendered with every battleship intact and little loss of life. Three of their cruisers destroyed. No loss on our side.

"ED. S. ROBERTS,
"Admiral of the Fleet in Cisneros Bay."

That from Colonel Rutherford was:

"The entire land force of the enemy at Zapata surrendered to this command at 4.45. Our projector destroyed early in the operations, but the Nullifiers completed the attack.

M. J. RUTHERFORD,
"Colonel of the Cisneros Expeditionary Force at Zapata."

ELECTRICAL HELPS FOR AMATEUR PHOTOGRAPHERS.

(*Continued from page* 493.)

thing must be sharp and distinct, is not like taking a snapshot out of doors in bright sunshine.

Before thinking of anything else you should select the "viewpoint" for your picture, whether you are going to use daylight or flashlight. In choosing your point of view you will find that it will help the picture a lot if you can put some very conspicuous instrument about one third of the way from each edge of the picture (that is to say, so that it would occupy the same position as one of the four heavy dots in Fig. 4). If you are to include yourself in the picture your face should occupy this place.

If you are to use daylight you should also observe that you can see, from the same point of view as your lens, the bright side (not the shadow side) of every instrument, without any instrument being in the shadow of another. If you cannot do this, you had better use a flashlight. Also, if, taking the picture by daylight, you find that you have to include a front view (or even 45° view) of a window, you had again better use a flashlight. In this case it would be better to take the picture *at sundown* than at night, as you will then avoid the peculiar effect caused by black windows, which would mar the photograph.

The next thing after choosing your viewpoint, if you are going to use a flashlight, is to choose the "place for the flash." Here again you should follow the same rule as for daylight, the lens should see the bright side of every instrument of any importance, without its being in the shadow of another instrument.

The exposure is the next thing to consider. If you are going to use daylight you should consult an exposure table, which any photographic dealer will give you free of charge or at very small cost. If you use a flashlight you will find that complete directions about exposure come with the magnesium powder or flash sheet. A very good idea in taking a picture of this

Mr. King rose from Newsboy to Meter Engineer

YOU are needed NOW AS METER ENGINEER

Get the big job. Earn the big salary. Get into the new profession where high salaried positions are seeking the men. Train yourself to fill one of these big jobs. There is one or more in every Electric Light Plant. The demand is growing daily for Meter Engineers. We have trained hundreds of others and placed them in big jobs. We can do the same for you.

Earn $1,200 to $3,000 a Year

Just a few short months at home during spare time. You learn while you earn. Course is interesting, concise, thorough. You learn all about meters and instruments. No problem will stump you. Step into an Electric Light Plant as Meter Engineer at a salary of $1,200 to $3,000 a year. Our course prepares you for every emergency.

Mr. King's Rise to Meter Engineer

His experience is no different from hundreds of our students. He wanted the big job and trained for it. He has a fine position—at a big salary. His training makes him indispensable to his employer. His job is sure the year round.

Our Money-Back Guarantee

We guarantee to furnish you with our complete course of instruction in Electrical Meter Engineering and train you without charge, other than tuition as specified in our Enrollment Blank, until you are qualified to accept a position paying from $75 to $300 a month. Furthermore, we guarantee to assist you in securing a high grade position after you receive your Diploma. If after receiving all supplies and instructions to which you are entitled, and after fulfilling all of your agreements, you are not perfectly satisfied, we are to refund the full amount of your tuition.

FREE—Full Information—Use Coupon. Get the School Literature story of Mr. King's rise, terms, testimony from students and graduates, outline of course, duties of Meter Engineer—all absolutely free. Write to-day, "NOW." Use coupon.

FOR ELECTRICAL AND EXPERIMENTAL WORK

THIS "RED DEVIL" EXTRA HEAVY SIDE CUTTING PLIER No. 1950

Is without parallel. Will stand severe tests and save time, temper and material. The electricians' and mechanics' standard tool—used the world over. Sample 7 in. size mailed postpaid for $1.00. **Booklet Free.**

SMITH & HEMENWAY CO., Inc. 126 Chambers Street New York City

Big Money in Electricity

The electrical industries offer wonderful opportunities for boys with a liking for electricity. The salaries paid to trained men are large—promotion comes rapidly, and, best of all, the profession is not overcrowded.

The opening of new lines, from time to time, (such as wireless telegraphy and telephony), promise attractive and paying fields to those who wish to specialize. The *will to do* and *Special Training* will bring success to you.

The International Correspondence Schools of Scranton can help to make you an expert in electrical work. Hundreds of boys have already won success through I. C. S. help. You can do the same. Everything is made so clear that you can learn in your spare time, regardless of where you live or what you do. No books to buy.

There's big money in electricity. Get after it by marking and mailing the attached coupon today. Finding out costs you nothing.

Mark the Coupon—NOW

kind is to expose three negatives, one with the exposure given by your tables or directions; another with one-third of that exposure, and another with three times the exposure. Each of the three negatives should then be developed *separately* (if roll films are used cut them apart). One of them is bound to come out right and give perfect results.

The diaphragm stop used should not be too large, as the instruments at the side of the picture will not be sharp enough. On the other hand, if it is too small, it will considerably lengthen the time of exposure necessary. The best rule to follow is to make it as small as a reasonable time of exposure will permit.

Once the negative is taken the rest, of course, is the same as for ordinary snapshots.

MEASURING THE HEAT FROM DISTANT STARS.

(*Continued from page* 470.)

Using Dr. Coblentz's apparatus at the Lick Observatory, and during the sensitive tests made it was ascertained that the total radiation received from a red star was from two to three times the value of that received from a blue star of the same photometric brightness.

Another interesting problem taken up in this branch of science is the measurement of the radiation from variable stars, especially those which undergo a change of color. The real knowledge, however, will not be gained by measuring the total radiation from stars but by dispersing the starlight and measuring the distribution of energy in its spectrum, and this may be said to be the dream of the experimenter; in other words, the goal toward which he has always turned his efforts. In the near future it is hoped that sufficiently sensitive apparatus of this nature may be constructed which will enable the results aimed at to be achieved. To accomplish this the apparatus must be sufficiently sensitive to measure the radiation of a sperm candle at a distance of more than 500 miles. Dr. Coblentz believes that this can be accomplished without a doubt with some possible changes in the electrical apparatus and also in the reflecting telescope and mirror employed for the purpose.

DOES ELECTRO-MAGNETIC INDUCTION DEPEND UPON LOOPING OR CUTTING OF FLUX.

It was demonstrated by Faraday that when a wire was moved across a magnetic field so as to cut the magnetic flux an electromotive force was induced in the wire during the motion. Faraday also demonstrated that if a loop of wire is linked with magnetic flux any change in the linkage, due either to motion of the loop or to motion of the flux, sets up a temporary electromotive force in the loop. Ever since that time there has been a difference of opinion between electromagneticians as to the manner in which these phenomena should be regarded, says *Electrical World* editorially. Some declared the fundamental law to be that whenever a loop has its flux contents changed in any manner there will be a generation of electromotive force, and the primordial idea is that of a circuit loop. Any cutting of flux by a conductor is therefore a mere case of altering the flux in the loop circuit to which it belongs. Others took the opposite view and contended that a loop is a mere series aggregation of conducting elements, the primordial idea being that of the cutting of flux by some of these elements. It is true that when cutting is effected in this way there will be a change of flux in the circuit, but that is a consequence and not a cause of the electric action. So the loopers and the cutters carried on an animated intellectual warfare, each side declaring that the other side set the cart before the horse. There is a large literature on this peaceful war. In the great mass of engineering dynamo phenomena it was a matter of complete indifference, from a practical point of view, which opinion was held. There was nearly always both a looping action going on, to satisfy the loopers, and also a cutting action going on, to content the cutters. Nevertheless, from an intellectual standpoint, each saw the universe of the other as inside out.

Of recent years, however, the evidence has been accumulating on the side of the cutters. It has been pointed out, for example, that if a loop full of magnetic flux was suddenly injected into a circuit loop, without any flux cutting, and merely by switching at some point of contiguity, no electromotive force was generated in the circuit, and yet flux was being inclosed in a new loop. Blondel recently demonstrated by a series of experiments that when loops are changed in flux contents by tangential motion, as distinguished from motion which cuts, no perceptible electromotive force is generated. This is another blow for the loopers.

Looked at from the standpoint now reached after 70 years of debate, it would appear that no electromotive force can be induced in a circuit unless flux cuts the boundary. "No cuts, no volts," is the day's password. Furthermore, this slogan means, if it is to be trusted, that when a secondary coil lies outside of a primary coil, as, for example, when we apply first a primary and then a secondary winding to a laminated ring core, the flux which traverses the core when the primary winding is energized does not spring up and develop within the primary coil, but comes jumping through the secondary coil from outside, so as to cut the secondary wires. Let us hope that the loopers will finally admit that their loops are cut, and find other fields to occupy their honest and valuable warlike activities.

DR. DE FOREST TELLS OF RADIOPHONE TESTS.

Dr. Lee De Forest, the American wireless engineer, who went to England in September in connection with the trans-Atlantic wireless telephone tests, returned recently from Bordeaux. In an interview regarding trans-Atlantic radio-telephone tests between Arlington and the Eiffel Tower, Dr. De Forest said:

"I was in Paris when for the first time in history words spoken in America were heard across the Atlantic Ocean. I am immensely gratified that it should have been my inventions which first made possible the realization of the prophecy I made seven years ago. At that time I was criticised for announcing that trans-Atlantic wireless telephony would be an accomplished fact within 10 years.

"I found that the French Army officers had been using my audion and amplifier for more than a year, and were particularly pleased at the strength of the telegraph signals they obtain with it from our naval radio station at Darien, Isthmus of Panama.

"The three or four words heard were very faint, but they served at least to accomplish the feat desired by my patent licenses. It marked a genuine epoch. As a matter of fact, it was unnecessary to attempt to use the Eiffel Tower antenna for receiving from Arlington. A connection to some of the network of telephone and telegraph wires to the west of Paris would have answered the purpose."

BARON MÜNCHHAUSEN'S NEW SCIENTIFIC ADVENTURES.

(*Continued from page 474.*)

The Martian, by long training of his brain for generations back, is enabled to "tune" his mind to a comparative wide range of waves, thus with but little effort he can think in a high "pitch" or in a low one. As each pitch has its own characteristics—no two being alike—it becomes easy for anyone to "listen" to the selected one only. It is the same as if you converse with your friend while ten other people talk all at one time in the same room. By instinct you are enabled to listen to your friend's characteristic voice, disregarding all the other voices. You "tune" your ear automatically to his voice, and while the sounds of the ten other voices reach your ear, you do not *consciously* hear them.

Exactly the same is the case when the Martian converses by thought transmission; his brain "hears" only that what he actually wishes to hear and nothing else. Nor can one Martian force his thoughts upon another if the latter does not want to "listen." He simply shuts the other out, just as you can shut out your friend's voice if you do not care to listen to him. You "tune" his voice out by concentrating real hard on a subject, with the result that you are not conscious of what he is talking about. The same is the case with the Martian.

On the other hand, if the Martian does not want to have anyone "listen" to his thoughts he simply pushes the plates away from his temples, when, of course, no thought transmission can take place.

But, as usual, I get ahead of myself. I believe that I told you last night how we had taken an excursion over the mighty Mars canals with our host, the Planet Ruler, and how we had been shown the machines which move the waters in these miraculous canals. After the inspection our host took us back to the executive palace and once more we were seated in our transparent chairs.

Our host also resumed his transparent chair in front of his desk, which, as I mentioned yesterday, was flat and transparent, while on top 20 transparent Tos rods, curved like goose necks, were mounted in two semi-circles. Our host sitting in front of the desk formed the center of one of the semi-circles, in such a manner that one goose neck was as far away from him as the other.

The august ruler hardly sat down when a 10-foot transparent Tos rod which was mounted on the desk suddenly gave out a pleasant but penetrating chime-like sound. Our host immediately assumed an exceedingly grave manner and quickly motioned to us to pay close attention.

We then witnessed a most astounding procedure.

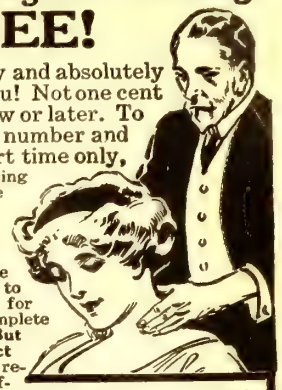
The ruler of the Planet Mars placed his finger upon a black button-like contrivance in front of him and instantly the transparent goose neck Tos rod in front of the button changed its color and became almost milky white. Simultaneously its upper sharp point began to glow in a bluish white color and a faint discharge, not unlike tobacco smoke, struck our host squarely in the face. This discharge was unlike any electrical high tension phenomenon we had ever witnessed, for it was transparent and it did not make the slightest sound. Moreover it seemed to constantly undergo changes; for a few seconds the stream would be bluish white, quickly to change to a pinkish color during the next moment. Then again it would appear slightly violet. One moment it would spread out, the next it would look like a single beam of light. Altogether it was the most singular, astonishing phenomenon we had ever seen.

But this was not the most wonderful part, for when our eyes were directed upon our host's face another surprise awaited. His expression was continually changing; sometimes he would smile, sometimes he would look very severe. At other times he would nod as if he was giving his approval to something; then again he would sway his head slightly from one side to the other, but at all times while we were watching him we could not rid ourselves of the idea that he was "reading" something.

Indeed, as we were to find out later, this was precisely what he was doing. In other words, we were witnessing how *the Ruler of the Planet Mars was "reading" his morning "correspondence!"*

While we were still marveling the goose neck stopped its dicharge—the ruler had read the first "letters."

We were to see immediately how he answered it. He simply touched a red button in front of the black one, which he had just released, and by his demeanor we did not find it difficult to understand that he was transmitting his thoughts pertaining to the "letter" just received to one of his secretaries. He "dictated" for a few minutes and when he had finished he pressed upon the second black button in front of the second goose neck—he was now "reading" his second letter.



For an hour or more he thus attended to his "correspondence," never slacking, never resting a minute. Whatever the qualities of a Martian ruler are, it is certain that he must be energetic in the utmost, as well as a quick worker. Of course, we had not the slightest inkling of what was going on, but we were to learn the details later.

Briefly they are as follows: The Planet Mars is divided into 10 equal "zones," each administered by a "Zone President." These 10 officials, scattered over the planet at different points, are directly responsible for the welfare of their zone and report to the Planet Ruler once each day at a certain predetermined time.

As the most vital question on Mars is invariably the supply of water, nine-tenths of the Planet Ruler's "correspondence" is on this subject. So strenuous is the battle for existence on Mars that the inhabitants of the planet themselves are always considered after the water supply, never before it. If the Zone President's report has been prepared by him he sits down in front of his desk, similar to the one described, except that it has fewer goose necks than the one of the Ruler. When he presses the red button in front of him his thoughts are immediately transmitted through a cable to the executive capitol and are received by the Planet Ruler. I described a few minutes ago the manner by which the message is received by him. Simultaneously while the Ruler receives his message a record of it is made by one of his secretaries. Connected to the tall Tos rod on the Ruler's desk, which is used to receive the transmitted thought waves, is a sensitive recording mechanism. This latter is in charge of a secretary and works as follows: A thin metallic ribbon of the thickness of tissue paper unrolls slowly in front of a sharp stylus. The thought waves acting upon an amplifying system operate this stylus, which in turn engraves a continuous wave line on the thin metallic ribbon. This wave line is perfectly legible and a Martian can read it as well as you can read an electric ticker tape. Thus incoming as well as outgoing "correspondence" is always recorded, so it can be readily looked up should occasion arise. Each tape is carefully labeled and stored away in the

(*Continued on page 526.*)

11 Lessons of Course In Drugless Healing FREE!

Positively and absolutely free to you! Not one cent to pay now or later. To a limited number and for a short time only, we are giving 11 Complete Lessons in Mechano-Therapy absolutely free. There is no cost to you at all for these 11 complete lessons. **But you must act quick!** This remarkable offer is strictly limited As soon as a certain number of these sets of 11 lessons have been given we shall withdraw the offer. Don't wait a minute. Act now.

These Lessons Teach You

How to Treat Headache	How to Treat Catarrh
How to Treat Neuralgia	How to Treat Epilepsy
How to Treat Constipation	How to Treat Hay Fever
How to Treat Indigestion	How to Treat Paralysis
How to Treat a Sprain	How to Treat Pleurisy
How to Treat Dyspepsia	How to Treat Asthma
How to Treat Rheumatism	How to Treat Gout
How to Treat Lumbago	How to Treat Jaundice

Why We Make this Great Offer

We want the public to know the real truth about drugless healing. We want you to convince yourself by an actual and practical demonstration just what a marvelous curative force may be used at your command We want you to see for yourself what tremendous opportunities have been opened to practitioners of Mechano-Therapy. You will see what has been done. You will see what can be done—by you! A Diploma in Mechano-Therapy offers you a profession of dignity, prestige, influence and wealth. No special training or experience needed. If you are ambitious and can read, the way to success is open to you. Take advantage of this lifetime opportunity.

Also Free! $15.00 Set of Eight Anatomical Charts

Each chart 30½x22 inches, lithographed in many colors. Shows 70 diagrammed illustrations of different organs and parts of the anatomy. Regular $15.00 set of charts. Now also free for a limited time only.

New Illustrated Book on Drugless Healing FREE

Thousands of Mechano-Therapists throughout the United States are making a big success. Let us tell you about them. Let us prove how you can easily make $200 to $500 per month and more. Write while this special 11 free lessons offer is open. Send free Coupon or your name and address on postal today, and receive, free, beautiful Colored Anatomical Chart, new illustrated Book on Drugless Healing which makes everything clear.

American College of Mechano-Therapy Dept. 495 81 W. Randolph Street, Chicago, Ill.

American College of Mechano-Therapy Dept. 495 81 W. Randolph St., Chicago, Illinois

Without cost or obligation, send me free your New Illustrated Book on Drugless Healing, Colored Anatomical Chart and your offer of 11 Free Lessons.

SLICING COSTS FOR YOUR BENEFIT

In announcing these wonderful prices it is with the absolute knowledge that **our readers are offered the lowest prices for standard Magazines that it is possible to obtain anywhere.** Only by special arrangement with the publishers are these prices possible, but to take advantage of them, you must act quickly. **Don't delay, do it now.** This offer is so good that of necessity it must be limited in time. Just think of buying standard Magazines at reduced prices in time for Xmas Presents, and **they certainly make ideal gifts** being a constant reminder for a whole year of a considerate friend. Just glance over our wonderful prices, and see how **we enable one dollar to bring you two dollars' worth,** and then make up your list. Just fill out the coupon, enclose the money and make sure you tell us what Magazines you want, and where they are to go. It is not necessary that all go to the same address. **But be sure you do it now. To-morrow means you may forget** and lose this wonderful opportunity. All prices quoted are for subscribers in U. S. A. only, Canadian and Foreign subscriptions require additional postage.

BARON MÜNCHHAUSEN'S NEW SCIENTIFIC ADVENTURES.

(*Continued from page 523.*)

archives of the capital and, being of metal, it will last practically forever.

But I note by my chronometer that the time is up and in a few seconds the telegraphone wire on my radiotomatic on the moon will be full to capacity. So I must cut off short. *Au revoir*, dear boy, and pleasant dreams till to-morrow.....

A snap, a whirring click and the last ether wave from the moon had reached the earth for that night. I lighted my faithful Nargileh once more and gave myself up to a new series of pipe dreams.

(*To be continued.*)

WIRELESS NOW TO TAHITI.

The radio station being built by the French Government on Tahiti Island, Society Islands, will be ready to receive and transmit commercial messages shortly, the United States Bureau of Navigation announces. Communication will be established with stations at San Francisco, in Cochin-China, South America, Honolulu, Sydney and even in Martinique and Guadaloupe, West Indies.

An electric safety razor sharpener has been developed which its inventor claims will re-edge blades as much as 12 times. The blades are clamped in a holder and inserted between two revolving cylinders. The holder moves backward and forward while the cylinders are revolving, and the blades are edged by even pressure applied to both sides.

CAN HEAR VOICE AROUND, WORLD, SAYS PROF. PUPIN.

Now that the human voice has been heard by wireless telephone across a space one-fifth that around the earth it is commercially practicable to hear it all the way around.

Such is the claim made for the invention of Prof. Michael I. Pupin, of Columbia University, which has overcome the static disturbances caused by electrical storms. He said:

"There is nothing now to prevent the transmission of messages by wireless telephone to every part of the globe. We may talk to the antipodes, or, for that matter, send a message completely around the globe if we like."

This discovery is the result of seven years' experimentation in the engineering laboratory at Columbia. Without going into details which might disclose prematurely his patent claims, Professor Pupin said his device is an improvement over the present form of the wireless antennae and makes the apparatus sensitive only to the particular Hertzian waves desired.

WATER ON MARS.

Dr. Percival Lowell asserts that water vapor exists on the planet Mars. Spectrograms taken by Dr. Silphen indicate a difference in the amount of water vapor at different parts of the planet's surface, and Professor Vary, who has been comparing the spectrograms, is satisfied that the source of the moisture is polar precipitation, the equatorial portions of the planet being very dry. The springtime melting at the North Pole produces a considerable amount of vapor.

ACCEPT THIS BOOK FREE

IT'S INVALUABLE YET CAN'T BE BOUGHT

Just as you will receive it, cloth bound, size 7 x 10¼ ins., 160 pages, 20 lessons, 350 illus., 30 tables, with every bit of information on Wireless you can possibly want, besides valuable information on Electricity, Magnetism and Theory of them **—and it's FREE as explained.**

Will you take a 20 lesson Wireless Course absolutely FREE—even postage charge prepaid?

A course that tells you everything you can possibly want to know about "Wireless" starting off in Lesson No. 1 by explaining the Principles of Electricity. The Second and Third Lessons are devoted to magnetism, motors; generators and wiring. And then, by simple easy stages this wonderful Course takes you into "Wireless." The mysteries of "Wireless" are unfolded to you by the use of such simple language so skillfully used, that of necessity you must understand every word. The subject is not treated superficially, however, for there is a whole lesson devoted to the Theory and Mathematics of this epoch marking subject. To lend charm to the Course, the last Lesson (No. 20) is devoted to a history of Wireless and the men who developed it. The wireless course positively cannot be bought, but will be sent absolutely free with a full year's subscription (12 numbers) of the Electrical Experimenter at $1.00. It's the biggest dollar's worth you can ever buy anywhere at any time. Send for it to-day enclosing $1.00. Send **now** before you forget. The coupon below is a convenient way. **But do it now.**

Gentlemen:

On your absolute guarantee that your 20 Lesson Wireless Course is just as described by you, you may send me same *FREE*. You are to send me this Course at once, all charges paid, and enter my name for a full year's subscription to the *Electrical Experimenter*, 12 numbers, for which I enclose *$1.00, the price of the Electrical Experimenter alone.

(If a 2-year subscription is desired, enclose $1.85.)

My name is.....

My address is.....

(12) *Canada and Foreign Countries, $1.50—2 years, $2.85.

With the "Ad-Man"

WAR orders in every industry we hear are bringing millions of dollars to American factories and American pockets. Prosperity we know is here and apparently here to stay. But—what, say you, have these war orders to do with the electrical experimenter—he is not profiting by them.

He is, and, feeling that he doesn't really appreciate how little he is affected, yet how often he is prone to complain of his lot, I must explain a few things to him and tell him why I think he is lucky.

Firstly: How many articles does the electrical experimenter use that haven't increased in price and often increased heavily as a result of the enormous demands of the whole world for our products, or because they are imported?

Offhand, I can't think of one, so you will probably suggest wood. Even that has gone up slightly, and surely finished wood *has* gone up, following increases in cost of varnishes, shellacs, resins, etc. Yet, the electrical experimenter pays practically the same prices for goods as he did before the war started and in many cases less (with the possible exception of a few sizes and styles of batteries). Of course, it's a natural question for you to ask, if brass, zinc, copper, rubber, everything has gone up in cost, why doesn't the electrical experimenter pay more for his goods. Simply because he buys most of his supplies from reputable concerns that have catalogs widely distributed which contain fixed prices, and they simply have to take that increased cost off their profit, and all too often take a loss rather than raise their prices.

And the manufacturers and supply houses besides increased prices have other troubles, for even at increased prices they cannot get prompt delivery or even reasonable delivery on raw and manufactured materials. I understand that the largest aluminum manufacturer is only taking orders for delivery *eight months later*, while one of the biggest steel companies *won't take an order at all*, and similar conditions exist in the copper, brass, zinc and many other industries. Therefore, friend experimenter, when delivery from a supply house is a bit slower than in the past, try to have a little patience; remember the other fellow's troubles these days that he doesn't pass on to you or tell you about, and be thankful for your lot even tho it may seem a bit hard.

MILTON HYMES.

A recent proclamation of the Governor General of Australia prohibits the importation of electric or magnetic belts.

Scientific Exchange Columns

UNDOUBTEDLY you have at the present time some things for which you have no further use. Do you wish to exchange them for something, for which you have immediate use? There is no surer and quicker way to do this than by advertising your articles in these columns. The **Very** people, the **Only** people, who could possibly have a use for your things read this journal. More than 40,000 interested people will see your ad. It is furthermore the cheapest advertising medium for you in the country. Dealers' advertising accepted in Opportunity Exchange Columns only.

The rates are: One cent per word (name and address to be counted) minimum space 3 lines. Count about 7 words to the line.

Remittance must accompany all orders.

We reserve to ourselves the right to refuse any advertisement which we consider misleading or objectionable. Advertisements for the February issue should reach us not later than January 5th.

The Classified Columns of "The Electrical Experimenter" Bring Positive Results.

Subscribers experiencing trouble in dealing with any advertiser should notify the publisher very promptly.

BARGAIN—3-amp. "Amco" hot wire ammeter, 5 inches diameter; slightly used; cost $6. Will sell for $3.50. Eugene Hartnell, Salem, Wis.

FOR TRADE—12 numbers of "World's Advance" Dec. 1914-1915. Want book of "Experimental Wireless Stations" or Electro's universal detector. Forrest Monroe, 1153 Te Walt, Vincennes, Ind.

BARGAIN!! First remittance of $9.50 takes transformer coil with vibrator (½ K.W.) electrolytic interrupter, electrolytic detector and large transmitting condenser. All in good condition. Raymond Guy, Tottenville, S. I., N. Y.

FOR SALE OR EXCHANGE—Modern Electrics, June 1909 to June 1914; Popular Electricity, Dec. 1909 to Nov. 1914; Elect. & Mechanic, Feb. 1910 to Jan. 1912; Wireless Age, first 18 numbers; all inclusive. What have you to "swap"? Leon Bryant, Camden, Me.

HAVE four ½ coils, $1.50 each, Marvel carburetor. Harold Barnum, Knowlesville, N. Y.

WANTED — Small sending and receiving set for $5 gas moving picture machine, generator and film. List of things for stamp. D. MacLean, 334 Stevens, Lowell, Mass.

SWAP—Year 1915 "Telephone Engineer" magazine, value $2, fine condition, for year 1914 "Electrical Experimenter" or good key, or one good 1,000 ohm 'phone; also good telephone magneto for detector, camera for 'phones, dandy 12-inch 3-speed D. C. fan for 'phones, or consider good boxing-gloves bargains. Have large A. C. ammeter for offers; also want audion bulb, "Detectiphone" transmitter, or what? Everybody answered if you write quick. Lloyd Smith, 468 Oak St., Ashland, Ore.

EDISON standard phonograph, New York projecting lantern; each cost $25. Exchange for typewriter, etc. Tillinghast, 63 Wendell St., Providence, R. I.

FOR SALE—Electro $4.50 phones, $2.75; oscillation transformer, $2; high-tension air-cooled spark gap, $1.50. Instruments in excellent condition. Stuart W. Pierson, Carrollton, Ill.

$6 takes induction coupler in hard rubber cabinet, coupling and turns varied by knobs. Want two 43-plate variables. Francis Pray, 102 Heath St., Somerville, Mass.

FOR SALE—Double slide tuner, $1.25; galena detector $.50; Junior fixed condenser, $.40. Whole set, $2. Raymond Horney, Centreville, Md.

FOR SALE—Six telephone magneto generators in good condition, at 75c. each. Can be used as shocking machines, etc. Write Box 360, Lancaster, Pa.

FOR EXCHANGE—Moving picture machine, run by motor. Machine and reels cost $17. In good condition. Will exchange for two 6-volt 60-amp.-hr. storage batteries. Wm. Combs, Water St., Troy, O.

WANTED—A drum. Have all kinds of athletic goods. $50 stamp collection. Write for list. Larest Elwell, 539 Mercantile Bldg., Rochester, N. Y.

FOR SALE OR EXCHANGE—Marconi magnetic detector, cost $10; fixed condenser, receiver ear cushions, ¼-inch spark coil, potentiometer, electrolytic and silicon detectors, mili-ammeter, folding Brownie No. 2 camera. Want variable, or offers. Frank Bremer, 3613 Boulevard, Jersey City, N. J.

NOTICE—110-volt A. C. fan, new condition, $3; 6-volt 10-lb. motor, $2.50; 75-ohm receiver and cord, $.35; Ajax motor, $.50. Sell or exchange for anything of equal value. Electrical, wireless, X-rays, camera, musical, etc. Francis H. Ransford, Dalton, Mass.

FOR EXCHANGE—$15 post card projector, 4x10 Panoram camera, 3x5 Kelsey printing press, $32 B. & L. micro-tessar lens, 72 mm., for 5x8 printing press, binocular or field glass. J. F. Goering, Ames, Kan.

FOR EXCHANGE—Complete wireless outfit, cost $9.25; No. 3 Brownie with portrait attachment, $4.50; Ferron detector, $5; Mesco wireless key, $1.65; Eveready detector, $1.75; fixed condenser, small telescope, spark gap and four-tip cord, $2.60; electrical magazines, $3.50. Everything in fine condition. Want audion, crystaloi, variables, or what? Benj. F. Kinnick, Jr., Greenwood, Ind.

FOR SALE—2x2-inch gasoline engine; has new piston, cylinder, coil and carburetor. The first $15 takes it. Fisher Ames, Massena Springs, N. Y.

FOR SALE OR EXCHANGE—Corbin Duplex coaster brake, $2; carbide bicycle lamp, 75c.; electric bicycle light, $1; boxing gloves, $1.25; waterproof hunting coat, $3; Eastman 3½-inch film developing tank, $3.50. Will exchange for Gernsback rotary variable condenser, interrupter, ½ K. W. transformer coil, or what have you? All letters answered. R. St. John, 609 St. John St., Fairmont, Minn.

FOR SALE—One-inch transmitting set, loose coupled receiving set, including aerial wire, electrose insulators, 100-ampere lightning switch; also 1-7 H. P. motor, medical coil, Brownie 2A camera, tools, etc. Sell to first reasonable offer; all answered. Arthur Reider, 456 E. 10th St., New York City.

HAVE type AA crystaloi. Want good audion bulb or will pay cash for one good or burnt-out. M. Burberry, 627 Germania St., Columbus, O.

RESULTS!

Rosser, Man.

Please make 3 more insertions of my ad. as per enclosed clipping. **Results have more than exceeded my expectations.**

(Signed) J. L. GREEN.

THERE'S A REASON.

WILL SELL good 25-cal. Stevens single-shot rifle for $2.50 or exchange for good 22-cal. single-shot rifle. Ingwald Wick, Hendrum, Minn.

FOR SALE—1½-inch coil, used a short time, for $2.75; also an 80-watt magneto generator for $4.25. Dominick Frank, 111 E. Walnut St., Indianapolis, Ind.

PAIR of steel skates, No. 9½, in good condition. Want pint Leyden jar. Donald Whittier, Readfield Depot, Me.

HAVE good magic lantern and four dozen slides. Will exchange for wireless supplies. Donald Whittier, Readfield Depot, Me.

INGENTO enlarging lantern, cost $55; also set Sheldon salesmanship text books, cost $65. Want printing press and outfit, or what? Daniel Goff, 3159 Indiana Ave., Chicago, Ill.

FOR SALE—Pocket wireless outfit, size of watch. Write for particulars immediately. T. H. Moore, Jr., 321 N. Spring St., Pensacola, Fla.

WILL SELL oak cabinet receiving set, loose coupler (with primary switch) variable condenser, crystal detector, fixed condenser, peroxide of lead detector (new), with new potentiometer and battery, only $10.35; large D. P. S. T. switch on slate base, 55c.; Ajax motor, 90c.; buzzer, 45c. Want burnt or broken audion bulb. Roy Keddy, 35 Josephine Ave., Somerville, Mass.

WANTED—Air guns and rifles. Have football, two cameras, stamp collection $20, electrical and athletic goods. Larrest Elwell, 539 Mercantile Bldg., Rochester, N. Y.

FOR SALE—Wireless instruments, complete receiving set; also key, spark gap and sending condenser. Cheap. Write Walter J. Schneider, R. R. No. 2, Hamilton, O.

FOR SALE OR EXCHANGE—A. C. motor, $2; galvanometer, 75c.; tuning coil, $1.50; ¾-inch spark coil, $1.50; chemistry scale, $1. Write Albert Heyman, 227 S. 20th Ave., Minneapolis, Minn.

WANTED—Camping and bicycle materials for wireless apparatus, or will sell. Arthur Sacha, 2669 E. 40th St., Cleveland, O.

FOR SALE—Cornet, fife, books and some cowboy and wireless goods. Send for list of articles. Frank Saunders, Richmond, Me.

FOR SALE OR EXCHANGE—Nearly new 4 H. P. Indian cycle motor, with carburetor, muffler, friction clutch, pulley and Bosch magneto. Condition perfect, used three months, $30 C. O. D. W. J. Wilson, 2613 Binney St., Omaha, Neb.

FOR SALE OR EXCHANGE—Complete E. I. Co. Tesla coil, including 2-inch spark coil, gap, condensers, Geissler tubes, cost $20; $35 course in elocution, course in hypnotism, how to enter vaudeville, and electrical books. What have you? All letters answered. William Morris, 130 Elizabeth St., Moberly, Mo.

WILL PAY cash for used or burnt-out audion bulb. Four thousand feet of motion picture film given if desired, or iron scroll work machine, cost new $8. Harry Smejkal, 1349 First Ave., New York City.

WANTED—To buy telephone desk set, any standard make, first-class condition, without ringer. Also want separate long-distance telephone transmitter. Donald Palmeter, Roundup, Mont.

WANTED—Constant speed spring motor that will run at least 30 minutes, power stronger than phonograph motor; also unused audion bulb. Fair prices will be paid for these articles if in good condition. William H. Trippe, Toms River, N. J.

EXCHANGE—New radioson detector as part payment on R. J. '4 audion in perfect condition, or will buy. Write Carl A. Mathiasen, Onawa, Ia.

FOR SALE OR EXCHANGE—One ohm-meter for measuring resistance; has range one-tenth to one hundred thousand ohms. Just the thing for wireless experimenters. Cost $30. Will make a good swap. Also two fan motors—A. C.—two volt ammeters for storage batteries. Want a good barometer, hygrometer, or what have you? H. H. Peebles, 1371 Westlake Ave., Cleveland, O.

EXCHANGE—Premoette Jr. No. 1, with outfit. Want small dynamo-motor. Also want water motor cheap for cash. Charles Clapp, Uphams Corners, Mass.

FOR SALE—Complete wireless outfit, mounted and connected on base. Receives Arlington, Va., and Sayville. Sends 10 miles, $30. Send stamp for details. Make fine Xmas present. Charles Palmer, 57 Wollaston Ave., Arlington Hts., Mass.

FOR SALE—Indian twin, '14 model, in fine running condition. Will sell for $125. Louis Germains, 257 Pleasant St., Worcester, Mass.

MERKEL single motorcycle to exchange for long-distance receiving set and small sending set, complete with aerial, or will sell for $19 cash. C. D. Wright, Hamburg, Ia.

FOR SALE OR EXCHANGE—Moving picture machine with oil lamp, film, slides, cost $4, sell for $2. One thousand shot air rifle, cost $1.50, sell for $1, with shot, carrying cover. All in perfect condition. What have you electrical? E. Feddersen, 235 W. 12th St., New York.

FOR SALE—Receiving set, cabinet type, combining receiving transformer, audion detector etc.; also audion amplifier. Other apparatus. Particulars on request. J. A. Crowdus, 5047 Washington Ave., St. Louis, Mo.

WILL EXCHANGE a good motorcycle in first-class running order, free engine clutch, fully equipped, for a four-cylinder gasoline engine in good running condition. R. A. Peschman, Box 3, Ft. Sheridan, Ill.

MOTOR BARGAIN—Kimble ⅛ H. P., 110-volt A. C., six speeds, just rewound and in good condition, $15. Might trade. Ross Gunn, 369 W. Lorain St., Oberlin, O.

FOR SALE—Elec. inst. and books. Write for price list. E. W. Sanor, 198 15th St., Milwaukee, Wis.

I WILL dispose of all my wireless instruments very reasonably. Send for photo and information. E. B. Nassinheimer, 145 W. Fourth St., Cincinnati, O.

FOR SALE—New E. I. Co. $7.50 loose coupler, $5 cash. Freddie Silsbe, Prattsburgh, N. Y.

FOR SALE OR EXCHANGE—Edison phonograph, Model A, combination type, for $10; cost $25.75. Also 22-caliber rifle, Stephen's Favorite, $3; or exchange for nickel-plating outfit. Address Earle Cochran, Poplar Bluffs, Mo., Route 2.

WILL EXCHANGE post card projector, worth $5, for variable condenser either Gernsback, Murdock, Blitzen or Amco. Address Max Clinch, Lakewood, N. J.

WANTED to exchange photo cameras and goods for wireless set; also want dynamo and gas engine. A. B. Warfel, Photographer, Cadiz, O.

FOR SALE—I. C. S. Reference Library Electric Lighting and Railway Course, five volumes, complete, A1 condition. Robert Onstott, care Y. M. Sing, R. 1, Sheldon, Ia.

WILL EXCHANGE 3-inch spark coil for $6 type crystaloi detector. Those interested write. Will Gasper, N. Third St., Marquette, Mich.

FOR SALE—One type AA crystaloi detector, roller and ice skates, two baseball gloves, fish pole, Popular Mechanics (30 old ones), boys' books, Baldwin camp lamp and carbide. Wanted, old, broken or new audion bulbs. Will exchange bulbs for equal value of articles for sale. Write for prices. George Auten, Oberlin, O.

TWO complete sets of wireless receiving instruments sell at half price. For particulars write to Fred Carlotte, 80 Charles St., New York City.

DE FOREST audion detector type R. J. 4 (with X grade bulb), $12. Write for particulars. Francis Blewer, Newark Valley, N. Y.

STOP! Have navy type transformer (switch points), imitation rubber, rotary variable condenser, drafting inst. (12 piece) and 110-volt A. C. motor, 1/6 H.P. Want Crystaloi, electro loading and a single shot 22 rifle. W. O. Fitchett, Waverly, Va.

Carrollton, Illinois,
Nov. 25th, 1915.

Dear Sirs:

I put an ad. in the Scientific Exchange Columns recently, having five instruments for sale. I sold every one of them. ADS IN THESE COLUMNS CERTAINLY BRING RESULTS.

Yours truly,
S. W. Pierson.

FOR SALE—Storage battery plates, six pairs 3¼x5, new. O. Brinnel, 523 First Ave., New York.

FOR SALE—Brand new Murdock 2,400 ohm headset, never used, $4.50; new brass key, ½-inch contacts, $2; smaller key, 50c.; small gap, 40c.; coronet headband, 35c. Clinton Stanley, 153 Mariner St., Buffalo, N. Y.

SALE OR TRADE—1 Murdock rotary gap, 1 1/10 gap motor, 1 navy type loose coupler, $23 kind, will take $13; 4 variable condensers, 3 pr. 'phones, 1 Blitzen 1 K.W. transformer, 1 aerial switch, detectors, insulators, wire 1 motor generator 6-6, 1 jeweler's lathe used 3 months, worth $15, will sell for $9; 1 1-inch spark coil, 1 pr. aluminum roller skates, kodak, and complete outfit; $10 commercial key, new, for $6. All letters answered. Don I. Shepherd, 316 N. West, St. John, Kan.

FOR SALE—Complete portable wireless sets, 2-inch spark coil, sending condenser, spark gap, key, battery and aerial switches, loose coupler, rotary and variable fixed condensers, mineral detectors, loose coil; sacrifice, $25. Fifty ohms learners' set, with battery, $1.50; combination safe, $3; medical coil, 75c. A. Sterling, 78 Third Ave., Brooklyn, N. Y.

FOR SALE—Loose coupler, $1.25; Gem receiving set, $1.25; both Nichols make. In good condition; nearly new. William F. McCarter, 4718 N. Camac St., Philadelphia, Pa.

WANT good 2-inch coil, cheap. For sale, 1-inch Manhattan coil and other wireless goods. Write William F. McCarter, 4718 N. Camac St., Philadelphia, Pa.

WANTED—Wireless goods, battery motor, electrical books, magazines. Have $30 bicycle, 4x5 Seneca camera, 20-ohm sounder, pole climbers. All communications answered. Greer Peck, Springfield, Tenn.

HAVE E. I. Co Junior loose coupler, potentiometer, fixed condenser, electrolytic detector with 2-inch wire. Value of all $8; sell $5. Paul Ramsdell, Calais, Me.

FOR SALE—Navy type loose coupler, 6,000 meter—30 inches long—with dead-end switch, $9; 1 K. W. transformer, unmounted, $9; ¼ K. W. transformer, unmounted, $5. Paul Flehr, Ironton, O.

FOR SALE OR EXCHANGE—Brownie No. 2 camera, $1; detector, 25c.; $2 tuning coil, $1; or will exchange for a ½-inch spark coil. Henry Ananiantz, 700 W. Washington, Los Angeles, Cal.

FOR SALE AT A BARGAIN—A Meccano outfit No. 5 for $9, cost $18. I will trade for some wireless apparatus. Particular sending. Would prefer someone in my own city. Write and get particulars. Alfred Emmerton, 2242 Polk St., San Francisco, Cal.

FOR EXCHANGE—Good $10 Eastman folding Kodak, good as new, for good head phones or good loose coupler. What have you? Dean Wight, Lamoni, Ia.

FOR EXCHANGE—One Gasoline engine, 3 horsepower, A1 condition, for wireless receiving instruments; make me an offer. A. Rush, 323 Traymore Ave., Pittsburgh, Pa.

AUDION detector and 2-step amplifier combination. Best cash offer takes it. Be quick and write for particulars. This is the chance of your life. Have ½ K.W. transmitter at same terms. Louis Gebhard, 1127 Ellicott St., Buffalo, N. Y.

Opportunity Exchange

YOU will probably find more opportunities and real bargains in these columns than anywhere else in the country. Most good things in life are hard to find and worth going after—these little ads illustrate that point; you alone will be the real loser if you don't take the time to scan through these columns.

Advertisements in this section 4c. a word for each insertion. Count 7 words per line.

Name and address must be included at the above rate. Cash should accompany all classified advertisements unless placed by an accredited advertising agency.

Ten per cent. discount for 6 issues, 20 per cent. discount for 12 issues from above rate. Objectionable or misleading advertisements not accepted.

Advertisements for the February issue should reach us not later than January 5th.

WHAT YOU SAVE

on these remarkably good 'phones will buy other Murdock apparatus for your station. REMEMBER, these low prices do not mean cheapness in the goods. These No. 55 receivers are real wireless 'phones, with pure copper wire coil windings—with resistance guaranteed. They are far superior to any you may obtain elsewhere—in sensitiveness, in materials, in construction. They bring in the signals from far and near with the sensitive precision of more expensive instruments. They work well, look well, and wear well.

MAKE A TEST YOURSELF

We will, upon receipt of price, forward the set desired for fourteen days' trial. If they are unsatisfactory in any way, they may be returned and your money will be refunded immediately.

Prompt shipment is part of the Murdock policy of service to customers. This should be appreciated in holiday-rush times.

Our catalog is free. Ask for it.

No. 7729.

THE AMCO NAVY TYPE RECEIVING TRANSFORMER

Represents the latest advances made towards the ideal tuner and embodies the greatest degree of perfection yet obtained. No greater value can be secured where accurate selectivity, sensitiveness and finish are desirable. The illustration shown herewith cannot possibly do justice to the instrument itself. The primary winding is enclosed in a cabinet, the sides and top of which are polished hard rubber. Two 15-point switches are mounted on the front. One switch controls the primary in groups of several turns and the other controls one turn at a time. The entire variation of the primary is thus secured by the rotary motion of two knurled knobs rather than the movement of a slider, and may be varied from **1 to 225 turns in steps of one turn at a time.** The windings are especially adapted to long wave lengths. The secondary is wound with green silk covered wire. The ends are HARD RUBBER, turned and polished. Secondary variation is secured by a 12-point switch which makes it possible to secure a very fine adjustment. **PRICE. ONLY $15.00**

Christmas Gift Suggestions

ELECTRIC LIGHTING OUTFITS FOR CHRISTMAS TREES

For the Christmas tree, the house party table, and at all other night-time gatherings—either indoors or out—our lighting sets may be tastefully worked into the decorations. They are safe, easily installed and will last for years.

We especially recommend these outfits for Christmas tree lighting as shown in our illustrations. There is hardly a thing that is more welcomed by the little ones as well as grown-ups than an electric lighted-up Christmas tree. People who have never seen these outfits in actual use cannot appreciate the beauty that can be obtained by colored electric lights. The wiring as well as the sockets that hold the lamps are in green to match the color of the tree itself, and for that reason only the lights themselves show up to their full advantage.

Any one even with no experience at all can place these lights on the tree and it is of course self-understood that the larger the tree the more lights should be used.

BATTERY OUTFITS

In localities or houses which do not have lighting current we recommend our battery outfits which work from 15 to 20 hours figuring 3 hours' steady use each day. Of course if the current is turned on for a shorter period of time the batteries will last much longer.

BATTERY OUTFIT PRICES

No. 5700 Electric Tree lighting outfit, with 8 lights and 3 batteries. Size of box without batteries 6¾x5¾x2 ins. Shipping weight 12 lbs. **$2.35**

No. 5701 The same outfit without batteries. **$1.85**
Shipping weight 2 lbs

No. 5702 Electric Tree lighting outfit with 8 lights and 6 batteries. Size of box without batteries 6¾x5¾x2 ins. Shipping weight 20 lbs **$2.80**

No. 5703 Electric Tree lighting outfit with 16 lights, 6 batteries. Shipping weight 25 lbs. **$4.40**

No. 5704 The same outfit without batteries. Size of box without batteries 6¾x5¾x2 ins. Shipping weight 3 lbs **$3.60**

110 VOLT LIGHTING OUTFITS

These outfits do not use any batteries but each festoon is equipped with patent attachment plug which screws into any 110 volt electric light socket. There is no danger to this outfit either from fire or from shock. These outfits have all been approved by the National Board of Fire Underwriters.

The lamps themselves have an average life of 800 hours. The lamps are quite powerful, having 14 volts and will give a strong light, even 1 festoon will light up a small tree quite brilliantly.

Each outfit has an assortment of the following colored lamps Red, green, blue, frosted, clear.

LIGHTING CURRENT OUTFIT PRICES

No. 5706 1 festoon, 8 lamps 14 volts. **$1.95**
Size 10x4½x2½ inches. Shipping weight 2 lbs.

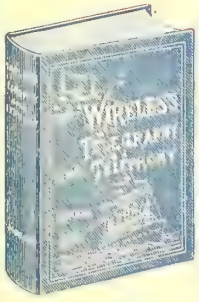
No. 5707 2 festoon, 16 lamps 14 volts. **$4.05**
Size 13½x5½x2½ inches. Shipping weight 3 lbs.

No. 5708 3 festoon, 24 lamps 14 volts. **$5.85**
Size 14x6½x3 inches. Shipping weight 4 lbs.

No. 5709 4 festoon, 32 lamps 14 volts. **$6.90**
Size 15x8x3 inches. Shipping weight 5 lbs.

NOTE.—These outfits work on either direct or alternating current. If they are to be worked with 220 volts, get our special prices on resistance and state how many festoons you wish to use.

No. 255. ELECTRICITY AT HIGH PRESSURES AND FREQUENCIES



No. 255

By Henry L. Transtrom. Only a few years ago a potential of 2,000 volts was considered unusually high, but at the present time we are using pressures as high as 60,000 volts, while that of 110,000 volts is not uncommon.

This work is a practical treatise of some of the wonders of high-frequency currents at high and other potentials, and should be in the hands of every electrician and engineer who desires to keep abreast of the times. **One of the most wonderful books ever written.**

Handsomely bound in cloth; printed in large type on good paper and profusely illustrated. Size 5 1-4x7 1-2 in.; with 141 illustrations and 247 pages. **Price,** sent prepaid, **$2.00.**

No 283. WIRELESS TELEGRAPHY AND TELEPHONY SIMPLY EXPLAINED

No. 283

By Alfred P. Morgan. This is undoubtedly one of the most complete and comprehensible treatises on the subject ever published. A close study of its pages will enable one to master all the details of the wireless transmission of messages. The author has filled a long felt want and has succeeded in furnishing a lucid, comprehensible explanation in simple language of the theory and practice of wireless telegraphy and telephony. Cloth bound, 154 pages, 156 engravings. Size 7x5¼ in. Price, sent prepaid **$1.00**

No. 761. PRACTICAL ARMATURE AND MAGNET WINDING

No. 761

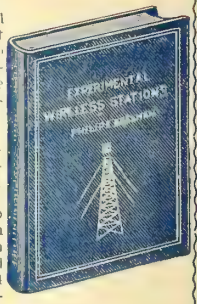
By Henry C. Horstmann and Victor H. Tousley. Treats in a practical and concise manner a very important subject. All armature winding and design of same are fully explained. In pocket size; bound in full Persian morocco leather, with round corners and red edges; contains 255 pages and 128 illustrations; also useful tables. Size 4¼x6¾ in. **Price, $1.50,** sent prepaid.

No. 252. THE BOY MECHANIC

No. 252

The best "Boy Book" ever compiled, and one that is so fascinating to grown-ups. Tells how to make 700 articles, **has 300 illustrations and 480 pages.** Tells how to make things to experiment with in electricity, mechanics, sports, arts and crafts work, magic, etc. Tells how to use cast-off articles, usually discarded, and which every boy has at hand. Is clearly printed on high grade book paper, and durably bound in cloth, with cover design in four colors. As a gift nothing will excel this truly remarkable book. Size 7x10 in **Price,** sent prepaid, **$1.50.**

No 755. OPERATORS' WIRELESS TELEGRAPH AND TELEPHONE HAND BOOK



By Victor H. Laughter. A complete book, giving history, construction and operation of wireless stations, with all rules, codes, etc., in non-technical language. Is 7¼x5¼ in. size; bound in substantial cloth; contains 210 pages, with 86 illustrations and 6 full page half-tones of wireless on U. S. ships and liners. **Price, $1.00,** sent prepaid.

No. 755

No 293 EXPERIMENTAL WIRELESS STATIONS

By Philip E. Edelman. A wireless school in itself, because it enables the readers to build their own apparatus, to study the principles of wireless transmission, to perform all calculations, using simple arithmetic only, and to design and use efficient stations and instruments. **A book no wireless amateur can afford to keep from his bookshelf.** Bound in cloth; contains 224 pages and 68 illustrations. **Price,** sent prepaid, **$1.50.**

No. 293

No. 267. TELEPHONE CONSTRUCTION INSTALLATION, WIRING, OPERATION AND MAINTENANCE

By W. H. Radcliffe and H. C. Cushing. Gives the principles of construction and operation of both the Bell and Independent instruments; approved methods of installing and wiring; the means of protecting from lightning and abnormal currents; their connection for operation as series or bridging stations; and rules for their inspection and maintenance. Line wiring and operation of special telephone systems are also treated. Size 7x4 1-2 in.; 200 pages, 150 illustrations; cloth binding. **Price,** sent prepaid, **$1.00.**

No. 267

No 291. STORAGE BATTERIES

By Prof. A. E. Watson, E. E., Ph.D. This book tells all about storage batteries, their theory, construction and use. The most complete and up-to-date treatise for the practical man. It contains a "How to Make It" chapter. Rules for setting up and care of batteries, switch-board arrangements, very valuable diagrams, etc. The author writes from practical experience, with exceptional clearness. Size 5x7 1-4. Bound in cloth, red edges; 166 pages, 63 illustrations. **Price,** sent prepaid, **$1.50.**

Cut shows the "Superior" Type Brandes Head Set. Price, complete with german silver headband, $5.

The Brandes Trans-Atlantic Type Receivers (price $9) are Used in the Eiffel Tower Station, Paris.

"Astonished at its Value for the Money"

THAT'S what hundreds of purchasers of our "Superior" Receivers have said.

"The best receiver sold at $5 to-day" is what dealers tell us.

The value comes in the *perfectly matched tone*; in the strong, rigid—yet light—construction; in the unusually handsome finish.

It is superior to many receivers sold at a higher price. It is less expensive than receivers which look similar but cost less.

Investigate. Send 4c. for Catalog E, a valuable book of wireless equipment, containing full information about Brandes receivers. Send to-day.

DUCK'S NEW BIG No. 9 320-PAGE ELECTRICAL and WIRELESS CATALOG

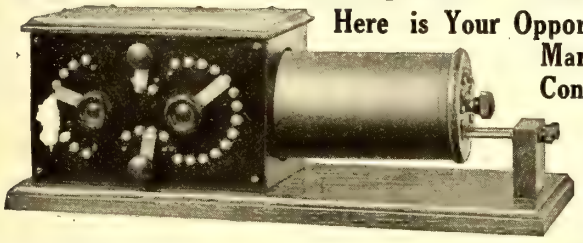
MORE THAN EVER JUSTIFIES YOUR VERDICT
THAT IT IS THE *ONE* CATALOG WORTH WHILE

Everything Electrical
FOR THE BOY—HOME OR STORE

ONLY 8c. in stamps will bring this unrivalled catalog to your home. The great cost of catalog and the exceptionally low prices (oftentimes fully 25% below usual retail price) prohibits its distribution otherwise. You may deduct the 8c. on first dollar purchase.

Our records show that 70% of our catalogs produce us patrons. Many of our competitors admit the waste of 90% of their catalogs. Who pays for them? This is the big, controlling reason why you should have our catalog, backed by a great selling and purchasing power, before even thinking of buying elsewhere.

Over 40 New Pages of Wireless Instruments



and substantial reductions on many popular wireless instruments and standard electrical supplies.

A FEW OF THE ARTICLES IN OUR CATALOG:

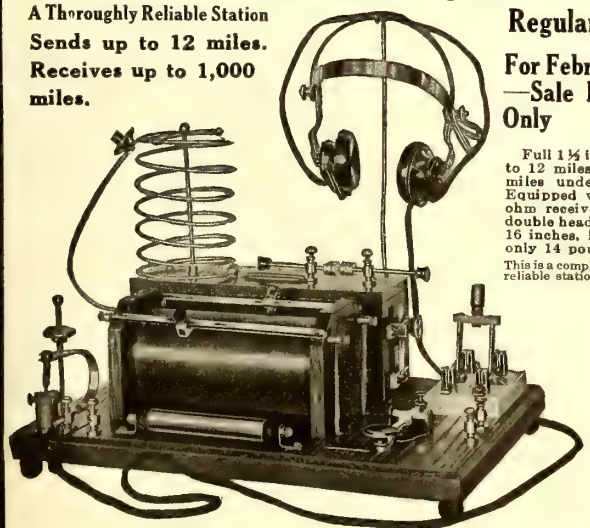
129 pp. Wireless Instruments (129 pages) magnet wire of all kinds, raw material, storage batteries, telegraph instruments, battery motors, commercial motors and generators, sewing machine motors, telephones, step-down transformers, massage vibrators, bells, push buttons, auto accessories, flash lights, hand lanterns, auto and miniature lamps, Xmas tree outfits, voltmeters, ammeters, lighting plants, Victrolas, air rifles, electric aeroplanes, model builders, electric railways, electrical and mechanical books and general electrical supplies.

The William B. Duck Co., 230-232 SUPERIOR ST. TOLEDO, OHIO

WIRELESS BARGAINS SAVE 25% IF YOU ACT NOW

Here is Your Opportunity to Secure the Best Navy Type Loose Coupler on the Market. Regular Price - - - - - - $15.00 $10.00
Continued for February—Reduced Sale Price - - -

A brass lacquered 6,000 meter inductance tuner, perfect in every detail. Equipped with four point loading inductance which increases the wave length 4,000 meters over the average Navy Type Transformers. The primary winding has 24 taps—one switch controls the primary in groups of tens, the other controls one turn at a time—and is equipped with a dead end switch. Enclosed in a cabinet, the front of which is polished hard rubber. The secondary coil is wound with double silk covered wire and the inductance is varied by a ten point switch. With this coupler the very finest and most accurate tuning is easily and quickly secured. With a good sized aerial the reception of wave lengths up to 6,000 meters is possible.



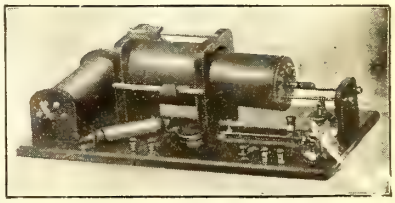
All Finished Parts Ready For Assembling With Full Instructions, Special $6.50

Our No. 810 Complete Sending and Receiving Station

A Thoroughly Reliable Station
Sends up to 12 miles.
Receives up to 1,000 miles.

Regular Price $20.00

For February —Sale Price Only $14.00



Full 1½ inch coil type. Sends up to 12 miles. Receives up to 1,000 miles under favorable conditions. Equipped with 2 double pole 1,000 ohm receivers, 6 feet silk cord and double headband. Size of base 12 x 16 inches, height 13 inches, weight only 14 pounds.

This is a completely equipped and thoroughly reliable station, mechanically and electrically perfect and ready for instant service. Nothing better in this class was ever constructed. The new improved tuning coil enables you to tune in or tune out any party you might desire, thus eliminating any interference. The set consists of a 1¼ in. Spark Coil, 12 Flat Plate Condensers, our "Don't Jar Out" Detector, Buzzer and Switch to tell if your detector is working, Double Slide Silk Wire Wound Tuner for long wave station capacity, Fixed Condenser, Helix Key, DPDT Switch and complete 2,000 Ohm Headset.

What It Contains

It contains 658 illustrations, 2,000 articles, complete Code Chart of Morse, Continental and Navy Codes, sixteen-page "TREATISE ON WIRELESS TELEGRAPHY," list of Call Letters of U. S. Government and Commercial Ship and Shore Wireless Stations, besides a great many useful tables, and formulas. This valuable book is 6¾ x 5¼ inches in size and ½ inch thick, and well bound. IT IS SENT FREE FOR 4c. TO COVER POSTAGE ONLY.

"The Livest Catalog in America"

CONTAINS

75 New Things

What It Contains

It contains the largest assortment of Wireless and electrical experimental apparatus shown in any catalog published. In addition are shown Commercial Wireless Sending and Receiving Outfits, Electric Motors, Dynamos, Flashlights, Medical Batteries, High Frequency Apparatus, Plating Outfits, Toys, Printing Presses, Tools, Sporting Goods, and the LARGEST Scientific Book section published. This book will give you as much information as many books that cost you $1.00 or more. SEND FOR THIS WONDERFUL BOOK TO-DAY, WHICH IS FREE. YOU TO PAY 4c. FOR POSTAGE ONLY.

Forty Years of the Telephone

THE year 1916 marks the fortieth anniversary of the telephone perfected by Alexander Graham Bell in February, 1876, and patented by him on March 7 of the same year.

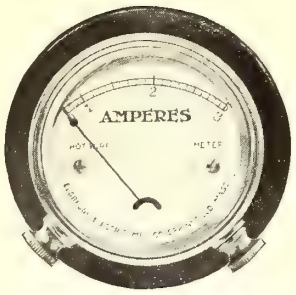
It is extremely difficult to realize that the instrument which has so revolutionized our every-day lives is but 40 years old, while to our present generation it seems incomprehensible how the world could possibly get along without it prior to 1876. But our fathers and mothers remember full well what inconveniences the daily life beheld before the advent of the uncanny little instrument; they know the drudgery of those days before the slogan, "Don't walk—talk!" had been coined. Forty years back it was "Walk, if you wish to talk!"

Of all the great inventions we know no other which has benefited humanity at large as much as Bell's telephone. Not only does it save us millions of unnecessary steps, but it brings us together closer than ever before. Space has vanished. When the Twentieth Century man of New York calls up his friend in Chicago or in San Francisco, he takes it entirely as a matter of course. He gets married over the 'phone, he calls up the Fire Department by 'phone and thus saves his house from destruction. Or if he is ill he calls up his doctor and is cured over the 'phone. In the course of the day he accomplishes a hundred more remarkable things with the little instrument accessible to the humblest as well as to the richest man. He can accomplish more in a day than either Alexander or Caesar could accomplish in a month, and still he complains of his lot!

As remarkable as the telephone is in its broad field, as remarkable as its career was, so remarkable an exception is it among the great inventions. During the first few years after its appearance it was met with incredulity and derision and Bell, the young struggling inventor, was forced to walk a long path strewn with thorns. It is a matter of history that as wise a man as Senator Platt, of New York, to whom Bell went for financial support, ordered his secretary to "throw that fool Bell with his fool talking machine down the stairs if he calls again." Nor was it encouraging that five minutes after Bell's patent attorney had handed his patent application into the Patent Office, Elisha Gray appeared with a similar patent application at the Patent Office. Few inventions have been subject to more litigation than the telephone, for there were untold millions at stake, but Bell triumphed and his basic patent was upheld by the highest courts. Likewise few inventors have reaped such an immense benefit from their invention as has Bell, nor have many lived to witness such a tremendous as well as universal application of their invention. There is no civilized country on earth where the telephone is not known and used daily; there is hardly a child who does not know what a telephone is. The number of the telephones scattered over the globe reaches in the millions, New York City alone having over 650,000 'phones, or more than London, Paris and Berlin combined!

Most remarkable of all, however, is the surprising fact that the telephone receiver which we use daily is practically the same instrument as the one made in 1876. The shell, the magnets, the coils, the diaphragm are identically the same; 40 years of advance in the electrical arts have left the telephone untouched. Bell's original instrument has not been improved to speak of; his receiver has stood the onslaught of time and brains. Only minor improvements have been made, the construction as a whole remaining the same.

Not only has the telephone found a wide field of usefulness for transmitting speech by wire, but without its use wireless telephony would not be possible. The telephone is used to listen to the criminal's faintest whisper; the European nations at war now use it under water to detect the deadly submarine; the ships at sea with it listen to the tolling of the submarine bell to guide their course in a fog or at night, and we could name a dozen more equally interesting applications of this wonderful little instrument.



When congratulating Bell this year, let us pray that he may live to see the day when some experimenter perfects the so necessary adjunct to the telephone, the *Telephot*, whereby you can see your friend over the wire while talking to him.

H. GERNSBACK.

THE ELECTRICAL EXPERIMENTER is published on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. The subscription price is $1.00 a year in U. S. and possessions. Canada and foreign countries, $1.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 10 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of THE EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. ***A green wrapper indicates expiration.***

All communications and contributions to this journal should be addressed to: Editor, THE ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full return postage has been included. ALL accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.

NEW DE FOREST AUDION APPARATUS

"Incomparably Superior to Any Other Known Form of Detector"

De Forest Audion Detector
Type R J 8—Price, $25.00

¶ **We have improved the Audion,** both in efficiency and adaptability.

¶ It was "fully 50 per cent. more sensitive than any other known form of detector" (Bulletin U. S. Bureau of Standards, Vol. 6, No. 4, Page 540).

¶ It is now even more efficient.

¶ Briefly, the former "step by step" switch controlling the high voltage or "B" battery circuit, has been replaced by a special potentiometer. The high voltage or "B" battery is no longer in the instrument or furnished with it, but is to be supplied by the user, and connected externally, where the cells may be tested readily. The instruments are of the popular panel type. ¶ Greater value is furnished for the price for these reasons.

¶ We build also a line of complete receiving cabinets, incorporating suitable and specially designed tuning equipment of a quality and efficiency comparable to this peerless detector. The maximum of long-distance operation can only be obtained with this justly famous detector in connection with our special Audion Tuning Equipment, designed and built as no one but the manufacturers of the Audion can build it.

¶ It will be worth a two-cent stamp for you to be informed on the Audion and these new instruments.

De Forest Audion Detector
Type R J 9—Price $14.00

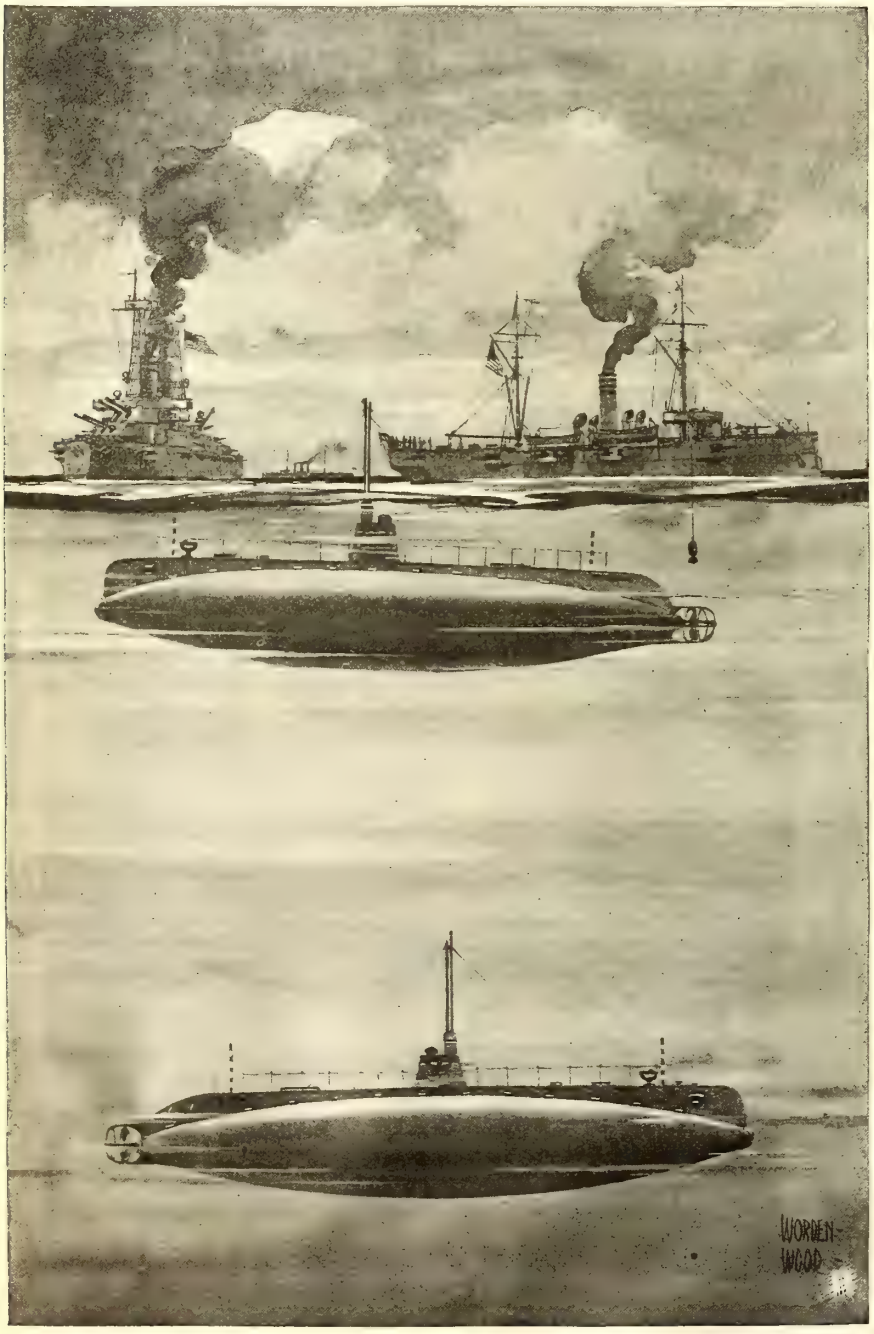
How Vessels at Sea Signal Through the Water

SUBMARINE signaling is a science not very well known to the general public, as little has been published on the subject. However, this method of signaling, utilizing primarily the basic principle that sound waves can be transmitted through water much better than through air, has received extensive patronage both in this country and abroad, especially in the merchant marine. Besides submarine sound wave signaling is of great service to submarine war vessels, for it can be used for inter-communication between ships and between ships and shore stations.

The great scientists Tyndall and Raleigh devoted special attention to the propagation and reception of sound waves in air, but there the matter apparently was dropped until Arthur J. Mundy, of Boston, some years ago, suggested the use of water mitting such signals through and proceeded to prove its value for such purposes by practical demonstrations.

The advantage of water over air for the transmission of signals are many: In the first place, it is free from the dangerous zones of silence which occur when the signals are produced in air. The absorption of the sound is much less in water, and consequently the signal is not only absolutely reliable but is transmitted to a distance many times greater than when it is transmitted through air. Sounds in the water are not carried away by the wind in stormy weather, as is the case with the Siren. Sound waves through water are not affected by atmospheric disturbances, as is the case with wireless, to some extent at least. Again it permits the accurate determination of the direction from which the not the case with any other form of signaling service now available for ships.

Finally the work of Mundy, Wood, Fay, Williams and others working along this line resulted in a completely practical system. The illustrations herewith show some applications of modern submarine signaling, as well as the bell and indicator used in this remarkable system of intelligence transmission and reception.



(C) SUBMARINE SIGNAL COMPANY

Sinking Liner Found in Fog by Submarine Signaling Bell.

The sound waves as used in submarine telegraphy are set up by one or more compressed air or electro-magnetically actuated sound disseminators, one of which is illustrated herewith in Fig. 1. This transmitter consists of a 220-pound bell, about 15 inches in diameter, attached to a case containing the actuating mechanism. This is of simple construction. It comprises a large electro-magnet, which attracts a disc shaped

to the rod which moves the hammer of the bell. The bell may be suspended from a cable over the side of the ship as one of the larger illustrations indicates, or in case it is used along the shore, it may be suspended from a tripod resting on the bed of the harbor or ocean. The tripod in such cases is made of steel channel beams and stands about 21 feet high. A waterproof cable leads from the electric bell to the shore station which is generally located in

(C) SUBMARINE SIGNAL COMPANY
Submarines and Another Ship Maneuvering by Submarine Signals.

a lighthouse, for in this way the attendant can cause the bell to give out its note as desired, either continuously as a warning signal against fog, or in short and long strokes as in sending a message by the Morse code.

The sound waves thus transmitted through the water (at the rate of aproximately 4,400 feet per second) are picked up or received by a supersensitive microphone. It has been found best to mount

noise due to the machinery on board the ship and the water noises will be eliminated. One of these microphone tanks is mounted on each side of the bow, inside of the ship. From each tank wires are run to a device which is known as the indicator box, shown in Fig. 2. This comprises a switch so arranged that by throwing the handle to one side the starboard microphone is connected to the telephone and by throwing the handle to the other side the port microphone is connected to he telephone receiver. These receivers are furnished in duplicate. Thus it is obvious that once the bell signal is picked up the captain of the vessel has only to turn his vessel until the sound is heard with equal intensity on each side to know that his ship is then pointing in the direction from which the sound is coming, and in this way he can take compass bearings of the lightship on which the bell is situated, if such happens to be the source from which

feasible and has become possible indeed through the use of later developments along this line, principally those of Prof. R. A. Fessenden, of wireless fame. He employs for the purpose what is termed an "oscillator." Its construction is shown in Fig. 3. In this sectional view the iron of the magnetic circuit and the copper tube are shaded and the magnetizing coil is cross-hatched. The copper tube is at A, which lies in the air gap of a magnetic field formed by a powerful ring magnet B, built up in two parts, as perceived. The ring magnet is energized by the coil C, and produces an intense magnetic flux across the air gap containing the upper part of the copper tube, thence through the central stationary armature D, thence across the other gap to the lower pole face of the ring magnet and thence through the yoke of the ring magnet back to the upper pole face. Around the armature is wound a fixed winding, known as the armature winding, and which is reversed in direction, so that one-half of same is wound clockwise and the other counter clockwise.

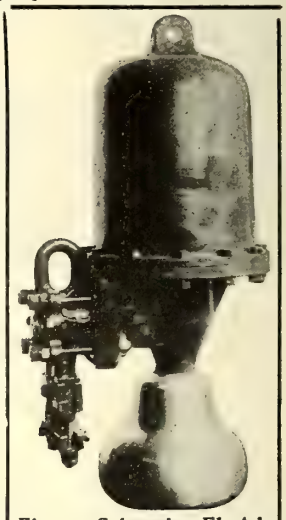


Fig. 1. Submarine Electric Bell.

When the alternating current is passed through this armature winding, it induces another alternating current in the copper tube. Only by this construction, it is said, has it been found possible to obtain the enormous force necessary to rapidly compress the water and thus make possible the rapid transmission of telegraphic signals through this medium, as well also as telephonic transmission.

Further, in order to apply this force now set up, an electro-magnetic reaction is started. In other words, to transmute this force into wave compression in the water, the copper tube is attached to solid discs of steel, which in turn are attached to a steel

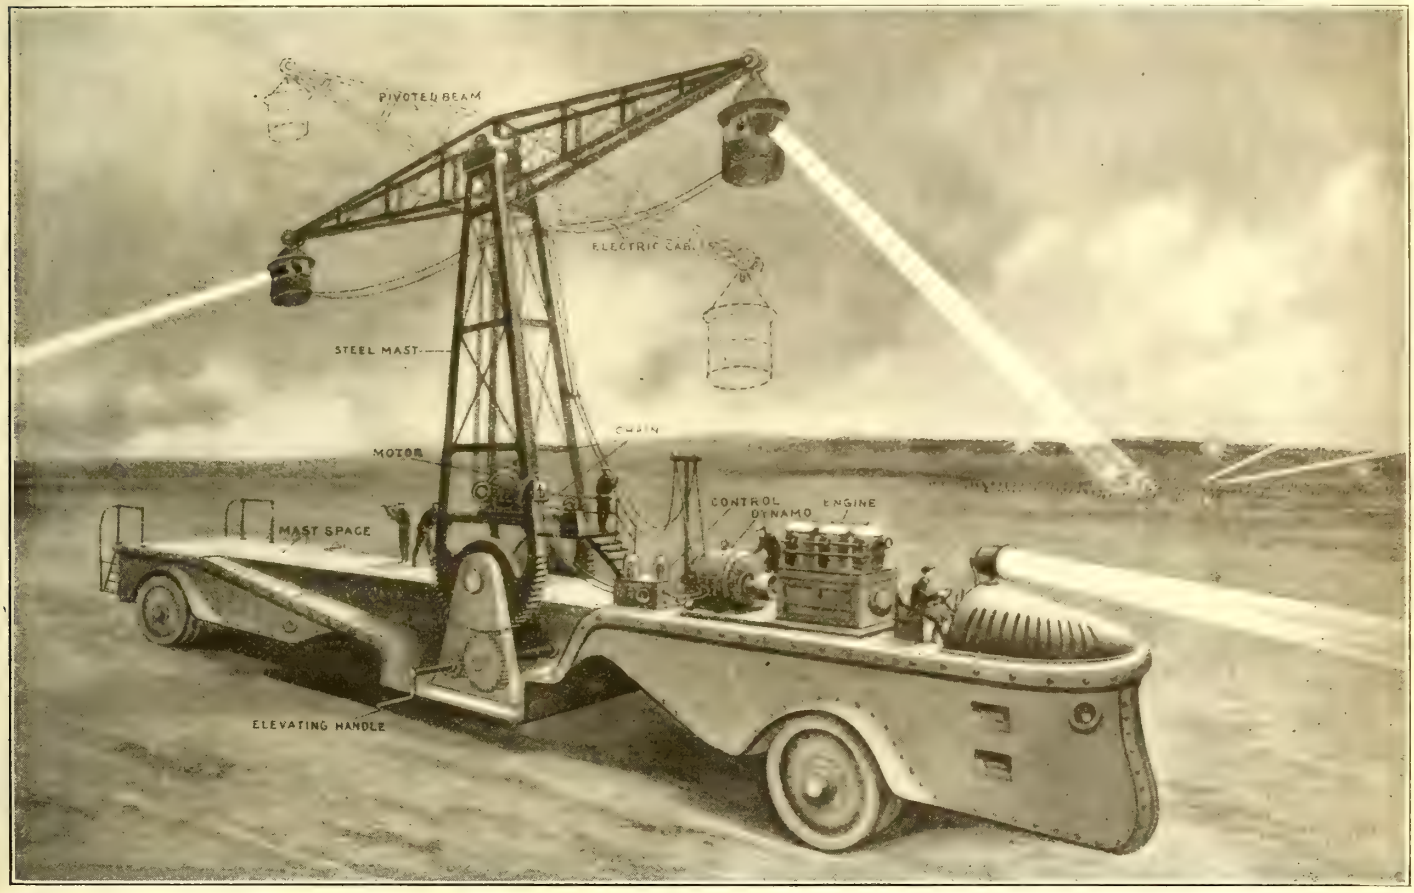
diaphragm one inch thick, which may be

New Searchlights Foil the Enemy's Guns



IN the illustration herewith is perceived a somewhat novel form of searchlight mounted on a rapidly movable or oscillating arm, which in turn is carried by a powerful motor truck so as to be very mobile and thus readily transported from place to place as required. This idea has been brought forth by H. Gernsback.

As is quite well known, a fixed searchlight, such as now used by the great European armies, becomes very quickly a target for missiles of all sizes and descriptions, which, needless to say, soon reduce it to a scrap heap. The gun spotters of today, even those in charge of large caliber field pieces, are notoriously accurate in their work, and unless a searchlight which is visible to them is constantly moved it is bound to be the unhappy target for a host of high explosive shells before many peaceful moments have passed.

To obviate these and other untoward difficulties surrounding the use of searchlights in night-time warfare, this design has been promulgated, and, as may be gleaned from the illustration, it is intended to use one or both searchlight beams at the same time. The motor truck of large size carries a complete dynamo and gasoline engine for running same, which is seen mounted behind the driver's seat on the truck. By means of heavy flexible cables from the dynamo the searchlights, which are carried in small cases when not in use, are supplied with current. When being used the projectors are constantly oscillated or moved up and down at an ever-changing speed. This is obtained by a hand crank, which is shown in the illustration.

However, it is possible to also effect this irregular up and down movement of the horizontal girder carrying the searchlight baskets by means of electricity. The electric control box for this arrangement is indicated on the truck. Such a mechanism may consist principally of a motor-driven drum having on its surface a considerable number of segments making contact with a pair of brushes. To every pair of segments on the drum there can be joined a different resistance, so that as the drum is rotated it will cause differing values of current to be supplied to the motor on the main pedestal, which in turn controls the up and down movement of the horizontal searchlight girder.

It is also very easy to arrange reverse current trips on the device just mentioned, so that the arm will move downward so many degrees and then reverse and move upward so many degrees. If desired, this arrangement may be modified in many ways so as to be adapted to stationary requirements. In such an event the truck could be made many times larger, most probably to advantage. Again, the center pedestal carrying the constantly moving horizontal arm could be swung about on its vertical axis so as to give greater play to the searchlights and also simultaneously to make them a more difficult target for the enemy's gunners. The dotted lines in the illustration show a second position of the horizontal girder carrying the searchlight baskets. It is thought that the constantly moving searchlights of this type are practically proof against the enemy's fire, as it would be impossible to accurately train a gun on them. However, it remains for such a device to be actually tried out before we can predict the results.

Remarkable Mobile Searchlight Tractor Designed to Keep the Searchlights Constantly Moving, Vertically as Well as Horizontally. A Difficult Target for the Enemy.

PROFESSOR ULIVI OUTDONE IN AMERICA?

Professor Montraville M. Wood, of Chicago, who spoke in Paul Revere Hall at Boston, recently, outdid Giulio Ulivi's claims for his F-rays in claims for the ultra-violet rays, which appear to be the same thing. According, however, to Professor Wood, the naval advisory board is in possession of "the secret of the ultra-violet ray" and the wonderful power it controls, and is conducting experiments with it, and he predicts that within a short time the turret guns of the ships of the United States will be operated automatically by the use of the ultra-violet ray, and that the guns will not fire until they are in a direct line with the object at which they are aimed. Men, except to load the guns, will not be needed.

In regard to the employment of time fuses in the starting of fires on board the ships carrying supplies, the professor says, what really happens is that someone, either off shore or on the ship, conceals a carefully tuned Hertzian ring in a lump of coal, and closes the cup, or gap, with a piece of guncotton. The ship sails, gets as far as mid-ocean. There is a sudden explosion, followed by fire. An operator on shore fired that ship, either by tuning his wireless coil until he reached the proper wave, or by bringing the ring in focus with the ultra-violet ray, or so the professor thinks.

DETECTS THUNDER STORMS 300 MILES AWAY.

Using a modified wireless receiving instrument, a French scientist has been able to detect thunder storms more than 300 miles distant.

The Trench Tractor

By H. Gernsback

BEFORE the advent of the monstrous 14-inch field guns, it was thought impossible to take a well-manned fortress by the then existing means. But since we have learned that the strongest fortress can be reduced within a few hours to a mere scrap heap it has become necessary to keep the enemy so far away from the fortress that his guns cannot reach it.

So the curious paradox has come to pass, as witnessed in the great war, that concrete and steel fortresses are protected no longer by stone or steel walls, but by human flesh sheltered by trenches.

Once two contending armies dig themselves in trenches, these armies practically cease to exist for their respective countries. They become deadlocked and up to this time, as the European war demonstrates so clearly, nothing has been invented whereby one army can effectively drive the other from their trenches. For over eighteen months at this time of writing the Germans and the French have been deadlocked, neither contending army having moved forward or backward for more than five miles. To be sure, local successes occur here and there and sometimes one or the other carries a few hundred yards of trenches only to lose them the next day.

The Germans being the first to realize the unsatisfactory results of trench warfare set out to devise some means to drive the enemy from his trenches. We are all familiar with the result whereby poisonous or asphyxiating gases were used. This plan worked well for a time till the enemy learned to wear respirators, and it is now a rare occurrence that a trench is won by means of gases alone.

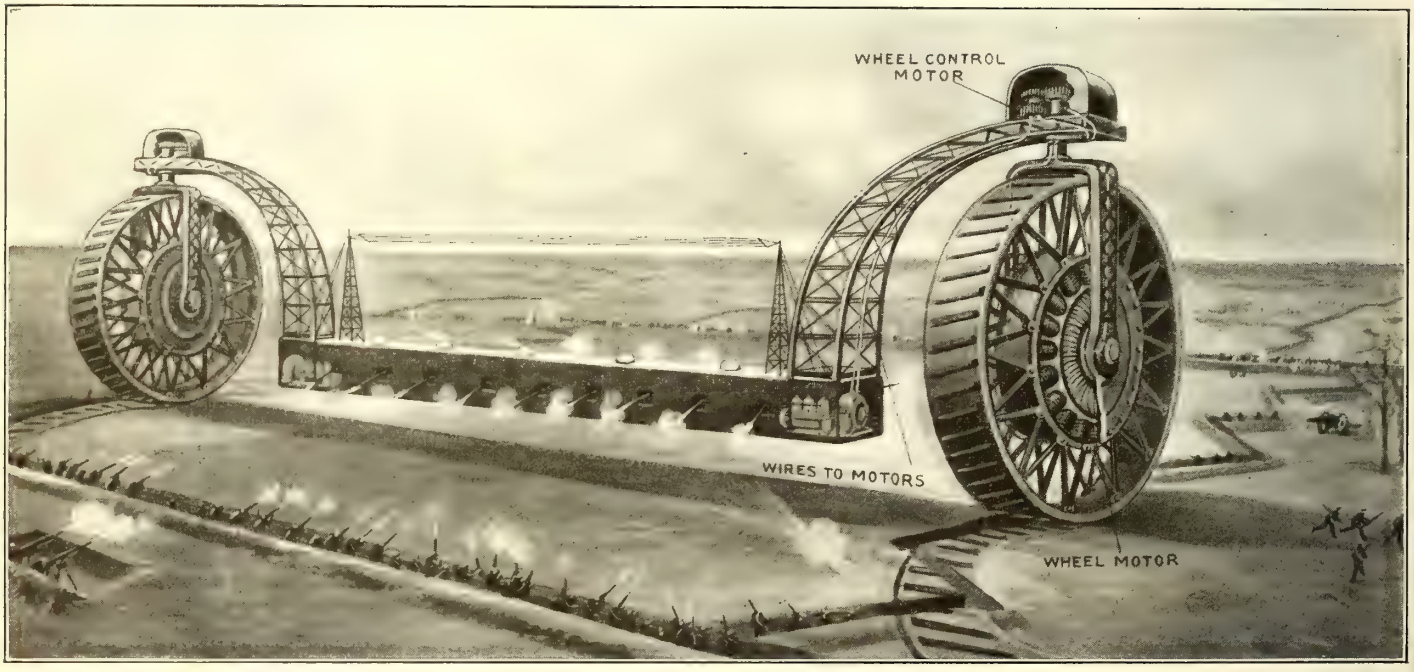
What is needed to-day is a machine to effectually combat the men in the trenches by either destroying them or otherwise putting them out of action. This must be accomplished with great rapidity in order to quickly repeat the operations with the second and the third line of trenches. Then when a successful gap has been made, it will be a comparatively simple matter for the men to rush up into the break and *"consolidate"* the new advanced positions, as the French term this process.

The writer desires to advance a new idea by which to accomplish the foregoing, and while it may appear fantastic at first thought it is nevertheless not an impossibility. We need but remind the incredulous that but eighteen months ago the wisest military engineers outside of Germany would have laughed at the idea of running a 14-inch 140 ton gun over land. It was accomplished, nevertheless.

While the Trench Tractor as conceived by the writer is of course purely imaginary, we are not at all sure that a machine of this type will not roll over the ground in the not very distant future.

Briefly, the Trench Tractor is a huge two-wheeled monster, propelled by electricity and of sufficient size to "walk" over ordinary trenches with ease.

The imaginary tractor, as shown in our illustration, has two wheels, each 40 feet high and 15 feet wide. The business part of the machine is about 70 feet long and about 15 feet square. In it are carried 200 fully armed men, bomb throwers, a number of 3-inch and 6-inch guns, as well as machine guns, ammunition stores, supplies, wireless apparatus, a steam generating plant, the two power plants, etc., etc. The tractor is to run at a speed of about 20 miles and is estimated to weigh 10,000 tons. It is needless to say that the body of the machine is armored with a heavy plating so as to protect the men in the interior from the enemy's shell fire.



At first thought one would imagine that such a huge machine requires an enormous amount of power to move it at a speed of 20 miles an hour, but this is not the case. Moving over level ground but 2,600 horsepower are required, which is but 2,000 kw. The average electric train of 3,000 tons requires 605 kw. to move it at 20 miles an hour.

Thus our imaginary tractor, to run over rough ground or to ascend hills (in a zigzag line) would not require over 3,500 horsepower at the utmost. This is very much less than is used by a moderate-sized steamship.

The right wheel, which shows the detail of the motor which propels the former, is illustrated with the plating broken away to show the interior; both wheels, however, are of course heavily plated with armor to protect the motors.

Two independent high speed gasoline or oil engines are used to drive the dynamos, which in turn supply the current to the slow running wheel motors. As the wheels are so large they need but run at 14 revolutions per minute in order to drive the tractor at a speed of 20 miles per hour. For this, and other self-apparent reasons, the electric mode of propelling the machine is necessary.

In the illustration the tractor is shown running with its wheels parallel to each other. This is the fighting position. As the length of the entire machine, measured from one side of one wheel to the other is over 140 feet, the tractor could not of course run on a road. For this and other reasons the wheels can be turned about, bicycle fashion, so that the machine can run lengthwise. In this position it measures but 18 feet wide and it will roll comfortably on a road and even over a steel bridge. In this position also it offers but small surface to the enemy's fire.

A Powerful Land Fighting Machine That Can Travel Sidewise or Longitudinally. It is Capable of Carrying Heavy Guns as Well as Rapid Fire Machine Guns.
